These results parallel other reports that bipolar depressed and major depressive patients have significant abnormalities of anterior pituitary ACTH and prolactin, as well as adrenal cortisol, secretion. Specifically, abnormalities of ACTH suppressibility to dexamethasone was noted, and 1600 post-dexamethasone ACTH levels were better discriminators of bipolar depressed and major depressive disorder patients from other nosological types of patients in the subject group. Matthews et al. (1982) have similarly reported that post-dexamethasone plasma concentrations of anterior pituitary β-Endorphin-like immunoreactivity were better nosological discriminators than post-dexamethasone cortisol levels. These results also suggest that the abnormality in adrenal cortisol hypersecretion widely noted in melancholia, may

TABLE 3. Cut-points Obtained Using a Fisher's Exact Test That Differentiate Significantly Between Depressed and Nondepressed Patients.

	ACTH—1600 Post-Dexamethasone			
	≤ 19.0	> 19.0	*p* value	
Nondepressed	11	0	.030	Sensitivity = 38.5%
Depressed	8	5		Specificity = 100.0%
	Prolactin—0800 Baseline			
	≤ 20.1	> 20.1	*p* value	
Nondepressed	5	3	.049	Sensitivity = 100.0%
Depressed	12	0		Specificity = 37.5%
	Prolactin—1600 Post-Dexamethasone			
	≤ 14.6	> 14.6	*p* value	
Nondepressed	4	4	.010	Sensitivity = 100.0%
Depressed	14	0		Specificity = 50.0%
	Cortisol—1600 Baseline			
	≤ 8.8	> 8.8	*p* value	
Nondepressed	6	5	.043	Sensitivity = 90.0%
Depressed	1	9		Specificity = 54.5%

represent, at least in part, dysfunction at the pituitary or even more central levels.

Prolactin levels tended to be lower (Table 3) pre- and post-dexamethasone, in bipolar depressed and major depressive disorder patients than other nosological types of patients, as has been reported by others.

These results need replication with much larger sample sizes, but suggest to us that concomitant measurement of pituitary ACTH and prolactin (and β-Endorphin-like immunoreactivity in a previous study, Matthews et al., 1982) may be of clinical utility in improving the sensitivity and specificity of the DST, and in understanding neuroendocrine dysfunction in melancholia.

Summary

Plasma concentrations of ACTH and prolactin were measured at 0800 and 1600 before and after the standard 1 mg overnight DST. Dexamethasone suppressed plasma concentrations of ACTH, prolactin, and cortisol in the subject group as a whole. There was a significant group time interaction when post-dexamethasone ACTH concentrations were compared between DST suppressors and nonsuppressors. "Cut Points" (Fisher's Exact Test) of plasma prolactin at 0800 pre-dexamethasone and at 1600 post-dexamethasone, of plasma ACTH at 1600 post-dexamethasone, and of plasma cortisol at 1600 pre-dexamethasone significantly differentiated patients with bipolar depressive disorder and major depressive disorder from other psychiatric patients. These pilot findings suggest that monitoring plasma prolactin and ACTH concentrations in the DST might increase the sensitivity and specificity of this laboratory test for melancholia.

Recent Advances in Biomedical Research in Schizophrenia

Chair:

Robert O. Friedel, M.D.

Introduction

The prevalence of schizophrenia has been estimated to be approximately 0.6 to 0.8 percent of the population across most cultures studied. However, these numbers do not reflect the cost in human suffering, lost productivity, and medical and other expenses caused by this illness. In spite of the fact that there has not been a major breakthrough in our understanding of the etiologies or treatments of schizophrenia since the serendipitous discovery of chlorpromazine in 1954, there has been a steady advance in our knowledge in these areas. In addition, as a result of the recent application of sophisticated research methodologies and technologies, there has been a relative burst of new information coming from the field which has created renewed enthusiasm for and increased interest in research in schizophrenia. Most of these data support the contentions that schizophrenia has biological origins, may well involve a disturbance in function of one of the CNS dopaminergic pathways, and appears to result in the disturbance of certain functions of the prefrontal cortex.

The purposes of this panel were to present some of the most provocative and representative data of this type, and to provide a selective state-of-the-art review of the field.

I am indebted to Dr. Seymour Kety for helping me to think through the topics to be covered, though I am responsible for whatever biases and omissions resulted from the final selections.

The Genetics of Schizophrenia: A Current Perspective

Kenneth S. Kendler, M.D.[1]

This review will focus on recent work addressing four questions: 1) *is schizophrenia familial?* If schizophrenia is familial, 2) *to what extent is the familial aggregation of schizophrenia due to environmental versus genetic factors?* and 3) *what is transmitted within families that predisposes members to schizophrenia?* Finally, if genetic factors play an important role in the familial transmission of schizophrenia, 4) *what is their mode of genetic transmission?*

Over 25 family studies published before 1980 have all suggested that schizophrenia strongly aggregates in families. However, nearly all of these studies had three important methodologic limitations: 1) no control groups were used, 2) diagnoses were made nonblind, and 3) neither structured personal interviews nor operationalized diagnostic criteria were used.

These limitations and the demonstration in small uncontrolled samples of low degrees of familial aggregation for schizophrenia have raised questions whether schizophrenia, when carefully or "narrowly" diagnosed, is indeed a familial disorder. Since 1980, four major studies meeting most or all of these methodologic criteria have been performed which permit an evaluation of these claims. These studies, performed in Switzerland (Scharfetter & Nusperli, 1980), Iowa (Tsuang et al., 1980; Kendler et al., 1985), St. Louis (Guze et al., 1983), and New York (Baron et al., 1985), have all found a highly significant excess risk for schizophrenia in the relatives of schizophrenic probands compared to relatives of either psychiatric or normal control groups. Three of these studies used narrow criteria for schizophrenia. Results of recent more methodologically rigorous family studies have replicated earlier findings in suggesting that schizophrenia, even when "narrowly" diagnosed, is indeed a familial disorder.

A major goal of genetic epidemiology is to discriminate for familial disorders the degree to which familial transmission is due to genetic versus nongenetic mechanisms. For schizophrenia the great bulk of our knowledge about this problem comes from twin and adoption studies.

The last 5 years have seen two important advances in our understanding of twin studies of schizophrenia. Twin studies have often been faulted because of the "equal environment assumption," that is, that monozygotic (MZ) and dizygotic (DZ) twins are exposed to approximately equal environments. Studies have shown that for many social variables, the environment is more similar for MZ than for DZ twins. While this may invalidate twin studies, another interpretation is possible. The similarity in behavior of MZ twins might *create* for themselves more similar environments. As recently reviewed (Kendler et al., 1983), these two alternative hypotheses have been subject to empirical test in at least nine different studies. Consistently, these studies suggest that the environmental similarity of MZ twins is the *result* and not the cause of their behavioral similarity. Current evidence supports the validity of the equal environment assumption of twin studies.

Twelve major twin studies of schizophrenia have been performed to date. None of these studies meet all the methodologic criteria outlined above for family studies and an additional criterion that zygosity assignment be made blind with respect to psychiatric diagnosis. A major problem in interpretation of these studies stems from the fact that they vary considerably in the mode of selection of proband twins and diagnostic criteria applied. Taking advantage of the fact that these differences should equally affect MZ and DZ concordance rates, it is possible to compare across twin studies by using genetic models which take into account concordance rates for both twin types. When one such model (the multifactorial threshold model) is applied, substantial agreement was found across all major twin studies of schizophrenia (Kendler, 1983). The heritability of liability of schizophrenia was found to range in nearly all studies from 0.6 to 0.9. Twin studies consistently suggest that genetic factors play a major role in the familial transmission of schizophrenia. These figures are reassuringly similar to those obtained fitting path analytic models to the transmission of schizophrenia in twins and a wide variety of nontwin relationships.

Regarding adoption studies of schizophrenia, the major advance in the last 5 years has been the application of operationalized diagnostic criteria to previously collected samples. The study of the adopted-away offspring of schizophrenic and control parents performed in Denmark by Rosenthal and coworkers has been reanalyzed by Lowing et al. (1983). Excluding many of the parents for whom the diagnosis was not secure, they nonetheless broadly reconfirmed the results of the original investigators. The famous Danish study of biologic and adoptive relatives of schizophrenic and control adoptees of Kety and coworkers has been subject to several reanalyses. The only complete analysis was performed using DSM-III criteria by Kendler and Gruenberg (1984). Their results replicated and extended all the major findings of Kety and coworkers.

Only one new adoption study of schizophrenia has been reported since 1980. Tienari and coworkers in Finland (1985) have collected the largest sample to date of adopted away offspring of schizophrenic and control parents. Preliminary results suggest that psychosis is significantly more common among the adopted away offspring of schizophrenic versus control parents. However, they also find a strong correlation between the psychiatric status of the adoptee and the functioning of the adoptive family. While this may be due to a disturbed adoptive family causing disturbance in the adoptee, it cannot as yet be ruled out that the reverse process is occurring; that is, that a disturbed adoptee is causing disturbance in the adoptive family.

On the level of psychopathological syndromes, four major hypotheses can be articulated about the form of liability to schizophrenia that is transmitted in families: 1) a general liability to all psychiatric illness, 2) a liability to poor psychosocial functioning, oddness, suspiciousness, etc., 3) a liability to psychosis, and 4) a specific liability only to classic schizophrenia. These hypotheses are useful because they generate specific predictions about the pattern of psychopathology that should be observed in families of schizophrenics.

While early family and adoption studies of schizophrenia provided clues to the validity of these four hypotheses, more definitive evaluation had to await the introduction of operationalized criteria, blind diagnosis, and normal control groups. The crucial comparison is between relatives of schizophrenics and a sample representative of the general population. Both of the two recent family studies containing such a control group and using DSM-III criteria (Baron et al., 1985; Kendler et al., 1985) found results clearly inconsistent with the first hypothesis. In both studies, no excess risk for affective illness, anxiety disorders, or alcoholism was found in the relatives of the schizophrenics versus controls. Similar results on a smaller sample size were found in the Copenhagen sample of the Danish adoption study (Kendler & Gruenberg, 1984) and in pilot data from the West of Ireland (Kendler et al., unpublished data). The familial liability to schizophrenia appears to possess some specificity.

As suggested by earlier studies, the more recent application of operationalized criteria has provided considerable support for the second hypothesis. Reanalyses of the Danish adoption samples (Lowing et al., 1983; Kendler & Gruenberg, 1984) found that, as defined by DSM-III, schizotypal, paranoid, and possibly schizoid personality disorder have a strong genetic relationship to schizophrenia. Three further investigations based on intact families have supported these findings. Two were done in New York, one employing the family history method (Kendler et al., 1984) and the other utilizing direct interviews (Baron et al., 1985). Both provided strong evidence for a familial relationship between schizophrenia and schizotypal and paranoid personality disorder. The third study comes from county Roscommon, Ireland (Kendler et al., unpublished data) where pilot data also show a significantly higher risk for schizotypal and paranoid personality disorders in interviewed first-degree relatives of schizophrenic versus control probands. All of these studies, of course, argue against the fourth hypothesis that the transmitted liability to schizophrenia is specific for only the chronic psychotic disorder.

Recent studies have also provided some support for the third hypothesis. In the large Iowa cohort, Kendler et al. (1985) found evidence for a familial link between DSM-III schizophrenia and schizoaffective disorder, atypical psychosis, and psychotic affective illness. Both Baron et al. (1982) and Scharfetter and Nusperli (1980) also found evidence for a familial relationship between schizophrenia and at least certain subgroups of schizoaffective patients.

In summary, results to date strongly suggest that neither the first nor the fourth hypothesis is correct. The familial predisposition to schizophrenia is neither completely nonspecific, nor highly specific. Results are available to strongly support the second hypothesis and also to provide some evidence in favor of the third hypothesis. These findings provide an increasingly complex, but informative picture of the nature of the transmitted liability to schizophrenia.

While evidence in favor of a genetic contribution to schizophrenia has been available for nearly 50 years, we are still largely ignorant about the mode of transmission of this liability. This undesirable state of affairs largely results from 1) the inherent complexity of the "schizophrenic phenotype," 2) the lack, until recently, of sufficiently powerful statistical-analytic tools, and 3) a paucity of large, carefully controlled data sets, collected using the major advances in field techniques in psychiatric epidemiology made in the last decade.

Interest has largely focused on two techniques with incorporate information about family structure with the goal of detecting a single locus that substantially affects liability to illness: complex segregation analysis and linkage analysis.

While developing from a relatively simple method to determine the segregation ratio within sibships, segregation analysis has grown considerably in complexity; and modern techniques will include estimates of gene frequency, penetrance, transmission probabilities, polygenes, common sibling environment and variable age of onset. Despite these advances, applications of this method to schizophrenia have been few and controversial.

Four major segregation analyses of schizophrenia have been published. Two of them (Elston et al., 1978; Tsuang et al., 1982) found evidence for vertical transmission of schizophrenia but strongly rejected a single gene model. The other two (Carter & Chung, 1980; Risch & Baron, 1984) also found strong evidence for vertical transmission of schizophrenia and found the pattern could be explained by polygenes with a relatively high heritability (.62 to .82). However, in both studies a single major gene alone or a single major gene with a modest polygene "background" also gave a good fit to the data. These results should be regarded as very preliminary. Only two of these studies used data sets that would meet the methodologic criteria noted above for family studies (Tsuang et al., 1982; Risch & Baron, 1984) and only one of these included a specific evaluation of the schizophrenia spectrum (Risch & Baron, 1984). Both of these methodologically adequate studies were based on a relatively small number of interviewed first degree relatives (354, Tsuang et al.; 276, Risch & Baron). Power analyses have suggested that the sample size required to detect a major gene for a discontinuous trait like schizophrenia is more likely to be in the range of 1,000 first-degree relatives. Finally, segregation analyses of schizophrenia have not to date incorporated exciting new developments including tests for genetic heterogeneity and the incorporation of environmental risk factors into the analysis.

Given the many complexities that may underlie the genetic transmission of schizophrenia, the ultimate resolving power of segregation analysis remains controversial. In the wake of the scientific revolution spawned by DNA technology, and the spectacular success at locating the genes for Huntington's disease and cystic fibrosis, interest has increased markedly in the application of linkage analysis to psychiatric disorders such as schizophrenia. Linkage analysis used to be limited in man because informative markers could be found in any given pedigree for only a small proportion of the human genome. Using recent developments in molecular genetics, the number of potentially informative markers is now nearly unlimited.

If a sufficient number of large informative pedigrees can be found and a single gene exists which substantially influences liability to schizophrenia in at least a subset of these pedigrees, it is theoretically only a matter of screening a sufficient number of markers to locate the gene. However, there are many reasons why the detection of a major gene for schizophrenia by linkage analysis should be much more difficult than for the typical Mendelian human disorders. Probably the most important such reasons are incomplete penetrance and genetic heterogeneity.

To date, linkage studies of schizophrenia using conventional markers have been few and relatively disappointing. Two early studies reported possible linkage between schizophrenia and the group specific protein (Gc), the immunoglobin Gm locus (Elston et al., 1973), and HLA (Turner, 1979). However, the most carefully done linkage study of schizophrenia to date (McGuffin et al., 1983) could replicate neither of these findings nor find evidence for linkage between schizophrenia and any other of the 17 markers examined. Given the small sample sizes used and the limited number of markers examined, the negative results are not surprising.

In summary, the evidence is relatively strong that schizophrenia is a familial disorder and that the familial aggregation of schizophrenia is due largely to genetic factors. Whatever the familial predisposition that operates for schizophrenia, it not only "codes" for the classic, psychotic disorder but also increases liability to "schizophrenia-like" personality disorders and probably other nonschizophrenic nonaffective psychoses. We remain largely ignorant about the mode of transmission of the genetic liability to schizophrenia. Although previous studies have been inconclusive, newly developed methods of complex segregation and linkage analysis provide a source for cautious optimism regarding the possibility of clarifying this central issue.

The Dopamine Hypothesis: Variations on a Theme (II)

Richard Jed Wyatt, M.D.[1]

Introduction

The basic dopamine (DA) hypothesis of schizophrenia states that there is a functional excess of DA in the brains of schizophrenic individuals and that the excess is causally related to the disorder. Many investigators have proposed variations to the basic DA hypothesis (Crow, 1981), including that the mechanism of action of neuroleptic drugs is attributable to their blockade of brain DA receptors (Carlson & Lindqvist, 1963). Another variation is that there is a functional decrease in brain DA activity in certain schizophrenics (Wyatt & Weinberger, 1984; Wyatt, 1985; Chounard & Jones, 1979). Below I review some of the evidence relating to these DA hypotheses and propose still further variations. These new models attempt to explain several observations of schizophrenia which, if they are "facts," must be explained by any model proposing a common pathophysiology, if not cause, of schizophrenia.

The DA Hypothesis of Schizophrenia

The notion that there might be an excess of DA in schizophrenia began when it was realized that stimulants, such as amphetamine, when given in high doses, or for prolonged periods, were capable of producing a paranoid psychosis that in many ways was indistinguishable from schizophrenia (Young & Scoville, 1938; Woodrow, Reifman, & Wyatt, 1978). During the 1960's and 1970's some of the mechanisms of action of amphetamine became understood and one of these was that amphetamine releases DA from neuronal terminals. In 1963 Carlson and Lindqvist published their finding that medications that decrease the symptoms of schizophrenia, chlorpromazine and haloperidol, are capable of increasing brain 3-methoxytyramine, a major metabolite of DA. Medications that do not alter the course of schizophrenia did not produce this increase. Based on this finding, they proposed the novel hypothesis that neuroleptics block DA receptors. Several groups of investigators (Creese & Snyder, 1976) demonstrated a striking correlation between the average daily dose of neuroleptics and their ability to displace radiolabeled haloperidol in the striatum. In comparing equivalent clinical potencies of neuroleptics used to treat schizophrenia and affective disorders, however, there is also an equally striking correlation across neuroleptics (Wyatt & Torgow, 1976). This correlation and other findings suggest that any DA alteration in these disorders might be downstream from the cause but still of considerable pathophysiological importance (other explanations also exist).

Additional "Facts" Requiring Explanation

A. *Gender Differences and the Role of Estrogen*: It has been known for a number of years that there are striking gender differences in schizophrenia (Mendelson, Gillin, & Wyatt, 1977; Seeman, 1985). Schizophrenia affects males and females in the same percentages, but females are affected later, have a milder course, have a better response to neuroleptics, and sometimes become worse premenstrually and during the postpartum period. There is often, however, an improvement during pregnancy. Thus there appears to be an association between estrogen concentration and the severity of the illness. Also, in the past estrogens have been used in the treatment of psychosis. Animal data suggest that estrogens behave as neuroleptics; they appear to block DA.

B. *Age of Onset*: The onset of schizophrenia generally begins after puberty. At this time the prefrontal cortex becomes fully myelinated (Yakovlev & LeCours, 1964) and the ability to perform abstract thinking is well established. A number of investigators have found apparent alterations in the prefrontal cortex of schizophrenic patients using psychophysiological and imaging techniques (Weinberger, Berman, & Zec, 1986). Possible prefrontal cortex abnormalities in schizophrenia include abnormal smooth pursuit eye movements, increased electroencephalographic delta wave activity, decreased regional cerebral blood flow, particularly following provocative tests, and increased prefrontal sulci size seen on CT scans.

---

[1] Neuropsychiatry Branch, National Institute of Mental Health, WAW Building, Room 536, Saint Elizabeths Hospital, Washington, D.C. 20032.

C. *Genetics*: Schizophrenia appears to be, at least in part, a genetic disorder. There must be a corresponding genetic alteration in the brain, unless schizophrenia is like phenylketonuria where the primary lesion is in the liver. The similarities of response to neuroleptics in affective and schizophrenic disorders suggest that the primary deficit is not in the DA system for all schizophrenics. The effectiveness of neuroleptics in treating schizophrenia does suggest, however, that the primary alteration must either affect the DA system or be affected by it (Wyatt & Torgow, 1976).

D. *Environment*: Since schizophrenia cannot be accounted for entirely by genetic contribution, an environmental contribution must play a significant role. There are considerable data that some initial schizophrenic episodes begin during times of stress (Dohrenwend & Egri, 1981) and that subsequent exacerbations are also related to stress (Goldstein et al., 1978). Although the data are not conclusive, they suggest that any physiological phenomenon altered by stress might be related to schizophrenia. It has been demonstrated in a number of animal studies that frontal lobe dopaminergic activity is increased by stress (Reinhard, Bannon, & Roth, 1982).

E. *The Course of Schizophrenia Is Extremely Variable*: Some patients have one or several episodes and then return to normal function, while other patients have a gradual downhill course. Still other patients, even though they have been ill for many years, have what appears to be gradual recoveries. This variability must be considered as part of any explanatory hypothesis of schizophrenia.

F. *Neuroleptics Are Useful in the Treatment of Schizophrenia*. Any explanation of schizophrenia must deal with how neuroleptics produce their effects. As previously discussed, a number of scientists have demonstrated that the average daily dose of neuroleptics correlates with the drug's ability to inhibit DA receptors as measured by displacement of another neuroleptic, usually haloperidol. Clinicians glancing at some of the drugs used to derive these calculations may note discrepancies from their clinical experience. Promazine, for example, is often used in biochemical studies, yet a number of clinical studies have found promazine not to be as effective as chlorpromazine and others have found promazine no more effective than placebo. One of the displacement studies included trazodone, which is an antidepressant. The studies also contain drugs for which there is little or no experience in schizophrenic patients. Using equivalent clinical potencies of equally efficacious neuroleptics relative to chlorpromazine (Wyatt, 1976), I have recalculated the Pearson correlation (with log transformation) for 16 neuroleptics against their 3H-haloperidol IC_{50}. The 0.73 correlation found is not as high as that seen in previous calculations but, nonetheless, accounts for at least 50 percent of the variance. Once again this association suggests that at least part of the neuroleptics' mechanism of action can be accounted for by dopaminergic blockade.

Data Supporting an Increase of DA

A. *Stimulants, DA Precursors, and Agonists*: As discussed previously, one human model for schizophrenia is the amphetamine-induced paranoid psychosis. It should be pointed out, however, that while amphetamine does release DA, it also releases norepinephrine in at least equal quantities (Karoum et al., 1982). On occasion, L-dopa will produce a psychosis in patients taking it for Parkinson's disease, but again it is unclear if this result is related to the production of DA or norepinephrine. Perhaps more convincing are the number of case reports of DA agonists producing a psychosis.

B. *Brain DA and Its Metabolites*: Autopsy studies by Bacopoulos et al. (1979) and Bird, Langais, and Benes (1984) show increased homovanillic acid (HVA) in the frontal cortex, as well as increased DA and HVA in the nucleus accumbens and anterior perforated substance. Most studies of schizophrenic brains, however, do not show this phenomenon and Bacopoulos et al. theorize that the increase is a neuroleptic effect similar to that found in animals given neuroleptics (Matsumoto et al., 1983).

C. *Cerebrospinal Fluid (CSF)*: While there are few data indicating that there is an increase in DA or its metabolites in the CSF of schizophrenics compared with controls, there are two studies that show positive correlations between the quantity of HVA and productive symptoms (Rimon, Roos, & Rakkolainen, 1971; Kaufmann et al., submitted). This suggests that there might be increased DA turnover in those patients with active symptoms.

D. *Plasma*: There is one study indicating increased plasma HVA in schizophrenics compared with controls (Pickar et al., 1984). More striking, however, is the positive correlation between plasma HVA and symptoms (Davis et al., 1985). Neuroleptics produce a decrease in plasma HVA at a time when the patients improve.

Data Supporting a Decrease in DA

A. *Chronic Stimulant Use in Animals*: There is now considerable evidence that stimulants in high doses produce loss of dopaminergic terminals in the brain. One group (Seiden & Vosmer, 1984) has demonstrated that during the time of stimulant-induced DA release 6-hydroxy DA is produced, which in turn is taken into DA terminals and destroys them.

B. *Von Economo's Encephalitis or Encephalitis Lethargica*: During the world wide epidemic beginning during the winter of 1916–1917, Baron Constantine von Economo described a striking hypokinetic state he called "psychic torpor." Often reactions to encephalitis lethargica were mistaken for schizophrenia and at times it was even called epidemic schizophrenia. Even after patients apparently recovered, a number developed Parkinson's disease. While it is possible that the early symptoms were related to alternations in DA, it is equally likely that they were related to irritation of the brain by the encephalitis.

C. *Parkinson's Disease*: The major alteration in Parkinson's disease appears to involve destruction of DA containing neurons; primarily of the nigro-striatal system. The meso-cortico-limbic dopaminergic system is also involved. Since a number of the deficit symptoms (mild intellectual impairment, apathy or depression, lack of spontaneous speech, problems with concept formation) of Parkinson's disease are similar to those of schizophrenia, it is reasonable to contemplate a similar DA alteration in both disorders.

D. *Akinesia*: Akinesia is a well-known side effect of neuroleptic medications involving both motor and cognitive functions and is seen both in humans and animals. Akinesia is thought to be attributable to a blocking of DA by neuroleptic drugs. Neuroleptic induced akinesia is often indistinguishable from the deficit symptoms of schizophrenia.

E. *Brain DA and Its Metabolites*: While in general no statistically significant decreases of DA or its metabolites in the autopsied brains of schizophrenics have been found, in our study (Kleinman et al., 1979) of a limited number of subjects there were substantial (40% for dopylacetic acid (DOPAC) in the substantia nigra), but statistically nonsignificant decreases in DA, DOPAC, and HVA in the hypothalamus, nucleus accumbens, and substantia nigra.

F. *CSF*: There are several CSF studies indicating that DA or its metabolites are decreased in the CSF of some schizophrenic patients (Kaufman et al., submitted). In several of these studies there has been a negative correlation between HVA concentration and the deficit symptoms associated with schizophrenia. These include poor prognosis and length of illness, as well as negative symptoms ratings.

G. *Urine*: There are relatively few studies measuring DA and its metabolites in urine. One recent study (Karoum et al., 1985) found that when the molar sum of DA and its metabolites are expressed as a ratio over the sum of norepinephrine and its metabolites, medication-free schizophrenics had a lower mean sum DA/sum norepinephrine than a group of normal controls. The ratio increased to normal levels in the presence of neuroleptic drugs.

H. *Animal Models*: There are a number of animal models suggesting that decreased DA can produce symptoms consistent with those of schizophrenia. For example, Wise (1982) studying rats given neuroleptics, which consequently had decreased functional DA, found they had ". . . selective attenuation of motivational arousal which is (a) critical for goal-directed behavior, (b) normally induced by reinforcers and associated environmental stimuli, and (c) normally accompanied by the subjective experience of pleasure. . . ."

I. *Location of Changes*: There have now been well over 30 studies demonstrating that the brains of some schizophrenics, as seen on CT scans, are altered. The alterations include enlargements of the lateral and third ventricles and what appears to be cortical atrophy. One finding of considerable interest is an apparently high incidence of prefrontal cortical atrophy in chronic schizophrenia (Shelton et al., submitted). This is consistent with studies demonstrating decreased regional cerebral blood flow in the prefrontal cortex, particularly where the prefrontal cortex has been cognitively activated (Weinberger, Berman, & Zec, in press). As mentioned, there is reason to believe that prefrontal cortical function is dependent on DA. In animal studies it has been found that stress produces increased DA turnover in the frontal cortex (Thierry et al., 1977).

Variations on a Theme

Hypothesis 1: This variation suggests that schizophrenics have a vulnerable dopaminergic system (perhaps genetic) and that with repeated stress there is loss of dopaminergic terminals. The stress itself is responsible for increased DA turnover and the productive symptoms of schizophrenia. The loss of DA terminals is ultimately responsible for the burned out state of schizophrenia. This hypothesis is consistent with a retrospective course study of Pfohl and Winokur (1982) in which patients began their illness with predominantly productive symptoms but 35 years later had predominantly deficit symptoms. The hypothesis requires the progressive loss of dopaminergic terminals similar to what is seen in stimulant-induced release of DA.

Hypothesis 2: This variation suggests that there is decreased dopaminergic function in the prefrontal cortex of schizophrenics, and that this decrease is responsible for some of the progressive symptoms seen prior to the first acute phase of the disorder. The acute phase of schizophrenia might be caused by stress and a corresponding accompanying increase in DA turnover. Neuroleptics increase DA turnover in the prefrontal cortex without tolerance developing, as appears to occur in other parts of the brain. To speculate further, the increased DA turnover in the frontal lobes produced by neuroleptic administration might decrease the deficit symptoms. Thus, where there is a potentially active prefrontal dopaminergic system in schizophrenia, neuroleptics are capable of decreasing the deficit symptoms. But where the prefrontal DA system is not capable of activation, neuroleptics cannot effect these symptoms. The effects of neuroleptics in other parts of the brain decrease some of the productive or positive symptoms of schizophrenia. It is understood that these hypotheses are simplistic but are offered so that they might lead to further investigations.

The Combined Use of Neuroleptics and ECT in Drug Resistant Schizophrenic Patients

Robert O. Friedel, M.D.[1]

Introduction

The purposes of this paper are to review briefly the literature relevant to the efficacy and risks of using electroconvulsive therapy (ECT) combined with neuroleptics in the treatment of neuroleptic-resistant schizophrenic patients and to present the results of an open trial of ECT and neuroleptics in nine consecutive schizophrenic patients with drug-resistant psychotic symptoms. Because of the personal, social, and economic costs resulting from failures of existing pharmacological treatments of schizophrenic patients, a search for treatment alternatives seems indicated. A careful review of the literature (Roehrich & Friedel, unpublished data) covering the use of ECT combined with neuroleptics in the treatment of schizophrenic patients suggests that: 1) combined treatment may result in a more rapid onset of therapeutic response when typical and low doses of neuroleptics are used; 2) at low doses of neuroleptics, the addition of ECT may result in a synergistic therapeutic effect; 3) the ECT neuroleptic combination may be efficacious in some neuroleptic-resistant patients; and 4) there does not appear to be a clinically significant increase in the morbidity or mortality rate associated with the combined treatment, especially if high potency neuroleptics are used instead of chlorpromazine.

There are three studies which suggest an increased rate of therapeutic response by schizophrenics to ECT plus neuroleptics compared to the response rate to neuroleptics alone (Smith et al., 1967; Taylor & Fleminger, 1980; Janakiramaiah et al., 1982). In all of these studies, lower than normal neuroleptic doses were used and in one (Janakiramaiah et al., 1982), normal doses were also given. These findings suggest an increased rate of response to the ECT drug combination, with the possibility of enhanced peak effectiveness as a result of the combined treatment. Given increasing pressure to shorten hospital lengths of stay, improved response rate would be an important finding.

The results of four studies suggest that neuroleptics given at lower than normal doses combined with ECT are significantly more effective than comparable doses given alone (Smith et al., 1967; Taylor & Fleminger, 1980; Janakiramaiah et al., 1982; Ray, 1962). There are no controlled studies that do not show a significant advantage of low doses of neuroleptics combined with ECT compared to low doses of neuroleptics given alone. Because of growing and considerable concern about serious and permanent side effects to neuroleptics, some of which may be dose related (Gardos & Cole, 1976; Task Force Report No. 18, 1980; Marder et al., 1984), further study of the treatment of acute exacerbations of schizophrenic psychosis with low doses of neuroleptics and ECT seems indicated.

The often stated concern that the combination of ECT plus neuroleptics results in increased morbidity and mortality does not appear to be supported by the literature (Roehrich & Friedel, unpublished data). Although five reports of death and serious medical morbidity associated with ECT-neuroleptic treatment have been reported (Weiss, 1955; Kalinowsky, 1956; Gaitz et al., 1956; Lesse, 1959; Barker & Baker, 1959), a review of the controlled studies noted above and survey studies suggests that the death rate with combined ECT-neuroleptic treatment is no greater than that for ECT alone. In addition, the studies which report mortality as a result of combined treatment failed to provide contextual data to determine comparative mortality rates with neuroleptics and ECT alone in the same populations. Nonetheless, it may be concluded that the available evidence suggest the possibility of mortality and morbidity rates of chlorpromazine plus ECT greater than those with either chlorpromazine or ECT alone. There are some data that suggest this may not be true when high potency neuroleptics are used with ECT. In summary, the question of adverse treatment effects admonishes us to carefully evaluate the indications for the combined treatment in each patient for whom it is considered.

Finally, Childers and Therrien (1961) have reported that 11 of 23 schizophrenic patients who had been unresponsive to 5 weeks of treatment with either 1000 mg per day of chlorpromazine or 40 mg per day of trifluoperazine demonstrated a moderate to marked improvement when drug dose was reduced and a series of 15 ECT given. This is the only systematic study noted in the literature which evaluates the effect of the neuroleptic-ECT combination in patients unresponsive to a known and adequate trial on neuroleptics. The finding is weakened because there was no control group of drug-resistant patients continued on neuroleptics alone. To the best of my knowledge, no such controlled study exists in the literature in spite of this detailed report and similar findings in other uncontrolled studies which followed (Witton, 1962; Weinstein & Fischer, 1971; McNeill, 1977; Rahman, 1968). Because of the need for treatment alternatives for drug-resistant schizophrenic patients and the results of these older studies, an open trial of neuroleptics plus ECT was conducted on patients whose psychotic symptoms failed to respond to treatment with neuroleptics alone.

Methods

Twenty-one patients meeting DSM-III criteria for schizophrenia with moderate to severe psychotic symptoms were entered into the study. Treatment was initiated with thiothixene and dosages increased until a moderate to marked improvement was achieved, disabling and uncontrollable side effects intervened, or thiothixene plus desmethylthiothixene plasma levels exceeded 15 ng/ml. Thiothixene and desmethylthiothixene plasma levels were assayed using an HPLC technique (Narasimhachari et al., 1984). Nine of the 21 original patients achieved a moderate to marked improvement with medications. The thiothixene plus desmethylthiothixene plasma levels of these patients ranged from 6 ng/ml to 15 ng/ml.

Of the remaining 11 patients, who achieved either no (or slight) improvement with medications, all received dosage increases until drug plasma levels greater than 15 ng/ml were reached. These patients were considered to be medication nonresponders and nine of them were started on a course of either unilateral or bilateral ECT at the rate of three treatments per week. Patients were rated as either not improved or having mild, moderate, or complete remission of psychotic symptoms. In addition, global memory impairment was evaluated weekly and cardiovascular toxicity defined as any unusual alterations in blood pressure, pulse, or electrocardiogram observed during and after each ECT.

Results

Of the nine patients entering into treatment with thiothixene plus ECT, eight patients achieved a complete remission of psychotic symptoms and one patient continued to exhibit very mild symptoms at the completion of the course of ECT. In this open trial, a variable number of ECT were given depending on the individual patient's response. The range was from 8 to 25 treatments with a mean of 13.6 treatments. The dose of thiothixene varied from 30 mg to 60 mg per day during the course of ECT. Six of the patients received unilateral ECT and three received bilateral ECT. There did not appear to be any difference in the efficacy of these two electrode placements, but memory impairment was clearly greater using bilateral ECT with three patients experiencing either moderate or marked memory impairment with this electrode placement. Three of the patients receiving combined ECT plus neuroleptic treatment were lost to follow-up. Of the remaining six, the duration of remission appeared to be longer with bilateral ECT (6.5 months versus 4.6 months), but the number of patients treated is too small to draw firm conclusions.

Discussion

Based on the response of the nine patients treated with ECT plus thiothixene, the combined treatment appears to be effective in the treatment of psychotic symptoms of drug-resistant schizophrenic patients. The average patient in this study had been continously psychotic for over 3 years and had been treated with a number of neuroleptics and neuroleptics plus lithium with only mild to at best moderate success. After the combined treatment it was common for family members to report that the patient was "doing better than we have seen him in years." For example, one of the patients was able to return to outpatient care after more than 5 years of chronic continued hospitalization.

The lack of significant cardiovascular side effects in this population supports the contention that patients receiving ECT plus high potency neuroleptics are not at significant risk for serious cardiovascular complications.

In sum, these data suggest the need for a controlled trial of ECT combined with neuroleptics versus neuroleptics alone in a well-defined, drug-resistant population of psychotic schizophrenic patients. The results of this pilot study must be viewed with caution because patients were not evaluated during and after treatment with an operationalized rating scale by raters blind to treatment, and because a control group of patients continuing on medications alone was not employed. In addition, follow-up data need to be collected on patients for a significant period after treatment to determine the duration of remission in patients who respond to the combined treatment. Nonetheless, the data support the previous study by Childers and Therrien (1961) and the approach warrants further study.

Lack of Serotonergic Modulation on ^{3}H-Imipramine Binding Sites in Basal Conditions and During Prolonged Treatment With Desmethylimipramine

Nicoletta Brunello, Ph.D.,[1] Alessandra Cecilia Rovescalli, Ph.D.,[1] Marco Riva, Ph.D.,[1] and Giorgio Racagni, Ph.D.[1]

Introduction

Typical antidepressants (ADs) display multiple neurochemical effects, generally consistent with the increase of monoamine synaptic availability, through inhibition of presynaptic uptake mechanisms (Korf, 1983).

However, while these effects occur after the acute administration of ADs, clinical studies reveal that prolonged treatments (7 to 15 days) are required to induce the symptomatic improvement of depressed patients. It is therefore apparent that the biochemical mechanisms underlying the therapeutic effects of ADs should be better investigated following repeated administration of these drugs. It is well known that a prolonged treatment with desmethylimipramine (DMI) decreases the activity of noradrenergic neurons in the central nervous system (CNS); in particular the following biochemical modifications have been observed: reduction of the concentration of cortical β-adrenergic receptors (Banerjee et al., 1977); reduced sensitivity of norepinephrine (NE)-dependent adenylate cyclase activity (Vetulani & Sulser, 1975); decrease of the central content of normetanephrine, the O-methylated metabolite of NE (Racagni et al., 1982). Previous studies indicate that an intact serotonergic function is required to enable chronic ADs to desensitize noradrenergic neurons (Brunello et al., 1982a; Janowsky et al., 1982). Moreover, the involvement of serotonergic system in the action of antidepressant drugs is further supported by the existence of high-affinity recognition sites for ^{3}H-imipramine (^{3}H-IMI) on serotonergic terminals (Raisman et al., 1979, 1980).

Correspondence should be addressed to: Prof. Giorgio Racagni, Institute of Pharmacology and Pharmacognosy, Center of Neuropharmacology, University of Milan, via Balzaretti 9, 20133 Milan, Italy.

Even if the precise physiological significance of ^{3}H-IMI binding sites is not yet known, they have been demonstrated allosterically coupled to the serotonin (5-HT)-uptake molecular complex (Langer et al., 1980). A chronic treatment with ADs induces opposite modifications in the kinetic properties of these two sites; in particular DMI-induced down-regulation of ^{3}H-IMI binding sites and increase of the V_{max} of *in vitro* 5-HT-uptake have been observed in brain (Barbaccia et al., 1983a; Racagni & Brunello, 1984).

The present paper reports studies on the involvement of 5-HT in the mediation of the effect of DMI on ^{3}H-IMI recognition sites. To this purpose kinetic properties of ^{3}H-IMI binding following repeated coadministration of DMI and para-chlorophenylalanine (pCPA), a selective inhibitor of 5-HT biosynthesis have been evaluated. Moreover, studies have been performed on the acute and chronic effects of tryptolines (THβCs: 5-methoxytryptoline, 5-MeOT; 5-hydroxytryptoline, 5-OHT; unsubstituted tryptoline, Tp), putative endogenous modulators of 5-HT-uptake molecular complex (Langer et al., 1984; Segonzac et al., 1985), on the kinetic properties of *in vitro* 5-HT-high affinity uptake and ^{3}H-IMI binding.

Materials and Methods

Adult male rats, Sprague-Dawley, 125 to 150 g (C.r.l. C.D. Charles River S.p.A., Calco, Italy) were employed in all the experiments. Rats were caged in air-conditioned light-dark controlled rooms (light from 6 a.m. to 8 p.m.) and fed with standard diet and water *ad libitum*.

In acute studies 25 mg/kg of 5-MeOT, 5-OHT, or Tp was intraperitoneally (i.p.) injected to rats, 20 minutes before the sacrifice.

In chronic studies, animals received 5-MeOT, DMI, and pCPA, according to the following schedule:

—pCPA, 300 mg/kg i.p., once daily for 3 days, followed by 100 mg/kg i.p. every other day for 13 days;

—5-MeOT, 25 mg/kg i.p. or DMI, 15 mg/kg i.p., once daily for 15 days, alone or together with pCPA when the dose of 100 mg/kg i.p. was administered.

All drugs were dissolved in water; control rats received daily injections of saline. Animals were killed 48 hours after the last injection of 5-MeOT or DMI, i.e., 24 hours after the last treatment with pCPA.

In vitro 5-HT-uptake was evaluated according to Baumann et al. (1977) with slight modifications. Briefly, cortical or hypothalamic slices were incubated for 15 minutes at 37°C in the presence of ^{3}H-5-HT, in a concentration range between 5×10^{-8}M and 4×10^{-6}M.

Blanks were obtained by adding 10^{-5}M fluoxetine.

^{3}H-IMI binding saturation curves were obtained in cortical membrane preparations, according to Raisman et al. (1980). The radioligand concentration ranged between 1.0 and 10.0 nM; nonspecific binding was determined in the presence of 10^{-4}M DMI. The incubation was performed at 0°C for 60 minutes. The kinetic properties of ^{3}H-IMI binding were calculated from the Scatchard analysis of at least three saturation curves.

Protein concentrations were determined according to Lowry et al. (1951) with slight modifications.

Results

Prolonged treatment with DMI induced a 30-percent decrease in the density of cortical ^{3}H-IMI binding sites, without significant changes in the K_d value; a similar reduction was detected also in animals treated with both pCPA and DMI. In animals treated only with pCPA the kinetic constants of ^{3}H-IMI binding sites did not differ from control values (Figure 1).

5-MeOT, 5-OHT, and Tp inhibited ^{3}H-IMI binding to rat cortical membranes (Figure 2). Scatchard analysis of saturation curves performed in the presence of a single concentration of THβCs indicate that the compounds behave as competitive inhibitors at the level of ^{3}H-IMI recognition sites, since they affect the K_d values without significant change in the B_{max}. The major decrease of K_d was observed in the presence of 100 nM 5-MeOT whereas 500 nM Tp induces the minor modification. IC$_{50}$ values calculated from displacement studies demonstrate that 5-MeOT possesses the higher affinity towards ^{3}H-IMI recognition sites, whereas Tp seems to

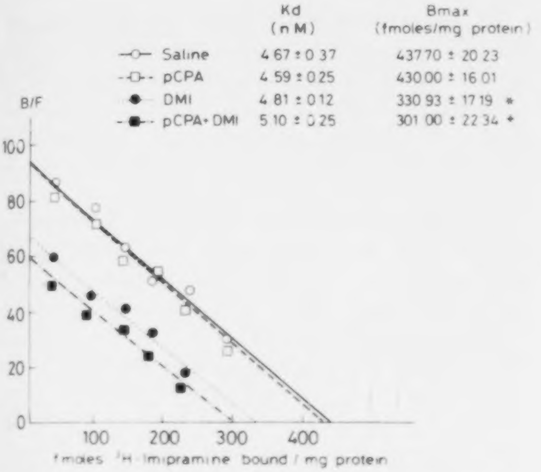

FIGURE 1. Scatchard analysis of ^{3}H-IMI binding to cortical membranes after chronic treatment with DMI, pCPA, pCPA + DMI or saline. Rats received repeated administration of pCPA, 300 mg/kg i.p. for 3 days followed by 100 mg/kg i.p. every other day for 15 days, DMI, 15 mg/kg i.p. daily for 15 days, pCPA + DMI or saline. Cortical 5-HT content (pmoles/mg protein) was reduced by chronic pCPA as much as 95% (saline: 7.5 ± 0.5; pCPA: 0.80 ± 0.04; DMI: 7.2 ± 0.3; pCPA + DMI: 0.60 ± 0.04). Data are the mean ± SEM of three separate experiments. [$^*p < 0.05$ vs. saline; $^+p < 0.05$ vs. pCPA (Dunnett's "t" test).]

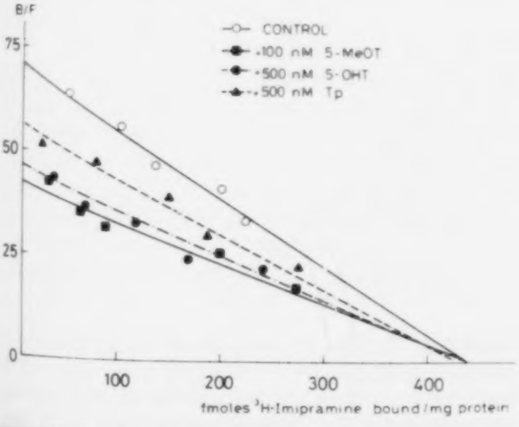

FIGURE 2. Scatchard analysis of ^{3}H-IMI binding to cortical membranes in the presence of 100 nM 5-MeOT, 500 nM 5-OHT or 500 nM Tp. IC_{50} values were calculated from displacement studies in which graded concentrations (from 10^{-8} to 5×10^{-5}M) of each THβC were tested on the binding of 5 nM ^{3}H-IMI to cortical membranes.

be the less potent compound (Figure 2). THβCs inhibited *in vitro* the ^{3}H-5-HT high affinity uptake by rat cortical slices with different potencies: IC_{50} values indicate that 5-MeOT and Tp are active at μM concentrations, whereas 5-OHT appears to be 10 times more potent (Figure 3).

The *in vivo* administration of 25 mg/kg i.p. of 5-MeOT, 5-OHT, or Tp resulted in a clear-cut decrease of the V_{max} of the *in vitro* ^{3}H-5-HT high affinity uptake both in the cortex and in the hypothalamus, Tp being the more potent compound (Table 1). In the same experimental conditions high affinity 5-HT uptake by platelets was completely blocked after the *in vivo* treatment with THβCs (data not shown). Repeated administration of 5-MeOT (25 mg/kg i.p. daily for 15 days) decreased the B_{max} value of ^{3}H-IMI binding to rat cortical membranes, without affecting the affinity of these recognition sites (Figure 4). As shown in Figure 4, the concomitant treatment with pCPA did not interfere with the 5-MeOT-induced decrease of the density of ^{3}H-IMI binding sites.

Discussion

It is generally accepted that ^{3}H-IMI recognition sites could be considered a target in

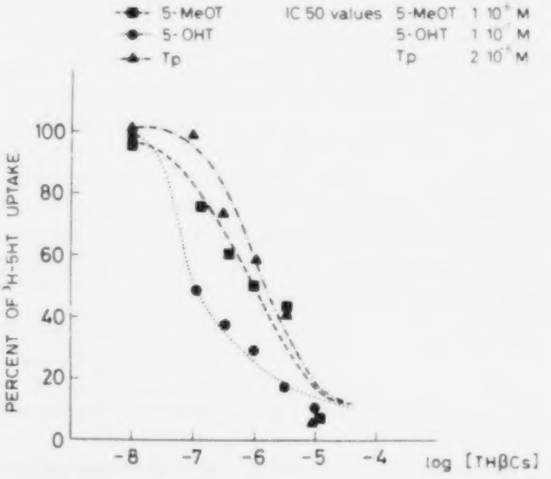

FIGURE 3. Inhibition of *in vitro* ^{3}H-5-HT uptake in cortical slices by 5-MeOT, 5-OHT, and Tp. Samples were incubated at 37°C for 15' in the presence of 10^{-7}M ^{3}H-5-HT and increasing concentration (10^{-8}M to 5×10^{-5}M) of THβCs. For blanks, 10^{-5}M fluoxetine was employed (for details, see Materials and Methods).

TABLE 1. V_{max} values of *in vitro* ^{3}H-5HT high affinity uptake in cortical and hypothalamic slices after *in vivo* administration of 5-MeOT, 5-OHT, and Tp.

Treatments	V_{max} (pmoles/mg protein/min)	
	Cortex	Hypothalamus
Controls (saline)	29.58 ± 3.05	19.60 ± 0.65
5-MeOT (25 mg/kg i.p.)	16.10 ± 1.04*	13.80 ± 0.31*
5-OHT (25 mg/kg i.p.)	5.37 ± 0.47**	8.33 ± 0.17*
Tp (25 mg/kg i.p.)	1.00 ± 0.03**	6.40 ± 0.15**

Rats were killed by decapitation 20 minutes after the injection of each compound. Slices were immediately obtained and incubated at 37°C for 15 minutes in the presence of increasing concentrations of ^{3}H-5HT (see Materials and Methods for details). Each sample was assayed in triplicate.

Data are the mean ± S.E.M. of three separate experiments.

$^*p < 0.05$; $^{**}p < 0.01$ (Dunnett's *t* test).

the action of ADs, since a prolonged treatment with these drugs, especially the tricyclics, induces a marked reduction in the cerebral density of these sites (Raisman et al., 1980; Kinnier et al., 1981; Racagni et al., 1983). Moreover, recent reports from our laboratory indicate that not only typical, but also atypical ADs, such as fluvoxamine, citalopram, viloxazine, and dothiepin, are able to decrease the concentration of ^{3}H-IMI binding sites (Brunello et al., submitted).

The precise physiological role of ^{3}H-IMI recognition sites is still unknown; however, there is strong evidence indicating that these sites may act as modulators of the 5-HT-uptake molecular complex at the level of serotonergic terminals (Langer et al., 1980; Barbaccia et al., 1983b). In this line, concomitant, though opposite, modifications have been observed in the kinetic properties of ^{3}H-IMI binding and 5-HT-uptake, either in pharmacological conditions, i.e., chronic treatment with typical and atypical ADs, or in physiological situations, i.e., the aging processes (Brunello et al., 1985a).

In addition, clinical studies performed in human platelets indicate the coexistence of altered B_{max} of ^{3}H-IMI binding and V_{max} of 5-HT uptake in depressed patients (Briley et al., 1980; Suranyi-Cadotte et al., 1985).

Though ^{3}H-IMI recognition sites are mainly concentrated on central serotonergic terminals (Sette et al., 1981; Brunello et al., 1982b), it is unlikely that 5-HT itself can be considered as the endogenous ligand for these sites, since it displaces ^{3}H-IMI with low affinity (Raisman et al., 1979).

In agreement with these results, data reported in Figure 1 suggest the lack of a direct involvement of 5-HT in the modulation of ^{3}H-IMI recognition sites, since no modification in the kinetic properties of ^{3}H-IMI binding was observed after depletion of brain 5-HT content with pCPA.

Moreover, inhibition of 5-HT synthesis by pCPA does not counteract the reduction of the density of ^{3}H-IMI binding sites induced by prolonged DMI treatment (Figure 1). These data indicate that 5-HT is not involved in the adaptive mechanisms which lead to the desensitization of ^{3}H-IMI binding sites, whereas it has been shown to play a permissive role in the down-regulation of β-adrenoreceptors induced by chronic DMI (Brunello et al., 1982a; Janowsky et al., 1982; Brunello et al., 1985b).

The existence of endogenous ligands for the ^{3}H-IMI recognition site as physiological modulators of the 5-HT uptake molecular complex has been largely postulated (Barbaccia et al., 1983b; Langer et al., 1984; Rehavi et al., 1985). Among these, some putative derivatives (Buckholtz, 1980) of indoleamines, THβCs, have been shown to inhibit both ^{3}H-IMI binding and 5-HT uptake (Langer et al.,

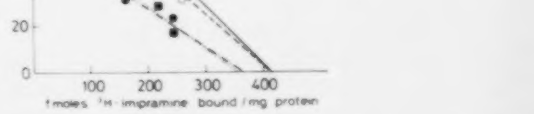

FIGURE 4. Scatchard analysis of ^{3}H-IMI binding to cortical membranes after prolonged treatment with 5-MeOT, pCPA, pCPA + 5-MeOT or vehicle (saline). Rats received pCPA, 300 mg/kg i.p. daily for 3 days followed by 100 mg/kg i.p. every other day for 15 days, 5-MeOT, 25 mg/kg i.p. for 15 days, pCPA + 5-MeOT, or saline. ^{3}H-IMI binding was performed as described in Materials and Methods. Data are the mean ± SEM of three separate experiments, each made in triplicate. $^*p < 0.05$ vs saline; $^+p < 0.05$ vs pCPA (Dunnett's "t" test).

1984; Segonzac et al., 1985). As shown in Figure 2, 5-MeOT, 5-OHT, and Tp inhibit competitively ^{3}H-IMI binding; in particular 5-MeOT is able to displace 50 percent of ^{3}H-IMI at high nanomolar concentration, being therefore as active as DMI.

In our experimental conditions THβCs are able to inhibit 5-HT uptake, both *in vitro* (Figure 3) and *in vivo* (Table 1). In agreement with data reported by Langer et al. (1984), 5-OHT is the more potent compound *in vitro*. In contrast it is now shown (Figure 3) that Tp, which inhibits 5-HT uptake in synaptosomes only at concentrations greater than 2000 μM, is as potent as 5-MeOT in cortical slices. Moreover, Tp when administered *in vivo* decreases the V_{max} of 5-HT uptake much more than 5-MeOT and 5-OHT (Table 1). These data could be explained by considering an *in vivo* metabolic conversion of Tp (Rommelspacher et al., 1978), which is partially preserved in slices and absent in synaptosomes.

Since 5-MeOT displays the higher affinity towards ^{3}H-IMI binding sites and inhibits also 5-HT uptake in a considerable manner, it was of interest to evaluate the effect of a prolonged treatment with 5-MeOT on ^{3}H-IMI binding. In particular 5-MeOT was daily administered at 25 mg/kg, a dose which has been demonstrated active in endocrine studies (Rovescalli et al., 1986).

As shown in Figure 4, the density of ^{3}H-IMI recognition sites is significantly reduced by chronic 5-MeOT. The magnitude of this decrease is about 25 to 30 percent and comparable to that obtained with DMI. Moreover, in line with data shown in Figure 1, the effect of 5-MeOT on ^{3}H-IMI binding does not seem to involve 5-HT directly, since it is maintained in pCPA + 5-MeOT-treated rats.

In conclusion, the present paper provides evidence that, unlike the effects of chronic ADs on adrenergic system which require a functional interaction with serotonergic neurons (Janowsky et al., 1982; Racagni & Brunello, 1984; Brunello et al., 1985b), ^{3}H-IMI binding sites seem to be poorly sensitive to 5-HT presence, both in basal condition and during pharmacological manipulations, thus emphasizing the likelihood of a precise endogenous ligand for this site. The continuance of this study will investigate whether THβCs, particularly 5-MeOT, may physiologically modulate the supramolecular complex of 5-HT uptake.

Effects of Drug Washout on CSF Monoamine and Psychoendocrine Variables

Hans Ågren, M.D., Ph.D.,[1] and William Z. Potter, M.D., Ph.D.[2]

Introduction

Psychoactive drugs have been so successfully incorporated in psychiatric hospital practice that postponing drug treatment after a short initial period of evaluation at times is considered unethical. Issues like psychobiological research being dependent on reliable baseline conditions compete with a rational use of psychiatric beds. Research protocols in depression usually demand 8 to 14 days off antidepressants before tests, and the desirable period off neuroleptics in schizophrenia research is often 4 weeks. Few studies have focused on the minimum period of time before various biochemical effects of, for instance, antidepressants become insignificant. Rapid cessation of antidepressant medication has been shown to trigger increased concentrations of plasma 3-methoxy-4-hydroxyphenylglycol (MHPG) (Charney et al., 1983). The same phenomenon has been observed during the abstinence phase of alcoholics (Hollister et al., 1980; Lubman et al., 1983). Alcoholic abstinence has also been clearly shown to trigger a transient elevation of CSF MHPG (Borg et al., 1981). We have analyzed the contribution of previous psychoactive medications in accounting for variance of several psychobiological variables in a large sample of affectively ill inpatients at the Department of Psychiatry at Uppsala University Hospital.

Methods

Patients

Currently or recently depressed patients ($n = 151$) were assessed using the Schedule for Affective Disorders and Schizophrenia (SADS) by Endicott and Spitzer (1979) and diagnosed as Research Diagnostic Criteria (RDC) major depressive disorders. Hamilton depression rating scale scores were extracted from selected SADS items following rules laid down by Endicott et al. (1981). Patients were subdivided into three groups (the "peak" va-

2: > 8 weeks	35%	38%

HDRS – Hamilton Depression Rating Scale extracted from the SADS (Endicott et al., 1981).

riable) according to time lapsed between period of peak severity of the depressive episode ("Worst Week") and the time of investigation ("Past Week") (*see* Table 1).

All patients were off antidepressant and neuroleptic medication for at least 8 days before lumbar punctures and 9 to 10 days before psychoendocrine tests. Almost half the males and one third of the females had received no antidepressants during the entire course of their current or recent depression, i.e., for several months (dichotomous variable "AD yes/no"). Close to 85 percent of both sexes were long-term free from neuroleptics, the rest having received low-dose drugs for anxiolytic purposes until recently (dichotomous variable "NL yes/no"). Patients were allowed continued medication with benzodiazepines throughout the investigation. About 40 percent had not taken any of this class of drugs for at least several months, about 35 percent had used these drugs at some time during the past week, and the rest were on a regular schedule (trichotomous variable "BDZ 0, 1, 2") (*see* Table 2).

TABLE 2. Composition of the Patient Sample, II.

	Males	Females
Patients long-term free from any antidepressant drugs	48%	35%
Patients long-term free from any neuroleptic drugs	84%	83%
Patients exposed to benzodiazepines:		
0: Long-term no BDZ	41%	37%
1: Some BDZ use past week	39%	32%
2: Daily regular medication	20%	31%

None of the sex differences is statistically significant.

Chemical and Hormonal Analyses

Monoamine metabolites 3-methoxy-4-hydroxyphenylglycol (MHPG), homovanillic acid (HVA), and 5-hydroxyindoleacetic acid (5-HIAA) in lumbar CSF were assessed by gas chromatography—mass spectrometry by L. Svennerholm (Andersen et al., 1981). Analyses of plasma cortisol for 1 mg dexamethasone suppression tests and plasma thyroid-stimulating hormone (TSH) for thyroid-releasing hormone (TRH) stimulation tests were carried out using radioimmunological assays as described by Ågren and Wide (cortisol: 1982; TSH: 1986).

Statistics

Information concerning prior drug usage (yes/no for AD and NL; 0, 1, and 2 for BDZ) were in turns forced as a first independent variable in analyses of covariance (ANCOVA), "predicting," in turns, CSF MHPG, CSF HVA, CSF 5-HIAA, post-dexamethasone plasma cortisol at 8 a.m., 11 a.m., and 8 p.m., and δTSH. The cortisol and ΔTSH variables were log transformed before calculations. The General Linear Models (GLM) procedure in the Statistical Analysis System (SAS) package was used, with *F* values calculated on Type 1 Sums-of-Squares. Nine other independent variables were introduced as 2nd to 10th term in order to control for the influences of severity and stage of depression, sex, age, height, and weight as well as three interactional terms, thus allowing examination of a direct influence of the three drug treatment conditions on the biological variables. If a partial correlation coefficient (evaluated through *F* values) was significant at the 5 percent level, the direct univariate correlation was checked by calculating Spearman's r_s.

Results

Withdrawal From Antidepressants

The ANCOVAs demonstrated a significant influence of late cessation of antidepressant drugs on CSF MHPG. Table 3 shows this variable to be the only one reaching a signifi-

cant partial correlation with CSF MHPG and also to show a significant direct univariate correlation. Scheffé's test demonstrates late withdrawal to increase CSF MHPG by a mean of 3.1 nmol/l, just reaching significance at the 5 percent level.

AD withdrawal did not significantly affect CSF HVA, CSF 5-HIAA, or any cortisol variable. However, Table 4 indicates a highly significant effect on ΔTSH: even when significant negative influences from depressive severity and male sex were accounted for, late AD withdrawal is associated with a less blunted ΔTSH (mean difference between the two groups is 2.8 mU/l).

Neuroleptic Withdrawal

No significant effect on any biological variable was detected.

** $p < 0.01$.

**** $p < 0.0001$.

Benzodiazepine Usage

The extent of medication with benzodiazepines was not associated with any effects on CSF variables. However, Table 5 shows more regular usage to be associated with a more blunted ΔTSH, which obviously is not explained by severity of depression since the interaction term BDZ × Hamilton score is nonsignificant. A similar but weaker effect ($p = 0.05$) was seen as benzodiazepines' increasing post-dexamethasone plasma cortisol at 11 a.m. Since the univariate correlation was nonsignificant and there was no effect on plasma cortisol at either 8 a.m. or 8 p.m., the meaning of this finding is uncertain.

Discussion

The main finding of this study is moderately increased CSF MHPG concentrations in patients in whom antidepressants were withdrawn a short period before lumbar puncture when compared with patients long-term free from these drugs. It is possible that this MHPG elevation represents an abstinence reaction similar to what Charney et al. (1982) observed in human plasma. A parallel observation is that effects of desipramine persist after 3 weeks, at least on the growth hormone response to clonidine (Corn et al., 1984). Furthermore, in rats chronic treatment with antidepressants may increase the concentration of MHPG in whole brain (Przegalinski et al., 1981). Whatever the cause, the observed MHPG difference was in reality quite small (only 3.1 nmol/l) and by itself may not be sufficient to invalidate interpretations of CSF MHPG.

The only other drug effects detected were on TSH responses to TRH injections. Antidepressant withdrawal was associated with less blunted ΔTSH, and might then be regarded as a source of false negative tests. Current benzodiazepine medication, conversely, was related to reduced TSH response to TRH and might be a source of false positive tests.

No convincing drug withdrawal effects or drug effects were observed for CSF HVA and 5-HIAA concentrations and on plasma cortisol concentrations after dexamethasone administration.

Summary

The effects of cessation of antidepressant and neuroleptic medication and of degree of benzodiazepine usage upon CSF monoamine metabolite concentrations, post-dexamethasone plasma cortisol levels and TSH responses to TRH were investigated in 151 patients with RDC major depressive disorders. Late stopping antidepressants prior to lumbar puncture produced a minor but statistically significant increase in CSF MHPG as well as a less blunted ΔTSH, but no other effects. Usage of benzodiazepines was only

Behavioral Depression Following Clonidine Withdrawal: A New Animal Model of Long-Lasting Depression?

Laura J. Hoffman, Ph.D.,[1] and Jay M. Weiss, Ph.D.[2,3]

In attempting to learn more about human clinical depression, numerous animal models of depression have been produced (Costa, Garattini & Valzelli, 1960; Nagayama, Hingtgen & Aprison, 1980; Hatotani, Nomura & Kitayama, 1982; McKinney, Soumi & Harlow, 1971; Seligman, 1974; Porsolt, Anton, Blavet & Jalfre, 1978; Katz, Roth & Carroll, 1979). These models vary in the extent to which they reproduce the behavioral symptoms of human depression. Among the symptoms seen in these models are psychomotor alterations, loss of appetite and weight, loss of normal grooming, play, and competitive behavior, and sleep changes. In some instances, modeling procedures generate sufficient symptoms to satisfy the criteria for a major depressive episode set forth in the Diagnostic and Statistical Manual of the American Psychiatric Association, 3rd edition (1980) (e.g., Weiss, Bailey, Goodman, Hoffman, Ambrose, Salman, & Charry, 1982). However, the duration of symptoms seen in models is of concern in that the DSM-III requires that symptoms persist for a minimum of 2 weeks. In contrast to this, many of the symptoms in the animal models described above are short-lived (*see* Maier, Drugan, Grau, Hyson, McLennan, Moye, Madden & Barchas, 1983; Overmier & Seligman, 1967; Weiss, Goodman, Losito, Corrigan, Charry & Bailey, 1981; Kaufman & Rosenblum, 1967).

We report here a procedure which, following treatment, generates depression of active behavior that endures without further treatment for at least 40 days. Also, this behavioral depression, once produced, can be reversed by the chronic, but not acute, treatment with the tricyclic antidepressant desmethylimipramine (DMI). In this animal model, behavioral depression is produced by administering clonidine to laboratory rats for a 2-week period and then removing the drug, after which the animals show reduced activity in a swim test. Reduction of motor activity is the most common symptom reproduced in animal models of depression (Costa et al.,

1960; Katz et al., 1979; Kaufman & Rosenblum, 1967; Klinger, Barta, & Kemble, 1974; Porsolt, LePichon & Jalfre, 1977; Weiss & Glazer, 1975).

The pharmacological procedure introduced here was derived from previous reports of effects of clonidine. Numerous studies have reported that acute administration of clonidine depresses active behavior, reducing locomotor activity (Anden, Gabrowska, & Strombom, 1976; Maj, Sowinska, Baran, & Kapiurkiewicz, 1972; Maj, Baran, Sowinska, & Zielinski, 1975; Skolnick, Daly, & Segal, 1979; Tilson, Chamberlain, Gylys, & Boyniski, 1977), operant behavior (Harris, Snell, Loh, & Way, 1977; Meyer, El-Azhary, Bierer, Hanson, Robbins, & Sparber, 1977), active avoidance responding (Kostowski, Plaznik, Pucilowski, Bidzinski, & Hauptmann, 1981; Laverty & Taylor, 1969), exploratory behavior (Herman, Brus, Drybanki, Szkilnik, & Slominska, 1976; Strombom & Svensson, 1980), and reward/self-stimulation (Franklin & Herberg, 1977; Hunt, Atrens, Chesher, & Becker, 1976; Spencer & Revzin, 1976; Vetulani, Leith, Stawarz, & Sulser, 1977). However, a number of studies have also indicated that when clonidine is administered repeatedly, behavioral deficits that occur with acute administration of the drug are no longer seen (Meyer et al., 1977; Laverty & Taylor, 1969); thus, animals apparently habituate to the effects of the drug, at least with respect to certain of its behavioral consequences. However, and most important, one group of investigators additionally reported that subsequent removal of clonidine after the drug had been administered repeatedly resulted in reappearance of a deficit (suppression of operant performance) that had been seen when the drug was administered acutely. This behavioral suppression was observed to continue for at least 9 days after removal of the drug (Meyer et al., 1977).

On the basis of the foregoing, we surmised that repeatedly administering clonidine to rats and then withdrawing the drug might result in their showing reduced behavioral activity as normally shown after acute administration of the drug, and that this reduction in active behavior might persist for some time. Should this prove to be the case, the result would be drug-free animals (drug having been withdrawn) that showed long-lasting depression of active behavior, a potential animal model of clinical depression in which the symptom(s) was long-lasting.

In the experiments we carried out, depression of active behavior was assessed by placing animals (Holzman male albino rats obtained from Charles River breeding laboratories) in a tank of water and measuring the amount of activity they showed. This swim test measures the propensity of an animal to engage in, and the capacity for, active behavior in a situation that is threatening and therefore highly motivating. The test, which appears to be superior in certain respects to measuring spontaneous activity when modeling depression (Weiss, Simson, Hoffman, Ambrose, Cooper, & Webster, 1986) has been used to detect depression of active behavior that follows exposure to a strong uncontrollable stressor (Weiss et al., 1981). To quantify activity in this test, the amount of time that an animal struggles (struggling defined as vigorous activity in which the front paws break the surface of the water) and the amount of time that it floats (floating defined as no movement of any limb) are measured. The two behaviors quantified are shown in Figure 1. To obtain an overall index of activity for an animal, time spent floating is subtracted from time spent struggling, and the resulting value is an Activity Score (AS). This index has proved to be particularly convenient because an untreated, naive animal normally struggles for about as much time as it floats in a 15-minute swim test, thus achieving an Activity Score of approximately zero on the test. Consequently, negative Activity Scores (i.e., more floating than struggling) indicate depression of active behavior while positive Activity Scores (i.e., more struggling than floating) indicate stimulation of active behavior.

Figure 2 shows the results of the initial study. Performance of clonidine-treated groups (Clonidine A and B) is shown as the difference from the performance of a group of animals that was treated as were the clonidine-treated groups but did not receive any clonidine during the experiment; i.e., were given placebo (0.85 percent saline) injections and normal drinking water throughout (*see* below). On day 1, clonidine-treated

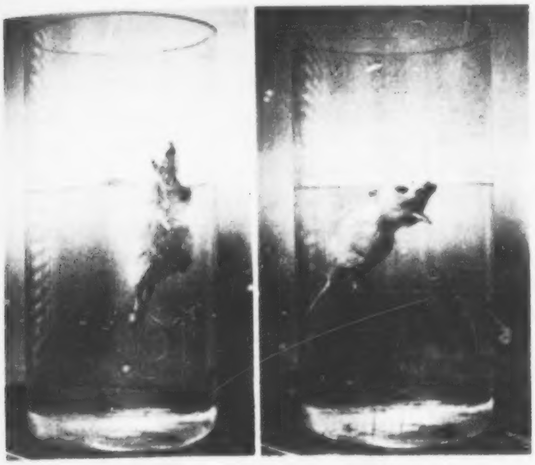

FIGURE 1. Shown above are the two types of behavior that were quantified (timed) in the swim test. At left is shown an animal engaged in struggling behavior in which the front paws break through the surface of the water in an apparent attempt to escape from the tank. At right is shown an animal engaged in floating behavior in which all four limbs are motionless in the water. Around the animal's midsection is visible a strip of tape which holds in place on its back a lightweight plastic bubble filled with air which prevents the animal from sinking if it ceases activity.

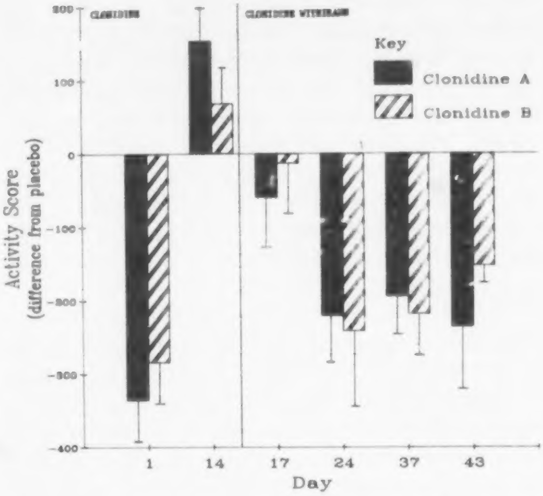

FIGURE 2. Mean (and standard error) Activity Scores in the swim test for two groups ($N = 6$ per group) treated with clonidine for 14 days after which the drug was then withdrawn. For details of clonidine treatment, *see* text. Mean Activity Scores for the clonidine-treated groups on each day are shown as the difference from the mean Activity Score of a group ($N = 6$) of untreated animals (i.e., placebo) tested on that day. When compared with the untreated group, mean Activity Scores of clonidine-treated groups were significantly different (at least $p = .05$) on the following days: Clonidine A—day 1, 24, 37, 43; Clonidine B—day 1, 24, 37.

animals were given an injection of clonidine (0.1 mg/kg) and tested in the swim tank 10 minutes later. As can be seen in Figure 1, the activity of these animals was quite low relative to placebo-injected animals, typical of what investigators have generally found when this drug is given. Following this initial test, these animals were treated with clonidine for 14 days, Clonidine A receiving clonidine by daily injection (0.1 mg/kg) together with drug in their drinking water (3 μg/ml) while Clonidine B received drug in drinking water only. On day 14, these animals were injected with clonidine again as on day 1, and all animals tested in the same manner a second time. It can be seen that clonidine no longer depressed activity in the swim test; in fact, the activity of the Clonidine A group approached (but did not reach) being significantly greater than that of the untreated animals at this time. The drug was then withdrawn; no further injections were given and normal tap water was now supplied to the animals. At varying intervals thereafter, the animals were returned for testing to the swim tank. When tested 3 days after clonidine was withdrawn, activity of clonidine-treated animals did not differ significantly from that of nontreated animals, but on subsequent tests beginning at day 10 after drug was withdrawn, they showed a marked depression of activity. The depression of activity was still present on the final test given in this study 29 days after the drug was withdrawn, although the effect had diminished in the Clonidine B group by this time.

The basic phemonena described above—initial depression of activity in the swim test in response to injection of 0.1 mg/kg clonidine, no depression of activity in response to this injection after 14 days (or in some cases 15 days) of clonidine treatment, and, most important, the development of prolonged behavioral depression following withdrawal of the drug—has now been repeated in three subsequent experiments. In one of these experiments, the depression of activity following withdrawal of clonidine was found to be present 3 days after drug withdrawal, so that post-clonidine depression of active behavior may in some cases present itself earlier than was seen in the first experiment. However, reduction of activity in the swim test following withdrawal of drug was seen in all experiments. In the longest experiment conducted thus far, behavioral depression has been found 60 days after the drug was withdrawn.

To summarize, experiments have shown that following administration of clonidine for 14 to 15 days, withdrawal of the drug results in a decrease in active behavior that is quite long-lasting (i.e., at least 30 to 60 days). The next question addressed was whether this behavioral depression would respond to treatment with an antidepressant. The response to desmethylimipramine (DMI) was therefore examined.

The results are shown in Figure 3. As in Figure 1, performance of clonidine-treated groups is shown as the difference from a group of animals tested at the same times but not given any drug (i.e., injected with placebo when drug injection is normally given and maintained on tap water throughout). In this experiment, procedures for clonidine treatment were the same as those used for the Clonidine A group in the previous experiments. Following 15 days of clonidine treatment, the drug was withdrawn, which resulted, as expected, in behavioral depression in the swim test 7 days later (day 22). These clonidine-withdrawn (i.e., behaviorally depressed) animals were then divided into two groups matched for behavioral depression seen in day 22. Beginning on day 27, one of these groups was then given daily injections of DMI (4 mg/kg) while the other was given vehicle. When tested on the first day of DMI treatment (swim tests given 2 hours after drug injection), DMI produced no significant change in the behavioral depression of clonidine-withdrawn animals. When tested after 8 days of DMI, however, the behavioral activity of the clonidine-withdrawn animals was found to have improved to the point where it no longer was different from that of normal untreated animals, whereas clonidine-withdrawn animals that had been given daily injections of saline vehicle rather than DMI

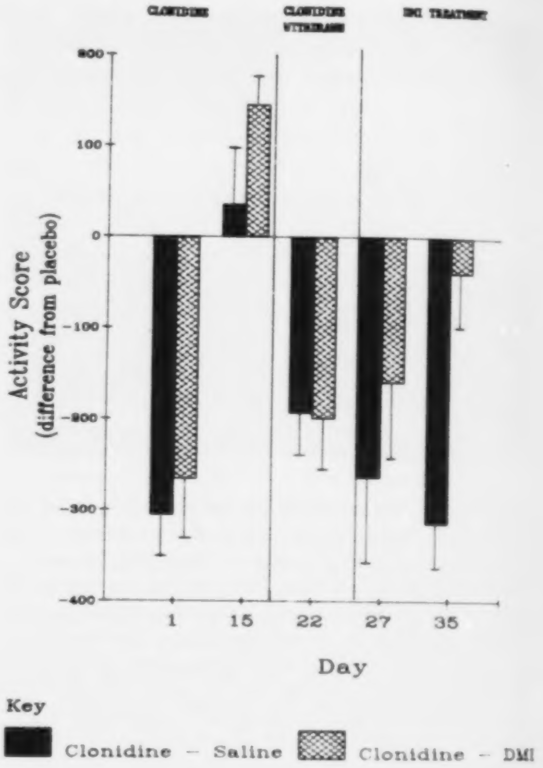

FIGURE 3. Mean (and standard error) Activity Scores in the swim test for two groups ($N = 9$ per group) treated with desmethylimipramine (DMI) (4 mg/kg) or saline vehicle after clonidine treatment for 15 days and withdrawal of clonidine. For details of clonidine treatment, *see* text. Mean Activity Scores for the clonidine-DMI and clonidine-saline groups on each day are shown as the difference from the mean Activity Score of a group ($N = 9$) of untreated animals (i.e., placebo) tested on that day. When compared with the untreated group, mean Activity Scores of clonidine-treated groups were significantly different (at least $p = .05$) on the following days: Clonidine-DMI—day 1, 22, 27; Clonidine-saline—day 1, 22, 27, 35. Also, clonidine-DMI differs significantly from clonidine-saline on day 35. (Note: in the results shown above, the clonidine-DMI group achieved somewhat higher activity scores [though not significantly higher] than the clonidine-saline animals on day 15. However, the ability of repeated DMI treatment to eliminate behavioral depression following clonidine withdrawal, as seen above, has been repeated in a second experiment. In this study, the activity scores of clonidine-saline and clonidine-DMI groups were essentially the same on day 15, so that the therapeutic effect of DMI seen above is not due to a difference in the populations selected for the two groups.)

remained behaviorally depressed. Thus, DMI eliminated the reduction in active behavior produced by withdrawal from clonidine, and did so when given repeatedly (for 8 days) but not when given only once.

In summary, the first attempt to evaluate how behavioral depression in the swim test following withdrawal of clonidine would respond to pharmacological treatment revealed that this behavioral depression was markedly reduced by 8 days of DMI administration but not by the first administration of DMI. In showing a therapeutic result from repeated but not acute treatment with a tricyclic antidepressant, this initial examination found the model to be consistent with what is seen in clinical depression. This experiment also demonstrates the potential usefulness of the model in that it permits the therapeutic efficacy of a treatment to be tested on animals that begin therapy when behaviorally depressed (i.e., following withdrawal from clonidine) and will remain so without further drug or other manipulation in the absense of therapeutic treatment.

In closing this report, some brief comments will be made about possible mechanisms underlying the behavioral depression that follows withdrawal from clonidine. Given the potency of clonidine in stimulating alpha-2 adrenergic receptors (Starke, Montel, Gayk, & Merker, 1974), the first possibility that warrants consideration as the potential mediator of behavioral depression following clonidine withdrawal is a change in alpha-2 receptors. In fact, the impetus for undertaking the procedures described above came in part from recent findings which suggested that withdrawing animals from clonidine was likely to affect certain alpha-2 receptors so as to produce behavioral depression. To be specific, our laboratory has recently found that behavioral depression which follows exposure of animals to uncontrollable shock appears to result from a "functional blockade" of alpha-2 receptors in the locus coeruleus (LC) due to large depletion of norepinephrine (NE) in this brain region brought about by the uncontrollable shock (e.g., Weiss et al., 1982; Weiss & Simson, 1985). If this hypothesized mechanism is correct, active behavior should also become depressed if alpha-2 receptors in the LC were made subsensitive. Several investigators (Engberg, Elam, & Svensson, 1982; Ishii, Yamamoto, & Kato, 1982) have demonstrated that prolonged administration of clonidine produces subsensitivity of presynaptic alpha-2 receptors in the LC region of the brain and, consequently, an increase in firing of LC cells (since alpha-2 receptors in the LC normally inhibit the firing of LC cells) after withdrawal of the clonidine. Thus, behavioral depression in the swim test following clonidine withdrawal may occur because alpha-2 receptors in the LC have become subsensitive, and thus this behavioral depression would share a similar mediation (i.e., disinhibition of LC cells) as behavioral depression produced by uncontrollable shock.

Another possibility focuses on beta receptors. Kistler and Davis (1980) have reported that, soon after animals were withdrawn from 6 days of clonidine treatment, an increase in the cyclic AMP response to the beta-adrenergic agonist isoproterenol is evident in brain stem tissue (but not in cortex). Thus, behavioral depression following withdrawal of clonidine might be related to an elevated responsiveness of beta adrenergic receptors in the brain stem. This possibility is attractive in that the brain stem contains loci which mediate clonidine's potent effects on the cardiovascular system (e.g., Schmitt, 1977; Kobinger, 1978; Zandberg, De Jong, & De Weid, 1979; Timmermans & Van Zwieten, 1981). This possibility also fits well with the fact that chronic, but not acute, treatment with DMI was found to eliminate behavioral depression following clonidine withdrawal in that the cyclic AMP response of brain tissue is reduced by chronic, but not acute, treatment with DMI (e.g., Vetulani, Stawarz, Dingell, & Sulser, 1976). It can be pointed out, however, that the therapeutic effect of chronic DMI (as well as its absence with acute DMI) is also consistent with the hypothesis advanced in the previous paragraph in that subsensitivity of alpha-2 inhibitory receptors in the LC will elevate norepinephrine release in the projection fields of the LC and consequently stimulate beta receptors in these regions at a higher-than-normal level; thus, down regulation of beta receptors should similarly counteract effects of this neural defect.

Turning to future analyses, numerous questions about this model remain to be answered before its value can be properly assessed. For example, it will be important to determine how many, if any, additional symptoms of clinical depression characterize the model in addition to the alteration in active behavior reported here. It similarly will be important to determine how specifically the behavioral depression responds to antidepressant treatment. Concerning mechanism, the time course of potential mediating changes (i.e., subsensitivity of alpha-2 receptors) needs to be measured in order to determine whether such changes present themselves at an appropriate time and are long-lasting. Through such studies, a useful animal model characterized by long-lasting behavioral depression may be developed.

Introduction

Richard H. Rech, Ph.D.

Although the effects of hallucinogenic drugs have been recognized throughout the ages, extensive scientific investigation was prompted only in recent times by the synthesis and characterization of lysergic acid diethylamide (LSD) by Hofmann in 1943 (Hofmann, 1970). Important recent studies in this area are listed in Table 1. The suggestion that LSD may act via brain serotonin (5-HT) functions was made independently by Gaddum (1953) and Woolley and Shaw (1954), based on smooth muscle interactions. Prominent effects on animal operant behavioral models were described by Appel, Freedman, and colleagues (Appel, 1968) several decades ago.

The use of electrophysiological techniques by Aghajanian and co-workers (1975) supported the concept that LSD acted as a 5-HT agonist to suppress discharge of brainstem raphe neurons by acting at neurosomal autoreceptors. Jacobs and colleagues (1978), and later work by Aghajanian's group (1975), demonstrated that the autoreceptor effect of LSD was not sufficient to explain the hallucinogenic activity. Only a few laboratories have dealt more broadly with investigation of various classes of hallucinogenic agents. Domino's group (1964) is one of these. He has demonstrated the more generalized behavioral disruption of deliriant hallucinogens such as atropine and PCP when compared to the psychedelics. The literature on clinical research with hallucinogens is derived mainly from studies done from 1950 to 1970 by Hollister (1984) and a few others. Due to later restrictions, carefully controlled human research on hallucinogenic mechanisms has been rare in the last decade.

3. Appel, Freedman and colleagues: Operant behavior of rats disrupted in a distinctive pattern by indolealkylamine and phenalkylamine hallucinogens, 1960's.
4. Aghajanian and coworkers: LSD was a potent suppressor of 5-HT raphe cell discharge by agonistic action at autoreceptors, early 1970's.
5. Jacobs and colleagues: Autoreceptor activity of LSD was not sufficient to explain hallucinogenic action, late 1970's.
6. Domino and others: Contrasted effects of deliriant hallucinogens (atropine-type, PCP) with those of the psychedelics, 1960's, 1970's.
7. Hollister and others: Clinical research on hallucinogens performed in the 1950's, 1960's.
8. Recent experimental research (Appel; Glennon; Jacobs; Rech): Psychedelics act at a certain subset(s) of 5-HT receptors in forebrain (as well as hindbrain?) to alter CNS functions.

*See selected references below.

Current animal research with the psychedelics has led to a consensus that these agents act at a certain type (or types) of brain 5-HT receptors to disturb a balance in the functioning of these systems that is necessary for normal sensory and other cognitive processings.

Structure-Activity Relationships and Mechanism of Action of Hallucinogenic Agents Based on Drug Discrimination and Radioligand Binding Studies

Richard A. Glennon, Ph.D.,[1] Milt Titeler, Ph.D.,[2] and Richard Young, Ph.D.[1]

The classical hallucinogens can be divided into several structural classes: phenalkylamine (PAA) derivatives and indolealkylamine (IAA) derivatives (Figure 1). Lysergic acid diethylamide (LSD) and related analogs have been classified as indolealkylamines, but might just as readily be classified as phenalkylamines based on their structural resemblance to these agents; as shown in Figure 1, they are accorded their own separate designation, i.e., lysergamides. Certain phenalkylamines [e.g., 1-(2,5-dimethoxy-4-methylphenyl)-2-aminopropane (DOM)] are hallucinogenic whereas others (e.g., amphetamine) are not. The same may be said of indolealkylamine derivatives. One of the early goals of our work was to to determine if a representative member of each of these three classes of hallucinogens was capable of producing a common behavioral (i.e., discriminative stimulus) effect in animals. After we had shown that this was indeed possible (Glennon et al., 1979; Young et al., 1981), our next goal was to determine which members within each of these classes of agents could produce similar behavioral effects. Once accomplished, attention could then be focused on (a) formulation of structure-activity relationships (SAR), (b) investigation of mechanism(s) of action, and (c) determination of a possible relationship between animal data and human hallucinogenic activity/potency.

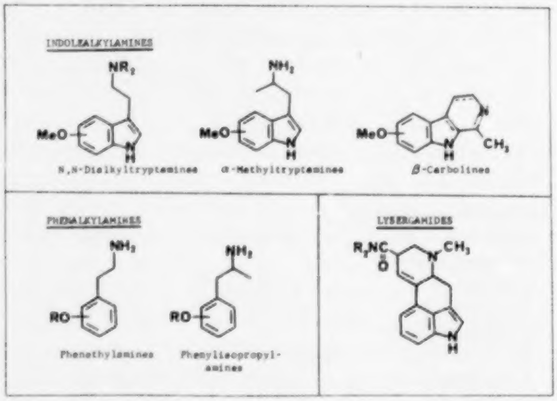

FIGURE 1. Structural classes of hallucinogenic agents.

Behavioral Studies

To accomplish the first goal, groups of rats were trained to discriminate either 1.0 mg/kg of racemic DOM hydrochloride or (+)−amphetamine sulfate from saline using a standard two-lever operant procedure. These animals, once trained, were then administered various doses of PAA and IAA derivatives in tests of stimulus generalization (i.e., transfer, substitution). In this way, it was possible to classify these agents as producing either DOM-like or amphetamine-like discriminative stimulus effects. Certain agents produced neither effect; that is, with some agents stimulus generalization did not occur with either the DOM- or the amphetamine-stimulus. Agents not resulting in stimulus generalization were of two types; some agents [e.g., 3,5-dimethoxyphenyl-2–aminopropane (3,5-DMA)] produced saline-appropriate responding (in both groups of animals) at the highest dose evaluated, whereas others (e.g., 2,6-DMA) resulted in partial generalization (in at least one of the two groups of animals) followed, at a slightly higher dose, by disruption of behavior. The present discussion will deal primarily with those agents that resulted in complete stimulus generalization (i.e., greater than 80 percent DOM-appropriate responding) in the DOM-trained animals. Table 1 presents qualitative results on selected

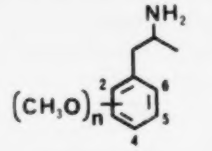
TABLE 1. Representative Results of Stimulus Generalization Studies Using Racemic DOM or (+)-Amphetamine as Training Drug.



Monomethoxy Analogs:		
OMA = A	MMA = A	PMA = A
Dimethoxy Analogs:		
2,3-DMA = *	2,4-DMA = D	2,5-DMA = D
2,6-DMA = *	3,4-DMA = *	3,5-DMA = *
Trimethoxy Analogs:		
2,3,4-TMA = D	2,3,5-TMA = D	2,3,6-TMA = #
2,4,5-TMA = D	2,4,6-TMA = D	3,4,5-TMA = D
Other Analogs:		
AMPH = A	(+)AMPH = A	(−)AMPH = A
DOM = D	DOET = D	MDA = A/D
(−)DOM = D	DOPR = D	(−)MDA = D
(+)DOM = D	DOBU = D	(+)MDA = A
DOB = D	(−)DOB = D	(+)DOB = D
DOI = D	(−)DOI = D	(+)DOI = D

Racemic mixtures were used unless otherwise noted. OMA, MMA, and PMA are the 2-, 3- and 4-monomethoxy derivatives, respectively. AMPH = amphetamine. D = DOM-stimulus generalization. A = amphetamine-stimulus generalization. Agents not resulting in complete stimulus generalization (in either group of animals) are indicated with (*); a (#) denotes agent not tested. Data from Glennon et al., 1983; Young and Glennon, 1986.

PAA derivatives that were evaluated both in DOM-trained and amphetamine-trained animals. It can be seen that none of the monomethoxy analogs, two of the six dimethoxy analogs (DMAs), and five of the five trimethoxy analogs (TMAs) resulted in DOM-stimulus generalization. In like manner, various other derivatives also resulted in either DOM- or amphetamine-stimulus generalization. With one exception, there were no examples of agents that were recognized by both groups of animals; this one exception is 3,4-methylenedioxyphenylisopropylamine (3,4-MDA, MDA). [The DOM-stimulus generalized to racemic and R(−)-MDA but not to S(+)-MDA, whereas the amphetamine-stimulus generalized to racemic and S(+)-MDA but not to R(−)-MDA. It appears that each of the component optical isomers produces a different stimulus effect.] Quantitative data for a small number of agents that produced DOM-like effects are shown in Table 2. Substitution at the 4-position of 2,5-DMA results in some of the more potent DOM-like analogs. With respect to the alkyl substituted derivatives, potency increases as the length of the alkyl chain increases from methyl to ethyl (DOET) to *n*-propyl (DOPR). DOPR is the most potent of the alkyl series and a further increase in chain length to *n*-butyl (DOBU) results in a decrease in potency. 4-Halogenated analogs, such as the bromo analog (DOB) are also among the most potent agents (Table 2). Where optical isomers were evaluated (e.g., DOM, DOET, DOB), the R(−)-isomers were generally twice as potent as the racemates and 5- to 10-times more potent than their corresponding S(+)-enantiomers. Data such as these have allowed for the formulation of *in vivo* SAR for the phenalkylamines.

Various indolealkylamines were also evaluated in the DOM-trained animals (Glennon et al., 1983). IAA derivatives with a primary amine function (e.g., tryptamine, 5-methoxy tryptamine) did not produce DOM-like effects unless there was an alkyl group alpha to the amine. With respect to these alpha-alkyl tryptamines, alpha-methyl derivatives were more potent than their corresponding alpha-ethyl derivatives. Alpha-methyltryptamines,

TABLE 2. Potencies of Selected Phenalkylamine Derivatives in DOM-Trained Animals.

Rats were trained to discriminate 1.0 mg/kg racemic DOM HCl from saline. Racemic mixtures were employed unless otherwise noted.

[a] 1,(2,5-dimethoxy-4-nitrophenyl)-2-amino propane.

like the phenylisopropylamines mentioned above, also exist as optical isomers; S(+)-alpha-methyltryptamine was approximately twice as potent as racemic alpha-methyltryptamine whereas the R(−)-isomer did not produce DOM-like effects. Both isomers of 5-methoxy alpha-methyltryptamine produced DOM-like effects; the (+)-isomer was about twice as potent as its racemate and 5-times as potent as its (−)-enantiomer. *N,N*-Dimethyltryptamine (DMT) was half as potent as racemic alpha-methyltryptamine; both the 5- and 4-methoxy derivatives (i.e., 5-OMe DMT and 4-OMe DMT) were more potent than DMT whereas 6-OMe DMT was less potent than DMT. A variety of other tryptamine derivatives were examined. With respect to beta carbolines, several (e.g., harmaline, 6-methoxyharmalan) produced DOM-like effects, but none was more potent than DMT. As with the phenalkylamines, SAR were formulated for the IAA.

Mechanistic Studies

It has already been fairly well documented that serotonin (5-HT) plays an important role in the mechanism of action of hallucinogenic agents. With respect to our studies, several different approaches were taken. Using animals trained to discriminate DOM from saline, tests of stimulus generalization and stimulus antagonism were undertaken using known 5-HT agonists and antagonists. In the second approach, animals were trained to discriminate other 5-HT agonists from saline; DOM and several related analogs were then examined in tests of stimulus generalization. Finally, radioligand binding studies were conducted using rat brain homogenates.

(1) *DOM-Trained Animals.* Fenfluramine is known to release endogenous stores of 5-HT; administration of fenfluramine to DOM-trained animals resulted in stimulus generalization supporting the contention that 5-HT may play a mechanistic role in the stimulus effects produced by DOM. However, there is considerable evidence for the existence of multiple populations of central 5-HT binding sites. Peroutka and Snyder (1979) have demonstrated the existence of 5-HT$_1$ and 5-HT$_2$ sites, and Pedigo et al. (1981) have shown that the 5-HT$_1$ sites are heterogeneous and consist of several different subpopulations of sites. Currently, three sub-populations of 5-HT$_1$ sites have been identified: 5-HT$_{1A}$, 5-HT$_{1B}$, and 5-HT$_{1C}$ (for a review, *see* Glennon, 1986). Although there are no 5-HT$_{1C}$-selective agonists, there is evidence that 8-hydroxy-*N,N*-(di-*n*-propylamino) tetralin (8-OH DPAT) is selective for 5-HT$_{1A}$ sites whereas agents such as 1-(3-trifluoromethylphenyl)piperazine (TFMPP) and RU-24969 are selective for 5-HT$_{1B}$ sites. Quipazine is a 5-HT agonist that appears to bind both to 5-HT$_1$ and 5-HT$_2$ sites. The DOM-stimulus generalized to quipazine, but not to 8-OH DPAT, TFMPP, or RU-24969. These results suggest that the DOM-stimulus might involve a 5-HT mechanism that is probably not 5-HT$_{1A}$ or 5-HT$_{1B}$ mediated.

Silverman and Ho (1980) demonstrated that the DOM-stimulus could be attenuated by pretreatment of the animals with the 5-HT antagonists cinanserin and methysergide; we later found that pizotyline (pizotifen, BC-105) was also an effective antagonist (Young et al., 1981). Shortly thereafter, Leysen et al. (1981) reported that agents such as cinanserin, methysergide, and pizotyline were 5-HT$_2$ antagonists; they also reported the development of two new agents, ketanserin and pirenperone, that were highly potent and selective 5-HT$_2$ antagonists. Subsequently, we demonstrated that ketanserin and pirenperone were very effective in blocking the stimulus effects of DOM, and DOM-stimulus generalization to mescaline, 5-OMe DMT, LSD, and quipazine. A 5-HT$_2$ mechanism had now been implicated, for the first time, as possibly being involved in the stimulus properties of DOM and agents to which the DOM-stimulus generalized.

One of the problems associated with ketanserin and pirenperone (and a number of other 5-HT$_2$ antagonists) is that although they are selective for 5-HT$_2$ vs 5-HT$_1$ sites, they are not necessarily selective for 5-HT; some of these agents display a high affinity for dopaminergic, histaminergic, and/or adrenergic binding sites. In order to determine if these other neurotransmitters might be playing a mechanistic role, antagonism studies were conducted with a variety of antagonists; none of these agents effectively antagonized or attenuated the DOM response. By this time, several new 5-HT antagonists had become available; although these agents (e.g., tetrahydrotrazodone, LY-53857, dihydroflutroline, ritanserin) are not necessarily specific for 5-HT sites, they possess different binding profiles and have in common the ability to bind at 5-HT_2 sites. Each of these agents was an antagonist of the DOM-stimulus (Glennon & Hauck, 1985). Thus, evidence was mounting for 5-HT_2 involvement.

(2) *Site-Selective Serotonin Agonists.* In the next phase of our study, groups of animals were trained to discriminate the 5-HT_{1A} agonist 8-OH DPAT and the 5-HT_{1B} agonist TFMPP from saline. If DOM and related agents produce their stimulus effects via a 5-HT_2 agonist effect, stimulus generalization should not occur when these agents are administered to the 8-OH DPAT-trained or TFMPP-trained animals. Also, it should not be possible to block the stimulus effects of these two training drugs with 5-HT_2 antagonists. In rather limited tests of stimulus antagonism, it was found that ketanserin, pirenperone, pizotyline, and/or tetrahydrotrazodone were unable to antagonize the stimulus effects of 8-OH DPAT or TFMPP. In tests of stimulus generalization (Table 3), the 8-OH DPAT stimulus generalized to 8-methoxy DPAT, but not to the 5-HT_{1B} agonists TFMPP, 1-(3-chlorophenyl) piperazine (mCPP), or RU-24969, or to the (putative) 5-HT_2 agonists DOM or 1(2,5-dimethoxy-4-iodophenyl)-2-aminopropane (DOI). The TFMPP-stimulus generalized to the 5-HT_{1B} agonists mCPP and RU-24969 but not to the 5-HT_{1A} agonist 8-OH DPAT, or to DOM, DOB, or DOI. The DOM-stimulus generalized to LSD and quipazine; however, neither agent resulted in generalization in the 8-OH DPAT- or TFMPP-trained animals. Interestingly, both of these agents did result in partial generalization in each group of animals, supporting the finding that LSD and quipazine bind both at 5-HT_1 and 5-HT_2 sites.

TABLE 3. Results of Stimulus Generalization Studies Using Site-Selective Serotonin Agonists as Training Drugs.

	Training Drug

[a] 1(2,5-dimethoxy-4-fluorophenyl)-2-aminopropane.

(3) *Radioligand Binding Studies.* If DOM and related agents act as 5-HT_2 agonists, it should be possible to demonstrate binding of these agents at 5-HT_2 sites. Using rat cortical membranes, 5-HT_1 and 5-HT_2 binding data were obtained for a series of PAAs (Table 4) and a representative number of IAAs. Only data for the PAA analogs will be discussed at this time. In general, PAAs display micromolar affinities (i.e., K_i values) for 5-HT_1 sites; binding at 5-HT_2 sites seems to be very sensi-

tive to the presence and position of various substituents, and a number of agents possess nanomolar affinities. The 2,5-dimethoxy pattern appears to be an important feature for binding at 5-HT_2 sites; further substitution at the 4-position of 2,5-DMA can result in a further increase in affinity and selectivity for 5-HT_2 sites. With respect to 4-alkyl substituents, the *n*-propyl analog DOPR is more potent than either the methyl, ethyl, or butyl analogs. The 4-halogenated derivatives such as DOB and DOI are among the most potent agents in terms of potency/selectivity for 5-HT_2 sites. In the few instances where optical isomers were examined, the R(−)-isomers are several-fold more potent than their S(+)-enantiomers at 5-HT_2 sites, whereas stereoselective binding is less evident at 5-HT_1 sites.

Conclusions

It is difficult to separate mechanistic studies involving large numbers of compounds from studies of SAR in that both provide similar types of information. We have previously demonstrated that a significant correlation ($r = \geq 0.9$) exists between the human hallucinogenic potencies of a series of PAA and IAA derivatives and their ED_{50} values as determined in stimulus generalization studies using DOM as the training drug. We have also found significant correlations ($r = \geq 0.9$) between the affinities of a series of these agents for 5-HT_2 sites and both these ED_{50} values and hallucinogenic potencies (Glennon et al., 1984). Structure-activity relationships derived from all three types of studies afford similar results. The results of these studies also suggest that certain of these hallucinogenic agents may be producing their stimulus effects via a 5-HT_2-mediated mechanism, and, further, that they may be acting as 5-HT_2 agonists. It might be noted that certain agents to which the DOM-stimulus generalizes (e.g., fenfluramine, quipazine, lisuride) and/or that possess an affinity for 5-HT_2 sites (e.g., quipazine, lisuride) are not necessarily hallucinogenic in humans. A satisfactory explanation cannot yet be provided although several can be offered: these agents may not be sufficiently selective for 5-HT_2 sites, may be partial agonists, may possess a still higher affinity for some other binding sites, may produce other effects that mask their anticipated behavioral effects, and/or may be differently distributed or metabolized in humans vs rats.

A dividend of our work with hallucinogenic agents was the identification of the first examples of a series of 5-HT_2-selective agonists. This prompted us to conduct several additional studies. A detailed SAR study on DOB has recently been completed. Substituent groups were removed or transposed in a systematic manner and each of the resulting agents was evaluated with respect to its stimulus properties and binding characteristics. Most structural alterations served only to reduce potency in the discrimination studies, or reduce affinity/selectivity for 5-HT_2 sites (Glennon et al., 1986). Subsequently, [^{3}H]DOB was synthesized and evaluated as an agonist radioligand for 5-HT_2 sites (Titeler et al., 1985). Also, animals have now been trained to discriminate the more 5-HT_2-selective agent DOI from saline; with a training dose of 0.5 mg/kg, an ED50 value of 0.16 mg/kg (0.44 micromoles/kg) was obtained (Glennon and McKenney, 1985). The DOI-stimulus did not generalize with 8-OH DPAT or TFMPP, although generalization did occur with DOM (ED_{50} = 0.45 mg/kg; 1.83 micromoles/kg). Stimulus generalization also occurred with the optical isomers of DOI, with R(−)-DOI being about three times more potent than S(+)-DOI. The DOI-stimulus was blocked by pretreatment of the animals with the 5-HT_2 antagonist ketanserin (ID50 = 0.03 mg/kg).

The overall results of our work lead us to suggest that PAA and IAA hallucinogens may act primarily via a 5-HT_2 agonist mechanism.

Acknowledgments

This work was supported, in part, by U.S. Public Health Service grant DA-01642. We would also like to express our appreciation to R. A. Lyon, J. D. McKenney, and A. E. Hauck for their contributions to various aspects of this project.

The Use of Drug Discrimination Procedures to Characterize Hallucinogenic Drug Actions[1]

James B. Appel, Ph.D.,[2] and Kathryn A. Cunningham Ph.D.[2,3]

Drug discrimination (DD) is a behavioral procedure in which animals are trained through differential reinforcement to detect the internal or "subjective" effects of psychoactive drugs. It has been useful in analyzing the neuronal mechanisms underlying the effects of diverse classes of compounds because of its reliability, sensitivity and, particularly, specificity (Appel et al., 1982).

Like most other assays, DD suggests that indolealkylamine and phenylalkylamine hallucinogens act primarily, if not exclusively, at postsynaptic 5-HT receptors, probably of the 5-HT$_2$ subtype. The evidence in support of this conclusion includes (but is not limited to) the following:

1) Antagonists with a high affinity for 5-HT$_2$ receptors (ketanserin, pirenperone, ritanserin) are the most effective antagonists of the discriminative stimulus properties of lysergic acid diethylamide (LSD) (Colpaert et al., 1982, 1985; Cunningham, 1985; Nielsen et al., 1985).

2) The stimulus effects of 2,5-dimethoxyphenyl-4-methylphenyl isopropylamine (DOM) and quipazine, both of which mimic LSD in rats (Kuhn et al., 1977), are blocked by pirenperone (Friedman et al., 1984; Glennon et al., 1983).

3) The 5-HT$_2$ binding affinities (K_i values) of various phenylisopropylamine derivatives correlate significantly with both DD-derived ED$_{50}$ values and hallucinogenic potencies (Glennon et al., 1982; Glennon, 1985).

4) The relative abilities of various 5-HT antagonists to block the quipazine cue correlate highly with their abilities to inhibit 5-HT$_2$, but not 5-HT$_1$, binding (Friedman et al., 1984).

Nevertheless, the possibility that indolealkylamine and phenylalkylamine hallucinogens act at 5-HT$_1$ as well as 5-HT$_2$ "receptors" cannot yet be dismissed, primarily because some of these agents (e.g., LSD) displace both 5-HT$_1$ and 5-HT$_2$ ligands *in vitro* (Peroutka & Snyder, 1979). We therefore reexamined the stimulus properties of the "prototype" hallucinogen, LSD, and compared them systematically to those of the 5-HT$_{1B}$ agonist, 1-(*m*-trifluoromethylphenyl piperazine) (TFMPP). In the present paper, we review the results of two such experiments.

Experiment 1: LSD-Saline Discrimination

Methods: The methods were similar to those we have been using for some time and are described in detail elsewhere (e.g., Appel et al., 1982).

Rats ($N = 23$) were trained (in commercially available, two lever chambers) to discriminate intraperitoneal injections of LSD (0.08 mg/kg) from saline (0.9% NaCl). A fixed-ratio (FR) 20 schedule of water reinforcement for "correct" (intraperitoneally, drug-appropriate) responding was used.

Once animals demonstrated mean individual accuracies of at least 85 percent correct over a period of 10 consecutive sessions, testing began. In *substitution* (cross-transfer, generalization) tests, a wide range of doses of novel serotonergic compounds (putative 5-HT agonists) were given (interperitoneally, in a volume of 1.0 ml/kg) in place of the training drug (LSD); these were: 8-hydroxy-2(di-*n*-propylamino)tetralin (8-OHDPAT; 0.02 to 0.64 mg/kg), Ru 24969 (0.2 to 3.2 mg/kg), *m*-chlorophenylpiperazine (mCPP; 0.1 to 1.6 mg/kg), 1-(*m*-trifluoromethylphenyl) piperazine (TFMPP; 0.1 to 1.6 mg/kg), and quipazine (0.2 to 3.2 mg/kg). In *combination*

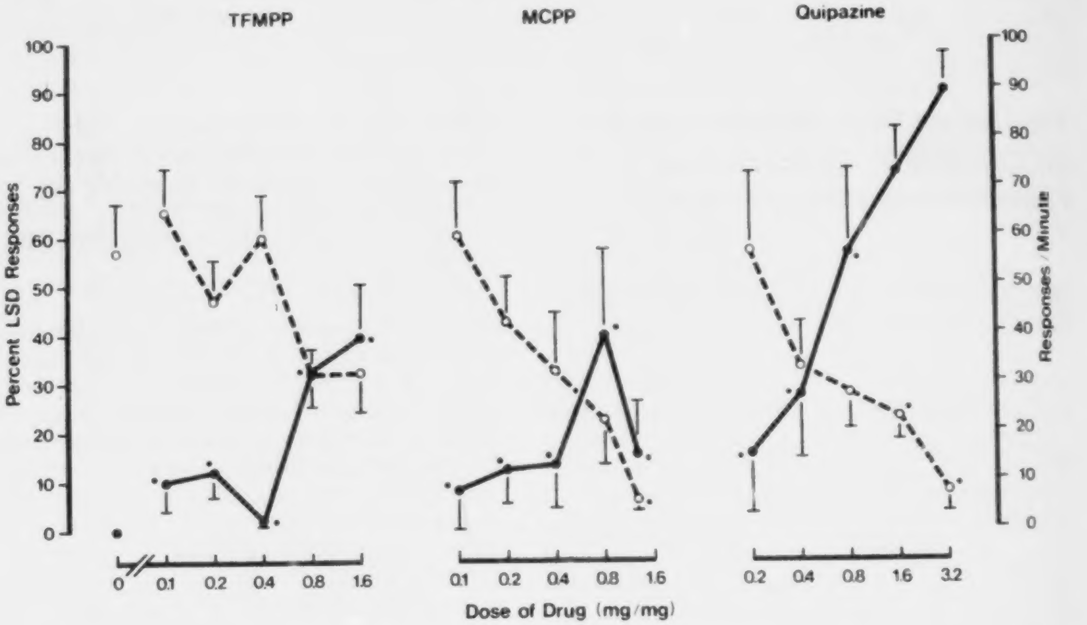

FIGURE 1. Results of substitution tests with TFMPP, MCPP, and quipazine in rats trained to discriminate LSD (0.08 mg/kg) from saline. Closed circles (connected by solid lines) denote the mean percentage of drug-appropriate responses (± S.E.M.) (left ordinate) and open circles (connected by broken lines) denote the mean response rate before completion of the first FR 20 on either lever (± S.E.M.) (right ordinate). Asterisks represent performances during test sessions which were significantly different from previous drug training sessions ($p < 0.05$). Control points, included for comparison, show the degree of stimulus control (± S.E.M.) (closed circle) and the response rate (± S.E.M.) (open circle) produced by saline when administered under test (extinction) conditions.

(antagonism) tests, the following 5-HT antagonists were injected 60 min prior to the training drug (0.08 mg/kg of LSD): pizotyline (BC 105) (0.2 to 3.2 mg/kg), 2-bromolysergic acid diethylamide (BOL; 0.1 to 1.6 mg/kg), Ly 53857 (0.4 to 3.2 mg/kg), metergoline (0.05 to 0.8 mg/kg), ketanserin (0.2 to 3.2 mg/kg), pirenperone (0.0025 to 0.08 mg/kg), and spiperone (0.02 to 0.32 mg/kg).

Results: Of the novel compounds tested, the only substance that mimicked the training drug was quipazine (1.6 and 3.2 mg/kg), the stimulus properties of which appear to be mediated by 5-HT$_2$ receptors (above). No dose of any 5-HT$_1$ agonist (5-HT$_{1A}$ or 5-HT$_{1B}$) induced more than 50 percent LSD-appropriate responding (higher doses disrupted choice behavior and could not be tested). The effects of quipazine as well as those of the putative 5-HT$_{1B}$ agonists TFMPP and mCPP on discrimination accuracy and response rate are shown in Figure 1.

While hampered by an absence of available 5-HT$_1$ antagonists, combination testing also produced consistent results; both relatively selective 5-HT$_2$ (e.g., pirenperone and ketanserin) and less selective (e.g., BC 105, Ly 53857, and metergoline) antagonists blocked the training drug cue; indeed the only 5-HT antagonist which did *not* alter the amount of LSD-appropriate responding was spiperone. Some of these data are illustrated in Figure 2.

Experiment 2: TFMPP-Saline Discrimination

Methods: Rats ($N = 24$) were trained to discriminate TFMPP (0.8 mg/kg) from saline using the same behavioral methods as those of Experiment 1.

After attaining criterion (85 percent correct for 10 consecutive sessions), testing began. Compounds given in substitution tests included LSD (0.01 to 0.16 mg/kg) as well as the following 5-HT agonists: fenfluramine

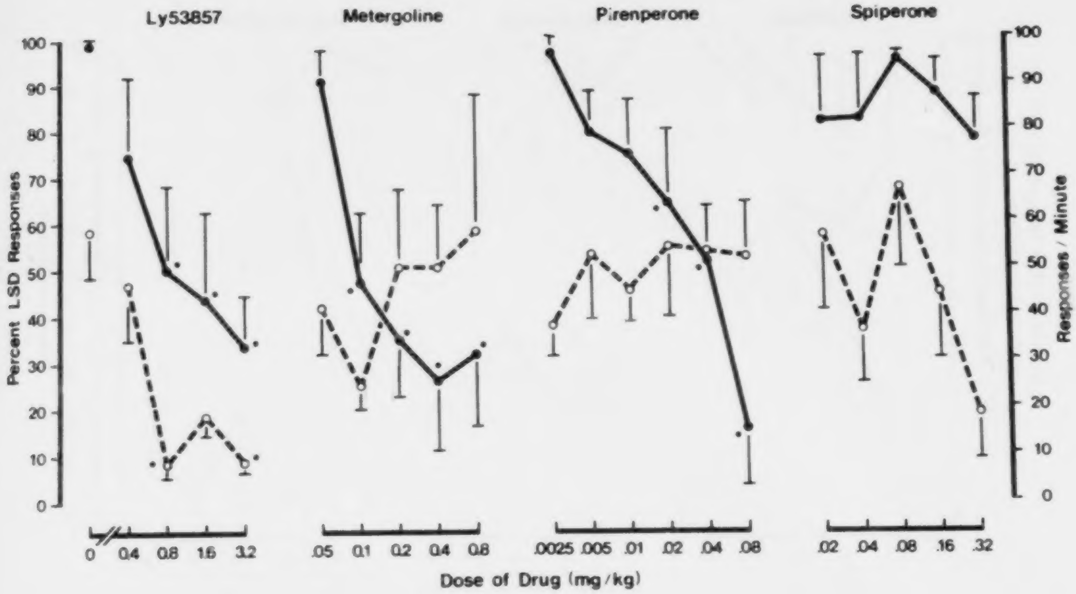

FIGURE 2. Results of combination tests with Ly-53857, metergoline, pirenperone, and spiperone in rats trained to discriminate LSD (0.08 mg/kg) from saline. Closed circles (connected by solid lines) denote the mean percentage of drug-appropriate responses (± S.E.M.) (left ordinate) and open circles (connected by broken lines) denote the mean response rate before completion of the first FR 20 on either lever (± S.E.M.) (right ordinate). Asterisks represent performances during test sessions which were significantly different from previous LSD training sessions ($p < 0.05$). Control points, included for comparison, show degree of stimulus control (± S.E.M.) (closed circle) and response rate (± S.E.M.) (open circle) produced by saline plus LSD administered under test (extinction) conditions.

(0.8 mg/kg to 1.6 mg/kg), mCPP (0.1 to 1.6 mg/kg), Ru 24969 (0.1 to 1.6 mg/kg), 8-OHDPAT (0.02 to 0.32 mg/kg), and quipazine (0.2 to 3.2 mg/kg). Compounds tested in combination with TFMPP were: BC 105 (1.6 to 12.8 mg/kg), BOL (0.8 to 1.28 mg/kg), ketanserin (0.8 to 6.4 mg/kg), Ly 53857 (0.2 to 1.6 mg/kg), metergoline (0.4 to 6.4 mg/kg), pirenperone (0.08 to 0.64 mg/kg), and spiperone (0.08 to 1.28 mg/kg).

Results: In marked contrast to the first experiment, mCPP and Ru 24969 (as well as TFMPP), each of which supposedly acts at 5-HT_{1B} sites, mimicked the training drug as did the 5-HT releasing agent fenfluramine; 8-OHDPAT (a 5-HT_{1A} agonist) and quipazine elicited saline lever responding. While the results with LSD were difficult to interpret, because all doses tested (0.01 to 0.16 mg/kg) elicited at least some (20 to 50 percent) responding on the drug-appropriate lever, this hallucinogen cannot be said to substitute for TFMPP. The effects of Ru 24969, 8-OHDPAT, and LSD on animals trained to discriminate TFMPP from saline are shown in Figure 3.

The results of combination tests also contrast markedly with those of the first experiment. No dose of any 5-HT_2 antagonist had any effect on the TFMPP cue; typical data are shown in Figure 4. While spiperone and metergoline did reduce drug appropriate responding somewhat (40 to 50 percent), even relatively high doses of these compounds did not antagonize the TFMPP stimulus completely (data not shown).

General Discussion

Since 5-HT_1 agonists (of either the 5-HT_{1A} or 5-HT_{1B} subtype) do not mimic and 5-HT_2 antagonists effectively block the LSD cue while 5-HT_{1B} agonists mimic and 5-HT_2 antagonists do not block the TFMPP cue, it is probably safe to conclude that LSD and

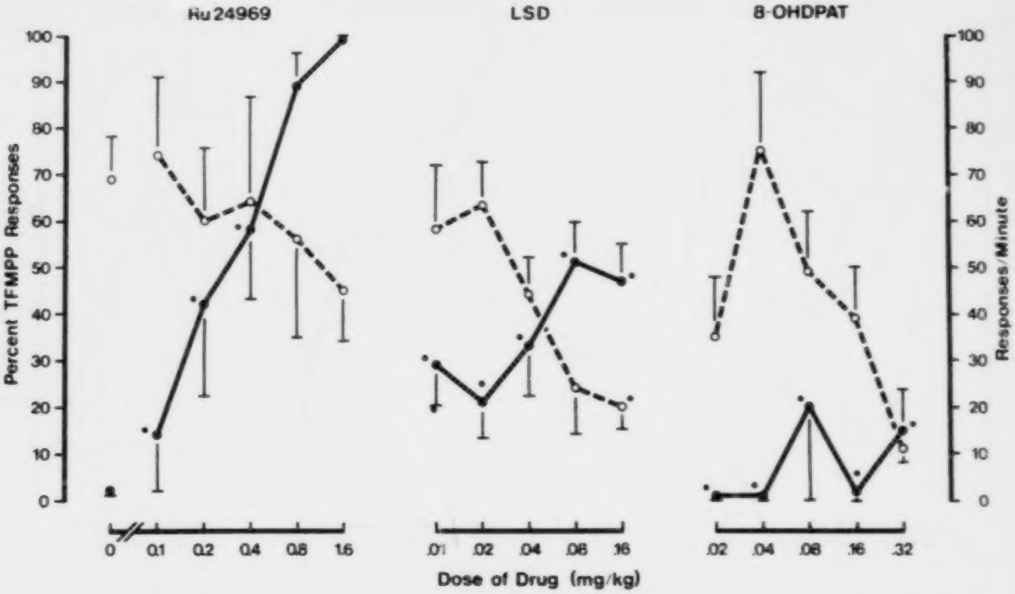

FIGURE 3. Results of substitution tests with Ru 24969, LSD, and 8-OHDPAT in rats trained to discriminate TFMPP (0.8 mg/kg) from saline. The symbols are the same as those of Figure 1. Reprinted from: Cunningham, K.A. & Appel, J.B. Possible 5-hydroxytryptamine-1 (5-HT_2) receptor involvement in the stimulus properties of 1-(*m*-trifluoromethylphenyl) piperazine (TFMPP). *J. Pharmacol. Exp. Ther.* (In Press) with the permission of the Am. Soc. for Pharmacol. and Exp. Ther. and Williams & Wilkins, Inc.

TFMPP have discriminably different properties (induce different "subjective" states) which are mediated by different neuronal mechanisms. The present results thus support those appearing elsewhere in this volume; converging biochemical, electrophysiological and behavioral evidence indicate that, in general, long-chain phenylpiperazines (e.g., TVX 07821), as well as 8-OHDPAT, act at 5-HT_{1A} while short-chain phenylpiperazines (e.g., TFMPP) act at 5-HT_{1B} receptor sites (Aghajanian, 1985; Fuller, 1985). The mechanisms underlying the effects of quipazine are difficult to characterize but appear to differ from those of structurally similar phenylpiperazines (e.g., Martin & Sanders-Bush, 1982).

The results of DD experiments in which LSD was investigated are summarized in Tables 1 and 2; since only one reference is cited for each finding (in the interest of space) these tables are meant to be illustrative rather than exhaustive. The data indicate that, out of the many, diverse psychoactive compounds that have now been examined: 1) The only agents that are similar to LSD (substitute completely) are other indolealkylamine and phenylalkylamine hallucinogens, putatively hallucinogenic beta-carbolines, structural congeners of LSD (most of which are not known to be hallucinogenic), and 5-HT agonists which have at least some affinity for 5-HT_2 receptors (Table 1a). Certain agents appear to substitute "partially" for LSD and therefore require further study (Table 1b). 2) The only compounds that block the LSD cue completely are 5-HT_2 and non-selective 5-HT antagonists (Table 2a). Thus, these results support the idea that, like other indolealkylamine and phenylalkylamine hallucinogens, the *in vivo* actions of LSD are mediated by 5-HT_2 receptors.

TABLE 1. Results of Substitution (Generalization) Tests in Rats Trained to Discriminate LSD From Saline.

a. Complete Substitution (≥ 80 %)	
Hallucinogens:	
DOB (2,5-Dimethoxy-4-bromophenyl)-2-aminopropane)	(Silverman & Ho, 1979)
DOM (2,5-Dimethoxy-4-methylphenyl)-2-aminopropane)	(Silverman & Ho, 1979)
Mescaline	(Cameron & Appel, 1973)
MDA (2,5-Dimethoxyphenyl)-2-aminopropane	(Shannon et al., 1984)
5-MeODMT (5-Methoxy-N,N-dimethyl tryptamine)	(Rosecrans & Glennon, 1979)
2,5-Dimethoxy-4-ethoxyphenyl isopropylamine	(Oberlender et al., 1984)
2,4-Dimethoxy-5-ethoxyphenyl isopropylamine	(Oberlender et al., 1984)
4,5-Dimethoxy-2-ethoxyphenyl isopropylamine	(Oberlender et al., 1984)
Psilocybin	(Schechter & Rosecrans, 1972)
2,4,5-Trimethoxyamphetamine	(Silverman & Ho, 1979)
Beta-Carbolines:	
6-MeO-THBC (6-Methoxy-tetra hydro-B-carboline)	(Nielsen et al., 1982)
THBC	(Nielsen et al., 1982)
Structural Congeners (Ergolines):	
Lisuride	(White & Appel, 1982)
N(6)-ethyl norlysergic acid-N,N-diethylamide	(Hoffman & Nichols, 1985)
N(6)-allyl norlysergic acid-N,N-diethylamide	(Hoffman & Nichols, 1985)
N(6)-propyl norlysergic acid-N,N-diethylamide	(Hoffman & Nichols, 1985)
Serotonin (5-HT$_2$?) Agonists:	
BL-3912 (2,5-dimethoxy-4-methyl-alpha-ethyl-phenethylamine)	(Winter, 1980)
MK-212 [6-chloro-2-(1-piperizinyl)-pyrazine]	(White & Appel, 1982)
Quipazine	(Colpaert et al., 1979)
Others:	
Yohimbine	(Colpaert, 1984)

TABLE 1. (Continued)

b. Partial Substitution (60–79 %)	
Serotonin Antagonists:	
Cyproheptadine	(Colpaert et al., 1979)
Methysergide (UML)	(Colpaert et al., 1979)
Mianserin	(Colpaert et al., 1979)
Phenylethylamines:	
1-[2,5-Dimethoxy-4-(2-butyl)phenyl-2-aminopropane]	(Oberlender et al., 1984)
Fenfluramine	(Winter, 1980)
PMA (alpha-methyl-4-methoxyphenyl ethylamine)	(Winter, 1984)
Sch 12679 (N-Methyl-1-phenyl-7,8-dimethoxy-2,3,4,5-tetrahydro-3-benzazepine)	(Winter, 1980)
Others:	
Clonidine	(Colpaert, 1984)
DPI [(3,4-Dihydroxyphenyl amino)-2-imidazoline]	(Appel et al., 1980)
Scopolamine	(Cameron & Appel, 1973)
THC (delta-9-tetrahydrocannabinol)	(Hirschhorn & Rosecrans, 1976)
Xylazine	(Colpaert, 1984)
c. No Substitution (≤ 59%)	
Dopamine Agonists:	
Amphetamine	(Schechter & Rosecrans, 1972)
Apomorphine	(Kuhn et al., 1978)
Bromocriptine	(Holohean et al., 1982)
Lergotrile	(Holohean et al., 1982)
Serotonin (5-HT$_1$) Agonists:	
mCPP (*m*-chlorophenylpiperazine)	(Cunningham, 1985)
8-OHDPAT [8-hydroxy-2-(di-*n*-propylamino) tetralin]	(Cunningham, 1985)
Ru 24969 [5-methoxy-3-(1,2,3, 6-tetrahydro-pyridin-4-yl) succinate]	(Cunningham, 1985)
TFMPP [1-(*m*-trifluoromethylphenyl) piperazine]	(Cunningham, 1985)
Serotonin Precursors and Uptake Inhibitors:	
Chlorimipramine	(Kuhn et al., 1978)
Fluoxetine	(Kuhn et al., 1978)
5-HTP (L-5-hydroxytryptophan)	(Cunningham et al., 1985)
L-Tryptophan	(Kuhn et al., 1978)
Structural Congeners (Ergolines):	
BOL (2-bromo-lysergic acid diethylamide)	(Colpaert et al., 1982)
1-LSD	(Cameron & Appel, 1973)
Ly-53857 [6-methyl-1-(1-methylethyl) ergoline-8-carboxylic acid, 2-hydroxy-1-methylpropyl ester (z)-2-butenedioate) (1:1)]	(Cunningham, 1985)
Neurotransmitter Antagonists:	
BC 105 (Pizotyline)	(Colpaert et al., 1982)
Chlorpromazine	(Cameron & Appel, 1972)
Cinanserin	(Colpaert et al., 1982)
Haloperidol	(White & Appel, 1982)
Ketanserin	(Nielsen et al., 1985)
Metergoline	(Colpaert et al., 1982)
Methiothepin	(Colpaert et al., 1982)
Ritanserin	(Colpaert et al., 1985)
Spiperone	(Colpaert et al., 1982)
Trazodone	(Cunningham, 1985)
Opiates:	
Meperidine	(Hirschhorn & Rosecrans, 1974)
Methadone	(Hirschhorn & Rosecrans, 1976)
Morphine	(Hirschhorn & Rosecrans, 1976)
Nalorphine	(Hirschhorn & Rosecrans, 1976)
Pentazocine	(Hirschhorn & Rosecrans, 1976)

Others:	
Barbital	(Hirschhorn & Winter, 1975)
Ditran	(Kuhn et al., 1977)
Harmaline	(Nielsen et al., 1982)
Harmane	(Nielsen et al., 1982)
5-MeOT (5-methoxytryptamine)	(White & Appel, 1982)
PCP (Phencyclidine)	(Kuhn et al., 1977)

TABLE 2. Results of Combination (Antagonism) Tests in Rats Trained to Discriminate LSD From Saline.

a. Drugs That Antagonize LSD (≤ 30% Drug-Appropriate Responding)	
$5\text{-}HT_2$ Antagonists:	
Ketanserin	(Nielsen et al., 1985)
LY-53857	(Cunningham, 1985)
Pirenperone	(Colpaert & Janssen, 1983)
Ritanserin	(Colpaert et al., 1985)
Trazodone	(Cunningham, 1985)
Non-Selective 5-HT Antagonists:	
BC 105	(Holohean et al., 1982)
BOL	(Colpaert et al., 1982)
Metergoline	(Cunningham, 1985)
b. Partial (Incomplete) Antagonism (31 ≤ 60% Drug-Appropriate Responding)	
Non-Selective 5-HT Antagonists:	
Cinanserin	(Colpaert et al., 1982)
Cyproheptadine	(Colpaert et al., 1982)
Methiothepin	(Colpaert et al., 1982)
Methysergide	(Colpaert et al., 1982)
Mianserin	(Colpaert et al., 1982)
c. Drugs That Do Not Antagonize LSD (≥ 61% Drug-Appropriate Responding)	
DA Antagonists:	
Butaclamol	(Kuhn et al., 1978)
Chlorpromazine	(Kuhn et al., 1978)
Fluphenazine	(Kuhn et al., 1978)
Haloperidol	(Kuhn et al., 1978)
Sulpiride	(Appel et al., 1980)
Trifluoperazine	(Kuhn et al., 1978)
Spiperone	(Colpaert et al., 1982)
NE Antagonists:	
Phentolamine (Alpha)	(Kuhn et al., 1978)
Propranalol (Beta)	(Kuhn et al., 1978)
Serotonin Uptake Inhibitors:	
Chlorimipramine	(Kuhn et al., 1978)
Citalopram	(Kuhn et al., 1978)
Fluoxetine	(Kuhn et al., 1978)
Others:	
Atropine	(Kuhn et al., 1978)
8-OHDPAT	(Cunningham, 1985)
Naloxone	(Kuhn et al., 1978)
Promethazine	(Kuhn et al., 1978)
Xylamidine	(Kuhn et al., 1978)

Disruption of Operant Behavior by Hallucinogenic Drugs[1]

Richard H. Rech, Ph.D.,[2] and David J. Mokler, Ph.D.[3]

Introduction

The use of animal models to study the effects of hallucinogenic drugs has never been very satisfying. This is true whether the test systems are based on analogous patterns of biological functions or presumed behavioral homologs. Nevertheless, various animal neurophysiological and behavioral models have been helpful in describing neuro–pharmacological and psychopharmacological aspects of the activity of these drug classes (Aghajanian et al., 1970; Appel & Rosecrans, 1984; Jacobs, 1976; McCall & Aghajanian, 1980; Rech & Commissaris, 1982; Sloviter et al., 1980). The test object that we employ is the pattern of the fixed ratio-40 (FR-40) schedule of operant responding in rats, originally observed by Freedman, Appel, and coworkers (1964) to be disrupted by hallucinogenic drugs. However, we have incorporated a counter to register number of interresponse times greater than 10 sec ("pauses"), since the hallucinogenic profile is to induce these abrupt pauses rather than a reduced rate of responding based on increased interresponse times of less than 10 seconds.

Results

Results of previous studies from our laboratory already reviewed (Rech & Commissaris, 1982) generally support the conclusions that the pattern of disruption of FR-40 behavior by hallucinogens relates to serotonin (5HT) agonistic activity at multiple sites in the brain, but not critically to dopaminergic activity or to specific patterns of altered turnover of brain dopamine or 5HT.

Interactions of lysergic acid diethylamide (LSD), 2,5-dimethoxy-4-methylamphetamine (DOM), quipazine, and lisuride with the three 5HT antagonists metergoline, pizotifen (BC–105), and cinanserin were examined (Mokler et al., 1983; Table 1). LSD was found to be most effectively antagonized by pretreatment with pizotifen, while metergoline and cinanserin were about equal in shifting the ED_{50}'s of LSD. Dimethyltryptamine (DMT) (not shown in Table 1) interacted with the antagonists in a pattern very similar to that of LSD. The effects of DOM were most dramatically antagonized by metergoline, with pizotifen being considerably less active and cinanserin being least effective. Interactions with mescaline resembled those for DOM (data not included in Table 1). Quipazine interacted with the 5HT antagonists with a pattern more like that of DOM and mescaline. The ED_{50}'s of lisuride were shifted to about the same extent by pretreating with metergoline and pizotifen (more like LSD). However, cinanserin pretreatment failed to increase the ED_{50}'s of lisuride, and this antagonist actually reduced the ED_{50} of lisuride to decrease the reinforcers earned.

The above 5HT antagonists are considered to act at both $5HT_1$ and $5HT_2$ type receptors (Martin & Sanders-Bush, 1982). Pirenperone appears to be selective as a $5HT_2$ antagonist (Leysen et al., 1981). Table 2 shows the extent of shift in the ED_{50}'s for pause intervals comparing agonists alone with agonists plus various doses of pirenperone (Mokler et al., 1985). Even the lowest dose of pirenperone (20 μg/kg) shifted the LSD ED_{50} by almost 3 times and all of the hallucinogens showed significant shifts in the dose-response curves from 3.45 to 15.1 times. As with metergoline, pirenperone was more effective in antagonizing DOM and mescaline than in blocking LSD and DMT. The quipazine dose for disrupting FR-40 was shifted by 7.98 times after

160 µg/kg pirenperone. However, the FR-40 effects of lisuride were not significantly antagonized even by the highest dose of pirenperone.

Domino and colleagues published several reports demonstrating a naloxone potentiation of disruption of fixed-ratio operant behavior by indole-type hallucinogens (Ruffing et al., 1979). Moreover, morphine and synthetic metenkephalins attenuated the behavioral effects of these hallucinogens (Ruffing & Domino, 1981, 1983). We verified that naloxone pretreatment potentiates indole hallucinogens and extended the interaction to phenalkylamine hallucinogens (Commissaris et al., 1980; Mokler et al., 1984). However, the effects of quipazine to disrupt FR–40 were antagonized by pretreatment with naloxone. Other opioid-hallucinogenic drug interactions in the FR–40 are summarized in Table 3 (*see* Henck et al., 1983, and Rech et al., 1983).

fects of LSD and DOM, we administered these agents directly into various brain regions in rats with chronically prepared cannulae. The potency of the agent infused intracranially (IC) was compared with that established by infusion into the lateral cerebral ventricle (ICV; Mokler & Rech, 1984). LSD was only slightly more effective (1.3 times) by the ICV route than by i.p. injection, while lisuride showed no dose differential by the two routes. ICV DOM was about 2.7 times more potent than i.p. DOM. Only for mescaline was the ICV route much more potent than i.p. injection (30 times). When LSD was infused IC into the dorsal raphe, the potency to disrupt FR–40 was slightly greater than for ICV administration (Table 4). On the contrary, when LSD was infused in the lateral habenula, potency by this intracranial (IC) route was less than by ICV infusion. LSD administered into other IC sites yielded intermediate potency values. The values for potencies of DOM administered IC into the various brain sites compared to that by ICV infusion are also listed in Table 4. In contrast to LSD, DOM was not more potent by IC infusion into any brain region, relative to ICV potency. The effects of DOM placed into the lateral habenula were complex; the overall ED$_{50}$ was 103 μg, but the dose-response pattern was multiphasic. The initial disruption of behavior (20 to 120 μg) demonstrated an ED$_{50}$ of 69 μg. Above 120 μg, the behavior appeared to be reinstated, and then to show a secondary disruption at doses of 160 to 240 μg, with an ED$_{50}$ of 176 μg.

TABLE 3. Summary of Opioid-Hallucinogen Interactions.

1. NAL (naloxone) potentiated FR–40 disruption by hallucinogens (blocking of modulating endorphin systems?).
2. CYCL (cyclazocine) disrupted FR–40 with the hallucinogenic pattern, but NAL antagonized CYCL; MTG (metergoline) also antagonized CYCL (kappa and sigma vs. delta and 5HT receptor activities?).
3. QUIP (quipazine) disruption of FR–40 is slightly antagonized by pretreating with NAL or CYCL (5HT-opioid interactions on appetite?).
4. EKC (ethylketocyclazocine) disruption of FR–40 is potentiated by NAL and MTG at low doses of EKC but blocked at high doses of EKC (kappa and 5HT receptor interactions?).
5. SKF–10,047 disruption of FR–40 is little affected by NAL and only slightly antagonized by MTG (direct sigma activity resistant to NAL and only slightly affected by 5HT systems?).

TABLE 4. ED$_{50}$'s for Change in Pause Intervals ICV vs. IC Administration.

Route	LSD (μg)	DOM (μg)
ICV	15 (10–19)	58 (13–83)
IC		
Dorsal Raphe	9 (2–20)	77 (60–117)
Median Raphe	25 (21–28)	47 (0–95)
Lateral Habenula	54 (29–249)	103 (29–208)
Dorsal Hippocampus	23 (14–37)	114 (74–187)
Prefrontal Cortex	13 (0–47)	92 (17–298)

Values are ED$_{50}$'s for increases in pause intervals using probit analysis. Values in parenthesis are 95 percent confidence limits.

Discussion

Comparing the 5HT antagonists with presumed 5HT$_1$ and 5HT$_2$ receptor activity for blocking the 5HT agonistic effects on FR–40, LSD and lisuride were antagonized best by pizotifen. However, lisuride was not blocked significantly by the 5HT$_2$-selective antagonist pirenperone, suggesting that lisuride exerts more 5HT$_1$ receptor effects to interfere with FR–40 behavior, and pizotifen then would have relatively more prominent antagonistic activity via 5HT$_1$ receptors. By inference, the indole hallucinogens appear to exert disruptive effects by a balance of 5HT$_1$ and 5HT$_2$ activity. Since cinanserin actually potentiated FR–40 effects of lisuride, cinanserin may be more of a partial agonist at 5HT$_1$ receptors. The fact that cinanserin administered alone causes a significant decrease in reinforcers earned also suggests a partial agonistic action at 5HT$_1$ receptors. Since the phenalkylamine hallucinogens were very effectively antagonized by metergoline and pirenperone and less effectively antagonized by pizotifen and cinanserin, these agonists may influence behavior to a greater extent via 5HT$_2$ receptor activity. Quipazine was well antagonized by metergoline, pizotifen, and pirenperone, although the actions of quipazine on behavior appear to be mediated primarily via 5HT$_2$ receptors (*see* Friedman et al., 1984).

An important finding is that the lisuride dose-response curve was not shifted significantly by even the largest doses of pirenperone. Therefore, lisuride may not exert a strong enough action at 5HT$_2$ receptors to alter brain functioning as do the hallucinogens. Quipazine, though having many behavioral effects in rats similar to the hallucinogens, does not appear to be hallucinogenic in man. Quipazine must affect FR–40 behavior in a somewhat different manner than do the hallucinogens, since naloxone pretreatment antagonized the disruption rather than potentiating it. Perhaps quipazine lacks efficacy as a 5HT$_1$ agonist at relevant brain sites to alter central functions to bring about the same imbalance as occurs with hallucinogenic drugs.

Intracranial administration of LSD into various brain sites indicated that activity at the dorsal raphe and prefrontal cortex may be important for the lowest dose effects on FR–40 responding. Nevertheless, the small dose differential between the various brain sites suggests that LSD activity at multiple brain sites generally contributes to the behavioral disruption. This conclusion could be extended to the activity of DOM since doses at various brain sites to disturb the operant behavior were not significantly different. Furthermore, these findings are consistent with previous results from our laboratory regarding enhanced potency of hallucinogens in rats pretreated ICV with 5,7-DHT. When this 5HT neurotoxin was administered IC into various forebrain sites, the potency of the i.p.-injected hallucinogens to disrupt FR–40 was not increased in any systematic manner (Rech & Commissaris, 1982).

Comparison of Phencyclidine and Related Substances With Various Indole, Phenethylamine, and Other Psychotomimetics[1,2]

Edward F. Domino, M.D.[3]

Introduction

Psychotomimetics are logically classified on the basis of chemical structure. They include: 1) Indolealkylamines such as tryptamine, dimethyltryptamine (DMT), 5-methoxydimethyltryptamine (5-MeODMT), psilocin, etc. 2) Lysergic acid amides (also called lysergimides) such as lysergic acid diethylamide-25 (LSD-25) or LSD for short. LSD contains an indole structure and is frequently classified as an indole hallucinogen. However, its more complex chemical structure warrants a separate classification. Furthermore, it is much more difficult to synthesize and therefore to obtain illicitly. 3) Some of the phenethylamines, including amphetamine-like compounds (amphetamine, *p*-methoxyamphetamine, methamphetamine), and mescaline-like compounds [mescaline, 2, 5-dimethoxy-4-methylamphetamine (DOM), methylenedioxyamphetamine (MDA)]. 4) Infrequently abused are the M-cholinergic antagonists such as atropine and 3-quinuclidinyl benzilate (QNB). The latter is also known as BZ and at one time was proposed as a chemical warfare agent to induce a psychotomimetic state. 5) Still another class of psychotomimetic agents is the arylcyclohexylamines such as phencyclidine (PCP). At least five chemical subtypes include PCP-like compounds, dioxalanes, benzomorphans, and unbridged and bridged benz(f)isoquinolines, all of which have been called "phencyclinoids" and/or "*sigma*" opioids (for SKF 10,047). Substances with other heterocyclic structures also produce psychotomimetic effects including 6) cannabinoids like Δ^9-THC, the active ingredient in marijuana, 7) β-carbolines like harmine and harmaline, 8) some of the constituents of nutmeg including myristicin and elemicin, and 9) catatonic producing agents such as bulbocapnine.

Prototypic Chemical Structures of Various Substances Showing PCP-Like Activity

As mentioned above, a number of chemicals with different molecular structures have PCP-like effects. All of these have been tested in animals. Only some of these have been verified to be similar in man. The compounds with prototypic structures include those shown in Figure 1. An important chemical problem is to establish the absolute configuration of all of these substances to determine the common elements shared with PCP itself. To make matters even more complex, PCP exists in four different conformations as shown in Figure 2.

This has prompted Kamenka (1983) to use the term "chameleon" in describing the PCP molecule and its four different conformations. Which is the active conformation in the PCP receptor complex?

Mechanism of Action of Psychotomimetic Agents

An important book which summarizes some of our knowledge on the neurochemical, behavioral, and clinical perspectives of hallucinogens is that edited by Jacobs (1984). With so many diverse chemical classes of psychotomimetics, there is no simple unifying theory as to how they act. Most investigators feel that the major chemical messengers in the brain including norepinephrine (NE), dopamine (DA), serotonin (5-HT), acetylcholine

(ACh), and some excitatory amino acids like glutamate, in particular, N-methylaspartate (NMA), are involved. The two catecholamines, DA and NE, along with the trace brain amines phenethylamine and phenethanolamine, appear to be most implicated with stimulant-induced psychoses such as those produced by amphetamine, methamphetamine, etc.

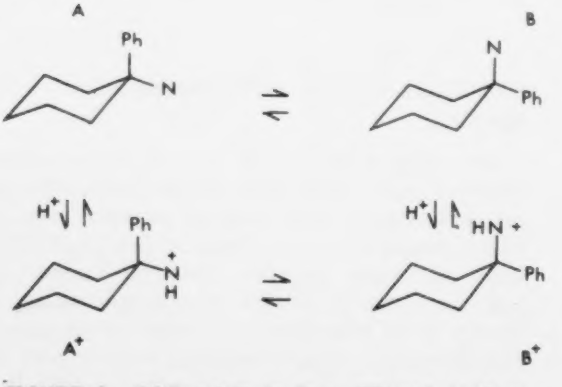

FIGURE 2. PCP exists in four different conformations.

On the other hand, other phenethylamines such as mescaline, DOM, and various indolealkylamine and lysergic acid amides, appear to involve the chemical messenger 5-HT. The newer developments in this field relate to the subtypes of 5-HT receptors. Ligand binding assays using *in vitro* brain membrane fractions from animals are now widely used by neuroscientists. LSD-25 binds to both 5-HT_1 and 5-HT_2 receptors as do some nonhallucinogenic ergot analogs like lisuride. However, almost all of these two classes of hallucinogens seem to interact more on 5-HT_2 sites (Peroutka & Snyder, 1983; Shannon et al., 1984). Shannon et al. (1984) used radiolabeled ^{3}H-5-HT and ^{3}H-ketanserin to label 5-HT_1 and 5-HT_2 sites, respectively. They found that among the various hallucinogens studied (especially phenethylamine derivatives which can be further subclassified as phenisopropylamines) that radioactive binding was more stereoselective to 5-HT_2 than 5-HT_1 sites. Furthermore, the 5-HT_2 binding affinities (called K_i values) of those hallucinogens correlated with rat behavioral discriminative data (effective dose 50 percent or ED50s). In turn, these correlated with the potencies of some of these compounds as hallucinogens in man.

About 20 years ago, it was discovered that animals, when properly trained, discriminate the effects of drugs. Ho et al. (1978), Colpaert and Rosecrans (1978), and Colpaert and Slangen (1982) organized symposia that have summarized much of our knowledge in this field. A given class of drugs such as LSD has discrete stimulus properties that can be distinguished from another unrelated class (Δ^9-THC, etc). Furthermore, animals such as rats can be trained to distinguish morphine from 0.9 percent NaCl placebo from LSD-25, etc. Appel et al. (1982) and Appel and Rosecrans (1984) have reviewed the behavioral pharmacology of hallucinogens in animals on respondent (pavlovian) conditioning and operant (instrumental) conditioning. They point out that the most highly specific operant paradigm to distinguish hallucinogens is drug discrimination. They reviewed the evidence for a common 5-HT_2 and/or hallucinogen receptor mode of action for a variety of compounds. Rech and Commissaris (1982) additionally have provided evidence that a particular spectrum of activity at 5-HT$_2$ relative to 5-HT$_1$ receptor sites is characteristic of a large variety of hallucinogens.

Jacobs (1984) summarized the evidence that hallucinogens such as DMT, DOM, LSD-25, mescaline, and psilocybin act on postsynaptic 5-HT receptors. All of these compounds elicit a so-called "5-HT behavioral syndrome" in rats which consists of head weaving, tremor, rigidity, Straub tail, splayed hindlegs, and forepaw treading. Tolerance and cross-tolerance to these effects are observed which correlate with decreases (down-regulation) of 5-HT binding sites. Jacobs (1984) has provided evidence that the behavioral effects of such 5-HT acting hallucinogens can be dissociated from their presynaptic actions on 5-HT neurons.

Can the actions of LSD-25 and related indole and phenethylamine hallucinogens on the 5-HT system be related to the actions of arylcyclohexylamines such as PCP or to psychomotor stimulants like amphetamine? Probably not, but there are some interesting relationships and contrasts. Most psychotomimetics, when given chronically, induce tolerance. On the other hand, in rodents chronic amphetamine effects are potentiated. In other words, chronic use produces supersensitivity. Nabeshima and his colleagues in Japan (1985) have shown that PCP given chronically to rats produces a mixed picture. The PCP-induced "5-HT like syndrome" is attenuated with chronic PCP administration and shows cross-tolerance to 5-MeODMT, while DA mediated behavioral effects such as sniffing, rearing, or licking are enhanced in chronic PCP treated rats given PCP or DA agonists such as apomorphine and methamphetamine. Thus, tolerance is observed in the 5-HT mediated but not the DA mediated effects of PCP. The conclusions by Nabeshima and colleagues are only partially in agreement with those of Greenberg and Segal (1985). The latter found that the acute co-administration of amphetamine and PCP increased only stereotypy, a classic DA mediated behavior. On the other hand, although chronic administration of both drugs separately produced enhanced locomotor stimulation, the chronic PCP treated rats showed a decreased response to amphetamine, indicating different mechanisms underlie the effects of acute and chronic administration of both drugs.

Perhaps the most important new development in the mechanisms of action of PCP involves its effects on excitatory amino acid neurotransmitter systems. It has long been known that PCP in receptor, binding assays acts on the muscarinic cholinergic receptor, on the *delta* subunit of the ion channel of the nicotinic receptor, and on various Ca^{++} and K^{+} ion channels (*see* Domino, 1981; Kamenka et al., 1983). Lodge et al. (1982, 1983) and Anis et al. (1983) were the first to show that arylcyclohexylamines including ketamine, PCP, tiletamine, and etoxadrol selectively reduced excitation of mammalian neurons by NMA, but not by quisqualate and kainate. Subsequently, Snell and Johnson (1985, 1986) reported that several substances with PCP-like behavioral effects inhibited the release of two chemical messengers, ACh and DA, evoked by NMA from rat striatal slices *in vitro*. They also showed that these effects were similar to the classic NMA antagonist, 2-amino-5-phosphonovalerate, except that the latter produced a parallel shift to the right in the concentration effect curve, while PCP produced a non-parallel shift to the right, suggesting a noncompetitive interaction between PCP and NMA. Koek et al. (1986) have used a behavioral analysis in animals regarding PCP and its interaction with NMA. They suggest that this might be important in the mechanisms of anesthesia induced by arylcyclohexylamines and related substances.

Conclusions

PCP-like compounds appear to possess a unique wide spectrum of pharmacological effects. Their mechanisms of action are as yet unknown, but clearly appear to be different from other major classes of psychotomimetic agents.

Clinical Aspects of Use of Phenylalkylamine and Indolealkylamine Hallucinogens

Leo E. Hollister, M.D.[1]

Scarcely any clinical studies of hallucinogens have been reported since 1968. A variety of reasons account for this diminution of interest. Much of the information about clinical effects, potential therapeutic uses, and adverse effects must be gleaned from older work (Hollister, 1968).

Mescaline is the prototypic phenylalkyl amine hallucinogen. Others include 2,5-dimethoxy-4-methyl amphetamine ("STP") and methylene-dioxymethamphetamine (MDMA). Lysergic acid diethylamide (LSD) and psilocybin are the prototypic indolealkylamine hallucinogens, which also include N,N-dimethyltryptamine and bufotenin. Aside from great differences in potency (1 μg LSD equals 225 μg psilocybin equals 5 mg mescaline), the clinical syndromes produced by these three drugs are virtually identical. Somatic symptoms include dizziness, weakness, tremors, nausea, drowsiness, paresthesia, and blurred vision. Perceptual changes include altered shapes and colors, difficulty in focusing on objects, sharpened sense of hearing and, rarely, synesthesias. Psychic manifestations include alterations in mood, tension and, rarely, hallucinations. The usual doses, in terms of LSD, to produce such effects range from 50 to 200 μg. No fatal overdoses have been recorded. The usual duration of drug effect is about 6 to 8 hours, or longer with higher doses.

Various claims have been made for therapeutic utility of these drugs in alcoholism, depression, schizophrenia, neuroses, and psychopathy. The drugs have been averred to facilitate insight psychotherapy, to provide a "mock death," to create religious experiences, and to promote better interaction in group psychotherapy. None of these claims has ever been validated experimentally. That claim most often studied, beneficial effect of LSD for treating alcoholics, has never been confirmed.

Acute panic reactions are the most common adverse effect, but are of limited duration. Depression and psychosis may be precipitated by the drug but are not created de novo. Thus, these drugs have failed to produce a valid model psychosis. "Flashbacks" are still of uncertain cause. Injury to self, and occasionally a homicide, are related to lack of judgment and/or disinhibition.

The major current concern is about the fad drug, methylene-dioxymethamphetamine (MDMA). This phenethylamine derivative was first synthetized many years ago but is not as well known or as well studied as methylene-dioxyamphetamine (MDA). The latter drug was one of many phenethylamine hallucinogens of interest to the U.S. Army as part of its studies of "incapacitating agents." A study of this drug at a major medical center during the early 1950s came to an abrupt halt with the death of one of the subjects. He had been given a dose of around 30 mg without much effect. Other subjects had received higher doses of related compounds. When he received the second dose of about 460 mg (6 mg/kg), he experienced muscle spasms, seizures, and cardiovascular collapse. The dose of 6 mg/kg had been predicted as potentially lethal based on toxicological studies.

In the late 1950s, Gordon Alles ran a series of clinical trials in which MDA was compared with amphetamine at doses ranging from 60 to 120 mg. At the highest doses, distinct visual and other sensory changes (increased auditory sensitivity and alterations in peripheral vision) were noted, but no hallucinogenic effects (Alles, 1959). In 1967 Alex Shulgin and collaborators reported on 8 subjects who received doses up to 150 mg. These subjects, who were well experienced with other LSD-type hallucinogens, reported no hallucinations, perceptual distortions, or eye-closed

imagery, all of which are very common reactions to LSD-type drugs. Similarities between MDA and LSD-type drugs were intensification of feelings, increased perceptions of insight, and heightened empathy with others. Most subjects also reported increased esthetic enjoyment. Effects appeared within 40 to 60 minutes of ingestion, peaked in about 90 minutes and had largely dissipated by 8 hours, a time course comparable to that of LSD-type drugs. It was concluded that MDA was not classifiable as a hallucinogen but rather was unique in producing an "inward, talky experience" (Naranjo et al., 1967).

Shulgin's group reported a few years later on 3-methoxy-4-,5-methylene-dioxyphenyl–isopropylamine (MMDA), a related compound. Clinical effects were similar to those from MDA, without true hallucinogenic effects. It, too, was deemed useful for psychotherapy. Rather low toxicity was found in rats, with a therapeutic index (LD_{50} rats/MED_{50} humans) to be 85, rather high. Striking hypotension was noted in dogs, however, indicating species differences in response (Shulgin et al., 1973).

A 1970 report on MDA confirmed the time course of the drug's effects. Subjects experienced a mild sense of physical well-being, increased taste sensation, decreased awareness of bodily sensations, and increased need for interpersonal relationships. Several short visual hallucinations were experienced by one subject. Physical exhaustion and free-floating anxiety which lasted up to 2 days were the usual sequelae (Jackson & Reed, 1970).

The potential lethality of MDA in overdose was again confirmed by a 1983 report. A subject who had taken a dose of about 500 mg experienced a tonic seizure followed by coma some 15 minutes after ingestion. Tachycardia, rapid respirations, and slight hypertension were noted. The pupils became dilated and fixed, sweating and piloerection were observed, the extremities became rigid along with trismus, and respiratory depression followed. The subject eventually recovered. Two other users of the drug had similar, though milder reactions (Richards & Borgstedt, 1971).

Another disconcerting aspect of the MDA story is that a recent study in animals suggests that it is a neurotoxin specific for serotonergic pathways in the brain (Ricuarte et al., 1985). The full implications of this observation are not at all clear. A similar observation has suggested that fenfluramine is also a serotonin neurotoxin, yet this drug has been widely used in clinical practice without any evident adverse neurological consequences.

It is conceivable that MDA is not truly a hallucinogen. Substitution of the aromatic portion of the molecule at the 3 and 4-positions is usually not adequate for producing hallucinogenic effects. Thus, the contention that MDA is not truly a hallucinogen but more closely related to amphetamine may be correct. The story with MDMA as reported by those therapists who use it sounds much the same. They report the same sort of empathetic experiences in their patients without major hallucinogenic actions. It would be surprising if MDMA were to be markedly different from MDA. Usual doses used in therapeutic sessions are around 200 mg, about 50% of the potential lethal dose. In contrast, a lethal dose of LSD has not yet been determined.

We should be hearing much more about MDMA, for some entrepreneur is funding studies of the drug directed towards a New Drug Application. He envisions a chain of clinics in which this drug would be used to facilitate psychotherapy. Specially trained "therapists," not necessarily physicians, would monitor the therapy. If MDMA is commercialized it would be the first such instance for a hallucinogen.

The 4-bromo homolog of 4-methyl,2,5-dimethoxyamphetamine (DOM, STP) has appeared in some countries as a street hallucinogen under several names including DOB or bromo-DMA (Delliou & Bromo, 1980). Shulgin had reported that in doses of 2 mg it resembled MDA. Even doses of 3 mg have been associated with convulsions, attesting to its much greater potency than DOM. Further, the Br substituent delays metabolism, so effects of this drug are prolonged.

Two young persons were poisoned by DOB. A young woman who had ingested what was believed to be 30 to 35 mg died after seizures and cardiovascular collapse. Postmortem finding included evidence of increased intracranial pressure and acute pulmonary congestion. Her companion, a young man poisoned with an unknown amount of this drug, experienced repeated convulsions and prolonged coma with permanent brain damage (Winek et al., 1981).

An unusual effect of DOB is the production of marked, diffuse, and progressive peripheral arterial vasospasm. A 33-year old man had taken an unknown amount of DOB several hours before the onset of cold extremities. Pulses were absent and spasm was demonstrated on subclavian angiograms. Vasodilators were used with reversal of the vasospasm in 24 hours. An earlier instance of vasospasm after a putative dose of 75 mg of DOB resulted in bilateral above-the-knee amputations. It is possible that the cerebral effects of overdoses of this drug are also associated with vasospasm (Bowen et al., 1983).

These two new phenethylamines have serious potential side effects, including death. Although no deaths have been directly attributed to MDMA, experience with MDA strongly suggests this possibility. Some trismus and muscle spasms have been noted even in subjects who received 200 mg "therapeutic" doses of MDMA. Thus, doses usually used in therapeutic sessions with this drug are perilously close to those that have been lethal. As it is not always certain that doses of street drugs can be accurately determined, a relatively minor error in dose could have serious consequences.

Whether MDMA will, despite its evident hazards, prove to be the panacea for psychotherapy claimed by its adherents remains to be seen. The present claims are exactly the same as those made by many of the same persons about LSD 20 years ago. The difference is that LSD has a remarkable margin of safety, something lacking in the newer agents.

Anticholinergic Prophylaxis in Young Adults Treated With Neuroleptic Drugs

C. Raymond Lake, M.D., Ph.D.,[1,*] Daniel E. Casey, M.D.,[2] Joseph P. McEvoy, M.D.,[3] Samuel G. Siris, M.D.,[4] William F. Boyer, M.D.,[5] and George Simpson, M.D.[6,*]

Although substantial literature supports prophylactic anticholinergic medication during neuroleptic treatment for reducing the incidence and severity of extrapyramidal side effects (EPS), arguments against this practice have been raised (McEvoy, 1983). Opponents contend that anticholinergic drugs have serious side effects of their own. These side effects consist of reversible increases in dyskinesia and dysphoria (Gardos et al., 1984), and various other anticholinergic effects, including new memory deficits (Tune et al., 1982) and the common peripheral effects (dry mouth, blurred vision, constipation, urinary retention, etc.). The severe effects of delirium and toxic psychosis have been observed in a small percentage of patients on combined medication (Simpson, 1983). These numerous side effects, which are particularly dangerous in the elderly (McEvoy, 1983), are produced not only by the prophylactic anticholinergic drugs themselves but also by their additive effects with the antipsychotic agents. Another argument is that the high doses of potent neuroleptics now commonly used are excessive and cause an unnecessarily high incidence of EPS. Opponents, who are usually proponents of low-dose neuroleptics, argue that if smaller doses were used, prophylaxis with the anticholinergics may be obviated. Little evidence exists to support prophylaxis with neuroleptics other than haloperidol, because few drugs, excluding haloperidol, have been tested in prophylactic studies (Simpson, 1983).

The first appearance of mild neuroleptic side effects, especially hypokinesia and rigidity, may signify the achievement of therapeutic neuroleptic doses (Simpson et al., 1970); identification of such a marker is impossible if prophylactic anticholinergic drug treat-

ment has been initiated. Opponents of prophylactic anticholinergic drug use contend that institution of medication from this class can be reasonably delayed until after neuroleptic-induced side effects are exhibited. These side effects, apart from acute dystonic reactions, develop progressively and gradually, are usually neither severe nor intolerable, and can be treated as required rather than prophylactically.

Nevertheless, high-dose neuroleptic treatment for acute episodes of schizophrenia and mania remains in fashion, despite the lack of evidence supporting such an approach (Ericksen et al., 1978). If high doses (greater than 10 mg haloperidol daily) are used, then arguments for using prophylactic anticholinergics are more convincing. The common and disturbing neuroleptic-induced side effects antagonize therapeutic rapport and medication compliance, which are critical in the treatment of schizophrenic patients. Under the best of circumstances and with minimal side effects, follow-up treatment and attention are frequently less than ideal for a considerable percentage of schizophrenic patients, partly because of the nature of the illness (disordered thinking with frequent paranoid ideations).

Although quite distressing, common neuroleptic side effects are often subtle and easily overlooked, and sometimes even misdiagnosed as worsening psychopathology (Van Putten, 1974; Rifkin et al., 1978; Siris, 1985). Akinesia, a syndrome of reduced spontaneity on a neuroleptic-induced extrapyramidal basis, may also arise insidiously and, while not dramatic, may be devastating to the patient's subjective and psychosocial progress (Rifkin et al., 1975; Rifkin et al., 1978; Van Putten, 1974). In contrast, one of the most dramatic and frightening side effects of the more potent neuroleptics is the acute dystonic reaction. Prophylactic use of anticholinergics to prevent or reduce subtle, but distressing akinesia and painful, startling dystonic reactions is likely to enhance patient compliance. An earlier contention that such prophylactic use may predispose to tardive dyskinesia no longer appears valid (Gardos and Cole, 1983).

Withdrawal studies in which the anticholinergic drugs were discontinued apparently support the use of anticholinergic drugs (Manos et al., 1981a,b; Jellinek et al., 1981). In a pair of studies, a large majority of schizophrenic patients chronically medicated with neuroleptic and anticholinergic drugs developed worsening EPS upon acute or gradual (over 3 weeks) withdrawal of the latter drug (Manos et al., 1981a,b). However, the withdrawal studies did not address the question of whether the anticholinergic agents were actually required initially. Additionally, in more than 30 studies examining drug discontinuation, only Stratas et al. (1963) intervened by decreasing neuroleptic drug dosage when EPS occurred: These side effects disappeared in 13 of the 16 patients without deterioration in psychiatric status.

Prophylaxis is justified to a greater degree if patients likely to develop EPS can be identified. Data indicate that youth, male sex, and high potency neuroleptics are associated with a high incidence of EPS. For example, one study reported that 29 of 30 males between ages 19 and 30, treated with haloperidol, experienced EPS (Neborsky et al., 1981), and similarly, another study found that 100 percent of their adolescent patients who were given high-potency neuroleptics suffered from these reactions (Chiles, 1978). In addition, Keepers et al. (1983) found 90 percent of their patients between 10 and 19 years old and 80 percent of 20 to 29 year olds treated with various neuroleptics experienced EPS. The popularity of prescribing more potent neuroleptics in higher doses has apparently increased the prevalence of EPS (Prien and Cole, 1968; Ericksen et al., 1978).

Several types of neuroleptic-induced EPS vary in severity and in times of onset. The most striking and acutely debilitating of these EPS is the acute dystonic reaction, which consists of intense muscle cramps primarily in the head and neck. This reaction is considered a form of EPS, which, like akinesia and the other symptoms of neuroleptic-induced parkinsonism, is both effectively treated and prevented with centrally acting anticholinergic drugs (Keepers et al., 1983; Stern and Anderson, 1979). Neuroleptic-induced dystonia differs in some respects from other EPS and may have a different pathophysiology. For example, dystonic reactions occur sooner after neuroleptics are administered (hours to days) than the other EPS (days to years). These reactions are more painful, frightening, acute in onset, develop without warning signs, and, if the respiratory muscles are affected, they are potentially fatal.

Data on the incidence of dystonic reactions implicate the same risk factors as for EPS in general. Moleman et al. (1982) found dystonic reactions especially common in neuroleptic-treated males under age 34. Chiles (1978) reported a 64 percent incidence of dystonia in 11 adolescents between ages 13 and 18 who were treated with potent neuroleptics. Dystonic reactions occurred in 33 percent of 40 neuroleptic-treated patients, some of whom also received benztropine (Stern & Anderson, 1979). In addition, Keepers et al. (1983) noted a 45 percent incidence of acute dystonia in 20 to 29 year olds and a 65 percent occurrence in 10 to 19 year olds treated with both high- and low-potency antipsychotics. Boyer et al. (in press) found an extremely high incidence of dystonia (94 percent) among young patients given haloperidol.

Several studies support the contention that anticholinergics are effective in preventing dystonic reactions in these populations. Keepers et al. (1983) observed that prophylaxis produced a significant decrease in dystonic reactions among those 10 to 39 years old, but not among older patients. Stern and Anderson (1979) reported an 11-fold increase in dystonia among patients given high-potency antipsychotics without prophylaxis. DiMascio and Demirgian (1970) noted incidences of dystonia of 18 and 10 percent, respectively, in "non-prophylactic" vs. prophylactic groups. In contrast, Sramek et al. (in press) found no significant difference in the incidence of dystonia between the prophylactic and "non-prophylactic" groups (12 and 20.6 percent, respectively); however, the difference between the groups reached significance (11.5 and 38.2 percent) when patients given only haloperidol were examined. Boyer et al. (in press) observed no dystonic reactions in their small group of seven patients who received benztropine prophylaxis, while 94 percent of 16 patients who received no prophylaxis incurred dystonia. The majority of these data imply that many young patients given high potency neuroleptics will incur dystonic reactions and, furthermore, that prophylactic use of an anticholinergic drug will substantially deter this side effect.

Opponents note that the incidence of dystonic reactions has increased from 2.3 percent in 1961 (Ayd, 1961) to 50 percent in 1979 (Stern et al., 1979) and believe that this increase relates to the unwarranted prescription of higher dosages of the potent neuroleptics (Sramek et al., in press). In this study by Sramek et al. (in press), no dystonic reactions developed in those patients given only low-potency neuroleptics ($N = 33$).

Some of the studies reviewed above reported that almost all dystonic reactions appeared shortly after beginning and maintaining patients on neuroleptic drugs (hours to a few days) (Keepers et al., 1983; Ericksen et al., 1978; Sramek et al., in press; Boyer et al., in press). In the study by Keepers et al. (1983), 85 percent of dystonic reactions occurred within the first 4 days of neuroleptic treatment. By day five and afterward, the incidence of dystonia in "non-prophylactic" patients was similar to that in patients who had received anticholinergic prophylaxis. Almost 90 percent of all dystonic reactions happened by day three in the study by Sramek et al. (in press). In the study by Boyer et al. (in press), all dystonic reactions occurred within 60 hours; 12 of the 14 patients experienced this side effect within 48 hours. From these data, it is conceivable that tolerance to the dystonic effects of the neuroleptic drugs develops over several days to a week.

Because it is the acute dystonic reaction that carries the greatest potential for detrimental effects in our patients, a compromise strategy may be forthcoming for initial and temporary prophylaxis with the centrally acting anticholinergic drugs aimed at specifically preventing these reactions. Such a strategy, particularly significant for young patients, especially males, given high potency neuroleptic drugs, proposes prophylaxis for a week followed by tapering of the anticholinergic drug over several days to a week. Then, if EPS subsequently occur, neuroleptic dosage can be decreased and/or an anticholinergic drug reinstated. Further definitive studies must determine if significant EPS emerge upon gentle tapering of the anticholinergic medication after only brief (1 week) prophylactic use. The data from the withdrawal studies may not apply here considering that those patients were on chronic prophylaxis for months to years (Manos et al., 1981a, b). Clearly, the strategy of using lower doses and less potent neuroleptics will decrease the incidence of EPS and lessen the need for prophylactic anticholinergics. Further research is warranted to determine the role of anti cholinergic prophylaxis in all EPS, particularly drug-induced parkinsonism and akathisia.

Poster Sessions—Editors' Choice—

The Inventory of Depressive Symptomatology (IDS): Preliminary Findings[1]

A. John Rush, M.D.,[2] Donna E. Giles, Ph.D.,[2] Michael A. Schlesser, M.D.,[2] Carl L. Fulton, M.D.,[2] Jan Weissenburger, M.A.,[2] and Cheryl Burns, M.S.[2]

The Hamilton Rating Scale for Depression (HRS-D) (Hamilton, 1960, 1967) is the most frequently used clinical rating. However, several difficulties are apparent upon inspection. First, only the 17-item version has undergone thorough psychometric assessment. The 17-item form gives differential weight to different symptoms (e.g., sad mood or work and interest are rated 0 to 4, while each of the three types of insomnia are rated 0 to 2), which is an arbitrary judgment. Second, some symptoms often found with depressed patients are not rated at all (e.g., hypersomnia; weight or appetite increase). Third, some endogenous symptoms are not rated (e.g., quality of mood; reactivity of mood). Furthermore, some items are confounded (e.g., the somatic energy item rates both specific pains and overall bodily energy/fatigability). In addition, some symptoms are rated under two or more items (e.g., headaches contribute to both the somatic energy and somatic anxiety items). Finally, the anchor points for some items are difficult to judge.

This is a preliminary report of findings with a new scale — the Inventory of Depressive Symptomatology (IDS) (Rush et al., in press), which is being developed both as a self-report (IDS-SR) and clinician rating (IDS-C).

Methods

Scale Development

The Inventory for Depressive Symptomatology (IDS) was designed to measure specific signs and symptoms of depression in both in- and outpatients. Items were developed from inspection of several existing inventories, diagnostic criteria, and clinical judgment. The present item wording and selection was achieved through an iterative process that incorporated feedback from both clinicians and patients.

The scale contains 28 items; each is rated from 0 to 3 with increasing severity represented as a higher item rating. Twenty-six of the 28 items contribute to the final score, since either appetite increase *or* decrease, and weight increase *or* decrease are rated. Total scores range from 0 to 78. The initial intent in developing items was to tap the following symptom dimensions: vegetative, cognitive, mood disturbance, endogenous, and anxiety/panic.

All items are equally weighted. Items were clinically selected to (a) include all symptoms required by DSM-III (Diagnostic and Statistical Manual — 3rd ed., 1980); (b) diagnose major depression and melancholic features;

(c) include all symptoms to define endogenous depression by Research Diagnostic Criteria (RDC) (Spitzer et al., 1978); and (d) include items used to differentiate atypical (weight gaining, hypersomnic), endogenous, and anxious (anxious/irritable mood, sympathetic arousal, panic/phobic) depressions.

Part I: Self-Report IDS (IDS-SR)

Subjects and Procedure. The patient sample consisted of consecutive referrals to the Outpatient Clinic of the Affective Disorders Unit (ADU) between August 1982 and December 1983 and four inpatients. All patients completed the self-report form of the IDS (IDS-SR), the 21-item Beck Depression Inventory (BDI) (Beck et al., 1961) and were interviewed by the Schedule for Affective Disorders and Schizophrenia Life-Time Version (SADS-L) (Endicott & Spitzer, 1978). The 17-item HRS-D was completed by the interviewing clinician who was unaware of the IDS-SR and BDI responses. Table 1 shows the diagnostic breakdown of the group according to RDC.

Patients averaged 38.2 (SD 12.1) years of age and 14.3 (SD 2.9) years of education. Sixty-four percent were female and almost all (97.2 percent) were Caucasian.

Normal controls (N = 23) included those who had negative personal and first-degree family histories of depression, alcoholism, schizophrenia, or other psychopathology. All normals were free of significant medical problems and were taking no medication of any type. Normals averaged 40.4 (SD 15.8) years of age, 15.2 years of education (SD 3.4) and 65.0 percent were female. Caucasians (95.7 percent) predominated.

Results

Reliability

Coefficient alpha (Cronbach, 1951) for the IDS-SR was 0.85 (high internal consistency). By comparison, coefficient alpha for this patient sample was 0.90 for the BDI and 0.80 for the HRS-D. Item total correlations were also satisfactory except for distinct quality to mood, which has been reworded in the present form.

Concurrent Validity

Of the 289 patients who completed the IDS-SR, 274 had concurrent BDI and 280 had concurrent HRS-D ratings. Mean IDS-SR score for the total sample was 32.0 (SD 12.3). The mean BDI score was 21.9 (SD 11.2) and the mean HRS-D score was 15.5 (SD 7.1). The IDS-SR positively correlated with both the BDI (r = 0.78) and the HRS-D (r = 0.67).

Since the HRS-D and BDI are highly intercorrelated, the relationship between the IDS-SR and these scales, independent of the other, was assessed with partial correlations. The partial correlation between IDS-SR and HRS-D (BDI covaried out) was 0.34 (p <.001). The partial correlation between IDS-SR and BDI (HRS-D covaried out) was 0.68 (p <.001). HRS-D and BDI scores corre-

TABLE 1. Diagnostic Description of the Sample (IDS-SR).

Diagnosis	*n*	Diagnosis	*n*	Diagnosis	*n*
Unipolar MDD	174	Bipolar I	22	Other Diagnoses	38
Primary	138	Depressed	18	Remitted	33
Secondary	35	Manic	3	Unipolar	27
(Unknown)	1	Mixed	1	Bipolar I	5
Endogenous	65	Bipolar II	22	Bipolar II	1
Nonendogenous	106	Depressed	19		
(Unknown)	3	Hypomanic	3		
Psychotic	5				
Nonpsychotic	166				
(Unknown)	3				

lated with each other (IDS-SR covaried out) ($r = 0.25, p <.001$). Thus, the IDS-SR was as highly correlated with the HRS-D (BDI covaried out) as the BDI was with the HRS-D (IDS-SR covaried out) ($Z = 1.06, p >.20$). These findings suggest that the IDS-SR has concurrent validity with other depressive symptom measures.

Construct Validity

IDS-SR scores for patients with unipolar major depression and bipolar, depressed phase disorder ($n = 211$) were significantly higher than for those with other diagnoses ($n = 38$) ($t = 8.42, df = 247, p <.001$) and for normals ($t = 16.9, df = 232, p < .001$). The mean IDS-SR score for depressed patients was 36.5 (SD 9.7) compared to 21.8 (SD 11.3) for other diagnoses. For controls, the mean score was 2.1 (SD 2.2).

The mean BDI score for depressed patients was 26.0 (SD 9.3), while other diagnoses averaged 11.3 (SD 7.6), which was significantly different ($t = 9.2, df = 238, p <.001$). The normals averaged 1.2 (SD 2.0) on the BDI which significantly differed from depressed patients ($t = 12.7, df = 223, p <.001$) and other diagnoses ($t = 6.23, df = 59, p <.001$).

A stepwise discriminant analysis (Jennrich & Sampson, 1983) was used to determine which IDS-SR items discriminated RDC endogenous and nonendogenous depressed patients, and to identify which combination of IDS-SR items maximally discriminated these two groups. The analysis contrasted unipolar endogenous (E) ($n = 52$) with unipolar nonendogenous (NE) ($n = 76$) patients. Results of these analyses are presented in Table 2.

All three ratings yielded satisfactory, but not spectacular classifications of E and NE patients. The IDS-SR was equivalent to the BDI and the HRS-D in correctly classifying endogenous ($\chi^2 = 2.46, df = 2, p = .29$) and nonendogenous ($\chi^2 = 2.00, df = 2, p = .37$) patients. Discriminating symptoms fit predictions from the literature.

A principal components factor analysis was conducted. We expected four factors: a general factor measuring mood and cognition, a vegetative (endogenous) factor, an atypical symptom factor (weight gain, hypersomnia, appetite increase), and an anxious depression factor.

The factor pattern following varimax rotation revealed four factors that accounted for

TABLE 2. Summary of Discriminant Analyses Using Rating Scale Items to Classify Endogenous and Nonendogenous Depressed.

Scale	Step	Variable Entered	Wilks' Lambda	F	Mean Score

$^a p <.01$.

a cumulative variance of 45.1 percent, with a final commonality estimate of 12.6. Factor 1 was interpreted as a mood/cognition factor. Items with high positive loadings on factor 1 included sad, irritable, and anxious mood; mood reactivity; concentration; self and future outlook; suicidal ideation; involvement; energy; pleasure and sexual interest. Factor 2 was labeled anxious/hypochondriacal, with high positive loadings on sleep onset insomnia, psychomotor changes, somatic and gastrointestinal complaints, sympathetic arousal, and panic and phobic symptoms. Factor 3 was identified as an endogenous symptom factor loading on items measuring decreases in weight and appetite, middle and terminal insomnia, and diurnal mood variation. Factor 4 showed high positive loadings on increases in appetite and a moderate loading on hypersomnia, and was labeled an atypical feature factor.

Part II: Clinician-Rated IDS (IDS-C)

Subjects and Procedures. Eighty-two outpatients were evaluated at initial interview with the clinician-rated Inventory of Depressive Symptoms (IDS-C) and the 17-item HRS-D. Clinicians conducted SADS-L diagnostic interviews on these patients and rendered RDC diagnoses. Table 3 shows the diagnostic composition of the sample. The sample averaged 36.9 (SD 3.1) years of age; 65 percent were female; most patients were Caucasian (89 percent).

Results

Reliability

The IDS-C had high reliability as revealed by item-total correlations and a coefficient alpha (Cronbach, 1951) of 0.88. The HRS-D and BDI demonstrated similar alphas of 0.89 and 0.91, respectively.

TABLE 3. Diagnostic Description of the Sample (IDS-C).

Diagnosis	*n*	Diagnosis	*n*
Unipolar MDD	68	Bipolar I	2
Primary	57	Depressed	2
Secondary	11	Bipolar II	5
Endogenous	37	Depressed	4
Nonendogenous	31	Mixed	1
Psychotic	0	Other Diagnoses	5
Nonpsychotic	68	Remitted Unipolar	2

Items most highly related to total score were: decreased pleasure, reactivity of mood, decreased appetite, lack of involvement, decreased energy, and sad mood. Hypersomnia, irritable mood, panic/phobic symptoms, increased appetite, and increased weight were least correlated with IDS-C total score as might be expected in a population with endogenous, nonendogenous, and atypical major depressions.

Concurrent Validity

All 82 patients also had HRS-D ratings, and 71 completed the BDI. The mean IDS-C score was 35.5 (SD 13.7), while the 17-item HRS-D was 22.6 (SD 8.9) for the total sample. The mean BDI score was 27.4 (SD 11.5). The IDS-C correlated with the BDI (r = 0.61, p <.001) and very highly with the HRS-D (r = 0.92, p <.001). Figure 1 shows the relationships between the IDS-C and HRS-D.

Partial correlations examined the relationship between the IDS-C, BDI, and HRS-D independent of the other. The partial correlation between the IDS-C and the HRS-D (BDI covaried out) was 0.83 (p <.001). The partial correlation between the IDS-C and the BDI (HRS-D covaried out) was 0.13 (p <.05). The partial correlation between the HRS-D and BDI (IDS-C score covaried out) was 0.24 (p <.05). Thus, the IDS-C was *not*

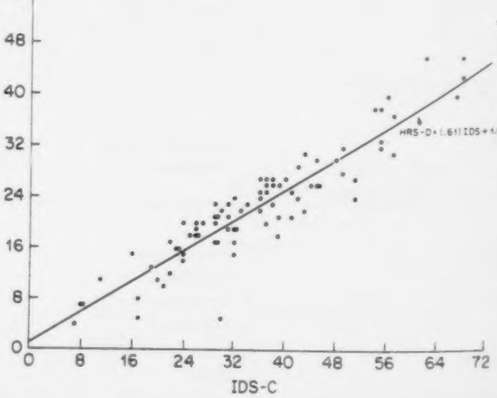

FIGURE 1. Total scores on the IDS-C and 17-item HRS-D for all patients (n = 82).

highly correlated with that portion of the BDI that is independent of the HRS-D. The IDS-C was *highly* correlated with the HRS-D (BDI covaried out) — even more so than the BDI was correlated with the HRS-D (IDS-C covaried out).

Construct Validity

Construct validity was evaluated by a stepwise discriminant analysis to determine which IDS-C items discriminated RDC endogenous from nonendogenous depressions and to identify which combination of IDS-C items maximally discriminated the two groups. Unipolar endogenous (E) ($n = 37$) were contrasted with unipolar nonendogenous (NE) ($n = 31$) patients. Table 4 summarizes these results.

Of the 3 ratings, the IDS-C most powerfully differentiated endogenous from nonendogenous depressions.

Discussion

The IDS-SR has good internal consistency by Cronbach's alpha and item-total correlation. However, the quality to mood item weakly related to total score, and has been reworded. Strong evidence for concurrent validity was obtained. A better partial correlation between the IDS-SR and the HRS-D was found than with the BDI and HRS-D.

Given the various scale ranges (BDI = 0 to 63; HRS-D = 0 to 52; IDS-SR = 0 to 78), a higher mean IDS-SR score (36.5) than BDI (26.0) and HRS-D score (18.0) was expected. No normal scored over 9 on the IDS-SR. One might expect the IDS-SR to be more sensitive than the HRS-D in detecting minor depressive symptomatology as more scale points are available between the upper end of normal (9) and the mean depressive level (36.5) for the IDS-SR.

It is not suprising that both self-reports (the IDS-SR and BDI) were somewhat less useful in differentiating E from NE depressions than was the HRS-D, as clinician judgment is employed with the HRS-D. What is reassuring is that the IDS-SR items that contributed to this discrimination were among those predicted by the literature.

Finally, the factor structure of the IDS-SR fit our *a priori* decisions with a robust commonality. This structure fits the notion that major depressions may include classical endogenous depressions, anxious phobic, atypical depressions, and nonendogenous depressions. These notions have been argued by Sargant and Dally (1962), Kiloh and Garside (1963), and Klein (1974) over several years. A recent study (Liebowitz et al., 1984) suggested that atypical depressions respond better to

TABLE 4. Summary of Discriminant Analyses Using Rating Scale Items to Classify Endogenous and Nonendogenous Depressed ($n = 65$).

[a] All p's $<.001$.

MAOI's than to tricyclics, which argues for the validity of the concept of atypical depression. None of the commonly used symptom rating scales, however, will detect certain symptom changes that can be expected in this group (e.g., hypersomnia, increased appetite/weight) except for the IDS.

The IDS-C also had high internal consistency. Concurrent validity was strongly supported by the correlations between the HRS-D, and IDS-C.

Several IDS-C items contributed to a very robust differentiation of endogenous from nonendogenous depression. In fact, a *better* differentiation was obtained with the IDS-C than with the BDI, HRS-D, or IDS-SR. Importantly, capacity for pleasure, appetite, and libido were discriminating as predicted by Klein (1974), who suggested that the capacity for pleasure was core to endogenomorphic depression. Apparently, the clinician's judgment about capacity for pleasure is better than the patient's self-report, as this item on the IDS-C but *not* the IDS-SR contributed to the discrimination.

In summary, an optimal measure of depressive symptomatology should weigh each symptom equally, include endogenous symptoms, be available as a self-report and as a clinician rating, keep the demand for abstract judgment to a minimum, and be easily applied in a clinical setting. Finally, reliability, internal consistency, construct, and concurrent validity are required. Both the IDS-SR and IDS-C appear to meet these requirements. Further studies to develop item kappas and to determine whether the IDS-SR and IDS-C reflect symptomatic change with treatment are ongoing.

Chronic Lithium and Desmethylimipramine Modulation of Locomotor Response to Growth Hormone Releasing Factor

Cindy L. Ehlers, Ph.D.,[1] Alfred Lopez,[1]
and R. Ian Chaplin, B.S.[1]

Electroencephalographic (EEG) studies of the sleep patterns of patients with affective disorder have clearly demonstrated that a cluster of abnormalities in sleep accompany the acute phase of the illness (Kupfer & Reynolds, 1983). In addition to these EEG findings, recent studies have also established that the sleep associated release of growth hormone is disturbed in depressed subjects (Jarrett et al., 1986).

The discovery and characterization of a growth hormone releasing factor (GRF) (Guillemin et al., 1984) has opened new avenues for exploration of the hypothalamic-pituitary axis in affective disorder. This 44 amino acid peptide was first isolated from a pancreatic tumor found in a patient with acromegaly (Guillemin et al., 1982) and has since been sequenced and synthesized using solid phase methodology. It has been demonstrated that in addition to its ability to release physiologically relevant amounts of growth hormone (Wehrenberg et al., 1982) GRF may have direct effects on central nervous system functioning. Recent studies have reported that intracerebroventricular (i.c.v.) administration of GRF can have potent consequences on measures of electrophysiology and behavior in rats; for instance, i.c.v.-GRF in doses of 2 nMols has been found to produce significant reductions in locomotor activity as well as significant increases in time spent in slow wave sleep (Ehlers et al., 1986; Wehrenberg et al., 1986).

The present study attempted to test whether chronic administration of two drugs commonly used to treat affective disorder, lithium (LI) and desmethylimipramine (DMI), could modify locomotor response to i.c.v.-GRF.

Method

Thirty-two male Wistar rats weighing between 300 to 450 g were used in the study. They were group housed, maintained in a normal light cycle (12:12 light:dark) and given diet and water ad libitum. For implantation of i.c.v. cannulae rats were anesthetized with nembutal [50 mg/kg given intraperitoneally (i.p.)] and secured in a Kopf stereotaxic instrument. Guided by the Atlas of Konig and Klippel a 23-gauge stainless steel guide cannula and stylet (Plastic Products) was lowered into the lateral ventricle (PO. 8, L2.0, V3.2, toothbar 5 mm above the interaural line) and cemented to the skull with dental acrylic. The animals were allowed 7 to 10 days to recover from the surgical procedures and were then assigned to one of four treatment groups: 1) chronic LI diet (Teklad Mills TD 79092, 30 mM/kg LI) $n = 8$; 2) control diet $n = 8$; 3) daily DMI injections (10 mg/kg dissolved in bacteriostatic water and given i.p. $n = 8$; 4) daily bacteriostatic water injections given i.p. $n = 8$.

After 21 days of exposure to LI or control diet or 18 days of DMI or water injections, behavioral response to GRF was tested. For locomotor measurements, rats were placed singly in wire-mesh cages equipped with two infrared photocell beams aimed across the long axis 2 cm above the cage floor. Rats were habituated to these cages for 90 minutes prior to (i.c.v.) injections. Each rat received a single i.c.v. dose of GRF (2.0 nmol), on one test day, and an i.c.v. injection of saline 5 to 7 days later. The order of the injections was randomized so that half of the rats in each group received saline first and half received GRF as a first injection. I.c.v. injections were accomplished by removing a dummy stylet and inserting an 8 mm 30-gauge stainless

steel cannula with 50 cm of Tygon microbase tubing through the guide previously implanted in the skull. Five μl of saline or saline plus GRF was then injected over a one minute period using a 50-μl Hamilton syringe. Only those rats in which no impedance to flow was noted were used in the experiment. An i.c.v. route of administration was not used to simulate a physiological event, as rates of transport into the brain of these peptides from cerebrospinal fluid (CSF) are not known. Rather, this method was used in order to gain access to several potential sites of action following a single injection. Ten minutes following i.c.v. injections locomotor measurements were begun. Activity was quantified by totaling photocell beam interruptions recorded on computer automated electromechanical counters, for 10 minute epochs, over a 3-hour test session. The tests were carried out between 1300 and 1600 hours. Statistical comparison of locomotor activity between saline sessions and GRF sessions between the 4 groups (LI diet, control diet, DMI injections, water injection) was determined using a two factor analysis of variance with repeated measure on one factor (time).

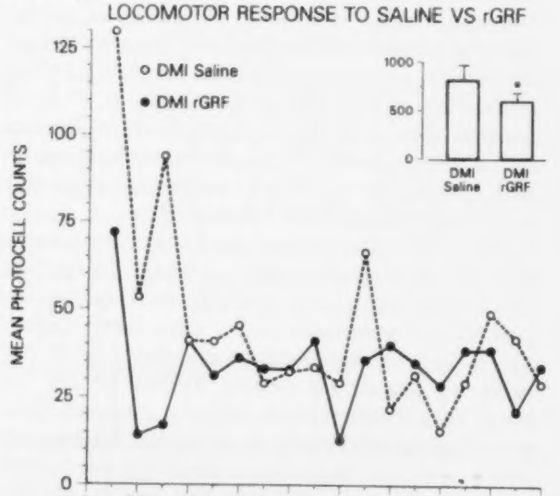

FIGURE 1. Locomotor response to an ICV injection of saline or rat growth hormone releasing factor (rGRF, 2 nMols) in rats given daily injections of DMI (10 mg/kg IP, 18 days). DMI significantly enhanced locomotor response to rGRF (ANOVA g×t, F = 1.6, df = 1,15, $p <$ .05).

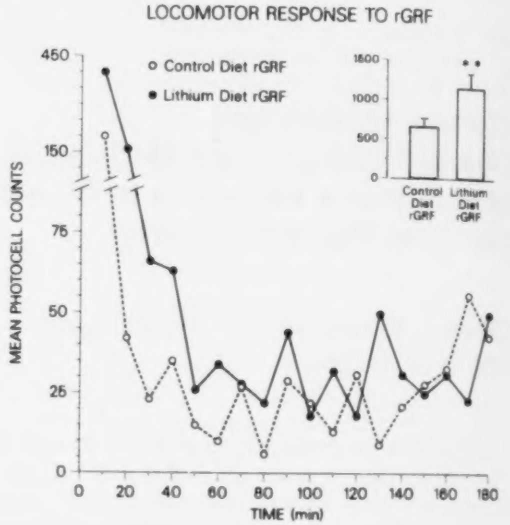

FIGURE 2. Locomotor response to an ICV injection of rat growth hormone releasing factor (rGRF, 2 nMols) in rats fed LI (30 nM/kg × 21 days) or control diet. Lithium significantly attenuated the locomotor response to rGRF (ANOVA Group effect, F = 5.9, df = 1,15, $p < .03$, g×t =2.06, df = 1,15, $p < .01$).

Results

Growth hormone releasing factor, when injected intracerebroventricularly, produced some decreases in locomotor activity in all four treatment groups. As seen in Figure 1, however, the pattern of locomotor response to GRF vs saline was significantly modified in rats given daily DMI injections (ANOVA gXt, $p < .05$), with DMI producing an enhanced response to GRF. In contrast chronic LI treatment in the diet produced a different response to i.c.v. administered GRF. As seen in Figure 2, rats receiving LI as compared to control diet were found to be significantly less responsive to GRF over the 3-hour test period (ANOVA g, $p < .03$, gXt, $p < .01$).

Discussion

These studies have demonstrated that chronic administration of the antimanic drug LI and the antidepressant DMI can significantly modify the locomotor response to i.c.v. administration of GRF in rats. DMI treatment was found to enhance the depression of locomotion seen following GRF; whereas, LI significantly attenuated the reductions in locomotor activity produced by i.c.v.-GRF.

The results of this investigation are consistent with previous studies where decreases in locomotion and increases in slow wave sleep were found following i.c.v. administration of GRF in the same dose range in rats (Ehlers et al., 1986). How these behavioral effects of GRF are mediated, however, still remains speculative. The anatomic distribution of GRF in the central nervous system (CNS) appears, from early studies, to be limited to hypothalamic sites. This severely restricts the possibility of GRF having direct neurotransmitter effects on the biogenic amine neurons suggested previously to play a major role in the actions of antidepressants (Snyder & Peroutka, 1984) and lithium (Emrich et al., 1982). Since it is not known whether GRF may be released into the ventricles, it is possible that it may influence biogenic amine neurons through diffusion from the CSF or it may act by reducing the activity or release of a behaviorally activating hypothalamic peptide such as corticotropin releasing factor (CRF).

The findings of an enhanced response to GRF following DMI treatment are interesting in light of previous studies which have reported enhanced responses to i.c.v. administration of CRF following identical chronic DMI treatment procedures in rats (Ehlers et al., 1985). Thus DMI may be acting to "sensitize" the system to the actions of these hypothalamic peptides. Conversely, depression may represent a state where the CNS is "desensitized" and thus cannot respond normally to peptide input. This notion is supported by clinical data demonstrating a blunted response of adrenocorticotrophic hormone to an i.v. infusion of CRF (Gold et al., 1984). In the case of LI, the attenuation of response to GRF is also consistent with previous studies in rats which have demonstrated that chronic dietary LI tends to reduce the variance of locomotion (Ehlers et al., 1983). Although the mechanisms underlying the actions of GRF are unknown, these studies suggest that the clinical effectiveness of DMI and LI may be partially enacted through systems responsive to GRF.

Acknowledgments

Postmarketing Surveillance of Long-Term Amitriptyline Side Effects

Stephen G. Bryant, Pharm.D.,[1] Seymour Fisher, Ph.D.,[2] and Ronica M. Kluge, M.D.[3]

Information obtained by both clinical trial and experience have demonstrated that adverse reactions caused by tricyclic antidepressants (TCA's) interfere with patients' tolerance of drug therapy and may result in an inadequate trial because of poor compliance. Anticholinergic and sedative side effects of TCA's have been widely described as being most bothersome early on in the course of drug treatment with patients' subjective complaints becoming diminished with continued use (Schoonover, 1983; Klerman, 1978). The purpose of this report is to characterize the adverse drug reactions reported by amitriptyline-treated patients who have started the drug quite recently compared to those reported by patients who have taken amitriptyline over a much longer period using a novel method for drug safety surveillance.

Methods

Study Design. The investigators have recently undertaken a large-scale study aimed at developing new methods for collecting postmarketing data on prescription drug experiences in ambulatory patients (Fisher et al.,1986; Fisher et al., unpublished). The new monitoring method is designed to complement rather than replace existing voluntary prescriber-initiated reporting systems for detecting adverse drug reactions (ADR's).

At the time that a targeted prescription drug is being dispensed at our outpatient pharmacies, cooperation is randomly solicited from half of the patients (experimental sample) via a printed notice attached to the outside of their medication bag; this patient package "outsert" provides a brief, concise statement of what the patient is being asked to do, the reason for the request, and a removable sticker that gives a toll-free phone number along with a summary of details about how to report "*any* new or unusual symptoms" experienced during the next 2 weeks. The other half of the patients (validation sample) do not receive any outsert, but approximately 2 weeks later are interviewed by a cadre of experienced personnel via telephone using a computer-directed, standardized method of collecting accurate reports of new or unusual "adverse clinical events" (ACE's) during or following a drug's use. An ACE may or may not be an ADR, depending upon information that permits inferences about causality; but all ADR's must first be valid ACE's. A "valid" ACE is defined as any untoward reaction that began only after the patient started our target drug and within the specific allowable 14-day reporting period.

The interview used to identify, describe, and quantify ACE's was developed from modifications of the SAFTEE, The National Institute of Mental Health's Systematic Assessment for Treatment Emergent Events, and has four sections: a general inquiry for spontaneously reported ACE's, a systematic ACE inquiry, a post-spontaneous ACE inquiry, and a medication inquiry.

For each symptom mentioned by the patient, the interviewer records its onset, duration, frequency, and pattern. In addition, the subject is asked to rate the subjective severity of each symptom by answering the questions "How bad is/was it at its worst?," choosing a rating from 1 to 5 (1 = minimal; 5 = very severe). The medication inquiry portion of the interview determines what medicines the patient is currently taking, when the patient most recently started the target medicine, whether it is still being taken and with any

significant dosage changes (whether and when it had been used previously), and—if one or more ACE's were reported—whether starting the target drug unequivocally preceded each ACE onset.

In the present study, because there is general agreement on a core set of expected side effects of our TCA target drugs, the investigators can single out those valid ACE's matching one or more of our assumed "true ADR's." Consisting mainly of sedative, anticholinergic, neurologic, and cardiovascular symptoms, tricyclic ADR's defined prior to the start of our study and obtained from recognized sources (Long, 1977; USP, 1983) were as follows: dry mouth, blurred vision, constipation, difficult urination, headache, fainting, dizziness or lightheadedness, rapid or irregular heartbeat, tremor, numbness or tingling of the extremities, excessive sleeping or drowsiness during the day, increased thirst, eye pain, and craving for sweets. *Any one of these predefined ADR's reported by a tricyclic patient was recorded as an* ACE_{tca}.

Subjects. Through the use of our staff-initiated telephone interviews with our validation sample, the investigators have completed analysis of side effect assessments for 85 control patients receiving amitriptyline who clearly fell into two groups on the basis of when they started their most recent course of continuous TCA treatment: 45 had started within 2 weeks preceding our telephone interview, while 40 had started more than 2 weeks before. These two groups of amitriptyline users did not significantly differ with regard to the number of days elapsed since starting the TCA, age, sex, race, number of current medications, and number of valid ACE's reported. The two groups had remarkably similar obvious characteristics, with the exception of time elapsed since starting amitriptyline (short-term = 10.1 ± 1.6 days; long-term = 227 ± 135 days).

Table 1 shows that almost two-thirds of the patients had at least one valid ACE (i.e., a new complaint) during the reporting period, with a somewhat higher but nonsignificant proportion occurring in those patients who had started the amitriptyline during the past 2 weeks. However, if only ACE_{tca}'s are considered, then the incidence estimate for patients with a potentially true amitriptyline side effect drops to 44 percent for the short-term patients and 35 percent for the long-term patients, a nonsignificant difference.

TABLE 1. Number and Percentage of Patients With at Least One Valid ACE and at Least One Valid ACE_{tca}.

	Short	Long	All
Total number of interviews	45	40	85
Number of patients with at least one valid ACE	32	22	54
Complaint percent	71.1	55.0	63.5
Number of patients with at least one valid ACE_{tca}	20	14	34
Predefined side effect percent	44.4	35.0	40.0

Table 2 presents frequency, incidence, and subjective severity data on the individual ACE_{tca}'s for the 20 "short" patients and the 14 "long" patients and demonstrated that the mean number of ACE_{tca}'s per patient was not appreciably different for the two groups. It may not be surprising that 16 percent and 9 percent of the short-term patients reported sedative effects and tremor or tingling, respectively, compared to 0 percent of those who had been on amitriptyline more than 2 weeks; or that heart rate symptoms, headaches, and lightheadedness or dizziness seem to appear less frequently with long-term use. More unexpected, however, is the likelihood that there may be other side effects that appear even with long-term use: 12.5 percent reported dry mouth as a new symptom occurring within the immediately preceding 2 weeks, 7.5 percent experienced blurred vision, 5 percent reported difficulty with urination, and 5 percent complained of new bouts of constipation; these incidences of anticholinergic ADR's are similar to those seen in the short-term patients. Table 2 further shows that the mean subjective severity of these ACE's was nonsignificantly higher for the short-term users (2.7) than for the long-term patients (2.2).

Amitriptyline daily dosage data (on all those patients for whom such data could be obtained) for those patients with a least one valid ACE as well as for patients with at least one valid ACE_{tca} showed no significant differences. Mean doses were remarkably low for all groups, probably indicating that some of these patients were not prescribed amitriptyline for the treatment of depression

TABLE 2. Individual Pre-Defined Side Effects Reported by Short-Term and Long-Term Usage Patients.

	Short (N = 45)			Long (N = 40)		
	f	%	Mean Subjective Severity	*f*	%	Mean Subjective Severity
Anticholinergic:						
Dry mouth	8	17.8	2.9	5	12.5	1.8
Constipation	2	4.4	3.0	2	5.0	1.5
Blurred vision	1	2.2	3.0	3	7.5	1.7
Difficult urination	1	2.2	1.0	2	5.0	3.5
Neurological:						
Excessive sleeping or drowsiness during the day	7	15.6	2.3	0	0.0	
Shakiness or tremor	0	0.0		1	2.5	2.0
Numbness or tingling (extremity)	4	8.9	2.8	0	0.0	
Other:						
Rapid or irregular heartbeat	2	4.4	2.0	1	2.5	1.0
Headache, dizziness or lightheadedness	6	13.3	3.2	3	7.5	3.3
Total ACE_{tca}'s	31			17		
Total patients	20			14		
ACE_{tca}'s per patient	1.6			1.2		
Mean subjective severity			2.7*			2.2*

*Weighted means, nonsignificant.

(most of these prescriptions were prescribed by nonpsychiatrists), and that less than expected therapeutic doses were prescribed for some patients who were depressed. Alternatively, the similar daily dosages prescribed for both short- and long-term patients may reflect that short-term patients were started at lower initial doses to be eventually titrated upward, while long-term patients' daily doses were stable maintenance therapy.

Discussion

A recent FDA study by Rossi et al. (1983) has shown that none of the existing formal postmarketing monitoring systems fare very well in detecting ADR's: manufacturer-initiated surveillance studies of three drugs requiring FDA-mandated labeling changes failed to identify any new ADR's, and all labeling changes for two of the drugs were added as a result of voluntary, spontaneous reports by practitioners. Yet there is widespread agreement that the system suffers from serious underreporting (Wardell et al., 1979), and it seems that reliance solely on a desultory system of voluntary reporting by physicians to manufacturers, journals, and governmental agencies is less than ideal.

The investigators' finding that approximately two-thirds of amitriptyline patients reported at least one adverse clinical event (irrespective of causality) within the 2 weeks after starting a prescription for the drug is comparable in magnitude to what others have labeled as "side effect incidence" (Newton, 1981). Obviously, patients asked to report "*any* new or unusual symptoms" will describe changes in physical state that may or may not be side effects of their medication. One of the clearest findings emerging from this study is that approximately 40 percent of patients reported at least one "true" tricyclic ADR (ACE_{tca}) at some point in the interview. If this global ACE_{tca} incidence is 40 percent, then the true incidence of ADR's must be less because patients could still be reporting any of the authors' pre-defined ADR's for reasons other than a true amitriptyline side effect: from the natural course or complication of current medical disorders, from the onset of a new illness, from environmental causes, from placebo effects, or from other concomitant medications.

The analysis of ACE_{tca}'s reported by patients just starting amitriptyline therapy compared to patients who have taken the drug for a much longer period at very similar doses challenges the common clinical impression that TCA side effects, in general, abate with continued treatment. These reports of new ADR's by long-term amitriptyline users may reflect the fact that such symptoms fluctuate in their occurrence and may not be recognized as potentially drug-induced until some threshold for patient tolerance is exceeded. The similar mean subjective severity ratings for all ACE$_{tca}$'s reported by either short- or long-term patients further qualify the perception held that patients accommodate to all of these ADR's. It is striking that many of the ACE$_{tca}$'s reported by the study subjects may well be anticholinergic side effects (blurred vision, difficult urination, constipation). It warrants emphasis that these are *new* symptoms reported by patients who have taken amitriptyline at a steady dosage for an average of over 7 months.

The Patient, the Family, and Compliance With Posthospital Treatment for Affective Disorders

Gretchen L. Haas, Ph.D.,[1] Ira D. Glick, M.D.,[1] James H. Spencer, M.D.,[1] John F. Clarkin, Ph.D.,[1] Alfred B. Lewis, M.D.,[1] Marcie Good-Ellis, M.S., O.T.R.,[1] Joanne Peyser, M.S.W.,[1] Nancy DeMane, M.S.W.,[1] Elizabeth Harris, R.N., M.A.,[1] and Veronica Lestelle, M.S.W.[1]

The efficacy of pharmacotherapy in the treatment of the affective disorders has been amply demonstrated in multiple controlled clinical trials. However, the bulk of these studies have focused on treatment during the acute phase of the illness wherein control of the acute symptoms is the primary goal (Prien, 1983). Few studies have investigated the efficacy of continuation and maintenance pharmacotherapy—delivered over an extended period—beyond the acute phase of illness. Moreover, recent research has shown that the benefits of medication for depressive disorders may be limited in several respects: pharmacotherapy may have only minimal impact on impaired social functioning (DiMascio et al., 1979; Friedman, 1975; Weissman et al., 1975; Klerman, 1983); psychosocial stress may provoke relapse—even among patients adherent to a prophylactic drug regimen. Finally, noncompliance with prophylactic medication is a serious problem in a high percentage of cases (Jamison & Akiskal, 1983; Shaw et al., unpublished). When medication is discontinued prematurely, the patient may relapse and the likelihood of multiple episodes is greatly increased (Prien, 1983).

Controlled outcome research indicates that psychosocial treatments may be helpful in dealing with each of these problems (DiMascio et al., 1979; Friedman, 1975; Weissman et al., 1979; Klerman, 1983; Jamison & Akiskal, 1983; Shaw et al., unpublished). In fact, several controlled studies suggest that optimal treatment for some types of depressive disorders is a combination of an antidepressant and psychotherapy which, together, are more potent than either alone. For example, controlled-clinical studies on unipolar depression have demonstrated that outpatient psychotherapy—when used in conjunction with pharmacologic treatments—can enhance patient functioning in the areas of social, family, and primary (work) role adjustment (DiMascio et al., 1979; Friedman, 1975; Weissman et al., 1979; Klerman et al., 1974). Relatively less is known about the effectiveness of psychosocial interventions for patients with bipolar disorders. What data there are suggest that long-term psychosocial treatments may enhance drug compliance (Fitzgerald, 1972; Cochran, 1984; Davenport et al., 1977) and minimize impairment of social, family, and work functioning among bipolar patients (Fitzgerald, 1972; Cochran, 1984; Davenport et al., 1977; Shakir et al., 1979; Volkmar et al., 1980). In view of the lack of controlled studies in this area, this study was designed to investigate the efficacy of a particular psychosocial intervention—Inpatient Family Intervention (IFI)—delivered in combination with pharmacotherapy and oriented toward enhancing compliance with the recommended posthospital continuation treatment program (including both pharmacotherapy and psychosocial interventions).

The specific aim was to test the incremental efficacy of a brief, crisis-oriented psychoeducational inpatient family treatment (added to a standard, multimodal hospital treatment) for DSM-III Major Affective Disorders recently admitted to hospital. One of the central questions addressed in this study was whether the addition of family intervention would enhance patient outcome. Two subsidiary questions were whether treatment with IFI would result in: 1) better patient

Supported, in part, by an NIMH Grant (MH-34466), an NIMH Biomedical Research Support Grant to Cornell University Medical College (507-RR05396), and grant from the Norman and Rosita Winston Foundation.

compliance with posthospital treatments; and 2) more positive family attitudes toward the patient and toward the prescribed treatment.

Methods

Subjects

Subjects were 60 Major Affective Disorder patients consecutively admitted to the hospital and screened for admission to the study by the unit treatment team. The following criteria were used for selection:

a) recent admission (within 2 working days of admission to the unit);

b) a DSM-III diagnosis of Major Affective Disorder; and

c) age 18 to 45.

Patients without available family or significant others or for whom a full course (a minimum of six sessions) of Inpatient Family Intervention was not feasible due to anticipated short stay (3 weeks or less), were excluded from the study.

Treatment Assignment

Within the first 2 days of admission to hospital all patients (and families) who satisfied the selection criteria and consented to participate in the study were assigned to one of two treatment conditions—multimodal hospital treatment with IFI or multimodal hospital treatment without IFI (the "comparison treatment" condition).

Six (five IFI and one comparison treatment) cases of the original 60 failed to complete the minimum amount of treatment to meet study criteria. For this report, data on the full sample of patients who met study criteria ($N = 54$) will be reported.

Comparison of Treatment Groups at Baseline

IFI and the comparison treatment groups were essentially equivalent in terms of demographics with the exception of marital status. There were proportionately more patients married (or previously married) in the comparison treatment than in IFI ($p < .006$). On baseline clinical ratings patients in IFI tended to show less severe overall symptomatology on the Psychiatric Evaluation Form (PEF) ($p < .05$). IFI family members tended to give higher ratings of patients' work functioning than did family of comparison patients at admission ($p < .05$).

Treatment

Treatment setting and procedures for random assignment have been described in a previous report (Glick et al., 1985). The average length of hospital stay was 51.0 (SD = 30.0) days.

The treatment programs for the two groups in this study have been described in a prior report (Glick et al., 1985). Both programs included the standard multimodal regimen of hospital treatments (pharmacotherapy, individual supportive, group, and activities therapies). A partially fixed drug regimen was implemented for all patients in an effort to balance the level of medication used across the two treatment conditions (Glick et al., 1975). This effort was successful in that there were no statistically significant differences in the amount of medication received.

The goals of the IFI treatment included the following: 1) helping patient and family to accept the reality of the illness and to develop an understanding of the current episode; 2) identification of possible precipitating stresses relevant to the current episode; 3) identification of likely future stresses both within and outside of the family; 4) elucidation of the family interaction sequences that produce stress on the identified patient; 5) planning strategies to manage or minimize future stresses; and 6) educating the patient and family regarding the nature of the treatment and the need for continued treatment following discharge from the hospital.

Assessment Procedures

Because hospital treatment of the major affective disorders is concerned primarily with ameliorating symptoms and improving functioning in the hospitalized patient, the traditional focus of assessment is on individual outcome. Therefore, the majority of outcome measures in this study are individual patient measures. However, because it was hypothesized that IFI would result in adaptive change in the family's attitudes toward the patient and posthospital treatments, measures of family attitudes were also included in this study. Patients and families were assessed at four times: admission, discharge and at 6- and 18-month follow-up.

Patient Measures. The areas of patient outcome that we have targeted for study include: global functioning, as assessed on both the Global Assessment Scale (GAS) (Endicott et al., 1976) and the Psychiatric Evaluation Form (PEF) (Endicott & Spitzer, 1972); symptom severity, as assessed on the PEF; and role functioning, as assessed on the Role Performance Treatment Scale (RPTS) (Good-Ellis et al., in press). Treatment compliance was assessed using the Treatment Compliance Scale of the RPTS.

Family Measures. Family attitudes were assessed using the *Family Attitude Scale (FAS)* (Levitt, 1982), a 53-item, structured interview, self-rating instrument for family members. The FAS includes a modified version of Kreisman's (1979) Patient Rejection Scale, items from the Family Evaluation Form (Herz et al., 1977) which assesses the family's sense of burden, and items which tap the family's willingness to seek help from professionals.

Data Analysis

All results were analyzed using three general statistical procedures: 1) analysis of covariance techniques were used where appropriate (i.e., where homogeneity of variance and a moderate size (.50) correlation between the independent and dependent variables existed); 2) in cases in which analysis of covariance could not be used, a repeated measures analysis of variance was performed to assess change over two or more assessment times; and 3) patient outcome measures were transformed into standardized residual scores via regression of the outcome scores against the admission scores, in order to control for possible pretreatment differences.

In addition to the above univariate analyses we have performed multivariate analyses on our data. A multivariate approach to data reduction was used to control for the increased likelihood of a Type I error with multiple outcome measures and univariate analyses. A principal components analysis was performed on the transformed (standardized residualized scores) data, yielding four orthogonal factors. The first rotated factor, comprised of the GAS, the PEF-OS, the symptom subscales of the PEF, and the role functioning scales of the RPTS (at follow-up only) represented a global outcome measure that was used as the dependent variable in subsequent analyses. Finally, a hierarchical multiple regression procedure was used to test the relative contributions of: 1) pre-treatment functioning and demography; 2) treatment assignment and treatment parameters; 3) posthospital compliance; and 4) two-way and higher order interactions on the global outcome variable.

Results

Patient Outcome

At Discharge. Patients treated with IFI showed better global outcome (than their comparison patient counterparts) as measured on the GAS ($F = 4.38$, $p < .04$, $df = 1,51$) and less symptomatology as measured on the grandiosity scale of the PEF ($F = 4.75$, $p < .03$, $df = 1,51$).

Independent analyses by gender revealed that this treatment effect was restricted to females, for whom treatment with IFI was associated with better global outcome, as measured on the GAS ($F = 6.16$, $p < .02$, $df = 1,32$). In fact, for males, treatment with IFI was associated with worse symptomatology at discharge ($F = 5.11$, $p < .04$, $df = 1,17$).

At 6 Months. For all patients combined, IFI treatment effects were attenuated at time of 6-month follow-up. However, independent analyses by gender revealed that for females, treatment with IFI was associated with better global functioning, as measured on the GAS ($F = 4.58$, $p < .05$, $df = 1,32$).

Indices of Clinically Significant Change. In addition to the more traditional statistical analyses of outcome using aggregate data as discussed above, we have chosen to describe patient outcomes in terms of criteria for clinically significant change, as suggested by

Kazdin and Wilson (1978) and more recently by Jacobson, Follette, and Revenstorf (1984).

Using the Jacobson et al. (1984) criterion of clinically significant improvement, i.e., exceeding the critical margin (mean score at admission + 2SD + 2.Se) for significant change, we found that at discharge a higher percentage of patients treated with IFI (84.6 percent) had achieved "significant improvement" as compared with patients given the comparison treatment (60 percent). The difference between these two proportions was significant ($z = 1.96$, one-tailed, $p < .03$). This contrast was maintained at 6 months, at which time 80.0 percent of the major affective disorder patients treated with IFI had achieved, and sustained, significant improvement, whereas only 57.1 percent of the patients given the comparison treatment had met this criterion. This difference was statistically significant ($z = 1.76$, one-tailed, $p < .04$).

Family Outcome

On measures of family outcome, there was a significant treatment effect favoring IFI on the family's willingness to accept professional help both at discharge ($F = 5.43, p < .01, df = 1,51$) and at 6 months ($F = 5.38, p < .03, df = 1,50$).

Multivariate Analyses

A hierarchical multiple regression analysis was conducted to assess the relative influence of demographic, pretreatment, and treatment variables on a composite global patient outcome factor. Results indicated that only the treatment/sex interaction was significantly related to outcome ($p < .003$), accounting for 16.2 percent of the total variance at discharge. These results confirm the importance of the striking contrast in treatment effects (reported above) for males and females at discharge. At 6 months the treatment/sex interaction effect on global patient outcome was not significant.

Results of the hierarchical multiple regression analyses are important in that they rule out the possible confounding influence of such covariates as severity of illness, chronicity, and age; demographic variables such as marital status, race, and living situation; and finally, such variables as subdiagnosis (unipolar versus bipolar disorder) and history of treatment compliance.

Second, the sex by treatment interaction effect at discharge (found in many of the univariate analyses) is confirmed by these multivariate results. The fact that neither treatment assignment nor the sex by treatment interaction factors proved significant in contributing to global outcome at 6 months is consistent with results of the univariate analyses which show a "weakening" of the treatment effect at 6 months. One explanation for this finding is that 6-month outcome is markedly influenced by a factor not present at discharge—posthospital treatment compliance. Support for this explanation comes from the finding that global patient outcome at 6 months (as measured on the GAS) is correlated with posthospital treatment compliance, $R(47) = .63, p < .0001$. These results suggest that posthospital treatment compliance may be a significant mediating variable linking hospital treatment with posthospital outcome.

Effects of Hospital Treatment and Prehospital Treatment Compliance on Outcome. Results of a series of multivariate analyses provide evidence for a model describing the relationship among prehospital treatment compliance, treatment, posthospital compliance, and outcome as follows:

> [Prehospital Compliance + Hospital Treatment→Posthospital Treatment Compliance → Patient Outcome]

Prehospital treatment compliance predicted global patient outcome ($F=18.40, p<.0001, 1,51$)—as revealed in a two-way analysis of variance, which tested the effects of treatment and prehospital compliance on global patient outcome at discharge. Second, hospital treatment exerted a significant main effect on global patient outcome at discharge, as measured on the GAS ($F = 4.55, p<.04, df=1,51$). Finally, there was a trend suggesting an interaction of treatment and prehospital compliance on global outcome ($F=2.443, p<.13, df=2,50$). This trend suggested that the treatment effect was confined to people who had either no history of previous treatment, or were adequately compliant with treatment prior to their hospitalization.

Patients with a history of adequate to good treatment compliance were likely to show better global patient outcome if assigned to IFI than if assigned to the comparison treatment.

The relative contribution of posthospital compliance to prediction of global outcome at 6 months was tested using a hierarchical multiple regression procedure. Results revealed that length of hospital stay and posthospital compliance accounted for 48.8 percent of the total variance in global outcome at follow-up. Posthospital treatment compliance was found to account for 24.4 percent of the total variance in outcome at 6 months.

Effects of Hospital Treatment on Compliance With Outpatient Treatments. Hospital Treatment Assignment (IFI vs. Comparison Treatment) was associated with posthospital treatment compliance, as revealed in results of an analysis of covariance, controlling for prehospital treatment compliance ($F = 4.15$, $p < .05$, $df = 1,50$). Patients who had relatively good prehospital compliance (or no history of previous treatment) showed equivalent or improved treatment compliance if treated with IFI. For these patients, treatment with IFI was associated with better posthospital compliance than was found for patients treated with Comparison ($F = 3.12$, $p < .09$, $df = 1,46$). For patients who showed poor prehospital compliance, there was no significant influence of treatment on posthospital compliance.

Discussion

Results of this study suggest that the addition of a brief, crisis-oriented family intervention to standard multimodal hospital treatment for major affective disorder contributes to improved global patient outcome and greater willingness on the part of the family to accept professional help during the posthospital phase of continuation treatment. Prehospital treatment compliance is a strong predictor of both posthospital treatment compliance and global patient outcome. The addition of an inpatient family intervention appears to enhance posthospital compliance, though only in those patients who have a history of good compliance or no previous treatment.

Another interesting finding is that the effects of IFI are largely restricted to females. The differential treatment effect for males and females was not anticipated; however, it is not wholly inconsistent with findings from controlled studies of psychosocial interventions for patients with other acute psychotic disorders. For example, in the area of psychosocial treatments for schizophrenia, there are some reports of males tending to do relatively poorly with family, as compared with individual, intervention (Goldstein et al., 1978; Hogarty, 1985). Speculating that what we have discovered for a sample of major affective disorder patients is more generally characteristic of males with major psychiatric disorders, one possible explanation for this differential outcome is that these males are biologically vulnerable to psychosocial stressors and thus less able to effectively respond to psychosocial, and specifically, multiple person interventions such as family, interventions. An alternate explanation is that because males, more often than females, are responsible for financial support of the family, the family may place greater stress on the male patient to resume functioning after hospital.

The family outcome data suggest that involvement of family members in the inpatient treatment program may enhance the family's willingness to turn to professional help during the posthospital treatment phase. In a prior analysis it was found that the family's willingness to rely on help from professionals is correlated with global patient outcome ($p < .05$). The implications of these findings are not clear. However, they suggest the possibility that the family's support of treatment compliance may have some functional relationship to patient outcome—either as a *causal link* initiating or sustaining patient compliance with treatment or as an *indirect outcome of successful treatment*, secondary to the patient's improvement during the posthospital recovery phase.

As would be expected, prehospital treatment compliance is a strong predictor of posthospital treatment compliance. The finding that IFI appears to enhance posthospital compliance in those patients who have a history of relatively good compliance or no previous treatment, is relevant to determining which patients are likely to benefit most from Inpatient Family Intervention. Future studies should address the prehospital noncompliance patients directly in order to determine their clinical characteristics and whether modifications in IFI might result in more impact on this refractory group.

The effect of IFI on posthospital treatment compliance has important implications. As noted earlier, noncompliance with prescribed treatment during the continuation and maintenance phases of treatment for affective disorder is a serious problem. The most severe episodes of affective disorder often result in hospitalization. Treatment of the acute phase with pharmacotherapy is not difficult, but noncompliance after discharge may result in relapse or recurrence. IFI is a psychosocial intervention which can be used while the patient is in the hospital and the family is often available and interested in obtaining help. If this treatment can significantly increase compliance with subsequent treatment during the posthospital continuation and maintenance phases, it can make an important contribution to the treatment of major affective disorders.

The Antipsychotic Drug Haloperidol Decreases Basal Ganglia Substance P, Substance K, and Preprotachykinin mRNAs

Michael J. Bannon, Ph.D.,[1] Jin-Moo Lee, B.S.,[1] Pierre Giraud, M.D.,[2,3] Alice Young, B.S.,[2] Hans-Urs Affolter, Ph.D.,[2] and Tom I. Bonner, Ph.D.[2]

The tachykinin neuropeptide substance P (SP) is present throughout the brain and peripheral tissues. The prominent SP projection from the striatum to the substantia nigra is thought to play an important role in the regulation of basal ganglia function and the response to dopaminergic and other pharmacological agents (Bannon et al., 1986). However, the physiological and pharmacological significance of this striatonigral SP system has been difficult to assess, since no useful measures of SP turnover have been available. Previous studies have shown that the repeated administration of dopamine antagonist (antipsychotic) drugs decreases the concentration of SP in the substantia nigra (Hong et al., 1978; Hanson et al., 1981; LeDourin et al., 1983; Oblin et al., 1984). Although the relationship between SP concentration and SP turnover remains obscure, the antipsychotic drug-induced decrease in SP has generally been thought to result from an imbalance between increased SP biosynthesis and an even greater acceleration of SP release (Hong et al., 1978; Hanson et al., 1981).

It has recently been demonstrated (Nawa et al., 1983, 1984) that two messenger ribonucleic acids (mRNA) derived from one preprotachykinin (PPT) gene by alternate RNA splicing encode for either SP alone or for both SP and the newly discovered tachykinin (Maggio et al., 1983; Kimura et al., 1983) substance K (SK): these are termed α and β PPT mRNA, respectively. Thus the biosynthesis of SP and SK could be differentially regulated in response to dopamine antagonists or other stimuli. We have quantitated the acute and chronic effects of the antipsychotic drug haloperidol on the levels of striatonigral PPT mRNAs (as well as SP and SK peptide levels) in single rat brain striata as a dynamic index of tachykinin turnover. The concentrations of both tachykinin mRNAs and peptides were decreased in parallel after haloperidol, suggesting that antipsychotic drugs may, in fact, decrease striatonigral tachykinin biosynthesis.

Methods

Adult male Sprague-Dawley rats (Charles River; 225 to 250 g) were killed by decapitation either 2 to 4 h after haloperidol or 24 h after 1 to 10 days of haloperidol treatment (1 mg/kg, i.p.; McNeil). Brains were blocked in a chilled aluminum brain mold (Activational Systems), dissected using previously described procedures for the striatum and substantia nigra (Deutch et al., 1985), quickly frozen on dry ice, then stored at −70°C until further use.

Tissues were extracted and SP-like immunoractivity and SK-like immunoreactivity were assayed by radioimmunoassay (RIA) as previously described (McLean et al., 1985; Lee et al., 1986). SK showed approximately 1 percent cross-reactivity compared to SP in the SP RIA; conversely SP cross-reacted to approximately 1 percent in the SK RIA. High performance liquid chromatographic analysis coupled to the tachykinin RIAs established that all detected striatal and nigral SP immunoreactivity was authentic SP, while authentic SK accounted for at least 86 percent of striatal and 94 percent of nigral SK immunoreactivity (Lee et al., 1986). Therefore, SP- and SK-immunoreactivity are hereafter referred to simply as SP and SK, respectively. Protein concentrations were determined by the method of Lowry et al. (1951).

One or two striata (~30 mg tissue each) previously stored at −70°C were rapidly Dounce homogenized in 3 ml of SET buffer (1 percent sodium dodecyl sulfate/5 mM EDTA/10 mM Tris pH 8) containing 100 μg/ml proteinase K (Rowe et al., 1978). After a 1.5 h incubation at 42°C, 100 μg of tRNA was added as a carrier, and the samples extracted 2 to 3 times with 2 volumes of 1:1 Tris-saturated phenol/chloroform. Following a further extraction with 2 volumes of 1:1 chloroform/butanol, total nucleic acids in the aqueous phase were precipitated overnight at −20°C with 0.4M sodium acetate/ 2.5 volumes of ethanol.

The construction, isolation and characterization of plasmids containing rat preprotachykinin genomic sequences is described elsewhere (Affolter et al., 1985). Plasmids RSP p23, RSP p18, and RSP p13 were purified from HB101 lysates using a DEAE high performance liquid chromatography column (Alltech). Restriction endonuclease digestion yielded DNA probes containing exon 7 (~460bp), exon 6 (~300bp), and intron 6 (~600bp), respectively. Restriction fragments were isolated by gel electrophoresis, purified on Nensorb columns (New England Nuclear) and labeled by nick-translation (Rigby et al., 1977) using [α-^{32}P] dATP (3000 Ci/mmol, Amersham) to a specific activity of 2×10^7 to 5×10^8 cpm/μg DNA.

Nucleic acids were denatured in 50 percent formamide/6 percent formaldehyde at 65°C for 5 to 10 min and electrophoresed in 1 percent agarose (formaldehyde-containing) gels (Lehrach et al., 1977). Gels were stained with ethidium bromide, destained, and photographed over a UV source. Photographic negatives were densitometrically scanned to quantitate the amount of 28S RNA/sample (Mocchetti et al., 1985). Only those samples where the 28S values differed by more than one standard deviation from the mean of the experiment (4/48 samples in total) were corrected for differences in extraction recovery. Nucleic acids were then transferred by the electroblot procedure (Thomas, 1980) to nylon-based membranes (Gene Screen; New England Nuclear), which were then baked at 80°C for several hours.

Northern blots were prehybridized for 6 to 18 h at 37°C with several milliliters of hybridization solution (50 percent deionized formamide, 0.1 percent polyvinylpyrrolidone, 0.1 percent bovine serum albumin, 0.14 percent ficol, 50 m*M* sodium pyrophosphate, 1 percent sodium dodecylsulfate, 0.75 M sodium chloride, 0.075 M sodium citrate, 250 μg/ml tRNA and 250 μg/ml herring sperm DNA) and 50 percent dextran sulfate in a 4:1 ratio. This solution was replaced with an identical solution containing 1×10^6 cpm/ml of various nick-translated, ^{32}P-labelled PPT genomic subclones. After a further 16 to 24 h incubation at 37°C, membranes were washed several times for 15 to 30 min at 37°C with 0.2 × SSC/0.1 percent sodium dodecylsulfate, then placed in a cassette with an intensifying screen and Kodak XAR-5 film for several hours at −70°C. Autoradiograms were scanned with an EC densitometer to quantitate probe hybridization to rat PPT mRNA. Each blot was autoradiographed for several different exposure lengths in order to obtain autoradiograms within the linear scanning range, which was established using serial dilutions of striatal nucleic acids.

Results and Discussion

As previously reported (Hong et al., 1978; Oblin et al., 1984; Bannon and Goedert, 1984), administration of the antipsychotic drug haloperidol did not alter either striatal or nigral SP concentrations within 2 to 4 h (with the exception of a possible decrease in striatal SP 4 h post-haloperidol; Figure 1). Likewise, SK concentrations were unaltered 2 to 4 h after haloperidol (Figure 1). Twenty-four hours after a single dose of haloperidol, striatal SP and SK concentrations were decreased (Figure 1). After 3 to 10 days of treatment, both striatal and nigral SP and SK levels were decreased (Figure 1). Thus, changes in SK concentrations after acute and chronic haloperidol administration parallel the previously reported changes in its cotransmitter, SP.

Total (α and β) PPT mRNA from single rat striata was quantitated using a genomic clone derived from the final PPT exon (exon 7), common to both mRNA species, as described

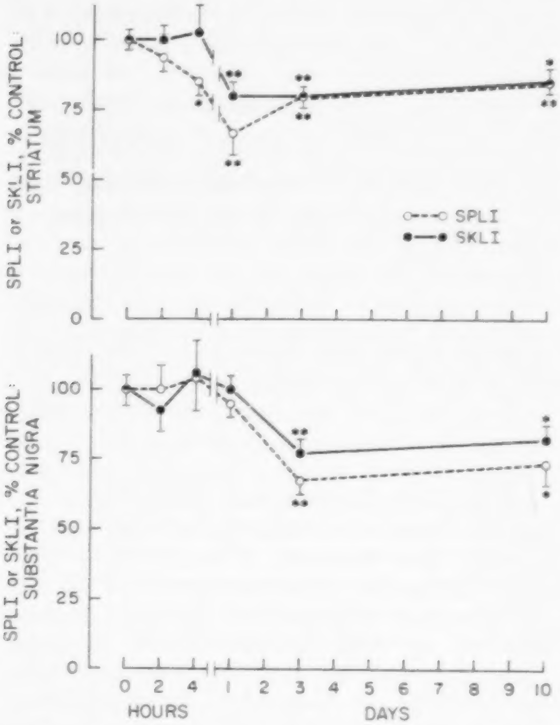

FIGURE 1. Effect of the antipsychotic drug haloperidol on striatal and nigral content of substance P and substance K. Tissue handling and radioimmunoassay procedures are described under Methods. The bars on the circles indicate the standard error of the mean. Values are expressed as a percentage of control striatal or nigral SP or SK values pooled from three separate experiments (striatal SP: 0.819 ± 0.036 fm/mg protein, $n = 23$; striatal SK: 0.861 ± 0.037 fm/mg protein, $n = 23$; nigral SP: 4.673 ± 0.306 fm/mg protein, $n = 21$; nigral SK: 4.030 ± 0.244 fm/mg protein, $n = 21$). Except for the 4 h group ($n = 5$), all experimental groups were comprised of 10 to 11 animals. $^{*}p < 0.05$, $^{**}p < 0.005$ when compared by a 1-tailed Student's *t*-test with vehicle injected rats.

in Methods. Twenty-four hours after a single dose of haloperidol, PPT mRNA levels were significantly decreased (Figure 2). Further decreases in PPT mRNA were seen after 3 to 10 days of haloperidol (Figure 2). Similar results were obtained by dot blot hybridization quantitated by either densitometry or liquid scintillation counting (data not shown). When β PPT mRNA was specifically quantitated using an exon 6 containing (SK encoding) probe, parallel changes of a similar magnitude were seen (data not shown). Thus, both α PPT (SP encoding) mRNA levels and β PPT (SP/SK encoding) mRNA levels decrease in parallel with SP and SK peptides (compare Figures 1 and 2).

Following hybridization, the prominent band visualized corresponds in migrational position (~1 kilobase) to the size of the bovine PPT mRNAs previously reported (Nawa et al., 1983, 1984). Since α PPT and β PPT mRNA differ by only ~50 nucleotides, these two bands are unresolved under the conditions employed. Upon longer exposure of blots, a higher molecular weight band (>6 kilobases) was also visualized. Since this band was also visualized using an intron probe derived from the PPT gene (data not shown), it is conceivable that this band corresponds to an unprocessed or partially processed precursor of mature PPT mRNA. Further experiments will be required to clarify the nature of this higher molecular weight band. The intensity of this higher molecular weight band apparently decreased after haloperidol in parallel with the mature (~1 kilobase) PPT mRNAs (data not shown). Although an effect on mRNA stability cannot be ruled out at present, the parallel changes in the tachykinin peptides, PPT mRNAs and the higher molecular weight band suggest that

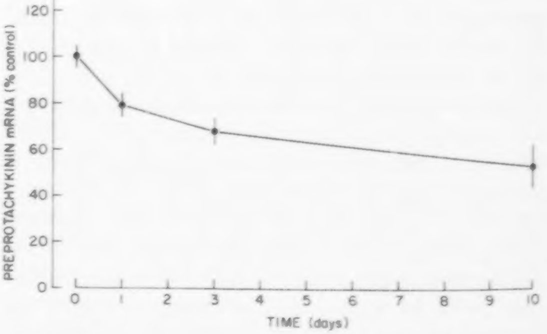

FIGURE 2. The effect of the antipsychotic drug haloperidol on striatal preprotachykinin mRNA levels. Rats were treated with haloperidol and the levels of PPT mRNA in single rat striata determined as described under Methods. Values are signal densities/unit 28S rRNA (arbitrary units), expressed as a percentage of control levels pooled from two separate experiments ($n = 10$ to 12 in each group). The bars on the circles indicate the standard error of the mean. All time points differ significantly ($p < 0.02$, 2-tailed *t*-test) from vehicle treated rats.

decreased PPT mRNA levels after haloperidol are reflective of decreased PPT gene transcription.

The present findings may offer some insight into the effects of acute and chronic antipsychotic drug administration on basal ganglia function. Dopamine is thought to normally provide a tonic inhibitory influence in the striatum (Bunney, 1983). Antipsychotic drugs like haloperidol, by blocking striatal dopamine receptors, may cause a disinhibition of many striatal cells, including γ-aminobutyric acid- and/or enkephalin-containing inhibitory neurons. For example, striatal enkephalin mRNA and peptide levels increase after haloperidol (Tang et al., 1983; Blanc et al., 1984; Hong et al., 1985). Thus, disinhibition of striatal inhibitory cells could account for the subsequent inhibition of SP/SK-containing neurons. SP, SK, and PPT mRNAs decrease after haloperidol with a time course that apparently parallels the period of maximal risk for the development of certain antipsychotic drug-induced extrapyramidal (Parkinsonian) side effects in man (Baldessarini, 1980). Thus, it is conceivable that decreased striatonigral SP/SK output is somehow related to the production of these adverse neurological symptoms. In support of this suggestion, the loss of basal ganglia dopamine cells in Parkinson's disease is also accompanied by a decrease in basal ganglia SP content (Mauborgne et al., 1983). The data presented suggest that, despite brain tissue heterogeneity, neuropeptide-encoding mRNAs from discrete brain regions of individual animals can be quantitated as a dynamic index of peptide biosynthesis.

Acknowledgments

We thank Drs. J.E. Maggio and R.L. Eskay for their gifts of SK and SP antisera, respectively. We gratefully acknowledge the expert technical assistance of Mr. Rolf Hanson and the excellent secretarial assistance of Mrs. Angelika Mayes and Mr. Rich Clement.

Alpha-2 Adrenergic Agonist Binding in Schizophrenic Brains

Grant N. Ko, M.D.,[1] James R. Unnerstall, Ph.D.,[2] Michael J. Kuhar, Ph.D.,[2] Richard J. Wyatt, M.D.,[3] and Joel E. Kleinman, M.D., Ph.D.[3]

Quantitative *in vitro* autoradiography is applied to postmortem brain tissue from schizophrenic and control brains in the pursuit of a neurochemical hypothesis. This technique allows for the quantification of possible group differences between patients and controls. Preliminary delineation of group differences between schizophrenic and controls is presented.

Introduction

That the schizophrenia syndrome is a group of disorders is not a new concept (Bleuler, 1911). Recent biological advances, however, have introduced the possibility that patients with the syndrome can be subtyped according to such structural and neurochemical variables as brain atrophy and dopamine (DA) hyperactivity (Crow, 1980; Wyatt et al., 1981). The paranoid subtype of schizophrenia is recognized phenomenologically (American Psychiatric Association, 1980) and may have genetic determinants distinct from other subtypes of schizophrenia (Kendler, 1981). One neurochemical hypothesis suggests that increased noradrenergic activity may identify and even account for some of the psychopathology in paranoid schizophrenia (Hornykiewiez, 1982). Increased norepinephrine (NE) seen postmortem in a number of primarily limbic structures, as well as increased cerebrospinal fluid (CSF) NE in primarily paranoid schizophrenic subjects, support this hypothesis (Farley et al., 1978; Lake et al., 1980; Gomes et al., 1980; Kleinman et al., 1979).

One possible explanation for increased NE in paranoid schizophrenia is a defect in the constant inhibitory control exerted on NE-synthesizing neurons. There could exist fewer inhibitory α_2 receptors on NE-producing cells. The inhibitory receptors on these cells respond to NE or the antihypertensive drug, clonidine, decreasing the number of discharges per unit time and the amount of NE released into the synapse with each impulse (Svenssen, 1975; Cederbaum & Aghajanian, 1976, 1977). Thus, NE in the synapse constantly regulates its own production. The antihypertensive action of clonidine is thought to occur, in part, through this mechanism.

In support of the possibility that faulty α_2-inhibitory control of NE-synthesizing neurons occurs, Sternberg and colleagues (1982) found that the plasma MHPG response of schizophrenic patients to a clonidine challenge was less robust than that of normal individuals. More recently, Rice and colleagues (1984), using platelets as a model for central nervous system (CNS) tissue, found decreased α_2-receptor ligand binding in schizophrenics compared with controls. [^{3}H]para-aminoclonidine (PAC) has been shown to label α_2 receptors in human and animal CNS (Unnerstall, 1984). In order to examine CNS α_2 receptors directly, we applied the technique of *in vitro* receptor autoradiography to postmortem samples from patients with paranoid schizophrenia and age-matched controls using PAC as the α_2 ligand. Since almost half of NE-synthesizing neurons are concentrated in the locus coeruleus (Swanson, 1975), thin coronal sections through the pons will include some of these cells. The technique of *in vitro* quantitative receptor autoradiography (Kuhar, 1978a and 1978b; Unnerstall, 1982) can be applied to these tissue sections. This technique circumvents the technical problem posed by small tissue quantities, such as the collection of NE cell bodies in the locus coeruleus. The results of this preliminary study will be presented.

Methods

Unfixed pontine material was obtained from the Medical Examiner's Office, cut and mounted on brass microtome chucks with brain paste, and, in the cryostat, coronal sections of 16 μ thickness were thaw mounted on subbed microscope slides and allowed to air dry at room temperature before being stored. [^{3}H]para-aminoclonidine (PAC, 40 Ci/mmol) was used to label α_2-adrenergic binding sites in the mounted tissue sections (Unnerstall et al., 1984). Briefly, sections were preincubated for 30 minutes at room temperature in Krebs-phosphate buffer (pH 7.4 at 25°C) containing 100 uM Na^+-GTP. Adjacent sections were then washed for 10 minutes at room temperature in the incubation buffer alone (0.17 M Tris HCl, pH 7.6 at 25°C plus 10 mM $MgCl_2$). Sections were then incubated for 60 minutes at room temperature in buffer containing 0.25 nM [^{3}H]PAC and 25 nM [^{3}H]PAC, in order to assess both the high and low affinity α^2 sites. Nonspecific binding was assessed utilizing the above ligand in the presence of 10^{-5} M phentolamine. After a 10 minute wash at 4°C in incubation buffer and a rinse in cold deionized water, the sections were dried under a stream of cool dry air. Standard curves were constructed from 16 μ sections of brain paste containing varying concentrations of [^{3}H]ornithine so as to allow for conversion of optical density measurements to receptor concentrations. Labeled tissue was then apposed to tritium sensitive film which after exposure and development was scanned by an automated densitometric system allowing each to be digitized and stored (Goochee et al., 1980).

Eighteen brains were examined. The identities of the sample donors were concealed from the tissue handlers, so as to preserve unbiased sampling, until after the final densitometric readings from [^{3}H] Ultrofilm (LKB Industries, Rockville, MD) were obtained. Schizophrenic specimens were compared with both non-psychiatric normals and suicide victims as control groups. One sample from each of the three groups was prepared for incubation in PAC simultaneously so as to minimize interassay variability. Exposure time for the films was about 2.5 months.

Conversion of optical density readings to femtomoles of ligand bound per unit of tissue protein (fmoles/mg protein) was made by constructing the standard curve from the ornithine-brain paste standards. Receptor concentrations for the group of schizophrenic samples were compared with control groups by analysis of variance (Winer, 1971). The formula for conversion is

$$\text{mmoles/mg protein} = \text{OD} \times \frac{\text{DPM/mg protein}}{\text{OD}} \times \frac{\text{mmole}}{\text{Ci}} \times \frac{\text{ICi}}{2.22 \times 10^{12}\text{DPM}} \qquad \text{(Unnerstall, 1982).}$$

Results

A review of the records available at the Medical Examiner's Office yielded the antemortem demographic features shown in Table 1. Blanks in the table indicate that data were not available. When possible, we attempted to match the postmortem interval and age of sample donors in each group.

Figures 1 and 2 are photographs of tritium sensitive film which has been exposed to pontine tissue from a normal control brain labeled with [^{3}H]PAC, which labels the α_2 receptors in each tissue section. The first film illustrates PAC binding to the locus coeruleus and surrounding tissue. The greatest exposure occurs over the locus coeruleus where α_2 receptors exist on NE-synthesizing neurons. The second film was placed next to an adjacent tissue section illustrating the result of displacement of PAC binding by an excess of phentolamine. Notice that optical density generated by this adjacent tissue section is obliterated.

We could not differentiate between high- and low-affinity binding sites given our single-exposure time of 10 weeks. The optical density of film was similar for both concentrations of PAC used. For the high-affinity binding site (low-PAC concentration), the mean concentration of ligand bound was lower for schizophrenic locus coeruleus than either the age-matched normal controls or the

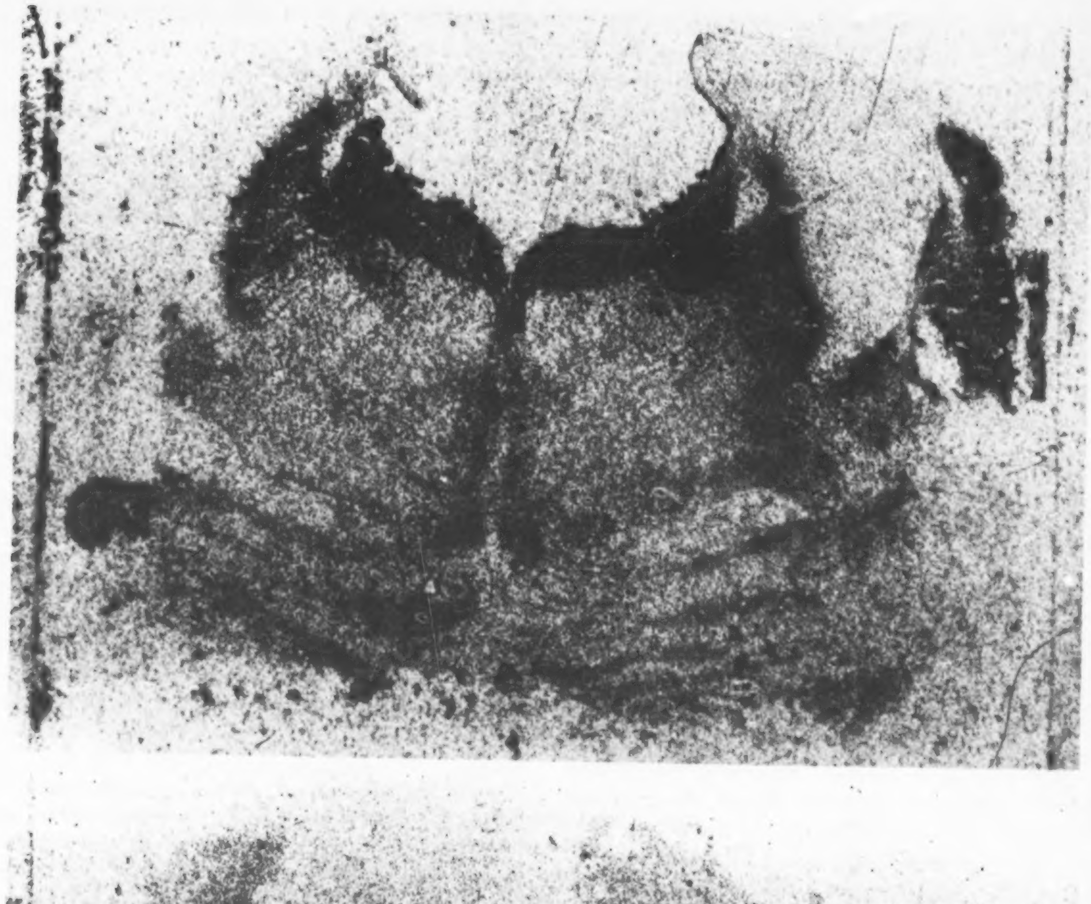
suicide victims, although this was not statistically significant ($P = 0.08$, ANOVA; Figure 3).

Discussion

This study demonstrates the application of *in vitro* receptor autoradiography to the investigation of the neurobiologic substrate for schizophrenia. It demonstrates that the application of *in vitro* quantitative receptor autoradiography (Unnerstall et al., 1982) to schizophrenia, as well as other neuropsychiatric disorders, is feasible and has the potential to substantiate current neurochemical and receptor change hypotheses generated from clinical observations and studies of CSF, blood, and urinary metabolites. The preliminary data suggest lower numbers of α_2 receptors at the locus coeruleus of schizophrenic patients, although the results were not statistically significant and the number of samples studied was small. We are continuing to pursue this question as more postmortem samples become available.

A quantitative decrease in the number of α_2 receptors on NE neurons in the schizophrenic condition represents only one explanation for the possibility of dysfunction of NE regulation in schizophrenia. These data by themselves cannot differentiate whether the changes seen in α_2 binding in the locus coeruleus are the cause of the increased NE turnover seen in schizophrenics or the result



of desensitization of α_2 receptors due to excess NE in the synaptic space. Further, while these data suggest that the number of α_2 receptors has changed in the locus coeruleus of schizophrenic patients, the possibility still exists that changes in receptor-effector coupling mechanisms may underlie the differences in NE function reported between schizophrenic patients and normal controls. Given the limited number of samples in this preliminary study, it was not possible to differentiate the high- and low-affinity components of the [^{3}H] PAC binding. In order to determine whether alterations in the molecular events involved in the coupling of receptors to second messengers may underlie the pathology, more extensive analyses of the binding characteristics and biochemical nature of the system are required.

Further extension of knowledge from animal studies to the human brain is possible utilizing this technique. For instance, Arnsten and Goldman-Rakic (1985) have reported that stimulation of α_2 receptors in prefrontal cortex of nonhuman primates is associated with improvement in performance of memory tasks. An application of receptor autoradiography to the study of postmortem Alzheimer's disease frontal cortex might lend valuable human relevance to emerging nonhuman primate data.

The following deficiencies in the present study can be alleviated in the future. We would like to construct a map of α_2-adrenergic receptors in the rostral to caudal dimension. We would also be happier with not one but rather a full spectrum of PAC concentrations to allow comparison of mean B_{max} and K_D for subject groups. Also, shortening the film exposure time should help to distinguish a high- and low-affinity binding site, if they exist distinct from one another.

FIGURES 1 and 2. (Opposite) These black and white prints were made directly from Ultrofilm which has been apposed to tritium-labeled NE cells in adjacent tissue sections from the same brain. Note darkened area (encircled) in Figure 1 (top). The degree of exposure is the data which yield an indirect measure of receptor numbers. Under constant experimental conditions, the degree of exposure will vary from individual to individual. Figure 2 (bottom) is an exposure from an adjacent tissue section which has been prepared with an excess of a competitive displacer, illustrating that binding in Figure 1 is specific. The tissue studied is pons from a normal control brain at autopsy.

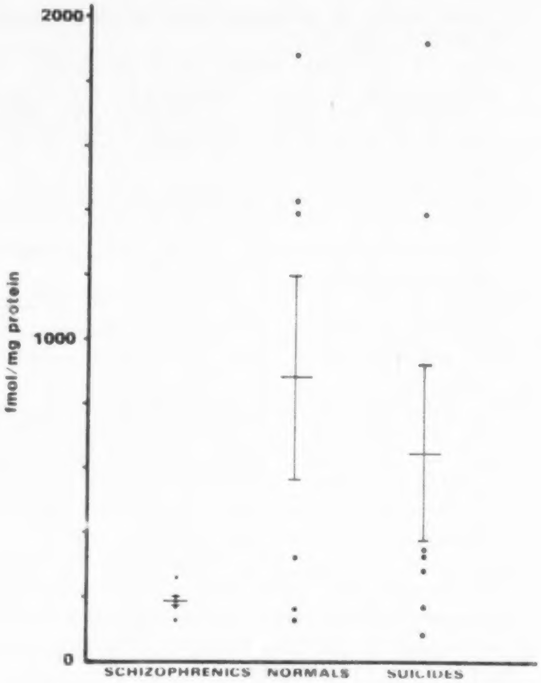


FIGURE 3. Illustration of the data from 18 postmortem brain specimens, with means and standard error bars. The mean and standard error for PAC binding to LC, expressed as femtomoles/mg protein, in normal controls was 887 ± 315 ($n = 6$), in suicide victims was 647 ± 270 ($n = 7$), and in schizophrenic patients was 190 ± 19 ($n = 5$). Schizophrenic brains had a lower mean α_2-receptor number than both control groups, but this did not reach statistical significance ($P = 0.08$, ANOVA).

Dose-Dependent Increases in Rat Spontaneous Chewing Rates During Long-Term Administration of Haloperidol but Not Clozapine

Per Johansson, Ph.D.,[1] Daniel E. Casey, M.D.,[2] and Lars M. Gunne, M.D.[1]

Rats can be observed displaying fairly regular chewing movements even in the absence of food. Though the frequency of such vacuous or spontaneous chewing movements (SCM) is to some extent modifiable by environmental changes (e.g., stress seems to increase it), SCM counts are markedly elevated by chronic neuroleptic drug administration. For that reason SCM measurements have been suggested as a rodent model of tardive dyskinesia (Gunne et al., 1982; Gunne & Häggström, 1983; Waddington et al., 1983; Sant & Ellison, 1984), a condition often characterized by involuntary oral movements. When various antipsychotic drugs were compared using this model, clozapine and sulpiride were found to produce low SCM rates while thioridazine, chlorpromazine, fluphenazine, and haloperidol all yielded high chewing rates (Gunne et al., 1986). In those experiments doses of each drug were chosen to correspond to the therapeutic doses used in the control of schizophrenia. However, a fair comparison between antipsychotics must involve a range of doses to elucidate whether the absence of SCM rise seen with some drugs is actually drug-related, or if it can merely be ascribed to an unfortunate choice of dose. Whenever a drug produces elevation of SCM rates the possibility of a dose dependency should also be explored.

The present study reports on a comparison between clozapine and haloperidol employing three different doses of each drug during chronic administration for 13 months. It is concluded that haloperidol produced dose-related increases in SCM rates, while clozapine in a range of doses was without effect.

Methods

Fifty-six Sprague-Dawley rats (28 male, 28 female) weighing approximately 200 to 250 g at the beginning of the experiment were randomly assigned to seven groups of 8 rats (4 male, 4 female) and housed under standard conditions of lighting, food, and temperature.

Three groups were given clozapine with the drinking water (0.2, 0.4, 0.5 mg/ml) and another three groups got haloperidol (1.0, 2.0, 4.0 μg/ml). In a pilot experiment 0.6 mg/ml of clozapine had been shown to be toxic. One group served as untreated controls. Drugs were given continuously for 13 months. Table 1 shows that the addition of drugs changed the intake of water to varying degrees. The table also shows the mean daily doses obtained in the various groups.

Observations of individual rats were made in a plexiglas cage (2×3×4 dm) with a mirror to improve visibility. SCM rates were assessed during 2 min sessions as described earlier (Gunne et al., 1982). These assessments were carried out at time point 0 and then monthly in all animals until the end of month 13.

Behavioral data were analyzed by a mixed design ANOVA. The between subject factor

TABLE 1. Relative Water Consumption and Mean Dose Levels Obtained During 13 Months in Rats Given Various Concentrations of Clozapine or Haloperidol With Their Drinking Water.

Drug	Drug Conc. (mg/ml)	Water Intake (% of untreated)	Dose (mg/kg/d)
None	—	100	—
Clozapine	0.2	76	11
Clozapine	0.4	65	19
Clozapine	0.5	60	50
Haloperidol	0.001	122	0.07
Haloperidol	0.002	98	0.14
Haloperidol	0.004	85	0.24

was drug and drug dose. The within subject factor was time of drug treatment. Planned comparisons of the untreated controls vs. the drug-treated groups were made for each drug and dose. The dose-effect function was examined by making the orthogonal comparison of the highest vs. the lower doses and the lower doses vs. each other for both drugs.

Results

In the untreated control group (Figures 1 and 2, broken lines) there was a gradual increase in SCM rate during the 13 months of experiment [$F(1,42) = 11.68$, $p < 0.002$]. This seems to indicate a rise in chewing rate with increasing age. ANOVA yielded no significant differences between controls and any clozapine group (Figure 1).

After 2 months of treatment all three haloperidol groups showed a significant increase in SCMs (Figure 2). Following the initial rise the SCM frequencies stayed up throughout the treatment period. ANOVA for the lowest dose level yielded [$F(1,42) = 9.77$, $p < 0.004$], the medium dose gave [$F(1,42) = 24.60$, $p < 0.0001$], and the highest dose [$F(1,42) = 55.03$, $p < 0.0001$] compared to controls. Furthermore, this long-term effect was dose-dependent, the highest dose (0.24 mg/kg/d) differed significantly from the medium (0.14 mg/kg/d) [$F(1,42) = 6.04$, $p < 0.02$] and lowest dose (0.07 mg/kg/d) [$F(1,42) = 18.42$, $p < 0.0003$]. The medium dose did not differ significantly from the lowest dose.

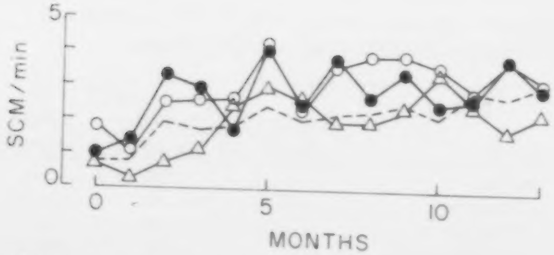

FIGURE 1. Long-term effects of clozapine 11 mg/kg/d (○), 19 mg/kg/d(●) and 50 mg/kg/d (Δ) on SCM rates. Broken line: untreated control rats.

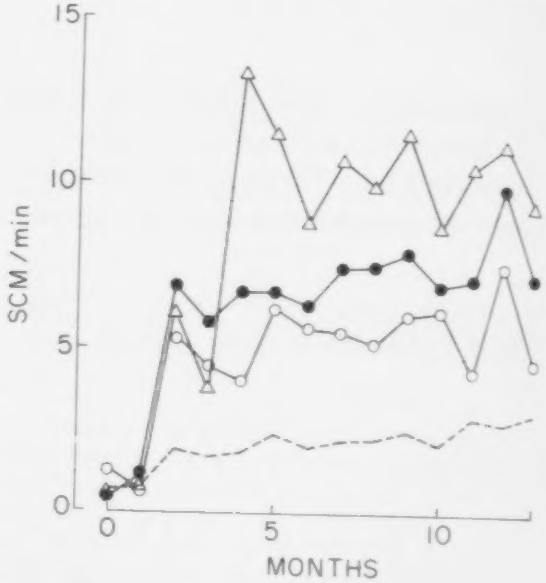

FIGURE 2. Long-term effects of haloperidol 0.07 mg/kg/d (○), 0.14 mg/kg/d (●), and 0.24 mg/kg/d (Δ) on SCM rates. Broken line: untreated control rats.

Discussion

The present study has shown that during long-term administration of haloperidol and clozapine in rats there are important differences in SCM response between the two drugs. Haloperidol in a dose range between 0.07 to 0.24 mg/kg/d produced various degrees of increased SCM rates, which were more pronounced at the higher dose levels, while clozapine-treated animals in a dose range between 11 to 50 mg/kg/d did not differ from untreated controls.

In an attempt to compare various antipsychotics with regard to their SCM-producing properties clozapine, sulpiride, thioridazine, chlorpromazine, fluphenazine, and haloperidol have been administered to rats for 10 months (Gunne et al., 1986). In those experiments clozapine gave no effects on SCMs, sulpiride was marginally higher than the controls, while the other drugs caused clearcut elevations in SCM rates. The doses employed were in ratio to the doses used in the clinic for the control of schizophrenia. However, due to species differences regarding drug metabolism and excretion the doses must be regarded as arbitrary. To eliminate the possibility that low or absent SCM responses may be due to inadequate dosing, a range of chronically administered doses should be employed for each drug.

The present findings show that the differences noticed between clozapine and haloperidol are most likely due to fundamental differences between the two drugs, and can hardly be ascribed to an inappropriate choice of doses. Major differences in action between clozapine and classical neuroleptics have been demonstrated both on dopamine systems in limbic and striatal brain areas (Andén & Stock 1973; Zivkovic et al., 1975) and on nigral GABA turn-over (Costa et al., 1978; Mao & Costa, 1978). Since haloperidol is known to produce TD both in the clinic (Jacobson et al., 1974; Jus et al., 1976) and in a nonhuman primate model (Gunne & Barany, 1976) whereas clozapine seems devoid of this long-term side effect (Ackenheil & Hippius, 1977; Simpson & Lee, 1978) the present findings appear to validate this rodent model of TD and support its usefulness for monitoring the inherent risk of TD in individual drugs.

Identification and Testing of New Drugs for Modulating Alcohol Consumption

Mary O. Lawrin, M.Sc.,[1] Claudio A. Naranjo, M.D.,[1] and Edward M. Sellers, M.D., Ph.D.[1]

Introduction

The identification of new drugs for decreasing alcohol consumption has been based mostly on serendipitous observations. The most commonly prescribed agents still are the alcohol sensitizing drugs (i.e., disulfiram). However, their clinical efficacy remains unproven and their use is limited by toxicity and other contraindications (Naranjo et al., 1981; Peachey & Naranjo, 1983). While the incidence of problems related to alcohol abuse continues to increase, research efforts have not yielded new effective pharmacotherapies. Until recently no systematic program had been designed to specifically identify and test new drugs to decrease alcohol consumption (Naranjo et al., 1981). Such a research program was developed in the Clinical Pharmacology Program, Addiction Research Foundation, Clinical Institute, Toronto, Canada (Naranjo et al., 1981).

The search for new pharmacologic treatments was based on the assumption that biologic factors play an important role in the regulation of ethanol consumption. The selection of probe drugs required a critical analysis of the available evidence, as well as the conduct of the appropriate studies in animals and humans (Naranjo et al., 1986b). Previous experiments indicated that ethanol intake is regulated by a complex interaction between neurobiological and systemic factors possibly involving several neurotransmitters (monoamines and neuropeptides), and/or hormones (Naranjo et al., 1986a). Studies suggested that the central serotonergic (5-HT, 5-hydroxytryptamine) system may be involved in the regulation of ethanol intake. Pharmacologic manipulations of central 5-HT neurotransmission had been reported to alter ethanol consumption and preference in experimental animals (Rockman et al., 1979, 1982; Amit et al., 1984; Naranjo et al., 1985, 1986a). The most consistent findings were obtained with treatments which directly or indirectly activate central serotonin activity (Naranjo et al., 1986a). Thus, the present research focused on drugs which enhance central serotonergic function. An additional factor in the selection of such drugs was their availability for animal and human experiments.

This paper will illustrate a strategy for identifying and testing drugs to decrease alcohol consumption by reviewing some experiments conducted with serotonergic drugs. A detailed review is presented elsewhere (Naranjo & Sellers, 1985; Naranjo et al., 1986a,b). The effects of several 5-HT uptake inhibitors and a 5-HT_2 agonist on ethanol consumption were tested in Wistar rats using a free-choice drinking paradigm between water and ethanol (6 or 7 percent v/v). The effects of two 5-HT uptake inhibitors, zimelidine and citalopram, on alcohol intake were also assessed in nondepressed alcohol abusers (Naranjo et al., 1984; 1986c).

Animal Studies

Methods

Animals: Male Wistar rats (Canadian Breeding Farm and Lab., Ltd., Charles River, Canada), originally weighing 200 to 220 g, were individually housed in stainless steel cages in a room regulated for constant temperature

(22 to 24°C), humidity (55 percent), and a 12-hour day–night cycle (7:00 p.m.–7:00 a.m. darkness). Each cage was equipped with two 100 ml calibrated Richter tubes to deliver fluid (ethanol solution and/or water) and a food dispenser. The position of the Richter tubes was randomly reversed to avoid position preference. Purina Rat Chow was available ad libitum throughout.

Drugs: The following specific serotonin uptake inhibitors (Fuller, 1980) were tested: zimelidine (Astra Lakemedel AB, Sweden); citalopram (Lundbeck, Denmark); fluvoxamine (Duphar BV Laboratory, Weesp, Netherlands); and viqualine (Pharmuka Laboratories, France). The selective 5-HT$_2$ postsynaptic receptor agonist tested was MK-212 (Merck Sharpe & Dohme, U.S.A.) (Fuller, 1980).

MK-212 (2.5, 10, 30, 40 mg/kg) and fluvoxamine (10, 25, 30, 40, 90 mg/kg) were made up to a concentration of 10 mg/ml by dissolving them in distilled water. Half of their doses were administered intraperitoneally (i.p.) twice daily at 1900 h and 0000 h. Zimelidine (10, 20, 30 mg/kg), citalopram (10, 20, 30 mg/kg), and viqualine (5, 10, 20 mg/kg) were dissolved in Ringer's solution in a concentration of 10 mg/ml. Zimelidine and citalopram were delivered via the Alzet® osmotic mini-pump (Alza Corp., U.S.A.) implanted subcutaneously under pentobarbital anesthesia. Viqualine was injected i.p. once daily at 1700 h. Ringer's solution served as the control for both the i.p. and Alzet® mini-pump administration.

Experimental Design: After a 5-day adaptation period, the rats were screened for their ethanol intake by presenting them with a free-choice drinking schedule between water and an ethanol solution. The concentration of ethanol (95 percent ethyl alcohol) was increased every 3 days from 2 percent to 4 percent up to 6 percent v/v (for fluvoxamine, viqualine, and MK-212) and up to 7 percent v/v (for zimelidine and citalopram). During the consecutive baseline, treatment, and post-treatment periods (each consisting of 7 days, except for 14 days with citalopram), the free-choice drinking presentation between water and the ethanol solution was continued. Body weight, fluid consumption (water, ethanol, total fluid intake), and food intake were also measured daily at the same time. Only those rats consuming more than 50 percent of their total fluid intake as the final ethanol solution (6 or 7 percent v/v) during baseline were used in the experiment. During the treatment period, the test drugs (zimelidine, citalopram, fluvoxamine, viqualine, and MK-212) were administered daily either IP or via the Alzet® mini-pump as previously described. The data were analyzed using the Duncan's Multiple Range test comparing ethanol consumption (g/kg/day) and ethanol preference (percent ethanol consumed/total fluid intake) of each dose level of drug with Ringer's control at $p < 0.05$ level.

In a separate experiment the effect of 5-HT uptake inhibitors (zimelidine, fluvoxamine) and a 5-HT agonist (MK-212) was assessed on water consumption alone to rule out a generalized effect on fluid intake. The experiment consisted of four periods each lasting for 5 days: adaptation, baseline, treatment, and post-treatment. Throughout these periods Wistar rats were allowed to consume water and food ad lib. During treatment, half of the respective doses of MK-212 (10, 20, 40 mg/kg), fluvoxamine (10, 20, 40 mg/kg) or Ringer's solution (4 ml/kg) were injected IP twice daily at 1900 h and 2300 h. Zimelidine (10, 30 mg/kg) was injected once daily at 1900 h. The data were analyzed using Duncan's Multiple Range test comparing water intake of each dose level of drug with every other group including Ringer's control at $p < 0.05$ level.

Results

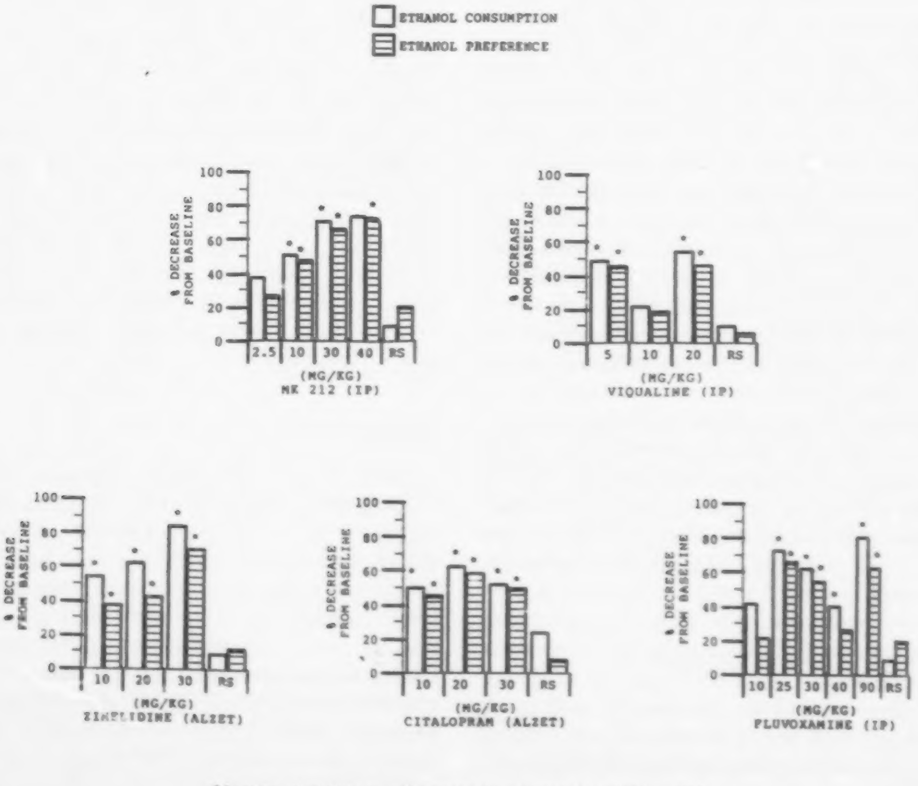
The effect of 5-HT uptake inhibitors (zimelidine, citalopram, fluvoxamine, viqualine) and a 5-HT$_2$ agonist (MK-212) on ethanol consumption (g/kg/day) and ethanol preference (percent ethanol consumed/total fluid intake) are presented in Figure 1. The results are expressed as percentage DECREASE in ethanol consumption and preference from BASELINE. All drugs significantly reduced both ethanol consumption and preference ($p < 0.05$). The ranges of decrease were 18 to 84 percent for ethanol consumption and 3 to 77 percent for ethanol preference. The effect was dose-related with zimelidine and MK-212. All decreases in ethanol intake reversed during the post-treatment period (i.e., returned to baseline levels) except for zimelidine 40 mg/kg, fluvoxamine 90 mg/kg, and MK-212 40 mg/kg. Only the highest doses of the drugs (i.e., 20 mg/kg viqualine, 30 mg/kg citalopram, 40 mg/kg MK-212, and 90 mg/kg fluvoxamine) decreased food intake.

In terms of their effects on water intake alone, MK-212 (10 and 20 mg/kg), fluvoxamine (10 and 20 mg/kg) and zimelidine (10 and 30 mg/kg) did not significantly alter water consumption when compared to Ringer's control ($p > 0.05$). The highest doses of MK-212 (40 mg/kg) and fluvoxamine (40 mg/kg) did significantly reduce water intake with respect to all other treatment groups including Ringer's. However, these effects are reflective of such toxic dose levels.

Human Studies

Methods

The effects of zimelidine (200 mg/day p.o.) were tested in 16 nondepressed, socially stable, physically, and emotionally healthy men (Naranjo et al., 1984). This double-blind, randomized, cross-over experiment consisted of five 2-week experimental periods: baseline, placebo 1 and 2, and zimelidine 1 and 2. Subjects were not instructed to modify their alcohol consumption. During the first 2 weeks (baseline), subjects recorded their alcohol consumption on a self-monitoring form and mailed in daily urine samples. Subjects who complied with these procedures and who consumed approximately 28 drinks per week were randomly allocated to initially



*denotes significant difference from Ringer's solution (RS) at P<0.05 level.

FIGURE 1. Effects of a 5-HT$_2$ agonist (MK-212) and serotonin uptake inhibitors (viqualine, zimelidine, citalopram, fluvoxamine) on ethanol consumption and preference in Wistar rats.

receive either 200 mg of zimelidine or placebo daily for 2 weeks. Every 2 weeks thereafter they received the alternate treatment. At the end of each day they recorded the total number of standard drinks consumed. They were reassessed biweekly. Changes in alcohol intake during each treatment period were assessed in terms of the number of drinks consumed and the percentage of abstinent days.

Results

Subjects took their experimental drugs and reported their alcohol consumption accurately. Three of the 16 subjects developed symptoms of drug-induced hepatitis, 2 subjects dropped out during the second zimelidine period, and a sixth did not comply with protocol during the last 2 experimental periods. Thus, the results for the first 2 experimental periods include the 13 subjects who did not have hepatitis, and the results for the 4 experimental drug periods include the remaining 10 subjects (Naranjo et al., 1984). In the 13 subjects, zimelidine decreased the number of drinks consumed ($F_{1,12} = 5.77$, $p < 0.05$) and increased the percentage of days of abstinence ($F_{1,12} = 14.14$, $p < 0.005$). In the 10 subjects the days of abstinence also increased ($F_{1,8} = 5.34$, $p < 0.05$), but the decrease in the number of drinks consumed was not significant ($F_{1,8} = 4.10$, $p < 0.10$). Zimelidine's effect on ethanol intake occurred in less than 2 weeks, indicating a rapid onset and offset of effect, in contrast to the usual 2- to 3-week delay required to observe the clinical effects of most antidepressant drugs. The pattern of response varied considerably among individuals, but the increase in the days of abstinence was a consistent and robust finding. Approximately half of the subjects were responders to zimelidine, 35 percent were partial responders, and 15 percent were nonresponders (Naranjo et al., 1986a). Our findings have been confirmed by another group (Amit et al., 1985).

In another recently completed randomized, double-blind, cross-over trial in nondepressed, healthy heavy drinkers, citalopram (40 mg/day p.o.) significantly decreased the number of drinks consumed and increased the number of days of abstinence (Naranjo et al., 1986c).

Discussion

This paper describes results obtained from a research program specifically designed to identify and test new drugs to decrease alcohol consumption. Because previous reports suggested a link between the central serotonergic system and ethanol consumption, the effectiveness of drugs, which enhance central serotonergic activity, to decrease alcohol intake was systematically evaluated. These drugs included specific 5-HT uptake inhibitors (zimelidine, citalopram, fluvoxamine, and viqualine) and a selective 5-HT$_2$ agonist (MK-212). Initially, they were investigated in an appropriate animal model consuming ethanol preferentially under free-choice conditions. Subsequently, the effects were assessed in alcohol abusers. Using such an approach provided a better insight into the neurochemical mechanism(s) which may regulate ethanol intake. More importantly, it also proved to be a valuable strategy with which to develop a new possibly effective treatment for alcohol abusers.

All serotonin uptake inhibitors tested (zimelidine, citalopram, fluvoxamine, viqualine) significantly and consistently decreased ethanol consumption and preference in Wistar rats, when offered a free choice between water and ethanol (6 to 7 percent v/v). These findings confirm and extend to previous studies showing that these and other 5-HT uptake inhibitors (norzimelidine, alaproclate, fluoxetine, indalpine) also reduce ethanol consumption in rats (Rockman et al., 1979, 1982; Le Bourhis, 1981; Amit et al., 1984). Serotonin uptake inhibitors have also been reported to decrease ethanol intake in ethanol-preferring genetically inbred animals. Fluoxetine decreased ethanol intake in P rats (Murphy et al., 1985) while other 5-HT uptake inhibitors, such as zimelidine, citalopram, and fluvoxamine, reduced ethanol intake and preference in UChB rats.*

The fact that all specific 5-HT uptake blockers consistently and repeatedly decrease alcohol intake in different animal models strongly supports the notion that enhancing central serotonergic function decreases ethanol intake. Further convincing evidence for such a notion comes from the other finding of this study, namely, that the alternative mechanism of increasing central 5-HT activity, i.e., stimulation of post-synaptic 5-HT_2 receptors with the specific 5-HT agonist, MK-212, also reduces ethanol intake in a dose-related manner. Additional evidence suggesting a role of central serotonin systems in the regulation of alcohol intake comes from reports showing that ethanol intake decreases following the administration of 5-HT itself (Hill, 1974) or its precursors, such as tryptophan (Zabik et al., 1985) and 5-hydroxytryptophan (Myers & Veale, 1972; Geller, 1973; Walters, 1977; Zabik et al., 1978, 1985).

---

*Mardones et al., personal communication.

The mechanism of this effect is not fully elucidated. However, several hypotheses have been suggested. For example, the effect has been attributed to an inhibition of the positive reinforcing properties of ethanol (Rockman et al., 1979). Since serotonin also plays a role in the regulation of food consumption (Blundell, 1984; Wurtman & Wurtman, 1984), it is also conceivable that enhanced central serotonergic activity produces its effects on alcohol intake by modulating critical synapses involved in the regulation of consummatory behaviors.

The clinical importance of serotonin-altering drugs becomes apparent with the findings that serotonin uptake inhibitors, zimelidine and citalopram, also attenuate ethanol intake in humans. Since these agents acted rapidly and subjects were not clinically depressed, this action is distinct from their antidepressant effects and most likely represents an interference with the neurobiological mechanisms regulating ethanol intake. The human findings provide cross-validation for the results obtained in animals, therefore indicating that the simple free-choice drinking paradigm in rats is a valid test for screening new pharmacological interventions. These findings also suggest an innovative approach for moderating ethanol consumption in problem drinkers.

In summary, the strategy described in this paper suggests an effective approach for the identification and testing of new pharmacotherapies for reducing ethanol intake. The findings also illustrate the progress being made by combining both animal and human experiments in a research program specifically designed to identify and test new drugs to decrease alcohol consumption. A similar strategy can be used for testing neuropharmacological agents affecting other neurotransmitter systems.

Effects of Noon Meals Varying in Nutrient Composition on Plasma Amino Acids, Glucose, Insulin, and Behavior[1]

Bonnie Spring, Ph.D.,[2] June Chiodo, Ph.D.,[2] Margarette Harden, Ph.D.,[3] Michael Bourgeois, M.D.,[4] Lorenz Lutherer, M.D.,[4] Debra Harner, B.A.,[2] Sherry Crowell, M.A.,[2] and Geoffrey Swope, B.A.[2]

A widely held popular belief is that the ingestion of carbohydrates, especially sugar, induces a temporary mood involving a sensation of high energy. On the contrary, our research findings to date reveal an opposite effect. Spring, Maller, Wurtman, Digman and Cozolino (1983) compared the responses of 184 normal adults 2 hours after they ate carbohydrate or protein meals. The carbohydrate meal used in this study was primarily high in sucrose. Mood was less tense and more drowsy, and concentration was poorer after the carbohydrate than the protein meal, especially among female subjects and older individuals. In a followup study Lieberman, Spring and Garfield (in press; *see also* Spring, Lieberman, Swope & Garfield, in press) compared the mood and performance of 40 young male subjects who ate carbohydrate and protein lunches on 2 different days in counterbalanced order. The carbohydrate meals in the second study contained primarily wheat starch, a complex carbohydrate. As compared to their responses to protein, subjects displayed slowed response speed and impaired concentration from 1 to 3.5 hours after the carbohydrate meal. Most recently, Conners, Caldwell, Caldwell, et al. (in press) randomly assigned normal and hyperactive children to a high-carbohydrate or high-protein breakfast or to fasting. From .5 to 3.75 hours after eating, the carbohydrate meal induced greater vigilance impairments than did the protein meal or fasting.

At least three candidate mechanisms have been proposed to explain the behavioral effects of carbohydrate foods. First, unlike protein-rich foods, many snacks rich in carbohydrate are sweet, dessert-type foods. Consequently, differences in taste or hedonic qualities might be at least partially responsible for the behavioral differences observed after meals varying in nutrient composition. Second, some popular accounts hold that reactive hypoglycemia underlies the low energy mood observed after carbohydrate intake. Since insulin given *exogenously*, as in the treatment of diabetes, can induce hypoglycemia, it has been suggested that *endogenous* insulin, triggered by carbohydrate intake, can also induce hypoglycemia and its associated symptoms.

A third explanation is based on the demonstration that certain food constituents are neurotransmitter precursors that can alter the synthesis and release of brain neurotransmitters (Fernstrom & Wurtman, 1971, 1972). Consequently, foods might produce changes in behavior by altering the levels of brain neurotransmitters that are associated with various psychological functions.

The brain synthesizes the monoamine neurotransmitter serotonin from its amino acid precursor, tryptophan. Although the body's nutritional supply of tryptophan is obtained from protein, a high-protein meal does not elevate brain tryptophan or serotonin. In fact the opposite occurs: brain tryptophan declines, as does serotonin synthesis. This paradox arises because tryptophan is scarce in protein (1 to 1.6 percent) in comparison with the other large neutral amino acids (LNAA): leucine, isoleucine, valine, tyrosine, and phenylalanine (25 percent). These LNAA's compete with tryptophan for access to the same carrier molecules for

transport across the blood-brain barrier. In addition, tryptophan is metabolized in its passage through the liver, whereas leucine, isoleucine, and valine are not. Hence these branched chain amino acids can represent as much as 90 percent of *all* the amino acids to enter systemic circulation from the liver and portal circulation after a high-protein meal. In sum, a high-protein meal decreases the ratio of plasma tryptophan to the competing LNAA, lowers tryptophan's influx into the brain and reduces brain serotonin synthesis and release.

In contrast, a carbohydrate-rich, protein-poor meal increases brain tryptophan and serotonin synthesis even though such a meal lacks tryptophan. In animals that have fasted overnight, the insulin secretion triggered by a carbohydrate meal causes a 40 to 60 percent fall in plasma leucine, isoleucine and valine and a 15 to 30 percent fall in plasma tyrosine. Plasma tryptophan levels do not decline because tryptophan binds to albumin molecules as insulin strips away the free fatty acids that are usually albumin-bound. Consequently, a meal that is poor in protein but rich in carbohydrate increases the plasma tryptophan/LNAA ratio. In humans, this ratio is significantly elevated from 1.5 to 4 hours after a carbohydrate meal containing either sugar or starch (Lieberman, Spring, & Garfield, in press). The rise in the tryptophan/LNAA ratio causes increased brain influx of tryptophan and increased release of serotonin from brain neurons, insofar as the latter can be assessed by CSF levels of serotonin's metabolite, 5-HIAA. To bring about an increase in brain serotonin release, a test meal must be not only carbohydrate-rich but also protein-poor. A balanced meal containing a substantial amount of protein directly contributes sufficient LNAA to the bloodstream to compensate for the insulin-mediated fall in LNAA that is triggered by carbohydrate.

Much of the brain's serotonin is localized in the midbrain raphe nuclei that play a role in the onset of sleep. Therefore, an elevation of brain serotonin induced by carbohydrates could simulate in the brain a state of readiness to fall asleep, and might account for the fatigue and concentration impairments observed after carbohydrate intake.

The purpose of this study was to test which of the three mechanisms—hedonic properties, fluctuations in plasma glucose, or changes in the plasma tryptophan/LNAA ratio—could best account for the behavioral effects of a carbohydrate meal.

In a within-subjects design in counterbalanced order, subjects fasted or consumed a lunch rich in carbohydrate and poor in protein, a lunch rich in protein and poor in carbohydrate, or a balanced lunch rich in both nutrients. The carbohydrate and balanced lunches were both sweet-tasting, cookie-like lunch bars. Consequently, they were expected to be similar in hedonic properties and in their effects on plasma glucose and insulin, but different in their effects on the tryptophan ratio. The inclusion of a fasting control condition permitted an assessment of whether any lunch, regardless of nutrient composition, would induce behavioral changes when compared to no lunch.

The subjects were seven normal females between the ages of 18 to 29. Subjects were screened to rule out a history of diabetes, hypoglycemia, eating disorders, obesity, substance abuse, or psychiatric hospitalization. Screening procedures also excluded any subject who had, in the past 6 months, met Research Diagnostic Criteria for mania, hypomania, or major depression. Selection criteria also specified that subjects could not be taking appetite suppressants, birth control pills, or any medication that could cause drowsiness (e.g., antihistamines, cold medication) or activation (e.g., stimulants). Prior to entering the protocol, all subjects were examined by a physician to ensure that they were in good physical health and not at risk from study procedures.

On 4 different days, 1 week apart, subjects fasted from 8:00 p.m. on the evening prior to the test day, until 7:30 a.m. the following morning. At 7:30 a.m. subjects reported to the laboratory where they were fed a standard breakfast consisting of two pieces of whole wheat toast with ½ tbs butter and 1 tbs jam, 4 oz orange juice and 1 cup skim milk. Participants were permitted to drink their usual amount of coffee or tea, as determined prior to study entry, in order to avoid caffeine withdrawal. Subjects remained in the laboratory, refrained from eating or drinking anything except water, and engaged in sedentary activities of their own choosing until 11:00 a.m. At this time, an intracath was inserted into the antecubital fossa region of the distal hand of each subject to permit blood samplings throughout the afternoon.

Lunch was eaten between 12:15 p.m. and 12:45 p.m. The carbohydrate meal was six lunch bars which supplied 105 g carbohydrate, .7 g protein, 42.7 g fat, and 799 calories. The protein lunch consisted of 318.8 g of turkey breast with mayonnaise which supplied 105 g protein, 33.3 g fat, and 780 calories. The balanced lunch was six lunch bars which supplied 76 g carbohydrate, 27.7 g protein, 40 g fat, and 774 calories.

Blood was drawn prior to lunch, and also four times following the meal. In addition, mood and performance were assessed before and four times after eating lunch. All behavioral assessments involved paper and pencil tests. Measures of mood were the Stanford Sleepiness Scale (SSS), the Profile of Mood States (POMS), and the Visual Analog Mood Scales (VAMS). At each assessment subjects were asked to rate their mood "right now." Measures of performance were the Digit Symbol Substitution Test (DSST), Letter Cancellation, and a test of Addition.

Blood samples were analyzed for plasma glucose, serum insulin, and plasma amino acids, the latter by means of a Beckman automated amino acid analyzer.

Data were analyzed by repeated measures analysis of variance with planned contrasts comparing test meals to fasting for selected post-lunch assessments. Analysis of the primary mood variable, POMS Fatigue, indicated that at 2 hours after lunchtime subjects reported significantly greater fatigue after eating the carbohydrate lunch than after skipping lunch. Neither the balanced nor the protein meal increased fatigue significantly when compared to fasting. Mean differences in performance between carbohydrate and fasting did not reach significance for these seven subjects.

Analysis of the blood constituents revealed that the carbohydrate meal, as compared to fasting, significantly elevated plasma glucose levels throughout the afternoon. The balanced lunch also elevated plasma glucose but the protein lunch did not substantially affect glucose. Both the carbohydrate and the balanced lunches significantly raised serum insulin throughout the afternoon. The increase in insulin following the protein meal was considerably smaller.

As expected, neither fasting nor the balanced lunch altered the tryptophan/LNAA ratio from the pre- to the post-lunch assessments. However, consistent with prior results, by 1.5 hours after lunch, the carbohydrate lunch increased the ratio significantly and this elevation persisted throughout the afternoon. Also as predicted, the protein meal lowered the tryptophan ratio for much of the afternoon.

Since only the carbohydrate lunch induced significant fatigue, but the carbohydrate and balanced lunches were similar in hedonic properties, it appears unlikely that psychological factors such as taste play a major role in generating the drowsiness that normal adults report following a carbohydrate meal. Moreover, fatigue following a carbohydrate lunch could not in these normal subjects be attributed to hypoglycemia, since glucose remained elevated. Nor could fatigue be explained by differences in insulin, since carbohydrate and balanced meals affected serum insulin similarly, but only the former caused fatigue. Since fatigue occurred at approximately the same time that the carbohydrate meal began to elevate the tryptophan/LNAA ratio, enhanced brain serotonin synthesis represents a plausible underlying mechanism.

The current study replicates and extends prior findings indicating that meals high in carbohydrate and low in protein induce drowsiness 2 hours after eating. At assessments beginning 30 minutes after eating, no evidence was found to support the popular belief that carbohydrate foods trigger a high-energy mood in normal subjects. At this level of caloric intake (slightly less than 800 calories), post-lunch fatigue occurred relatively specifically following unbalanced carbohydrate-rich meals, and not following meals that are rich in protein. The hedonic features of the meal or its effects on glucose and insulin appear unlikely to account for the effects of carbohydrate on mood. However, effects on brain serotonin synthesis represent a possible underlying mechanism.

Mouse Strain Differences in Acquisition of Discrete Lever-Press and Shuttle Avoidance Responses, and Drug Effects Thereon

Hisashi Kuribara, Ph.D.,[1] and Sakutaro Tadokoro, M.D., Ph.D.[1]

It has been well known that there are marked differences among strains of mice in their behavioral characteristics as well as in the sensitivities to psychoactive drugs (Bovet et al., 1969; Oliverio, 1974; Wahlsten, 1972). In respect to conditioned avoidance response in mice, a shuttle avoidance has been commonly applied to investigate genetic influence on the acquisition processes and to study the drug effects.

Recently, the authors newly assembled an operant box for lever-press avoidance in mice (Kuribara and Tadokoro, 1983a, 1984), and have studied characteristics of the acquisition processes and the psychoactive drug-induced changes in the discrete lever-press and shuttle avoidance responses in the dd strain of mice (Kuribara and Tadokoro, 1983a, 1983b, 1984, 1986; Kuribara et al., 1985). These experiments demonstrated that the drug-induced changes in the lever-press and shuttle avoidance responses were sometimes different according to types of the drugs, and that the difference in the response topographies between the lever-press and shuttle avoidances should be considered when the drug effects were investigated (Kuribara et al., 1985).

Hence, the purposes of this study were to investigate the acquisition processes of the discrete lever-press and shuttle avoidance responses, and to investigate the effects of methamphetamine and morphine, prototypes of central stimulant and narcotic analgesic, respectively, on these avoidance responses in three strains of mice (dd, ICR, and C57). Furthermore, the effects of the drugs on the ambulatory activity were examined in these three strains of mice.

Method

Animals

The experimental animals were male mice of dd (Institute of Experimental Animal Research, Gunma University School of Medicine), ICR (Charles River Japan, Inc.) and C57 (Charles River Japan, Inc.) strains. These mice had been housed in groups of 8 to 10 in aluminum cages in a controlled room (light period; 6:00–18:00, and temperature; 23 ± 2°C) with a free access to food (MF: Oriental Yeast Co.) and tap water except during the avoidance sessions. When the mice were 10 weeks old, and weighed 28 to 32 g in the dd and ICR strains and 23 to 28 g in the C57 strain, the training in either of the discrete lever-press or shuttle avoidance situations was started.

Discrete Avoidance

The experimental box for the lever-press avoidance (GT-8310; O'Hara & Co. Ltd.), 18 (w) × 9 (d) × 10 (h) cm, was attached by a stainless steel lever which could be activated with a force of more than 1.5 g. A speaker for presenting a warning stimulus was set in the ceiling.

Two different sizes of the experimental boxes for the shuttle avoidance were used in the present experiment. The dimensions of the larger box (GT-7750; O'Hara & Co. Ltd.) were 50 (w) × 15 (d) × 20 (h) cm with 2 photobeams arranged 36 cm apart, and the dimensions of the smaller box (GT-8450; O'Hara & Co. Ltd.) were 30 (w) × 9 (d) × 15 (h) cm with 2 photobeams arranged 18 cm apart. A speaker for presenting a warning stimulus was set in the ceiling of each box.

The temporal parameters of the discrete avoidance schedule (Hoffman et al., 1961) were an inter–trial interval of 25 sec and a warning duration of 5 sec. The warning stimulus was an 800 Hz pure tone from the speaker. The shock was an electric current of 100 to 150 V, 0.3 to 0.5 mA, 50 Hz AC, and was given to the mouse through the stainless steel floor grid of the experimental box. The maximum duration of the shock presentation was 3 sec and an escape contingency was considered in the schedule during the training sessions. During the drug-testing sessions, the shock duration was fixed to 0.5 sec. Each session consisted of 1 hr performance/day, and was held every other day during the training period, and every day during the drug-testing period. The indices of the avoidance response were response rate (number of lever-pressings or shuttlings/min) and avoidance rate (number of avoidance responses/number of avoidance trials). After 12 to 15 sessions of the training, the mice that achieved a critical level of the avoidance rate of higher than 75 percent were selected as good-performing mice, and the drug-testing was carried out in these mice.

Ambulatory Activity

For measurement of the ambulatory activity of the mouse, a tilting-type ambulometer, 20 cm in diameter (AM-10; O'Hara & Co. Ltd.) (Hirabayashi et al., 1978), was used. A mouse was put into the activity cage, and the ambulatory activity counts were recorded for 0.5 and 1 hr before and after the drug administration, respectively.

Drug Treatments

The drugs and the doses tested in the avoidance experiments were methamphetamine HCl (MAP) (Philopon: Dainippon Pharm. Co.; 0.13, 0.25, 0.5, and 1 mg/kg s.c.) and morphine HCl (MOR) (Takeda Pharm. Co.; 1.3, 2.5, 5, and 10 mg/kg s.c.). The doses were expressed in terms of the salt forms. MAP and MOR were dissolved in physiological saline vehicle, and each volume administered was fixed at 1 ml/100 g body weight. Each drug was administered immediately before the start of the avoidance session, and the avoidance response was observed for 1 hr thereafter. The drug-testing sessions were held twice a week at intervals of 3 to 4 days, and physiological saline was administered as the control session the day before. Administration of MAP was done first, followed by MOR, and the doses of each drug-testing were changed from the lower to the higher. When the drug-testing was changed from MAP to MOR, the mice were allowed to rest for 1 week.

After completion of the drug-testing in the avoidance experiments, the mice used were administered MAP (1 mg/kg s.c.) and MOR (10 mg/kg s.c.), which were the highest doses tested in the avoidance experiments, and their ambulatory activity was observed for 1 hr. In the control experiment, physiological saline was administered. The administration was carried out in an order of physiological saline, MAP and MOR at intervals of 3 to 4 days.

Results

Acquisition of Avoidance Responses

The acquisition processes of the discrete lever-press and shuttle avoidance responses in the dd, ICR, and C57 strains as well as the BALB/c, C3H, and DBA strains have been reported elsewhere (Kuribara and Tadokoro, 1986). The characteristic points are as follows:

After 15 sessions of the training in the lever-press situation, nearly 80 percent of the dd strain achieved a critical level of the avoidance rate (75%), whereas only 30 to 40 percent of the ICR and C57 strains achieved the critical level.

Within 10 sessions of the training in the shuttle situation of the larger box, approximately 80 percent of the dd strain achieved the critical level of the avoidance rate. However, there was no case that exhibited the critical level in the ICR and C57 strains although they were trained for 15 sessions or more. Therefore, the drug-testing by using the ICR and C57 strains could not be carried out in the shuttle situation of the larger box.

The acquisition of the shuttle avoidance response in the smaller box was faster than those in the lever-press situation and in the shuttle situation of the larger box. Further-

more, the avoidance rates as well as the percentages of the mice that achieved to show the critical level of the avoidance rate were higher in the smaller box than in the other two situations. In particular, all the mice of the C57 strain excellently acquired the shuttle avoidance response in the smaller box by the second session of the training, showing the best acquisition among the three strains, although this strain exhibited the poorest avoidance response in the lever-press situation and in the shuttle situation of the larger box. In contrast, the ICR strain demonstrated the poorest result in this situation as well as in the lever-press situation and in the shuttle situation of the larger box.

Drug Effects on the Avoidance Responses

Figures 1 and 2 show dose-effect relationships for MAP and MOR, respectively, in the lever-press situation (left panels), shuttle situation of the larger box (middle panels), and shuttle situation of the smaller box (right panels), respectively, in the 3 strains of mice. As mentioned above, the data of the shuttle avoidance response in the larger box in the ICR and C57 strains are not shown in these figures.

The baseline response rate in the lever-press situation was comparatively higher in the ICR strain than in the dd and C57 strains. In the shuttle situation of the smaller box, the baseline response rates were higher in an order of ICR > dd > C57 strains.

MAP increased the response rate in the dd and ICR strains in the lever-press situation almost in a dose-dependent manner, except in the case of the ICR strain at 0.5 to 1 mg/kg, whereas the C57 strain exhibited a dose-dependent decrease in the response rate after MAP. MAP increased the response rate in the dd, ICR, and C57 strains in the shuttle situations of the larger and/or smaller boxes in a dose-dependent manner. The avoidance rate slightly but sometimes significantly increased in the dd strain in the lever-press situation, and in the dd, ICR, and C57 strains in the shuttle situations. However, the C57 strain exhibited a dose-dependent decrease in the avoidance rate in the lever-press situation after MAP.

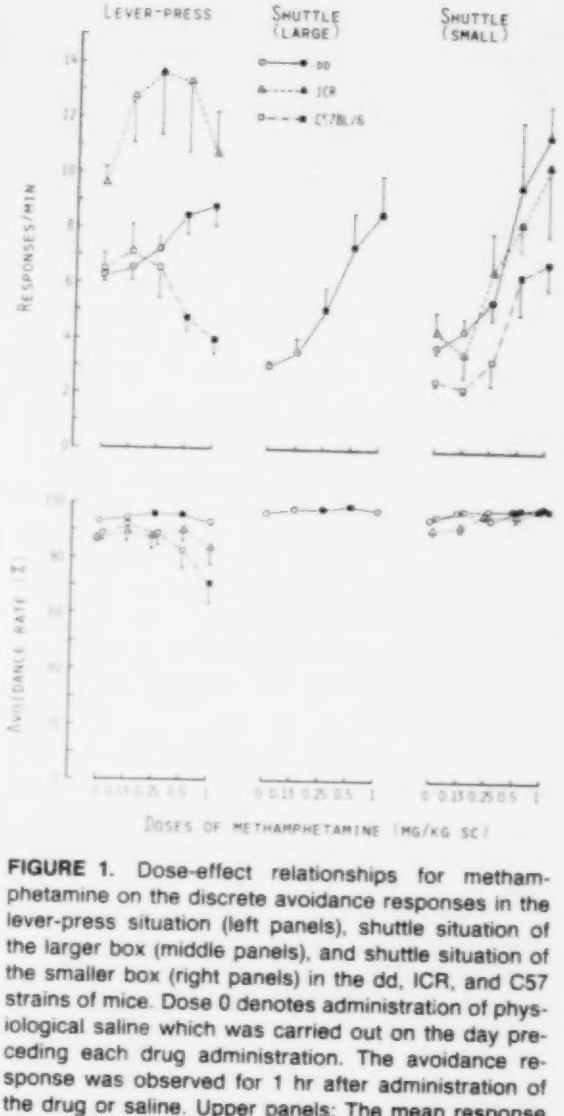

FIGURE 1. Dose-effect relationships for methamphetamine on the discrete avoidance responses in the lever-press situation (left panels), shuttle situation of the larger box (middle panels), and shuttle situation of the smaller box (right panels) in the dd, ICR, and C57 strains of mice. Dose 0 denotes administration of physiological saline which was carried out on the day preceding each drug administration. The avoidance response was observed for 1 hr after administration of the drug or saline. Upper panels: The mean response rates with S.E.M. Lower panels: The mean avoidance rates with S.E.M. The closed symbols indicate a significant difference as compared with the control value (dose = 0) within the same strains of mice ($p < 0.05$). Ten to 40 mice were used in this experiment. However, the data in the ICR and C57 strains in the shuttle situations of the larger box are not shown in this figure due to the reason mentioned in the text.

MOR decreased markedly the response rate in the ICR strain in the lever-press situation, while it tended to increase the rate in the C57 strain. On the other hand, MOR increased the response rate in the dd, ICR, and

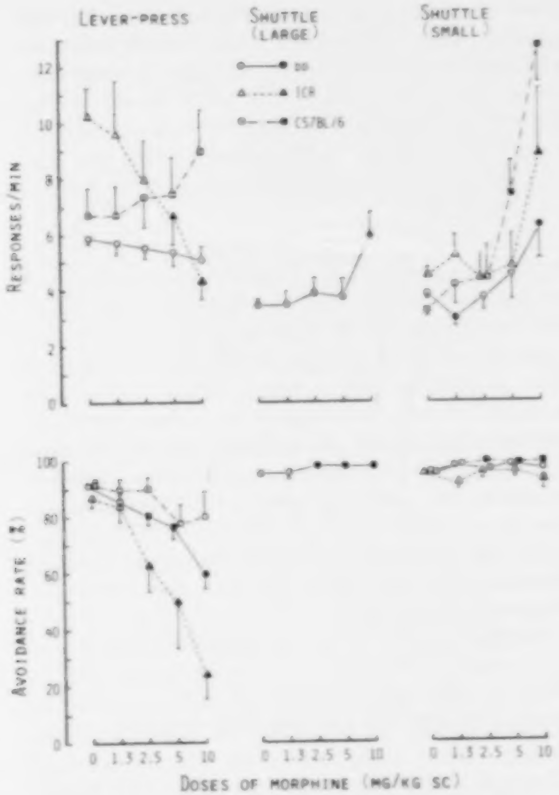

FIGURE 2. Dose-effect relationships for morphine on the discrete avoidance responses in the lever-press situation, shuttle situation of the larger box and shuttle situation of the smaller box in the dd, ICR, and C57 strains of mice. The data are shown in the same way as in Figure 1.

C57 strains in the shuttle situations of both the larger and smaller boxes. In particular, the C57 strain demonstrated the highest increase in the rate after MOR. The avoidance rate decreased in the dd and ICR strains in the lever-press situation after administration of MOR in a dose-dependent manner. In contrast, MOR increased the avoidance rate in the dd and C57 strains in the shuttle situations of the larger box and smaller box, respectively, at the high doses.

Effects of the Drugs on the Ambulatory Activity

Figure 3 shows the mean overall ambulatory activity counts during a 1 hr observation period after administration of saline, MAP (1 mg/kg), and MOR (10 mg/kg). After administration of saline, the C57 strain showed comparatively lower activity count than the dd and ICR strains. MAP and MOR increased the ambulatory activity in the three strains. The rank orders of the increased ambulatory activity were dd ≑ ICR > C57 strains after MAP, and C57 > dd ≑ ICR strains after MOR.

Discussion

Prior to evaluating the behavioral effects of psychoactive drugs, the characteristics of the experimental animals, such as the baseline levels of the behaviors and the sensitivities to standard drugs, should be investigated.

The present experiment demonstrated that there were marked differences in the acquisition of the discrete lever-press and shuttle avoidance responses among the dd, ICR, and C57 strains of mice. The results obtained in the lever-press situation and in the shuttle situation of the larger box were almost identical with those reported by Bovet et al. (1969), Oliverio (1974), and Sekiguchi (1982) that

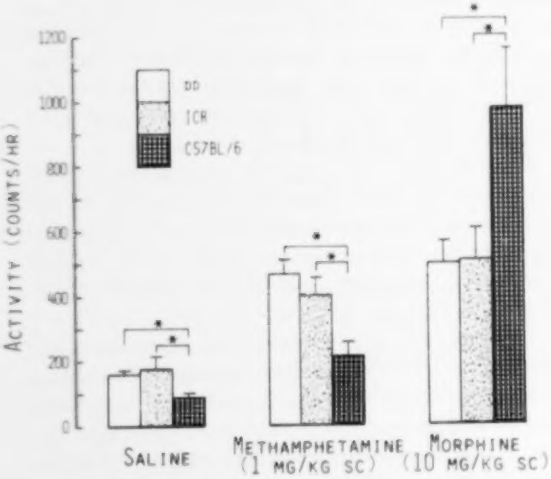

FIGURE 3. Effects of methamphetamine (1 mg/kg s.c.) and morphine (10 mg/kg s.c.) on the ambulatory activity in the dd, ICR, and C57 strains of mice. The doses administered were the highest doses tested in the avoidance experiment. The ambulatory activity of each mouse was measured for 1 hr after administration of the drugs. * indicates significant difference between strains ($p < 0.05$). N = 20 to 50.

the ICR and C57 strains exhibited poor avoidance response in the shuttle situation. However, when the dd, ICR, and C57 strains of mice were trained in the shuttle situation of the smaller box, the acquisition progressed more rapidly than in those trained in the larger box. These results strongly suggest that the acquisition of the shuttle avoidance response is affected by the size of the experimental box. In particular, the acquisition of the C57 strain was superior to that of the dd strain which has been considered to be a good-performing strain (Kuribara and Tadokoro, 1984; Kuribara et al., 1985). In the shuttle situation, the mouse has to move in the experimental box to avoid the shocks. Thereby, the general activity level of the mouse might affect the acquisition of the shuttle avoidance response as suggested by Messeri et al. (1972). The C57 strain exhibited a much lower ambulatory activity as well as a lower response rate in the shuttle situation. It is therefore considered that the inferior avoidance response in the C57 strain, which was demonstrated in the lever-press situation and in the shuttle situation of the larger box, is not simply due to a lower learning ability, but rather reflects a lower level of the general activity. In contrast, the ICR strain exhibited an inferior avoidance response in the three types of the avoidance situations, suggesting that the learning ability of the ICR strain is lower than the dd and C57 strains in the avoidance situation.

Furthermore, it can be considered from the present results that the acquisition of the avoidance response in the shuttle situation of the smaller box is easier than those in the lever-press situation or in the shuttle situation of the larger box.

The present experiment also demonstrated that there were strain differences in the drug-induced changes in the avoidance responses and in the ambulatory activity. Although the sensitivities were different among the strains, both MAP and MOR increased the ambulatory activity in the three strains, clearly reflecting the behavior-stimulating effects of these drugs (Chiuech and Moore, 1975; Cheney and Goldstein, 1971; Rethy et al., 1971), and such changes were well correlated with the MAP- and MOR-induced facilitations of the shuttle avoidance response as demonstrated with a dose-dependent increase in the response rate. However, the drug-induced changes in the lever-press avoidance response were not always identical with those in the shuttle avoidance response and the ambulatory activity. These results strongly suggest that the drug effects vary depending on the types of behavior.

The mouse strain differences in the acquisition processes of the avoidance responses as well as the sensitivities to psychoactive drugs are considered to be due to differences in the neural activities in the brain. In this study, the authors did not carry out the neurochemical investigation. It has been reported that there are differences in the acetylcholine, catecholamines, serotonin, GABA systems, etc., among strains of mice (cf. Al-Ani et al., 1970; Durkin et al., 1983). However, the authors could not find definite correlations between the present data and the neurochemical data.

Furthermore, it is considered that there are colony differences in the characteristics even in the same strain of mice. Hence, a further study is required to elucidate the mouse strain differences in the behavioral pharmacology. However, it can be concluded from the present results that there are marked differences in the acquisition processes of conditioned avoidance response as well as the drug effects thereon depending on the strains of mice, types of behavior, experimental situations, etc., and that these factors should be considered in the behavioral procedures of drug evaluation.

Differential Erythropoietic Response to Oxiracetam in Alzheimer's Disease and Multi-Infarct Dementia: A Potential Biological Marker

Roland J. Branconnier, M.A.,[1] Eric C. Dessain, M.D.,[1] Maureen E. McNiff, M.Ed.,[1] Nancy E. Harto, Ph.D.,[1] Karen F. Spera, B.A.,[1] Richard Katz, Ph.D.,[2] Frank Stallone, Ph.D.,[2] Joseph DeVeaugh-Geiss, M.D.,[2] and Jonathan O. Cole, M.D. [1]

Introduction

Dementia has been described as a clinical syndrome associated with chronic diffuse cerebral hemispheric dysfunction resulting in deterioration of intellectual capacity characterized by multiple involvement of cognition, memory, language, visual-spatial skills, and personality (Wells, 1979). However, dementia is a generic term that does not imply a specific etiology, but a group of diseases that present with similar clinical features (Schneck et al., 1982).

Dementia is observed principally in the aged. Differential diagnostic studies of aged patients with dementia revealed that in 80 percent of the cases the underlying specific diseases causing the dementia were Alzheimer's disease (AD) (50 percent), multi-infarct dementia (MID) (12 percent), or combination of both (18 percent). The remaining 20 percent had a broad spectrum of disorders such as normal pressure hydrocephalus, metabolic or endocrine diseases, drug toxicity, depressive pseudodementia, or intracranial masses (Wells, 1979).

Early differential diagnosis of the etiology of the dementia is critical since effective medical management and psychosocial intervention can minimize the functional disability of the demented patient. For example, although AD is a chronic, progressive, irreversible neurological disease, during the early stages of the disease, reality orientation and remotivation therapy can contribute to maintaining the patient's ability to cope with activities of daily living (West, 1983). Patients with MID can be helped by slowing the progression of the dementia by effectively preventing further infarction with control of risk factors for cerebral atherosclerosis, vascular surgery to alleviate stenosis or occlusion of cerebral arteries, or pharmacologic treatment with vasodilators, anticoagulants, or antiplatelet agents (Meyer, 1981). Lastly, dementia resulting from such diseases as normal pressure hydrocephalus, metabolic or endocrine disorders are usually completely reversible if specific therapy is applied before permanent brain damage has occurred (Besdine, 1982). While the differential diagnosis of dementia arising from the latter group of diseases can be made accurately with special laboratory procedures, the differential diagnosis of AD and MID is more difficult.

The most valid and reliable instrument for differentiating AD and MID is the Hachinski Ischemia Scale (HAS) (Hachinski et al., 1975; Hachinski, 1983). However, the accuracy of the HAS is dependent on a careful neurological examination and detailed history of the onset and progression of the dementia. Since these data are often unavailable, a reliable biological marker for MID would be a valuable adjunct in the differential diagnosis of dementia. Preliminary findings suggest that the nootropic, oxiracetam, differentially affects erythropoiesis in AD and MID, and therefore may be a potential biological marker for MID.

Method

Fourteen male and female patients who met DSM-III criteria for dementia were studied. Following an extensive differential diagnostic screening that included a detailed history, Hachinski Ischemia Scale (Hachinski et al., 1975), physical and neurological examinations, ECG, EEG, chest x-ray, clinical laboratory battery, and CT scan, 3 male and 5 female patients met DSM-III criteria for primary degenerative dementia, and 3 male and 3 female patients met DSM-III criteria for MID. All patients were rated as mild to moderate severity (GDS 3 to 5) on the Global Deterioration Scale of Reisberg et al. (1982).

This was a multi-center, single-blind, dose-ranging study of oxiracetam in the treatment of the cognitive symptoms of AD and MID. Qualified patients were given one placebo tablet h.s. for 2 weeks. On their second visit active treatment was initiated at 400 mg oxiracetam h.s. for 1 week. If no untoward effects were encountered the dosage was raised to 400 mg b.i.d. for the second week then 800 mg b.i.d. for the next 2 weeks. The dosage was then titrated to 1000 mg b.i.d., 1200 mg b.i.d. and 1600 mg b.i.d. each for a 4-week period.

Results

The demographic characteristics of the study sample are shown in Table 1. No significant differences in age, sex, degree of cognitive impairment or baseline depression were observed between the AD and MID groups. In contrast, the MID group had significantly higher scores on the HAS, and higher systolic and diastolic blood pressures than the AD group.

Following oxiracetam treatment, hematologic studies that were normal at baseline revealed that oxiracetam lowered hematocrit (HCT). Hematocrit data were analyzed by a Two-Factor Mixed-Design ANOVA. The between–group, nonrepeated factor was diagnosis. The within group, repeated factor was time. Results showed that there was no significant main effect for diagnosis, $F(1,12) = 0.24, p > 0.05$. Likewise, there was no statistically significant main effect for time, $F(3,10) = 1.33, p > 0.05$. In contrast, there was a highly statistically significant diagnosis × time interaction detected, $F(3,10) = 12.75, p < 0.001$ that indicated that the MID group was selectively affected.

Likewise, red blood cell counts showed that there was no significant main effect for diagnosis $F(1,12) = 0.01, p > 0.05$ or for time, $F(3,10) = 1.72, p > 0.05$. However, a highly statistically significant diagnosis × time interaction was observed, $F(3,10) = 13.16, p < 0.001$.

Analysis of the hemoglobin data revealed that, overall, there was no significant difference between diagnostic groups, $F(1,12) = 0.15, p > 0.05$. Similarly, there was no main effect for time, $F(3,10) = 1.59, p > 0.05$, and only a trend toward a significant diagnosis × time interaction, $F(3,10) = 3.07, p < 0.08$.

A discriminative validity analysis was also performed. If a 2-percent drop in HCT was used as a cutting score, diagnostic groups could be correctly classified with 100-percent accuracy, Fisher Exact, $p < 0.0003$. Thus, as a diagnostic test, a 2-percent drop in HCT has a sensitivity and specificity of 100 percent.

Investigation into the mechanism of the drop in HCT showed that the reduction in HCT did not result from occult blood loss (negative guaiac and blood in urine) or he-

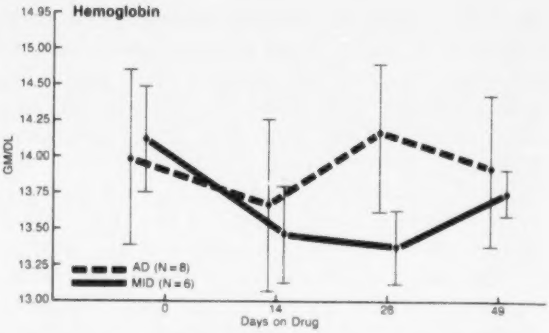

FIGURE 3. Time-response curve for hemoglobin.

molysis (negative antihuman globulin titer and normal bilirubin), but appeared to be related to reduced erythropoiesis since reticulocyte counts did not increase. While this suggests a bone marrow suppression, platelet estimates, and white blood cell counts were normal, and erythropoietin (EPT) levels were low, not high as would be expected in marrow suppression. This latter finding indicates that the reduction in erythropoiesis was probably secondary to decreased bone marrow stimulation by EPT.

Discussion

Oxiracetam is an analog of piracetam, a nootropic drug of putative value in the treatment of the cognitive/behavioral symptoms of dementia (Nicholas, 1982). Agents of this class have been shown to stimulate the conversion of adenosine diphosphate (ADP) to adenosine triphosphate (ATP) under hypoxic conditions, and it is this mechanism of action that is hypothesized to be the basis for its putative therapeutic effect in dementia (Gobert, 1972; Blass, 1980). This mechanism may also account for the differential effect of oxiracetam on erythropoiesis in AD and MID.

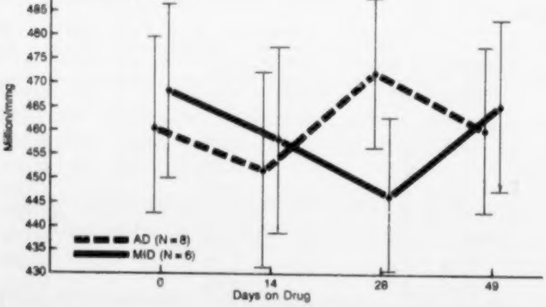

FIGURE 2. Time-response curve for red blood cell counts.

Erythropoiesis is regulated by tissue oxygenation. Under conditions of tissue hypoxia, the kidney is stimulated to secrete an enzyme, renal erythropoietic factor (REF). REF then cleaves a circulating precursor protein of erythropoietin to yield the active glycoprotein hormone, erythropoietin (EPT). Active EPT stimulates committed stem cell proliferation in the bone marrow and erythrocyte production is increased (Guyton, 1981).

It is hypothesized that the metabolic enhancing effect of oxiracetam, and probably other piracetam analogs as well, may improve tissue oxygenation in hypoxic tissue affected by atherosclerosis. As a response to this stimulus, erythropoietin levels are reduced, and erythropoietic activity is lowered. Since tissue hypoxia secondary to athersclerosis is probably more severe in MID than AD, this may be the basis for the differential erythropoietic response to oxiracetam. Thus, the findings suggest that it may be possible to administer oxiracetam and measure erythropoietin suppression as a diagnostic test for MID.

Thioridazine Metabolism and Effects on Stereotyped Behavior in Mentally Retarded Patients

Mark H. Lewis, Ph.D.,[1] Robert A. Steer, Ed.D.,[3] Judith Favell, Ph.D.,[2] James McGimsey, M.D.,[2] Luther Clontz, M.D.,[2] Carole Trivette,[2] Wendy Jodry,[2] Stephen R. Schroeder, Ph.D.,[1] Robert C. Kanoy, Ph.D.,[1] and Richard B. Mailman, Ph.D.[1]

Introduction

Thioridazine is one of the most frequently prescribed psychotropic drugs for behavioral control of mentally retarded patients (Aman & Singh, 1980; Lipman, 1970). Despite this, its efficacy in this population has not been adequately established (Aman & Singh, 1980; Davis, 1971; Davis, Sprague, & Werry, 1969; Heistad et al., 1982; Singh & Aman, 1981). The psychopharmacology of this drug is particularly interesting as thioridazine is believed to have at least two metabolites that contribute significantly to its behavioral effects. Recently, these S-oxidized metabolites (mesoridazine and sulforidazine) have been shown to be 2 to 100 times more potent than thioridazine depending on the *in vitro* test being used (Kilts et al., 1985; Lewis et al., 1983; Niedzwiecki et al., 1984). Thus, although circulating concentrations of thioridazine have been found to be poor predictors of behavioral outcome (Axelsson, 1977; Axelsson & Martensson, 1977), quantification of the drug plus its metabolites might increase this correlation markedly.

The present study sought to establish the efficacy of thioridazine for the control of stereotyped movement disorder. In addition, the study investigated whether the concentrations of the parent drug plus metabolites could better predict behavioral outcome. Finally, the question of whether abrupt withdrawal from chronically administered thioridazine would result in increased stereotyped behavior, other withdrawal emergent symptoms, or tardive dyskinesia was also studied.

The effects of thioridazine on the stereotyped behavior of institutionalized mentally retarded patients were determined using a double-blind, placebo-controlled, crossover design. Daily rates of several stereotyped behaviors were quantified over a 3- to 4-month period for each subject using computer-supported observational recording methods. Serum concentrations of thioridazine and its metabolites were determined over time for each subject by high performance liquid chromatography (HPLC). Three subjects went through an abrupt withdrawal design while three subjects were drug free at the start of the study and dose was titered to a preselected therapeutic range of active drug and metabolites.

Methods

Subjects

Six adult institutionalized mentally retarded patients exhibiting high levels of stereotyped movements (e.g., body rocking, head rolling, and hand flapping) participated in the study. Half the subjects had been free from antipsychotic medication for at least 6 months while the other half had been receiving at least 100 mg/day of thioridazine for at least the previous 6 months. Informed consent was obtained from the parent or guardian of each participant.

Experimental Design

A double-blind, placebo-controlled, crossover design was used to assess the effects of

either abrupt withdrawal from thioridazine or initiation of thioridazine treatment in drug-free patients. Four conditions with alternating on-drug and off-drug phases (withdrawal experiment) or alternating off-drug, on-drug phases (prospective experiment) were employed. Typically, each condition lasted approximately 4 weeks. One major difference in the prospective experiment was the adjustment of drug dose dependent upon rapid (24 hr) analysis of parent drug and metabolite blood levels. Each client was started on 100 mg of thioridazine with the desired endpoint that blood concentrations of "total active thioridazine metabolites" be equal to approximately 1000 ng "thioridazine equivalents"/ml.

Behavioral Measures

Continuous recording of selected behavioral topographies was carried out either three or four times each day for 30 minute periods by trained observers using electronic digital data collectors (Lewis et al., 1985). The effects of abrupt discontinuation of thioridazine were also assessed by the Abnormal Involuntary Movement Scale (AIMS).

Drug and Metabolite Determinations

Circulating concentrations of thioridazine and its major S-oxidized and *N*-demethylated metabolites (thioridazine-2-sulfoxide, thioridazine-2-sulfone, thioridazine-5-oxide, nor-thioridazine) were determined in serum by the HPLC method of Kilts et al. (1982).

Data Analysis

Time-series analysis employing the C-statistic was used to determine if changes in the rate of stereotyped responding following initiation or cessation of thioridazine treatment were statistically significant (Tryon, 1982; Young, 1941).

Results

Thioridazine and Metabolite Levels

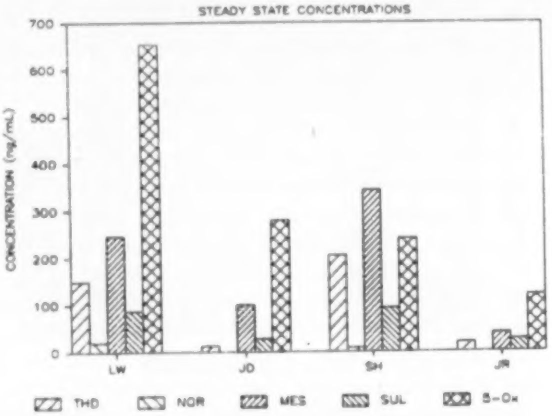

FIGURE 1. Drug and metabolite concentrations in patients on identical doses (100 mg/day) of thioridazine.

Discontinuation of thioridazine resulted in nondetectable blood levels of drug or metabolites 48 to 72 hours after the last dose. Both the absolute concentration and the relative proportion of drug and metabolites differed widely in individuals taking a constant dose or even identical doses of thioridazine (Figure 1). In all cases, the concentration of the parent drug was exceeded by one or both of the active S-oxidized metabolites. The ratio of active to inactive metabolites, which proved to be an indicator of behavioral outcome, was also variable across subjects (Figure 2) and not systematically related to dose. While total antidopaminergic activity and dose were positively correlated, abrupt increases in antidopaminergic activity were seen at specific dosage increments (Figure 3). [Total antidopaminergic activity was deter-

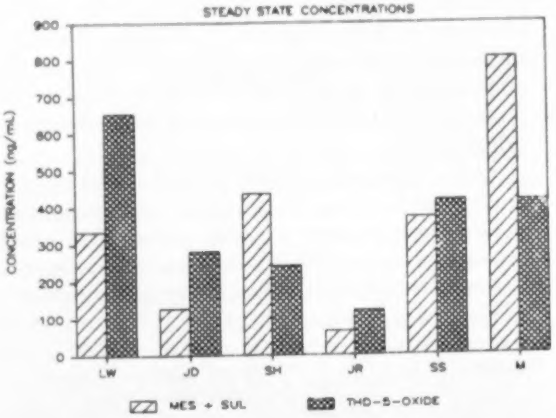

FIGURE 2. Ratio of active to inactive metabolites of thioridazine in all subjects.

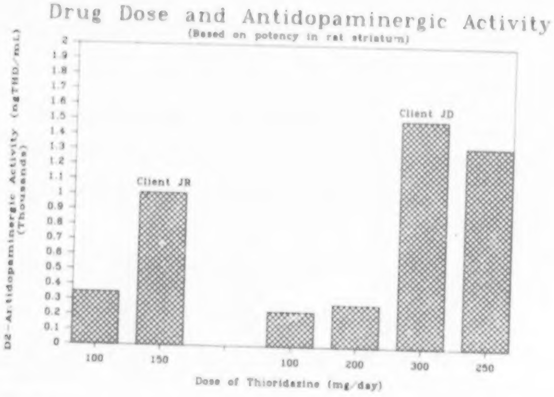

FIGURE 3. Total antidopaminergic activity in blood as a function of dose of thioridazine for two subjects.

mined by computing the sum of parent drug plus active metabolites weighted by their *in vitro* potencies in competing with ^{3}H-spiperone in rat striatal homogenates (Bylund, 1981; Kilts et al., 1985; Lewis et al., 1983)].

Thioridazine and Stereotyped Behavior

The results of the time series analyses employing the C-statistic showed that the initiation and cessation of thioridazine administration were significantly related to changes in the rates of responding for a variety of stereotypic behaviors. However, the pattern of results was inconsistent across subjects, with thioridazine increasing the rate of stereotyped responding in subjects SH and M (e.g., Figure 4) not appreciably affecting the rate in JR, JD, and SS (data not shown), and decreasing the rate in LW (Figure 5). Within the same individual, thioridazine administration or discontinuation was found to have similar effects on different stereotyped behavioral topographies.

Analysis of the AIMS data showed no evidence of tardive dyskinesia or withdrawal dyskinesias in any of the patients studied. Moreover, there did not appear to be evidence for withdrawal emergent symptoms. Indeed, only in one patient was there a clear indication of behavioral deterioration in the off-drug condition. This patient exhibited increases in screaming and pacing while showing decreases in stereotyped behavior following thioridazine discontinuation.

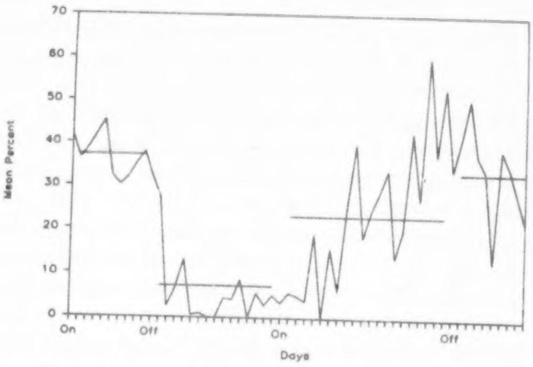

FIGURE 4. Rate of stereotyped body rocking for subject M during both thioridazine and placebo conditions.

Blood Levels and Behavioral Response

Relatively high levels of the parent drug and its active S-oxide metabolites coupled with relatively low levels of the inactive metabolite thioridazine-5-sulfoxide were associated with an increase in stereotyped behavior (subjects SH and M, Figure 2). The reverse was associated with either no change (subjects SS, JR, JD, Figure 2) or some improvement in behavior (subject LW, Figure 2). Neither dose nor total antidopaminergic activity appeared to be related to behavioral outcome. No evidence for a differential effect of drug administration or drug and metabolite blood levels on specific behavioral topographies was observed. For example, thioridazine administration or discontinuation had the same effect on three different stereotyped behaviors of subject M.

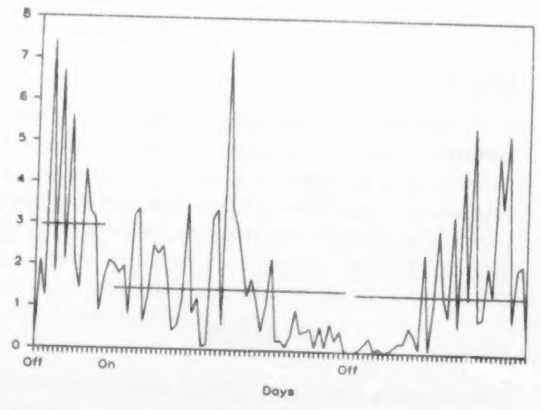

FIGURE 5. Rate of self-injurious behavior for subject LW during both thioridazine and placebo conditions.

Discussion

A number of reviewers have documented the serious methodological problems that have plagued psychopharmacological studies with mentally retarded patients (Freeman, 1970; Lipman et al., 1978; Sprague & Werry, 1971). As a result, the effects of thioridazine and other antipsychotic drugs on stereotyped responding or other behavioral categories have not been adequately demonstrated. The present study examined the effects of thioridazine on stereotyped behavior using a series of double-blind, placebo-controlled, intensive, single-case designs. Despite the fact that a frequently reported benefit of thioridazine is a reduction in stereotyped behavior (Heistad et al., 1982), we could find little support for such a position. Indeed, our data suggest that thioridazine in dosages typically used with this population may exacerbate stereotyped responding. These conclusions, while based on a relatively small number of subjects, are drawn from an intensive 3- to 4-month examination of each patient's behavior in several settings with concomitant determinations of drug and metabolite blood levels.

Thioridazine has been reported to suppress stereotypies at 2.0 to 2.5 mg/kg with either no improvement or behavioral deterioration observed at higher doses (Breuning, 1982; Singh & Aman, 1981). Our data suggest that even relatively low doses of thioridazine (100 mg/day) may exacerbate stereotyped responding depending on parent drug and metabolite levels. Heistad et al. (1982), however, have reported an 18-percent increase in stereotyped responding following thioridazine withdrawal. This effect was observed despite patients being maintained on relatively high doses of thioridazine.

A major conclusion to be drawn from the present study is the importance of quantifying parent drug and metabolite concentrations in mentally retarded clients when examining the behavioral effects of thioridazine. The wide variation in concentration supports the importance of blood level determinations and suggests that even fixed-dose studies may be inadequate. Another observation of some significance is the lack of withdrawal emergent symptoms observed in our subjects despite using an abrupt withdrawal design and patients on long-term thioridazine.

The lack of effect of thioridazine on stereotyped behavior may be due to its potent anti-cholinergic effects (Bylund, 1981) or lack of effect on striatal dopamine function (Bunney, 1984). However, the importance of establishing the effects of thioridazine on various classes of behavior seen in mentally retarded patients is underscored by its widespread use. Specific behavioral topographies must be intensively examined with appropriate attention paid to the role of drug metabolism. The results reported here suggest that thioridazine will not effectively suppress stereotyped behavior in dosages typically employed but may increase such responding. Low concentrations of active metabolites relative to inactive metabolites may be associated with some suppression of stereotyped behavior.

Methodological Issues in Treatment Research of Mental Illness in the Mentally Retarded[1]

Co-Chairs:

Introduction

The reorganization of the National Institute of Mental Health in October 1985 gave special emphasis to research on disorders of children and adolescents. Clinical, biological, and treatment studies were consolidated into a single branch, the Child and Adolescent Disorders Research Branch in the Division of Clinical Research. One of the most important problems receiving new emphasis in this Branch is the population of mentally retarded who are also mentally ill. This population is one of the largest with a serious and chronic illness, but effective clinical research has been hampered by several problems. Prevalence of these disorders in the community, where most of these patients now reside following deinstitutionalization, is difficult to establish. The diagnosis of specific mental disorders is complicated by the presence of retardation. The applicability of diagnostic criteria and assessment measures validated in research with individuals of normal intelligence cannot be assumed. Finally, specialized assessment techniques and research designs may be needed in order to assess the efficacy of treatments for mental disorders among the mentally retarded.

The following papers, presented at a special workshop for this population, reflect a beginning effort to resolve some of the research problems. The National Institute of Mental Health is committed to encouraging the research needed for more adequate treatment of the mentally retarded who are also mentally ill. This overview provides an assessment of the state-of-the-art, and we hope it proves useful to future research in this underdeveloped area.

Overview of Research in Psychopharmacological Treatment of the Mentally Ill/Mentally Retarded

Ronald S. Lipman, Ph.D.[1]

Introduction

Estimates of the prevalence of mental retardation vary from less than 1 percent to 12 to 13 percent. In general, 3 percent is taken as the prevalence figure and that translates to about 7,250,000 mentally retarded people (Breuning and Poling 1982). About 3 percent reside in institutions and the majority of those that are institutionalized are severely or profoundly retarded; that is, have IQs of less than 40 on the Wechsler Adult Intelligence Scale (WAIS; Wechsler 1955), or 35 on the Stanford-Binet test (Terman & Merrill 1973). The very large majority of retarded persons in the United States, 89 percent, are classified by IQ test scores as mildly retarded (IQs between 55 and 69 on the WAIS).

The most generally accepted definitions of mental retardation, both by the American Association of Mental Deficiency (Grossman 1983) and in the *DSM-III: Diagnostic and Statistical Manual of Mental Disorders* (American Psychiatric Association 1980), include three defining characteristics: (a) subaverage intellectual functioning (usually 2 or more standard deviations below the mean on a standard IQ test), (b) concurrent deficits in personal independence and social responsibility, and (c) onset before the age of 18.

Chromosomal abnormality—mainly Downs syndrome—accounts for roughly 15 percent of mental retardation; metabolic and nutritional disorders such as phenylketonuria are responsible for about 2 or 3 percent; about another 5 to 10 percent of cases of retardation are attributable to such factors as drug intoxication, infections, brain injury, or disease. The large majority of the mentally retarded—mostly the mildly and moderately retarded—are thought to owe their condition to environmental-cultural factors broadly grouped under such categories as psychosocial disadvantage and sensory deprivation.

Prevalence of Drug Usage

Institutional Settings

In a 1966–67 survey of drug usage in institutions for the retarded that included 142 State and 31 private institutions, Lipman (1970) found that 51 percent of residents were receiving psychotropic drugs and that two phenothiazine medications—thioridazine (Mellaril) and chlorpromazine (Thorazine)—accounted for 58 percent of all psychotropic drug prescriptions. These two drugs were the most frequently prescribed agents in 91 percent of the institutions participating in the survey. Moreover, 25 percent of these institutions typically used psychotropic medication from 4 years to an "indefinite" time period for their residents who received medication. While typical dosages were usually within the manufacturer's suggested range, it was not unusual to find maximal dosages well above the upper limits suggested by the pharmaceutical firms. The issue of polypharmacy was not examined in this survey.

Sprague (1977) reviewed the medical files on 1,094 residents of a large midwestern institution and found that 64 percent were receiving a psychotropic and/or antiepileptic medication. Thioridazine and chlorpromazine were prescribed for 34 and 5 percent of the residents, respectively. Polypharmacy was very much in evidence. While the median dose of thioridazine was 200 mg/day, the maximal dose was 1200 mg/day.

In another study, Marker (1975) reviewed the records for all the retarded residents in four State mental hospitals in a southern State. It was reported that about 60 percent of the residents were receiving phenothiazines with thioridazine and chlorpromazine being the most widely used. Moreover, 75 percent of the residents were receiving two or more drugs;

"many of these persons were receiving 4-5 drugs and some were receiving as many as 7-8 drugs" (p. 1).

DiMascio (1975), in a survey of two northwestern State institutions, found, in contrast to the Sprague and Marker results, much less polypharmacy. At one institution 53 percent of the residents were receiving a psychotropic drug, while at the other institution, 25 percent were on medication. The most frequently used psychotropic drug in both institutions was thioridazine, with chlorpromazine characterized as a "distant second."

Other surveys by Tu (1979) in Canada and Pulman, Pook, and Singh (1979) in New Zealand reported high rates of psychotropic drug usage, 42 and 47 percent, respectively. The treatment prevalence rates rose to roughly 60 percent when antiepileptic drugs were also included in the total.

Hill, Balow, and Bruininks (1985) reported the results of a national survey of drug usage conducted in 1978/1979 at the 1985 Pharmacotherapy and Mental Retardation Workshop sponsored by NIMH. They found a prevalence rate of 38 percent, excluding psychotropic drugs prescribed for epilepsy (36.3%). The major tranquilizers accounted for about 80 percent of psychotropic drug prescriptions. Roughly 3 percent of these medications were given for psychiatric conditions; the remainder were given for "overactive behavior" (p. 283).

Drug Usage in Community Settings

There is a more limited data base of the prevalence of psychotropic drug usage in the community or with children attending special education classes. In an Illinois survey of 3,306 trainable retarded children aged 3 to 21, it was found that about 7 percent received psychotropic medication for the management of behavior disorders, primarily hyperactivity (Gadow & Kalachink 1981). Roughly 12 percent of the sample was on antiepileptic medication.

Of real interest was the fact that stimulant medication tended to be the drug class of choice, although the major tranquilizers, primarily thioridazine, were a very close second. In general, doses were far lower than the dosage patterns observed in institutions.

In a second survey of about 2,600 handicapped children 3 to 5 years old attending special education class, Gadow (1981) found a 7.9 percent prevalence of psychotropic drug usage. Stimulant medications were used almost five times as frequently as neuroleptics. Again, these medications were prescribed for behavior disorders in which hyperactivity was present.

The most extensive study of drug usage in community residential facilities for the retarded was the one conducted by Hill and his associates cited above (1985). A true-probability sample of about 1,000 residents was selected from a nationally defined sample. Hill found that 25.9 percent were receiving psychotropic medication and 21.5 percent were receiving antiepileptic medications. About two thirds of these medications were neuroleptics. A small minority of these medications were given for a "psychiatric condition"; the great majority of medications were prescribed for "overactive behavior" (Hill et al. 1985, p. 283).

Data obtained by Agran and Martin (1985) on about 250 mentally retarded adults receiving services from a comprehensive community retardation agency found results quite similar to those reported by Hill; roughly half (48%) of the adults surveyed were receiving a psychotropic and/or anticonvulsant medication. About two thirds (66%) of the group received neuroleptics.

Psychotropic drug prevalence was also reported for retarded residents of public and community facilities by Intagliata and Rinck (1985). The study sample consisted of 295 clients randomly selected from the total of 3,600 individuals who resided in Missouri's community residential facilities and 171 clients randomly selected from the roughly 2,000 residents of the State's public residential facilities. The typical pattern of psychotropic drug usage was found. Thus, 54 percent of residents in public institutions and 36 percent of residents in community facilities were receiving psychotropic medications. The comparable rates for anticonvulsant drug use were 41.5 percent and 20.7 percent. As before, major tranquilizers—thioridazine, chlorpromazine, and haloperidol, in that order—were the most frequently used psychotropic medications, and stimulants were the least frequently used. Antidepressant drugs were also used infrequently in both residential groups. Polypharmacy was examined and dosage information was presented. While some polypharmacy was noted—4 percent in community residential facility clients and 13.4 percent in public residential facility clients—it was not judged to represent dangerous drug combinations. In general, dosage levels seemed more conservative than those found earlier by Lipman (1970).

These data taken as a whole suggest that about 35 to 50 percent of mentally retarded persons living in public institutions and about 25 to 35 percent of community residents are on psychotropic medications. When anticonvulsant medications are also considered, these prevalence rates rise from 20 to 30 percent. Clearly, then, these data support Aman's characterization of the retarded as among "the most medicated people in society" (Aman & Singh 1983).

Rationale for Pharmacotherapy in the Mentally Retarded

In some ways this workshop brings to mind the story of the man who had lost his car keys and was looking for them under the light of a nearby lamp post. He was asked by a well-meaning passerby why he was looking for his keys under the lamp post when his car was parked a few hundred yards away. He replied, "This is where the light is; this is where I can see." While there is undoubtedly "light" in the pharmacotherapy of the mentally retarded who have a dual diagnosis of schizophrenia or depression or mania, there is no question but that drugs are being prescribed for other reasons. One has only to look at the recent national survey by Hill and his associates (1985) to find that only a small minority of the mentally retarded in institutions and in community facilities who were receiving drugs were receiving them for a "psychiatric condition." Specifically 5.2 percent of the institutionalized and 2.9 percent of those residing in a community facility were said by those staff members most familiar with each resident to be receiving psychotropic drugs for a psychiatric condition. The overwhelming majority were on medication for "overactive behavior" (Hill et al. 1985, p. 283). These survey data confirm the view of the many reviewers of the pharmacotherapy literature involving retarded persons (Aman & Singh 1983; Lipman et al. 1978; Sprague & Werry 1971) who characterize the prescribing of psychotropic drugs as "usually prescribed to suppress maladaptive and nonconforming behavior" (Aman & Singh 1983, p. 318). These maladaptive and nonconforming behaviors include behaviors characterized as "aggressive," "assaultive," "hostile," "acting-out," "hyperactive," "self-injurious," "self-stimulating," and "stereotypic."

The actual literature on the efficacy of psychotropic drugs for psychiatric conditions in the retarded is very limited. Is this because the retarded are protected from other psychiatric disorders such as schizophrenia, major depressive disorder, or generalized anxiety disorder—or because most clinicians assume that schizophrenia will respond to antipsychotic medication regardless of the IQ of the patient and do not mount studies to investigate the question? In this regard, Eaton and Menolascino (1982) surveyed the extent of psychiatric illness in a sample of community-based mentally retarded people living in the Omaha, Nebraska, area. Of 168 individuals receiving psychiatric evaluation, about two thirds (68%) were given a psychiatric diagnosis. The most common diagnoses were organic brain syndromes occurring with transient behavioral or psychotic reactions (30%), followed by personality disorder (27%), adjustment reactions (21%), and schizophrenia (21%). No affective disorders and only one case of psychoneurosis were diagnosed. The diagnosis of organic brain syndrome was based on findings from mental status, physical and neurological examinations, and/or on a history of etiologically significant factors. The diagnosis of organic brain syndrome with behavioral reaction was used for that subgroup of retarded individuals who frequently displayed inappropriate acting-out behavior (e.g., emotional liability, impulsivity, poor judgment in social situations, and frequent temper tantrums).

The absence of diagnosed cases of affective illness in the Eaton and Menolascino (1982) survey probably reflects the low prevalence of this disorder among retarded persons, since Sovner and Hurley (1983) have reported that individuals with mental retardation were found to manifest the full range of affective disorders, i.e., depression and mania. They point out that individuals with all levels of severity of retardation can be adequately diagnosed as suffering from an affective illness. In the mildly and moderately impaired, standard *DSM-III* criteria can be employed. Gualtieri and Keppel (1985) believe that the standard diagnostic categories may be particularly tricky to apply to the severely and profoundly impaired but that to at least some degree traditional psychiatric categories are relevant. However, they also see merit in the development of a new psychiatric taxonomy which pays more attention to the behavioral position of psychologists like Baumeister and Rollings (1976), who maintain that psychiatric taxonomies are irrelevant to such problems as self-injurious behavior or aggression. It would also seem pertinent to screen for various types of conduct disorder and attention deficit disorder with or without hyperactivity in retarded children. Clearly, it would be helpful to support state-of-the-art diagnostic studies across the spectrum of severity of mental retardation and in cohorts of the mentally retarded living in public institutions, in various types of community residence facilities, and at home.

This author's intuition and sense of the literature suggest that mildly and moderately retarded individuals with a dual diagnosis will respond in keeping with expectations for their psychiatric diagnosis: i.e., mentally retarded schizophrenics will respond to neuroleptics much as nonretarded schizophrenics; retarded individuals with an affective disorder will respond to antidepressants and lithium as do the nonretarded; retarded hyperactive children will respond to stimulants as do normal IQ hyperactive children. But there is apt to be more variability in response to pharmacotherapy among the severely and profoundly retarded. In part, however, these anticipated differences are likely to reflect differences in the basic taxonomy of the psychiatric diagnoses and an overlay of organic and neurological impairment in the more severely retarded.

The anticipated similarity of therapeutic response in retarded and nonretarded schizophrenic patients is supported, in the main, by the results of a recent study comparing the relative efficacy of two neuroleptic medications. Menolascino and associates (1985) randomly assigned a total of 61 patients, about equally grouped into a retarded and nonretarded subsample of schizophrenics, to a 3-month trial of either thioridazine (Mellaril) or thiothixene (Navane). In this rater-blind study, it was concluded that thiothixene and thioridazine were as effective in the retarded schizophrenic as in the nonretarded schizophrenic. The following differences were observed: Optimal dose levels were lower in the retarded, and thiothixene alleviated symptoms reliably faster than thioridazine in the retarded but not in the nonretarded. Side effects were similar in both groups with drowsiness and sedation observed more frequently in the thioridazine-treated patients, and extrapyramidal symptoms (which responded well to symptomatic therapy) seen more often in thiothixene-treated patients. Menolascino indicates that thiothixene is the preferred drug not only because of its faster action in the retarded but because of its low incidence of drowsiness and sedation, which was judged likely to avoid further impairment in cognition.

Unfortunately, there is a dearth of literature on the treatment of affective illness in the mentally retarded. Naylor and associates (1974) studied 17 retarded inpatients who evidenced major depression and bipolar disorders. In the 14 patients who completed the 2-year placebo-controlled, double-blind trial with lithium, a statistically significant decrease in the "number of weeks ill" was noted. Actual episodes of illness were not significantly reduced. In another study involving patients with mood swings, Rivinus and Harmatz (1979) tested four patients with bipolar disorder and one patient with mania. These patients were judged to have had a statistically significant response to lithium and to have relapsed within about 6 months after double-blind placebo substitution. Again, in the main, similarities in therapeutic response between the retarded and nonretarded seem to outweigh differences.

If there are studies employing psychotropic medications for the treatment of anxiety disorders in the retarded, they have escaped the notice of reviewers (Aman & Field 1985; Lipman 1982). As with other classes of psychotropic medications, those studies which have employed the minor tranquilizers in the treatment of the mentally retarded have focused on behavioral symptoms such as hyperactivity, aggressiveness, and self-injurious behavior. The few better controlled symptom-focused studies suggest that the minor tranquilizers may actually increase hyperactivity and distractibility and decrease desirable behavior such as constructive play (cf. La Veck & Buckley 1961; Zrull et al. 1963).

Gadow (1985) has recently reviewed the literature regarding the stimulant drug treatment of hyperactive retarded and nonretarded children. This area is particularly difficult since hyperactivity is a symptom which may occur in the context of attention deficit disorder, in the context of conduct disorder, and in the context of organic brain syndrome. While the stimulant medications have been found very beneficial in the treatment of children with attention deficit disorders both behaviorally and on many laboratory tests of attention, vigilance, and memory, they are of arguable benefit for children with conduct disorders. Campbell and her colleagues (1982), concluded that stimulants failed to produce a satisfactory response. Minimal support for the efficacy of *d*-amphetamine in delinquents is provided in an early study by Eisenberg and colleagues (1963) and in a later study by Maletzky (1974). Diagnostic criteria were not spelled out in either study. In the Maletzky study, those delinquents who showed the best response were those who were most hyperactive prior to treatment and may well have met criteria for attention deficit disorder.

In his review, Gadow concludes that the response to stimulant medications among the more moderately impaired mentally retarded is similar to that of "hyperactive" nonretarded children: that is, mainly beneficial. In the more severely and profoundly retarded, response to the stimulants is primarily negative. These findings are probably tied to the presence of different diagnostic groupings in the different IQ levels studied. Diagnostic differences are also implicated in the relative efficacy with which Aman (1983) views the stimulants as contrasted with Gadow (1985). In this regard, Aman (1983) does not see the stimulants as "having a major role to play in the treatment of the mentally retarded." Very clearly, further studies are needed employing well-defined samples of retarded and normal children with attention deficit disorders and conduct disorders in which stimulant medications are tested in double-blind, placebo-controlled studies.

With regard to the pharmacotherapy of conduct disorders, there is a growing consensus that lithium carbonate is effective for the treatment of such symptoms as aggression, hyperactivity, and hostility. In a recent publication, Campbell and associates (1984) found lithium to be significantly more therapeutic than placebo in decreasing behavioral symptoms of hospitalized, aggressive children with conduct disorder. This was a well-designed and well-analyzed study and in a companion paper (Platt et al. 1984), Campbell and her colleagues reported that lithium had few, if any, adverse cognitive effects. Other studies have also shown a beneficial effect for lithium on aggression and hostility. These studies are reviewed by Campbell (Campbell et al. 1982). Behavioral symptoms of aggressiveness, self-injurious behavior, and chronic hyperactivity were reported to respond positively to lithium in a series of case studies reviewed by Aman and Singh (1983). Sovner and Hurley (1981) have also reviewed the literature in this area and conclude that "the available data lend tentative support for the use of lithium to manage behavior disorders in retarded individuals which are characterized by lifelong hyperactivity, aggressiveness, and/or self-mutilation" (p. 191).

It seems clear from the available literature that the response to lithium in the retarded and nonretarded vis-a-vis conduct disorder and/or the cardinal behavioral symptoms associated with the aggressive subtype of conduct disorder is essentially continuous across the chronological and mental age spectrum.

To make this point more generally, although time does not permit a full explication, there seems to be a qualitatively similar response to psychotropic drugs across the chronological and mental age spectrum for most disorders known to this writer. This issue was particularly salient with regard to stimulant medication where much of the early literature talked of a paradoxical response to stimulants in hyperactive children. However, the research of Rapoport and her associates (1980) and Werry and colleagues (Aman et al. 1984; Werry & Aman 1984) has indicated a qualitative similarity in response in normal children and adults as well as in hyperactive children. In general, all three groups showed a facilitation of cognitive performance and a reduction in physical activity.

Until some 5 years ago there was a real

question about whether or not children could be depressed and, if so, whether or not they could be helped by antidepressant medication. The answer to both questions was yes. Although there have not been many studies focused on the treatment of depression in the retarded, the review of the limited literature by Sovner and Hurley (1983) suggests that antidepressants and lithium may play a role in individuals with these dual diagnoses.

As has already been indicated in this paper, both retarded and nonretarded schizophrenic adults have been shown to respond favorably to neuroleptics by Menolascino and colleagues (1985) and there is evidence that children with autism and/or schizophrenia respond therapeutically to neuroleptics (cf. Fish et al. 1966), particularly to the more stimulating neuroleptics such as thiothizene. It is this author's impression that many of the neuroleptic studies conducted with hospitalized autistic and/or schizophrenic children included many children who were functionally mentally retarded.

In general, then, the literature tends to support the hypothesis that neither chronological age nor mental age is an important modifier of drug response, given reasonable diagnostic correspondence among samples.

Given that pharmacotherapy with the mentally retarded is overwhelmingly focused on the suppression of maladaptive behavior symptoms such as hyperactive, aggressive, or self-injurious behavior, how effective are psychotropic drugs? Here it should be pointed out that the vast majority of pharmacotherapy studies with the retarded fail to meet the basic criteria of adequate scientific trials, which have been clearly set forth in the excellent review by Sprague and Werry (1971).

Sprague and Werry (1971) indicated six minimal criteria that should be incorporated into any scientifically sound drug study. These criteria include (a) the use of placebo controls; (b) random assignment to treatment conditions; (c) "blind" evaluation of drug effects to protect against potential observer bias; (d) standardized dosages; (e) standardized evaluations; and (f) appropriate statistical tests. Unfortunately, most drug studies that employed retarded individuals do not meet acceptable methodological criteria. Aman and Singh (1983) added the additional criterion that clinical drug trials should be free of other confounding medications and noted how often this self-evident criterion had been violated in drug studies with retarded people.

It is interesting that although the data base of psychotropic drug studies with the retarded is particularly lacking in scientific merit, the quality of scientific reviews is particularly good. The most recent review in that tradition is by Michael Aman (1983). He concluded that the minor tranquilizers seem contraindicated and the antidepressants have not been adequately tested in well-designed studies. This author finds lithium carbonate promising. The efficacy of the stimulants is questionable; well-designed, diagnostically focused studies would be required to sort out whether these patients manifest behavioral problems in the context of attention deficit disorders, conduct disorders, organic brain syndromes, or childhood psychosis.

Major Tranquilizers

In a comprehensive review of 174 psychotropic drug studies with retarded persons, Lipman and associates (1978) reported that 60 percent of these studies dealt with the major tranquilizers. We have also seen that the bulk of psychotropic prescriptions written in institutional and community living facilities are for the major tranquilizers, primarily thioridazine, chlorpromazine, and the butyrophenone haloperidol. This is also the area of greatest concern since the long-term use of the phenothiazines, particularly in higher dosages, has been shown both to produce cognitive impairment and to be associated with the occurrence of a devastating abnormal involuntary movement disorder called tardive dyskinesia (TD). Aman has recently reviewed the literature relating drugs and learning in retarded individuals and, with the usual caveat that the literature is methodologically poor, reaches the same general conclusion as other previous reviewers of this literature (cf. Sprague & Werry 1971; Lipman 1979): the "preponderance of evidence suggests . . . the antipsychotics . . . are capable of depressing performance, especially at high doses" (Aman 1984, p. 159). The dose issue is a very important one since Werry and Aman (1975) found that high and low doses (0.05 mg/kg/day vs. 0.025 mg/kg/day) of haloperidol had opposite cognitive effects in nonretarded, aggressive, conduct disorder children. The low dose facilitated performance on a continuous performance task, whereas the high dose caused some deterioration on a test of short-term memory. Using somewhat higher doses of haloperidol needed to produce a clinically therapeutic effect with hospitalized aggressive children with conduct disorder, Campbell and associates (Platt et al. 1984) found that haloperidol, relative to placebo, caused significant decreases in Porteus Maze Test quotient scores and a slowing of reaction time on a simple reaction time task. These studies with the nonretarded as well as a few reasonably well-controlled studies with retarded persons (Adamson et al. 1958; Buck & Menolascino 1968; Claghorn 1972; Ucer & Kreger 1969) have indicated a therapeutic effect for haloperidol, both relative to placebo and to other phenothiazines, on acting-out and self-injurious behaviors. A few short-term studies support the efficacy of thioridazine on such behavior as well as on stereotyped behaviors such as rocking (Alexandris & Lundell 1968; Davis 1971; Davis et al. 1969; Le Vann 1970). Pimozide was also recently reported by White and Aman (1985) to be significantly more effective than placebo in reducing irritability and hyperactivity/noncompliance in a small sample of moderately to profoundly retarded residents. This drug seems particularly promising since at the 6 mg/day dosage used, it did not interfere with the learning of a discrimination learning task.

When one turns to concerns regarding the iatrogenic induction of TD via the use of neuroleptics, the literature is rather bleak in that we still have no effective active treatment for this abnormal involuntary movement disorder and the prevalance of the disorder is high enough to pose a real public health concern (Gardos & Cole 1980). A good general presentation of this area has been made by Gardos and Cole (1980) and an excellent study with retarded persons has just been published by Gualtieri and colleagues in the April issue of the *Archives of General Psychiatry* (Gualtieri et al. 1986). In this systematic neuroleptic withdrawal study, the prevalence of TD was 34 percent. The diagnosis of TD was used only when symptoms of abnormal movement persisted for at least 16 weeks after complete neuroleptic withdrawal. Moreover, 5 of the 13 patients with TD, 13 percent of the total sample, continued to be characterized by moderate to severe TD after 3 years of followup. Needless to say, these percentages translate into literally hundreds of thousands of retarded persons who are probably diagnosable as having TD. It should be stressed that Gualtieri and associates (1986) were able to identify only 3 of the 13 diagnosed cases of TD during maintenance neuroleptic therapy. They suggest that in order to detect early (presumably mild and reversible) forms of TD, a drug-free period of at least 4 weeks' duration be periodically employed. It should also be noted that in their data only total neuroleptic dose, and not the number of drug holidays, was related to the risk of developing severe TD.

The use of any treatment regimen should always involve (a) the assessment of potential benefits and risks; (b) a weighing of potential benefits and risks of alternative treatments (if they exist); and (c) the consideration of the risks involved in doing nothing. While this is obviously a complex judgment, it is, nevertheless, a critically important decision that should be based on solid scientific knowledge.

Conclusion

What, then, is the bottom line? Here this writer would agree with the position espoused by Gualtieri and Keppel (1985). Basically, the neuroleptics have a role in the short-term treatment of acutely disturbed mentally retarded persons *but* given the substantial risk of TD and the likelihood of cognitive impairment, long-term treatment might better employ behavior modification procedures.

From a research perspective, emphasis should be given to psychotropic medications which are less likely to result in cognitive impairment and serious side effects. Prime candidates for more systematic study are lithium and the psychostimulants such as methylphenidate and magnesium pemoline. In general, psychotropic drug studies should include measures of clinical efficacy, cognitive learning performance, and, whenever possible, behavioral alternatives. The National Institute of Mental Health and the National Institute of Child Health and Human Development should stimulate and encourage research in this area and might sponsor future workshops focused on issues of diagnosis and the development of objective, reliable, sensitive, and valid rating scales.

The relevant Institutes should encourage meaningful research in this area by the use of administrative devices such as the Request for Proposals and Request for Applications. It is not enough for the Institutes to play a reactive role to the field; they must encourage, stimulate, lead, and nourish, or progress in this area will continue to be slow and spotty.

Limiting Factors in the Use of *DSM–III* Criteria With Mentally Ill/Mentally Retarded Persons

Robert Sovner, M.D.[1]

Introduction

The treatment of psychiatric disorders in mentally retarded adults is severely hampered by the lack of diagnostic criteria which take into account the presence of developmental disabilities. However, current concepts regarding psychiatric disorders as discrete syndromes and their applicability, when there is coexisting mental retardation, are not at issue here. There is ample evidence that mentally retarded persons develop the full range of psychiatric disorders (Carlson 1979; Corbett 1979; Lund 1985; Reid 1972*a*, 1972*b*; Sovner & Hurley 1983), and that *DSM–III: Diagnostic and Statistical Manual of Mental Disorders* (American Psychiatric Association 1980) categories are valid—but not necessarily inclusive (Menolascino 1972)—for classifying behavioral-emotional disturbances in the developmentally disabled.

Nevertheless, the *DSM–III* was designed for mentally disordered persons with normal intelligence and psychosocial functioning. The effects of developmental disabilities upon the diagnostic process were not taken into account. As a result, *DSM–III* criteria are difficult to use when evaluating mentally retarded individuals, especially those with severe disabilities.

Effects of Mental Retardation on Clinical Presentation

Mental retardation affects the types of information which can be used for diagnostic decision-making and the diagnostic process itself. The interactions between mental retardation and mental illness are the result of four factors (see Table 1). These factors reflect the profound biopsychosocial effects of developmental disabilities.

Intellectual Distortion

Intellectual distortion refers to the effects of the mentally retarded person's diminished ability to think abstractly and communicate intelligibly. Deficits in the ability to observe and describe one's own behavior and feeling states severely hamper the elicitation of diagnostically relevant information (Carlson 1979; 1981) because the specific symptom criteria for most Axis I diagnoses rely on self-reports of essentially subjective experiences.

These difficulties are compounded by the poor communication skills of mentally retarded persons. They may have any combination of speech impediments, limited vocabulary, concrete thinking, hearing deficits, and receptive and expressive aphasia. There may also be the complete absence of language function.

TABLE 1. Four Nonspecific Factors Associated With Mental Retardation Which Influence the Diagnostic Process.

Factor	Definition	Clinical Impact
Intellectual Distortion	Concrete thinking and impaired communication skills	Inability of patient to label own experiences and report them
Psychosocial Masking	Impoverished social skills and life experiences	Unsophisticated presentation and lack of poise during interview can result in missed symptoms and misattribution of nervousness and silliness as psychiatric features.
Cognitive Disintegration	Stress-induced disruption of information processing	Bizarre presentation and psychotic-like state may be misdiagnosed as schizophrenia.
Baseline Exaggeration	Increase in severity of pre-existing cognitive deficits and maladaptive behaviors	Creates difficulty in establishing illness features, target symptoms, and outcome measures.

A main effect of intellectual distortion is that it is virtually impossible for an examiner to identify the characteristic features of psychotic disorders in patients with an IQ below 50 (Corbett 1979; Heaton-Ward 1977; Reid 1972*b*, 1976). Describing the form and content of hallucinations and delusions is beyond the ability of most mentally retarded persons with moderate or greater disabilities.

In addition, intellectual distortion subverts the clinical interview as the principal data collection mode for diagnosis. Psychiatry, as it is currently practiced, is based upon the supposition that a dialog between the patient and clinician is a reliable and valid way to elicit evidence of psychiatric illness (McHugh & Slavney 1983). Through the interview, the patient shares subjective, but diagnostically relevant information (e.g., guilt feelings).

However, the clinical interview has limited utility with regard to diagnosing psychoses in the mentally retarded, especially in those with moderate or greater disabilities or who are nonverbal. Through the interview process, the clinician may learn that the client is experiencing emotional distress, but not much will be learned about the cause of that distress. Thus, in many cases, the clinician must rely on the impressions and behavioral data collected by caregivers who work with the patient on a daily basis.

Psychosocial Masking

Psychosocial masking refers to effect of the developmental disabilities upon the content of psychiatric symptoms. By definition, the mentally retarded have deficits in interpersonal/social skills as well as diminished intelligence, and, as a consequence, are less likely to have had the wide range of life experiences enjoyed by their chronologically aged counterparts of normal intelligence.

This lack of real world experience contributes to a bland clinical presentation during a psychiatric illness. When self-reports are available, they are usually devoid of the richness of conception and detail that is associated with the symptoms of the major psychiatric disorders.

Delusional percepts may lack inventiveness and resemble the nonspecific fears of young children. Manic expansiveness may lack the usual grandiosity associated with this disorder. The grandiose content may go unrecognized unless the presence of mental retardation is taken into account: "When the normal person becomes manic, he thinks he's God. When the mentally retarded person becomes manic, he thinks he's not retarded" (Menolascino 1986).

Cognitive Disintegration

Cognitive disintegration refers to the tendency of mentally retarded persons to become disorganized under emotional stress (Menolascino 1983). Predisposed by organic deficits and concrete coping mechanisms, exogenous or endogenous stress can cause a deterioration in intellectual functioning and a clinically significant behavioral regression (Hucker et al. 1979).

The process of cognitive disintegration is similar to that which occurs in pseudodementia. During an acute episode of a psychiatric illness such as an affective disorder, an elderly person with compromised but compensated intellectual function develops many of the signs of a full-fledged organic brain syndrome. However, this cognitive deterioration remits when the acute psychiatric illness has been treated (Caine 1981). In addition, there is evidence that an acute affective illness, per se, may produce impairments in general intellectual ability and abstract thinking (Clark et al. 1985).

An analogous process may occur in mentally retarded persons. They are exquisitely vulnerable to stress-induced intellectual and emotional decompensation. Stress may overload their cognitive functioning, and, as a result, breakdowns in reality testing may occur. They may become transiently psychotic and present with the signs and symptoms of a brief reactive psychosis in response to seemingly minimal stress. Vague ideas reference or illusions may develop. Patients may withdraw and talk to themselves, creating or resurrecting an imaginary friend.

The effects of cognitive disintegration may be superimposed upon the features of a psychiatric illness so that clinical presentation may be quite atypical. Visual hallucinations have been reported to occur in mentally retarded persons with mania (Gordon 1919; Penrose 1963) and depression (Russell & Tanguay 1981). Penrose (1963) believed that mentally retarded manics were more likely to hallucinate than their counterparts of normal intelligence, and Schneider (1959, p. 71) suggested that the mentally retarded have difficulty modulating strong negative affects and tend to hallucinate "through fear and anxiety."

Thus, a bizarre presentation in a mentally retarded patient has little diagnostic significance. It may not even indicate that a psychotic process is present.

Baseline Exaggeration

Mentally retarded persons have a variety of cognitive and psychosocial deficits such as distractibility and poor judgment. These are seen in the absence of any mental illness. In addition, they may have developed a variety of maladaptive behaviors (e.g., self-injury) which serve as attention-getting and demand-avoidance maneuvers.

Baseline exaggeration refers to the fact that during a period of emotional stress, these deficits and maladaptive behaviors may significantly increase in severity. Thus, the signs and symptoms of a psychiatric illness may be a mix of new behaviors and an increase in severity of pre-existing ones. For example, chronic self-injury or aggression which occurs infrequently may suddenly increase in severity. Mania may cause an increase in the level of pre-existing distractibility and poor judgment. This phenomenon is particularly common in individuals who have a pervasive childhood developmental disorder and then go on to develop an affective illness or schizophrenia (Gilberg 1985; Reid 1976).

In some cases, it is therefore the exacerbation rather than the onset of behavioral problems which may be diagnostically relevant. This is of particular significance since the symptom criteria for most *DMS-III* Axis I disorders represent qualitatively abnormal disturbances of psychological function. If the significance of changes in the severity of pre-existing problems is unappreciated, diagnostically relevant information will be missed.

Approaches to Development of Diagnostic Criteria for Mentally Retarded Persons

The degree to which the diagnostic process is affected by the pathoplastic effects of mental retardation is a function of both the severity of the patient's developmental disabilities and his overall life experiences. For individuals with mild developmental disabilities, classic *DSM-III* criteria can often be employed. But even in these cases, sufficient cognitive disintegration and baseline exaggeration may be present to confuse the inexperienced practitioner.

Consequently, many clinicians, when working with individuals who have moderate or greater disabilities, are forced to adopt an intuitive approach to diagnosis because of the lack of diagnostic criteria which control for the pathoplastic effects of mental retardation. Gaps in the diagnostic picture are usually filled in with hypotheses, e.g., the patient's self-injury is a sign of dysphoria.

One approach to this problem has been to modify standard criteria. Hucker and associates (1979) published diagnostic criteria for depression and mania based upon the research criteria of Feighner and associates (1972), but adapted for use with mentally retarded persons. However, these criteria still contained items dependent on adequate communication and self-assessment skills (e.g., self-reproach/guilt).

A more promising approach is to use a diagnostic framework similar to that which has been developed for diagnosing affective disorders in children (Cantwell 1983). Children present many of the same diagnostic difficulties as do the mentally retarded, on account of their cognitive and psychosocial immaturity (Carlson 1981). This has led to the development of empirically derived diagnostic criteria based upon the presentation of depression in children.

Distortion-Free Diagnostic Criteria for Affective Disorders

The affective disorders are a good starting point for the development of distortion-free diagnostic criteria for the mentally retarded. The presence of neuro-vegetative features and specific responses to antidepressant and antimanic therapy make them relatively easy to diagnose, even in severely retarded persons (Reid 1976).

Table 2 lists behavioral criteria for major depression and mania. The types of behaviors which have been included are based upon the types of symptoms and behaviors which have

TABLE 2. Diagnostic Criteria for Major Depression and Mania for Use With Mentally Retarded Persons.

Major Depression	Mania
I. A disturbance of mood characterized by sadness, withdrawal, or agitation	I. A disturbance of mood characterized by elation, irritability, or excitability
II. Any 4[a] of the following 9 symptoms: • change in sleep • change in appetite and/or weight • onset or increase in severity of self-injurious behavior • apathy • psychomotor retardation • loss of activity of daily living skills, e.g., onset of urinary incontinence • catatonic stupor and/or rigidity • spontaneous crying • fearfulness	II. Any 4[b] of the following 7 symptoms: • decreased sleep • overactivity • biphasic course • onset or increase in severity of distractibility • increase in rate or frequency of verbalizations • onset or increase in severity of aggressiveness • onset or increase in severity of noncompliance

[a] Only 3 symptoms needed if there is a positive history of depression in a first degree relative.

[b] Only 3 symptoms needed if there is a positive history of bipolar disorder in a first degree relative.

been observed in affectively ill, developmentally disabled persons by the author and other clinicians (Carlson 1979; Corbett 1979; Heaton-Ward 1977; Hucker et al. 1979; Reid 1972*a*; Sovner & Hurley 1983). In addition, several elements have been introduced to increase the sensitivity of the criteria.

Family History

First, a positive family history for an affective disorder has been used to reduce the number of symptoms needed for a diagnosis. In some cases, clinical presentation is so confounded by cognitive disintegration and baseline exaggeration that it is difficult to find four diagnosis-specific symptoms, even when an affective disorder is strongly suspected. In those cases, family history data are often used to confirm the diagnosis.

Given the strong genetic component to the affective disorders (Winokur 1978) and the presence of an affective disorder in first degree family members of many symptomatic mentally retarded persons (Carlson 1979), the use of a positive family history is a reasonable way to increase the sensitivity of the criteria.

Biphasic Course

Biphasic course is a classic sign of bipolar illness and one which can be observed in mentally retarded persons irrespective of the severity of their disabilities (Reid 1976; Reid & Leonard 1977; Wallace 1983). It is often used to justify treatment with lithium carbonate (Reid & Leonard 1977), and, therefore, has been incorporated as a symptom criterion for the diagnosis of bipolar disorder.

Catatonia

A number of clinical reports have noted an association between catatonia and mental retardation (Earl 1934; Keegan et al. 1974; Rollin 1946; Zlotlow & Kleiner 1965) and there is a preponderance of evidence that catatonia is usually a sign of an affective disorder rather than schizophrenia (Reis 1985). In addition, the author has seen a number of depressed mentally retarded persons whose catatonic signs were related to an antidepressant-responsive affective illness. Thus, catatonia has been utilized as a depressive feature.

Conclusion

The confluence of intellectual distortion, psychosocial masking, cognitive disintegration, and baseline exaggeration makes it difficult to use *DSM-III* operational criteria in their current form. Future versions of the *Diagnostic and Statistical Manual of Mental Disorders* must recognize the limitations of diagnostic schema developed for individuals with normal intellectual and psychosocial functioning when applied to the mentally retarded with mental illness.

The Nature and Types of Mental Illness in the Mentally Retarded

Frank J. Menolascino, M.D.,[1] Andrew Levitas, M.D.,[1] and Carl Greiner, M.D.[1]

Introduction

The various degrees of mental retardation bring unique challenges relative to the risk of development of clusters of maladaptive behaviors. In general, persons with mental retardation are nearly twice as likely to have severe behavioral problems or mental illness as are the non-mentally retarded (Balthazar & Stevens 1975; Beier 1964; Eaton & Menolascino 1982; May & May 1979; Menolascino 1975; Penrose 1966; Pollock 1958). This risk may result in part from the person's difficulty in processing information; allied medical, physical, or sensorial difficulties; actual organic problems; cultural-familial factors; and society's nonacceptance of retarded persons with resultant elements of raw prejudice toward them. Other factors involve the inability of some retarded persons to communicate their feelings. This impairment is particularly important in the clinical setting wherein mentally retarded/mentally ill citizens have great difficulty in realizing the subjective and historical perspective of their behavioral status. Even those who appear to have superficially adequate language have extreme difficulty in processing abstract feelings and emotions. Many severe behavioral problems are caused by the way we teach or do not teach mentally retarded persons to become integrated into society. Globally, all of these problems are affected by society's role in the acceptance and support of people with special needs.

Undeniably, maladaptive behaviors are frequently reinforced and increase unnecessarily due to such reinforcement. For example, Johnny might throw objects on the floor in the classroom because he is frustrated. His frustration may be a condition of his inability to express himself. But if the teacher demands retribution, behavior could likely increase because he is getting the attention he might not otherwise receive. Paradoxically, the teacher's punishment becomes the child's reward; his maladaptive behavior is a means of avoiding the particular task, and the punishment allows him to avoid it. Over time this child can develop a cluster of "primitive" behaviors which enable him to gain control over an unresponsive world. If constantly punished, he would likely submit to his teacher, but he would not bond with the teacher. He would not learn the value inherent in human presence and participation, in equitable interpersonal transactions.

Examining the various levels of mental retardation shows its behavioral at-risk nature. Persons with *severe* and *profound* mental retardation often have major central nervous system disorders, sensory handicaps such as deafness and blindness, and severe motor and physical disabilities such as cerebral palsy and allied seizure disorders. These conditions all make the person more likely to have difficulty with interpersonal transactions, dealing with stress, and even what we might regard as minor changes in daily routine (Chess et al. 1971). Many persons with severe/profound mental retardation cannot express themselves without intensive teaching and ongoing support. They can easily learn to withdraw from the world through autistic-like behaviors (e.g., rocking, finger flicking, arm waving, and other perseverative behaviors) as an alternative to seeking others out and living independently. The lack of expressive language in many can easily lead to "primitive" communication in the form of aggressive, self-injurious, or self-stimulatory behaviors. These are often attempts to interact with, respond to, or master an otherwise overly complex or unresponsive world. *Moderately* retarded persons, besides their obvious developmental delays, have difficulty primarily with processing abstract information (Webster 1970). Most possess some degree of receptive and expressive language and are able to adapt well functionally in the world. In general, they can easily be taught the basic parameters of language, a wide repertoire of self-care and daily living skills, and vocational skills. Yet, they are also highly at risk to develop behavioral problems. Often their functionally adaptive and communicative abilities are a facade. The caregiver too often assumes that a moderately retarded person is adequately processing and dealing with complex situations such as the death of a loved one, the loss of a job, loneliness, etc., when actually such events can be overwhelming—in terms of both the person's comprehension and expression. Such complex and abstract human events may lead to severe "behavioral" problems. If retarded persons in crisis are not fully understood, enabled to express themselves, or actively supported in times of stress, they may display their emotions through what we would term "maladaptive" behaviors such as excessive sadness, withdrawal, or avoidance—beyond what is considered normal. In reality, these may be "normal" responses, given their ability to understand, communicate, and emotionally express themselves. Without adequate and sensitive support, a person with moderate mental retardation might rather quickly succumb to structured mental illness, such as an adjustment disorder, as a stepping stone to more serious illness (i.e., depression).

Diagnostic and Treatment Challenges

The diagnostic and treatment challenges of providing services for mentally retarded citizens who have allied emotional or behavioral needs is a topic that has recently taken on increased importance in view of significant changes in society's care and treatment of its retarded citizens. Deinstitutionalization has not only changed the physical site of service delivery, bringing persons with mental retardation into the mainstream of community life, but has also dramatically highlighted the need for teaching and treatment strategies for persons with mental retardation and allied behavioral challenges. No longer are these persons automatically hidden away in State institutions. No longer are punishment and restraint practices endured away from public scrutiny. Increasingly, many persons with both mental retardation and mental illness now live in their community in a societal climate which critically questions the demeaning and "put them away" practices of the past and present (United States Senate 1984).

The recent movement of retarded persons from institutional back wards into the community has literally changed the definitions of normal and abnormal behavior. Behaviors that were traditionally "expected" or "tolerated" in institutionalized retarded citizens are viewed as abnormal within the community mainstreams of our society. For example, the clinical phenomena of rocking, rumination, and headbanging are frequent behaviors in institutionalized persons; within the institution they are expected behaviors and their abnormality is tolerated at best and severely restrained at worst. It should be pause for reflection that such behaviors are rarely seen in retarded citizens who have been raised at home and matriculated through their home community system of educational-vocational-residential services.

As mentally retarded/mentally ill persons move from institutions into the mainstream of community life, they present caregivers with new diagnostic and treatment challenges. Diagnosis becomes important so that caregivers can gain therapeutically helpful insights into the underlying causes of "behavioral problems" and "noncompliant behaviors" and thereby apply similar treatment approaches to persons with similar behavioral needs.

A major issue in the care of retarded persons with severe behavioral problems is the widespread use of high levels and chronic usage of psychoactive medications for chemical restraint (Donaldson 1984; Lipman 1970; Lipman et al. 1978; Wilson 1983) rather than as entrees to learning. Another major issue is the relative lack of a sufficient number of community-based support systems for persons with mental retardation and allied mental illness (Menolascino & McCann 1983).

A number of major concepts, issues, and trends are relevant to the relationships between mental illness and mental retardation. The definition of mental retardation as found in the diagnostic system of the American Association on Mental Deficiency (AAMD; Grossman 1983) posits the presence of subaverage intellectual functioning and associated deficits in social-adaptive behavior. The majority of the disorders listed as capable of producing the symptom of mental retardation, however, are more descriptive of syndromes than of specifically understood diagnostic entities (especially in AAMD categories VII and VIII; see Table 1).

It should be noted that defining or describing the known/unknown causes of the symptom of mental retardation may say much (i.e., psychosis as part of the PKU syndrome and likewise for Lesch-Nyhan; tuberous sclerosis, etc.) or very little about expected behaviors beyond rough guidelines for social-adaptive accomplishments at different levels of retardation.

Similar perplexity may exist in the delineation of the causes and manifestations of mental illness in a given individual. (We define mental illness as occurring at that time when a cluster of behavioral signs and symptoms come together and become overly disruptive of the person's ability to function smoothly within the mainstreams of his/her family and community settings.)

Mentally retarded persons have been noted to display the vast majority of the major psychiatric disorders, that is, classically described instances of mental illness co-exist with mental retardation. The one does not exclude the other, even in severe/profound mental retardation. Some mental illnesses can cause pervasive developmental delays which may be separated only with great difficulty from strikingly similar developmental manifestations of mental retardation (e.g., infantile autism). When the uncertainty of primary causes of mental retardation are combined with the problems of clinical description in mental illness, an area of possible clinical confusion arises: symptomatic behaviors (although produced by different causes) can have the *same* final symptom(s) pathway: abnormal behavior. For example, the origins of an 8-year-old retarded child's hyperactivity may range from motor expression of anxiety to manifestations of cerebral dysfunction, or it may arise from both. Similarly, a shortened attention span in a mentally retarded 4-year-old child may be the end product of factors ranging from inadequate parenting relationships in infancy (suggesting that the parents were unable to operate as a selective stimulation barrier for the child) to actually impaired midbrain neurologic screening of incoming stimuli. The adult with moderate mental retardation can surely have a seizure disorder and also display schizophrenia along with his/her "old" developmental manifestations of mental retardation. Combined diagnoses are clearly indicated in these frequent instances of mixed disorders. Failure to describe and delineate multiple disorders in the same individual sharply limits both professional understanding and effective treatment.

TABLE 1. Classification of the Causes of Mental Retardation.

O.	Infections and intoxications (e.g., prenatal and postnatal infections)
I.	Trauma or physical agent (e.g., post-traumatic injury)
II.	Metabolism or nutrition (e.g., inborn errors of metabolism)
III.	Gross brain disease (postnatal) (e.g., neurocutaneous dysplasia)
IV.	Unknown prenatal influence (e.g., malformations of the brain)
V.	Chromosomal abnormality (e.g., Down's syndrome)
VI.	Gestational disorders (e.g., prematurity)
VII.	Following psychiatric disorder (e.g., childhood schizophrenia)
VIII.	Environmental influences (e.g., psychosocial disadvantages)
IX.	Other conditions (e.g., defects of special senses)

SOURCE: American Association on Mental Deficiency (Grossman 1983).

The symptomatic nature of mental retardation, however, coupled with multiple causes of an associated behavioral disorder, not only increases the possible number of causes but also presents challenging opportunities for alert professionals to initiate the necessarily wide array of specific treatment interventions which are so often needed. *DSM-III: Diagnostic and Statistical Manual of Mental Disorders* (American Psychiatric Association 1980) and its revised *DSM-III(R)* (American Psychiatric Association 1985) embrace most of the symptomatic and developmental parameters that are so important here. These considerations suggest that a description of mental illness in the mentally retarded should include behavioral patterns that produce serious conflicts within retarded individuals, their families, and the greater circle of their community transactions. A constellation of persistent personality traits, coupled with pervasive anxiety at a time of personal-social crisis, will significantly reduce a retarded person's effectiveness in intellectual and social-adaptive spheres.

Nature of Mental Illness in the Retarded

One reason frequently given for institutionalizing persons with mental retardation has been concern about their unmanageable behavior as they approach mid-adolescence or adulthood. Although such persons show a higher incidence of epilepsy and motor, special sensory, and allied handicapping conditions (Menolascino & Egger 1978), the tremendous improvements in medical treatment of these problems during the last 20 years have made possible revolutionary changes in our approach. Similarly, improved mental health treatment approaches have permitted a dramatic decrease in overly restrictive procedures and practices: isolation rooms, restraints, locked units, and excessive pharmacologic regimens have become associated with the professional practices of the past and, where still present, they are increasingly questioned by professionals and parents alike.

Improvements in the treatment of mental illness in the mentally retarded have flowed from an increased understanding of the nature (i.e., especially the etiological and developmental factors) and manifestations of mental illness in persons who are mentally retarded. Further exploration has made it abundantly clear that any condition which renders one less capable of handling reality-based demands makes one more susceptible to mental illness. Some of the factors that make persons with mental retardation vulnerable to mental illness are:

1. Relative inability to understand the demands of culture secondary to the presence of intellectual and social-adaptive limitations.

2. Major handicaps secondary to central nervous system impairments. These often lead to secondary behavior manifestations (e.g., self-stimulation as an external replacement for impaired inner resources).

3. Constricted emotional and personality growth secondary to delayed self-concept (i.e., differentiating the self from the nonself). Allied components are sensory and motor handicaps, and delayed integrative functions. These include poor reality perceptions and retained primitive thinking (e.g., magical thinking, confusion of reality/fantasy; problems in handling aggression, difficulty in pinpointing sources of frustration).

4. Delayed language development, with particular reference to delayed ability to express appropriate needs and decreased exploration of the world. Lack of ability to understand the interpersonal world around them leads to a very concrete cause-and-effect understanding of that world.

5. Impaired memory and transfer of learning. This leads to lowered inner control and decreased ability to delay responses and plan alternative methods of action. Thinking tends to be concrete and rigid, leading to poor responses to external and internal stress.

6. Low self-esteem fostered by early attendance at special schools. This leads to a sense of "differentness" and, eventually, a self-image of deviancy. The client perceives he or she failed the parents, leading to an increased need for praise and approval. Repeated nonapproval from peers leads to an increasing sense of incompetence and ineffectiveness. Peer rejection and lowered family and group expectations are reflected in lowered individual motivation.

7. Atypical personality defenses include increased obsessional behavior. This helps to control new situations and to control and/or cope with the environment. Fears, however, are retained longer and defenses are more fixed, leading to rigidity of lifestyle and increased utilization of nonadaptive defenses (e.g., denial, compulsive rigidity, withdrawal, regression, projection, etc.).

8. Vulnerability in adulthood. Continuation of the previously noted factors in childhood and adolescence directly leads to longer dependence, social and vocational limitations, and interference with heterosexual experiences. Failure to master key adaptational tasks at developmentally appropriate milestones in childhood and adolescence, when coupled with the lowered global intelligence, culminates in poor judgment.

Influences of the Level of Retardation

Severe Mental Retardation

The factors noted above are further affected by the level of mental retardation present. For example, in the severely retarded the presence of major central nervous system impairments tends to impair greatly their ability to assess or participate in social transactions. Without gentle and stable interpersonal support systems, the severely retarded tend to respond adversely to instances of gross interpersonal stress with stereotypical and out-of-contact behaviors that mimic autism. Similarly, their severe language delay (which is usually present) seriously restricts complex personality development, thus enhancing vulnerability to emotional under- or over-reactivity. A study by Chess, Korn, and Fernandez (1971) clearly noted that if severely retarded infants (in this study they were also blind and deaf secondary to rubella) were provided with early and ongoing interpersonal and developmental stimuli, they tended primarily to show delayed (i.e., primitive) behaviors that were consistent with their level of retardation. Chess and colleagues also noted, however, that in those instances where these early sets of interventive experiences were *not* provided, the infants consistently displayed "blindisms," prolonged rocking, marked irritability, persistent obstinancy, and "organic autism." Such learned responses often led to gross forms of harsh parental punishment and restraint. Thus the lack of early preventive intervention (including parental supports) so often, in reality, creates the very "problems" it later seeks to eradicate. Thus, if the handicaps were energetically treated, the impact on the person would be developmental delay but behavioral intactness; without these intervening developmental-treatment experiences the impact is a wide array of very disturbed and out-of-contact behaviors.

Moderate Mental Retardation

In the moderately retarded a set of personality characteristics is noted that can either lead to maximal developmental growth or become the focal point for mental illness. Specifically, during an extensive study of young moderately retarded children, Webster (1970) noted a consistent set of personality characteristics that he termed the primary psychopathology of moderately retarded youngsters:

1. benign autism;
2. repetitiousness;
3. relative inflexibility (rapid external changes leading to a heightened propensity for personality disorganization);
4. passivity (a protective posture secondary to perceived failure);
5. simplicity of emotional life (secondary to delayed personality development and allied symptoms such as motor and special sensory handicaps);
6. marked language delay.

The benign autism, nonobsessive repetitiousness, relative inflexibility, passivity, and simplicity of emotional life are all fertile ground for both the initiation of behavioral disorders (if highly supportive family or necessary program services are not provided) and misdiagnosis. Regarding the latter, one must be careful not to view the personality characteristics of persons with moderate mental retardation as signs or symptoms of mental illness. The few available autobiographies of moderately retarded individuals are helpful (e.g., Hunt 1967) since they illustrate the portrayal of the basic personality features without symptoms or signs of allied mental illness.

Mild Mental Retardation

Mildly retarded persons have a unique set of stresses. Their often nearly normal appearance tends to preclude their identification by others as disabled. This state of affairs can lead them and their loved ones to unrealistic expectations and major interpersonal failures. At the same time, these individuals are capable of developing some insight into their limitations.

Mental illness in the mildly retarded often is the result of the individual's being labeled as deviant, while being concomitantly enmeshed in the dynamic interplay of disturbed family transactions. The frequent delay in establishing that these youngsters have a distinct disability (usually not confirmed until 6 to 8 years of age) is a common source of anxiety. Low self-esteem is very frequent in persons with mild degrees of mental retardation; the stigma of attending segregated classes and adverse encounters with the social-interpersonal environment tend to make them feel even more ineffective and different. This life status is compounded by their inability to integrate the normal developmental sequences at the appropriate times. For example, during the late childhood period of personality integration, mildly retarded persons have considerable difficulty understanding the symbolic abstractions of schoolwork and the ongoing complexities of social-adaptive expectations from both family and peer group. At this stage they often gain some understanding of their limitations. Unfortunately, by early adolescence they have all too often established an identity that incorporates both mental retardation and behavioral deviancy. They are so often not buffered (or redirected) by loved ones into new interpersonal coping styles that could help them to correct earlier misconceptions about their self-identity. Without a source of ongoing family or community support and direction, they are at high risk for developing patterns of severe behavioral problems or marginal identities. In our experience with persons with mild mental retardation it is not uncommon to deal with severe psychosexual disorders, suicide attempts, and transgressions with the legal system. These personal-social developmental problems are primarily due to the lack of ongoing family and community support systems.

Persons with *mild* retardation primarily have difficulty with the societal acceptance of their "differentness" (Menolascino & McCann 1983). Society's posture of devaluation of retarded persons often leads to segregation and a superimposed subculture of deviancy. Raw prejudice can lead to more deviancy, which in turn can lead to more socially unacceptable behaviors. Most often, the mildly mentally retarded are all too cognizant of their cognitive limitations and understand the consequences of their actions. Yet, through naivete, misdirection, exploitation, or the pressures of social conforming, their behavior can become outside their direct control and lead to severe behavioral problems or mental illness more easily than in the population at large.

Lastly, a major complicating factor in the diagnosis and treatment of mental illness in the mentally retarded is the possible presence of any of a number of allied medical or developmental disabilities. The most common ones are cerebral palsy, the various types of epilepsy, auditory disorders, visual disorders, diabetes mellitus, and hypothyroidism (Ruedrich & Menolascino 1984).

Frequency and Types of Mental Illness in the Retarded

A few introductory comments on clinical diagnostic assessment are in order before the frequencies and types of mental illness in the mentally retarded are discussed.

The 1970s brought mental health and mental retardation professionals to a realization that mental illness can frequently hinder the intellectual and social adaptive growth of mentally retarded individuals. Nevertheless, there has been only minor change in the management of mentally ill/mentally retarded children or adults; their clinical diagnostic assessment is too often accomplished only with much difficulty and too little understanding of the manifestations of mental illness in persons with mental retardation.

It should be stressed at the outset that the mental status examination of a mentally retarded individual—whether to confirm the primary diagnosis of mental retardation, to assess the possibility of "pseudo-retardation," or to confirm the coexistence of mental illness with mental retardation—cannot be accomplished in isolation from general diagnostic procedures. In short, a psychiatrist ideally should carry out his or her own physical and neurological examinations and should be able to interpret pediatric, internal medicine, and neurologic consultations, as well as such studies as psychological evaluations and electroencephalograms. Direct caregivers play a key role in providing concrete objective data in these consultations. With these types of information the mental health professional is in a much better position to see the whole person and to piece together the diagnostic puzzle that mental illness can present in the mentally retarded person. To cast the mental health professional in the role of a "complete professional" may appear to be asking too much, but failure to assess clearly all parameters of behavior can result in many of the major diagnostic errors made with persons with mental retardation. It seems that exclusive focus on the mental status examination has perpetuated the classic split between the *psyche* and the *soma* in evaluating and treating persons with these special needs.

Studies concerning the frequency and types of mental illness in the mentally retarded have some major methodological problems. Before 1960, studies were carried out primarily in institutions. Frequency rates reported range from 16 percent (Penrose 1966) to 28 percent (Beier 1964) and as high as 40 percent (Pollock 1958). These studies, as well as more recent investigations of institutionalized persons (Balthazar & Stevens 1975; May & May 1979; Menolascino 1975) are questionable guides to the true frequency of mental illness in the mentally retarded because institutionalization traditionally has been used as society's mechanism for "managing" persons with social-behavioral difficulties. The more recent studies may also reflect the increasing referral of "community rejects" to institutions (Menolascino 1970). In other words, are these individuals disturbed because of personality deficits secondary to their underlying mental retardation, or are they disturbed because of the way they are treated by society?

Many reports on mentally retarded individuals living with their natural families or in their primary communities have appeared (Berman 1977; Chess 1962, 1970; Dewan 1948; Eaton & Menolascino 1966, 1967, 1982; Menolascino 1967, 1969; Webster 1970). These studies report that persons with mental retardation fall prey to the same types of mental illness that befall people with normal intellectual abilities. Recent professional literature repeats the theme that persons with mental retardation have the same range of psychoses, neuroses, personality disorders, behavior disorders, and adjustment reactions as the general population. Other investigators report a different spectrum and a higher incidence of mental illness among retarded persons than in the general population (Beier 1964; Garfield 1963; Phillips & Williams 1966). Some suggest that there are qualitative differences as well, so that some psychiatric conditions seen in retarded persons may represent unique syndromes (Bender 1970; Menolascino & Egger 1978; Webster 1970). Yet there have been few studies that have looked specifically at the frequency and types of mental illness in this population.

The data in Table 2 summarize the types of mental illness found in a review of 543 admissions of mentally retarded persons with mental illness to an acute psychiatric care setting over a 5-year period. (This review was conducted by the authors at the Nebraska Psychiatric Institute, Omaha, Nebraska.)

NOTE: A review of mentally retarded/mentally ill patients at the Nebraska Psychiatric Institute, Omaha, NE (unduplicated count) July 1, 1979, through June 30, 1985. *N* = 543.

A similar spectrum of types of mental illness was noted in a study of 115 mentally retarded citizens, all of whom lived in their primary homes or a community-based program. They were seen, in an outpatient setting, for diagnosis and treatment.

Review of Tables 2 and 3 shows that the mentally retarded can, and do, fall prey to any of the major psychiatric syndromes.

TABLE 3. Psychiatric Disorders in a Community-Based Sample of 115 Retarded Persons, by Level of Retardation.

Diagnosis	**Mild (*n* = 50)**	**Moderate (*n* = 41)**	**Severe (*n* = 24)**
Schizophrenia	13	8	4
Personality Disorder	22	7	2
Anxiety Disorders	1	0	0
Adjustment Disorders	9	14	1
Organic Brain Syndrome			
With transient behavioral reaction	2	8	11
With transient psychotic reaction	3	4	6

Even when persons with mental retardation are emotionally well adjusted, they experience some difficulty functioning independently or semi-independently in their community. If their lives are complicated by mental illness, their adjustment difficulties are obviously compounded. Recent studies rather consistently have reported a 25 to 30 percent frequency rate of emotional disturbances and have suggested strongly that clinical focus must be placed on the diagnosis and subsequent treatment of the combined findings of mental illness and mental retardation.

Childhood Schizophrenia and Mental Retardation

Psychotic reactions of childhood have presented a major challenge to caregivers because the psychotic child frequently functions at a mentally retarded level. Early observers believed that all psychotic children "deteriorated." In 1943, "early infantile autism" was described (Kanner 1943); yet labeling a child "autistic" presents some formidable diagnostic and treatment problems. A number of followup studies (Bender 1959, 1970; Menolascino 1970; Rimland 1964; Rutter & Schopler 1978; Schain & Yannet 1960), along with the literal rediscovery of the wide variety of primitive behavioral repertoires in retarded persons, have tended to mute the earlier clinical enthusiasm concerning the interrelationship between functional psychoses and early infantile autism. It is striking to observe bizarre behavior, persistent withdrawal, echolalic speech, and the affective unavailability of some persons in early adolescence who had clearly regressed from an earlier higher level of functioning.

Because treatment-prognosis guidelines may differ for youngsters with autistic reactions and the combined mental retardation-childhood schizophrenia syndrome noted above, the differential diagnosis is therapeutically significant beyond mere academic interest. For example, the vast majority of autistic youngsters seem to profit greatly from mental retardation services and secondary mental health consultations (Rutter & Schopler 1978). Conversely, the retarded youngster who develops schizophrenia has a primary need for mental health services, with mental retardation services filling a secondary role until the functional psychosis subsides.

Adult Schizophrenia and Mental Retardation

Instances of paranoid schizophrenia are noted in both verbal and nonverbal persons. Examples in the authors' recent clinical work include three nonverbal adults who drew their attackers on paper, complete with nonverbal gestures. One young man labeled his separate fingers as the "source" of his common delusions, which he portrayed symbolically in crude drawings. In the entire group of people with combined diagnoses of mental retardation and schizophrenia, the schizophrenia was clearly marked by altered affective responses, bizarre rituals, and interpersonal distancing.

Personality Disorders

Personality disorders are characterized by chronically maladaptive patterns of behavior (e.g., antisocial personality, passive-aggressive personality, etc.) which are qualitatively different from psychotic or anxiety disorders (American Psychiatric Association 1980). It is interesting to note that the schizoid personality has been reported only rarely in retarded persons. The authors have diagnosed and treated a number of such persons. The personality disorders occurred in individuals whose behavior was based primarily on extrinsic factors; none had causal relationships to the symptom of mental retardation. The presence of personality disorders can be an allied disability for mentally retarded persons.

Anxiety Disorders

Early reviews (Beier 1964; Garfield 1963) of the occurrence of psychoneurotic disorders in retarded persons suggested that their frequency was quite low. The type of psychoneuroses reported was limited to such disorders as anxiety and depressive reactions. Recent reviews (Balthazar & Stevens 1975; May & May 1979), however, dispute the concept of the incompatibility between neuroses and retardation. They are quite explicit regarding the diagnostic criteria and attribute the neurotic phenomena to factors associated with atypical developmental patterns and disturbed family functioning. For example, anxiety disorders in retarded children clearly link symptoms of anxiety (e.g., fear of failure and insecurity) to external factors such as chronic frustration, unrealistic family expectations, and persistent interpersonal deprivations. Interestingly, these reports suggest that psychoneurotic disorders are more common in individuals in the high-moderate and mild levels of mental retardation. This has prompted speculation that the complexity of psychoneurotic transactions is beyond the adaptive limits of more severely retarded persons. Alternatively, the manifestations of psychoneuroses may not be as obvious, or may present differently, in the supervised and regimented lives of the more severely retarded.

Adjustment Disorders of Childhood, Adolescence, or Adulthood

Although the category of adjustment disorders is perhaps overutilized in the assessment of nonretarded persons, it is only infrequently employed during the clinical assessment of emotional disturbances in the retarded population. Because mentally retarded individuals have a predisposition to overreact to stimuli and a limited understanding of social-interpersonal expectations, they are more likely to exhibit personality disorganization after minimal interpersonal stress. The adjustment disorders may be caused by continuing inappropriate social-adaptive expectations or unexpected and frequent changes in externally imposed life patterns. Clinically, these disorders respond rapidly to environmental adjustment (when coupled with the realignment of parental, residential, and educational personnel's expectations and goals), brief utilization of psychopharmacological adjuncts, supportive counseling, or a combination of these treatments.

Depressive Disorders

An area which has attracted little attention until recently is the appearance and recognition of depression in persons with mental retardation. Yet if we consider the language and communication problems of retarded persons as well as their limited social skills and lack of social networks, it makes sense that the retarded person is highly at risk to develop depressive reactions (Berman 1977; Matson 1982*a*, 1982*b*; Schloss 1982). The authors have often seen persons develop severe behavioral problems due to the loss of loved ones or transitions in family life. Caregivers may misunderstand these behavioral problems unless they are sensitized to the full sentient nature of persons with mental retardation and to the difficulty which many have in dealing with abstract phenomena. Indeed, the retarded person may display signs of depression different from those of the nonretarded population. Vegetative signs will be found, however, as will a high frequency of family histories and biochemical parameters compatible with, and indicative of, affective disorders.

In summary, persons with mental retardation, because of their high incidence of central nervous system impairment and their diminished interpersonal coping abilities, present a greater than average risk for developing associated mental illness. The reported frequency of mental illness in mentally retarded individuals suffers from the myopia of the reporters. As May and May (1979) noted, well-recognized forms of major personality dysfunctions (i.e., the symptom clusters noted in alcoholism or suicide) are only rarely reported in the current literature on the dual diagnosis of mental retardation and mental illness.

Conclusion

Caregivers need to understand the at-risk nature of persons with mental retardation which is related to a variety of factors—both intrinsic and extrinsic. Many of the predisposing conditions can be eliminated through ongoing supports which prevent mental illness. Others may be "given" predispositions which have to be worked around and dealt with in a compassionate, caring, and respectful way. Just as important, caregivers must understand that any clustering of behaviors which equates with a major mental illness requires active intervention; that such intervention requires the teaching or reteaching of new behaviors; and that persons with these needs require more integration and support, not less, if they are to live in the confluence of family life. They require sensitive caregivers and often a restructuring of their personal and social reality by such means as increased caregiver support to help them pass through times of acute stress.

The caregiver is essentially responsible for intervening at points of risk in a person's life to help that person make the transition from at-risk points to emotional stability. At these moments the caregiver becomes the person's emotional mediator.

Understanding the nature and underlying causes of mental illness in the mentally retarded is only the beginning. It provides the caregiver with insight into the person's problems and a roadmap for ongoing care and treatment. Regardless of the types or intensity of behaviors, the caregiver's fundamental goal should be to break through whatever avoidant, self-injurious, disruptive, or destructive behaviors might exist, and to respectfully and gently move the person from these states to human interdependence. Clearly, persons with the dual diagnosis of mental retardation and mental illness present a persistent challenge to the clinician and require specialized service models if their needs are to be appropriately met. These persons can be appropriately served if a range of psychiatric, medical, educational, vocational, and residential services and supports are available. On the surface, the continuum of care for this population appears to be no different from that utilized for the mentally retarded population in general. However, the services differ in their treatment intensity relative to staffing competency, staffing patterns, and the availability of psychiatric support services. Professionals need to develop specific acute care, subacute care, and ongoing long-term management approaches which utilize a balanced range of treatment techniques to ensure the optimal social reintegration of these complex retarded persons.

Mental retardation is a given. Some of the physiological causes of mental illness may be givens. The question is: How can caregivers bring persons with mental retardation from a disengaged state—a state in which their behaviors block them from meaningful human interactions—to a state in which they can participate fully in family and community life? The entire need for change does not rest with the person with mental retardation. Caregivers need to discover personal and social change strategies to help persons with special needs live fully in family and community life.

Psychometric and Demographic Characteristics of the Psychopathology Instrument for Mentally Retarded Adults[1]

Michael G. Aman, Ph.D.,[2] Janine E. Watson, B.Sc. (Hons.),[3] Nirbhay N. Singh, Ph.D.,[3] Sarah H. Turbott, B.Sc.,[2] and Catherine P. Wilsher, M.Sc.[2]

Introduction

Recently, Senatore, Matson, and Kazdin (1985) described an inventory of psychopathology for mentally retarded adults. Called the Psychopathology Instrument for Mentally Retarded Adults, or simply PIMRA, the instrument is available in both a Self-Report and an Informant version. The PIMRA is based on the *DSM-III: Diagnostic and Statistical Manual of Mental Disorders* (American Psychiatric Association 1980) and its 57 items resolve into eight subscales as follows: Schizophrenia, Affective Disorder, Psychosexual Disorder, Adjustment Disorder, Anxiety Disorder, Somatoform Disorder, Personality Disorder, and Poor Mental Adjustment.

Such an inventory could be important to the clinical application of psychotropic drugs in mental retardation for several reasons. First, it is important to have psychometrically robust tools to enable psychopharmacological research to make progress in looking for subject-treatment interactions. Second, such an instrument could facilitate the day-to-day clinical use of psychotropic medication. Third, given substantial evidence of overuse of psychotropic agents with this population (Aman & Singh in press), availability of suitable instruments may help to stem the tide of inappropriate treatment.

The authors became interested in the PIMRA as a possible means of studying psychopathology in mentally retarded individuals. The authors employed the Self-Report version developed by Senatore and associates (1985) but, because of some difficulty in obtaining the Informant version, generated a slightly different informant questionnaire by rewording the Self-Report version for completion by third parties. Data from the novel informant version will be presented elsewhere. In this paper data are presented from 160 mentally retarded adults on the psychometric properties of the Self-Report version as well as the effects of salient demographic variables. As the developers of the PIMRA have pointed out, it is essential that data be available on the reliability and validity of such instruments before they are assimilated for routine use in the field.

Method

Subjects

Criteria for subject selection were that the person under study be judged capable of understanding and responding to questions within the PIMRA, and that at least one caregiver be available who knew the individual well. The subjects were 160 mentally retarded adults drawn from two settings. Those in the first and larger group ($n = 95$) lived in the community and attended a workshop training center caring for 180 individuals. The second group ($n = 65$) was drawn from a residential institution caring for approximately 600 individuals. Characteristics of the two samples, including age, sex, and functional level are presented in Table 1. As is clear from Table 1, subjects within the institution tended to be older, predominantly male, and more severely impaired.

TABLE 1. Subject Characteristics Presented by Setting.

Variable	Community ($n = 95$)	Institution ($n = 65$)	Total ($n = 160$)
Age (Yrs.)			
Mean	24.08	36.03	29.38
SD	6.02	13.07	11.40
Range	18–52	18–67	18–67
Sex (%)			
Males	48.4	70.8	57.5
Severity of Retardation (%)[a]			
Borderline	24.2	12.3	19.4
Mild	62.1	26.2	47.5
Moderate	13.7	61.5	33.1

[a] Based on the American Association on Mental Deficiency (Grossman 1983) classification.

Procedure

Informed consent was obtained from the administration of the institution concerned and from parents of the community subjects, as well as from all subjects who took part.

Subjects completed the Self-Report version of the PIMRA during an interview led by a female research assistant who had 10 years' experience working with mentally retarded people. The interviewer stated each item to the subjects and recorded their response (yes or no). If necessary, the question was repeated or further questions asked to clarify the subject's response.

To assess interviewer accuracy, three additional observers scored 38 of the 160 interviews (24%). Spearman reliability correlations between scores ranged from .95 to .97, indicating high accuracy in interpreting subjects' replies and in coding these answers.

Five months after the initial ratings were obtained, a second set of ratings was collected on a random sample of 32 subjects.

In summary, the Self-Report version of the PIMRA was filled in for 160 mentally retarded adults residing either in the community or in a public residential facility. Assessments of interviewer coding showed that scoring of subject responses was very accurate. As a means of assessing stability over time, ratings were repeated for 32 subjects after 5 months.

Results

In general the data from the community sample and the institutional group were analyzed separately because of marked differences in age and sex distributions for the two samples. Insofar as it was possible to do so, the same statistical tests that were employed by Matson and associates (1984) and Senatore and associates (1985) were used here.

Psychometric Characteristics

Internal consistency. Coefficient alpha is a measure of internal consistency based on the average correlation among items, and it provides an estimate of the extent to which questions on a given subscale assess the same attribute. Alpha coefficients were calculated for each combination of setting and subscale. Alpha ranged from .45 to .73 with a mean of .64 (*see* Table 2).

TABLE 2. Alpha Coefficients Presented by Setting and Subscale.

Subscale	Community	Institution
Schizophrenia	.66	.62
Affective Disorder	.66	.63
Psychosexual Disorder	.64	.67
Adjustment Disorder	.64	.69
Anxiety Disorder	.61	.70
Somatoform Disorder	.45	.66
Personality Disorder	.56	.73
Mental Adjustment	.60	.71

Item-whole correlations. Internal consistency was also analyzed by computing the correlation between each item and its respective subscale total (Spearman correlations). The *mean* correlations (i.e., for each group of seven or eight items comprising each subscale) broken down by setting and subscale are presented in Table 3. These ranged from a low of .30 to a high of .54. Ninety-three of 114 items (82%) correlated significantly ($p < .05$) with total subscale scores, and the mean item-total correlation was .39.

Stability of ratings. Ratings were repeated after 5 months for 32 subjects. Because of the smallness of the sample, it was not possible to analyze separately for setting. Spearman correlations are presented in Table 4. Only three of eight subscales were found to correlate signifi-

TABLE 3. Mean Item-Total Correlations Presented by Setting and Subscale (Spearman Correlations).

Subscale	Community	Institution
Schizophrenia	.36	.39
Affective Disorder	.48	.41
Psychosexual Disorder	.32	.37
Adjustment Disorder	.41	.50
Anxiety Disorder	.53	.51
Somatoform Disorder	.28	.30
Personality Disorder	.38	.36
Mental Adjustment	.36	.34

cantly over this interval, and the mean correlation for all eight subscales was .31.

Effects of Demographic Characteristics and Setting

Age, sex, and functional level. Subscale scores were also analyzed as a function of age (treated as a continuous variable), sex, and functional level (mild and borderline vs. moderate mental retardation) using the general linear models procedure from the Statistical Analysis System (SAS; Ray 1982). As there were pronounced differences in subject composition across the two settings, these analyses were initially conducted separately for each sample.

Age. Within the community sample, no age effects were found. Within the institution, age was directly associated with scores on one subscale, Somatoform Disorder ($p<.05$, regression coefficient = .031).

Sex. Within the community group, there were no sex differences. However, in the institution, sex was associated with significant differences on Psychosexual Disorder ($p<.05$). Female residents had a mean score of .50 compared with .27 for males.

TABLE 4. Spearman Correlations Between Test and Retest for Subscale and Total Scores ($n=32$).

Subscale	Correlation
Schizophrenia	.29
Affective Disorder	.26
Psychosexual Disorder	−.15
Adjustment Disorder	.34
Anxiety Disorder	.29
Somatoform Disorder	.56***
Personality Disorder	.47**
Inappropriate Mental Adjustment	.40*
Total	.65***

* $p < .05$; ** $p < .01$; *** $p < .005$.

Functional level. No differences occurred due to functional level within either sample.

Summary. To recap, one comparison each showed an effect due to age and sex, but functional level had no measurable influence on psychopathology scores. Both significant findings were confined to the institutional group.

Effect of setting. Because of extensive age differences between settings, subjects at the two age extremes were deleted from this comparison. The effect of setting was analyzed for subjects between 23 and 40 years of age inclusive ($n = 84$), and the effects of age, sex, and functional level were partialled out by analysis of covariance. None of the subscales discriminated significantly between the community and the institutional sample.

Factor Structure

Factor analyses were performed using a principal components solution followed by varimax rotation. In keeping with the procedure adopted by Matson and associates (1984), all factors with eigenvalues of 1.50 or greater and with at least five items having a loading of .35 or more were included. The result was a four-factor solution (*see* Table 5). Factor I had numerous items relating to worry and mood and, as in the report by Matson and associates, it has been labeled Anxiety. Factor II dealt with orientation to other people and, as in the previous report, has been labeled Social Adjustment. Factor III is new and describes problems with sexual identification and reality orientation and has been titled Identity/Reality Problem. Finally, factor IV included an amorphous collection of problems (hearing voices, experiencing pain, need to make others happy), and it has not been labeled.

Discussion

In general, the statistics relating to the PIMRA's psychometric characteristics were not as convincing in this study as in the original reports. Coefficient alpha was substantially less with a mean alpha value of .64 as compared

TABLE 5. PIMRA Items Grouped by Factor.

Item No.*	Loading	Item Description
Factor I: Anxiety		
4	.47	Do you get real upset when things get confusing?
5	.56	Do you worry a lot?
12	.69	Are you a very nervous person?
13	.35	Do you have trouble thinking about one thing at a time?
20	.44	Do you get angry and fight with other people?
21	.42	Do you worry about making friends?
23	−.39	Do you care about what other people say to you?
29	.45	When things go bad for you, do you feel OK?
33	.40	Have things been bad for you?
42	.53	Are you real happy some days, and real sad other days?
44	.35	Do you hate rules . . . .
45	.40	Do you feel relaxed most of the time?
46	−.35	Is it bad to be sick?
53	.59	Are you nervous most of the time?
Factor II: Social Adjustment		
15	.40	Do you enjoy things that are funny?
22	.36	Do you breathe well?
26	.42	Do you feel happy most of the time?
30	.55	Do you think you will live a long time?
31	.39	Do people understand you?
32	.51	Do people like to be with you?
37	.39	Do you like talking to new people?
41	.75	Do you like living with other people?
50	.50	Do you like being with groups of people?
52	.40	Do you get along well with people at home and at work?
56	.49	Do you like to be alone most of the time?
Factor III: Identity/Reality Problem		
8	.43	Do you get along well with lots of other people?
11	.66	Do you wish that you were (opposite sex)?
28	.79	Do you take things that only belong to you?
35	.70	Do you ever take all your clothes off outside . . . . ?
36	.53	Can you do most things on your own?
48	.52	Do you wish that you were a tree . . . . ?
49	.36	Do you like to collect unusual things like old papers or garbage?
Factor IV: Unlabeled		
3	−.44	Are you happy that you are a (same sex)?
9	.42	Do you hear voices that upset you?
14	.43	Do you have a lot of pain?
19	−.40	Do you try real hard to act like a (same sex)?
39	.38	Do you get excited a lot?
43	.36	Do you get a real excited feeling when you see stockings or underwear?
55	.48	Do you always try to make other people happy?

*Item numbers do not necessarily correspond to those in the original scale.

with .85 reported by Senatore and associates (1985). Item-whole correlations were actually higher in this study than in the initial report ($r_s = .39$ as compared with .31). Nevertheless, in 21 of 114 comparisons, the items failed to correlate significantly with their respective subscales, and these items should perhaps be re-examined for their appropriateness.

The stability of the Self-Report version was substantially lower than in the original article (Senatore et al. 1985) with only three of eight subscales (as well as the Total score) showing a significant correspondence between original and subsequent ratings. The mean correlation of .31 obtained in this study was also substantially lower than the figure of .56 reported by Senatore and associates.

Demographic variables such as age, sex, and functional level had surprisingly little effect on psychopathology scores. However, this is basically what the developers of the instrument also found (Senatore et al. 1985). There are numerous reasons to speculate that individuals residing in an institution might show greater psychopathology than those living in the community, but these data do not bear this prediction out.

Finally, the factor structure was remarkably similar to that reported by Matson and associates (1984), although this analysis produced two additional factors. Anxiety and Social Adjustment emerged as the first two factors in both analyses with the addition of Identity/Reality Problem and another, difficult-to-label, factor in this study.

Conclusions

Certain problems with the psychometric characteristics of the Self-Report version were noted in this study. Therefore, further studies of both the Self-Report and the Informant versions of PIMRA appear to be indicated. Informant instruments have had a lengthy tradition of use in child psychology and psychiatry (Boyle & Jones 1985; Conners 1969; Costello et al. 1985; Quay 1979), whereas self-rating instruments have been relatively uncommon. Furthermore, many of the difficulties encountered in work with children are analogous to those confronted with mentally retarded adults. In view of these considerations, the Informant version of the PIMRA may well prove to be a more valuable tool than the Self-Report version.

Finally, there have now been several attempts in child psychiatry to validate the *DSM-III* diagnostic scheme (e.g., Koriath et al. 1985; Reeves et al. in press) and certainly not all have been confirmatory. The PIMRA is an attempt to extend that diagnostic system to mentally retarded individuals, but the presumed underlying dimensions again need validation. The factor analysis carried out here, together with that by Matson and associates (1984), raises the important question of whether the present scoring system for this instrument is appropriate for this population. The authors are presently conducting a cluster analysis with these data to take a more detailed look at this issue.

Components of the Design of Psychopharmacology Studies[1]

Barbara Geller, M.D.[2]

This paper addresses the various components of the experimental design of psychopharmacology studies with particular reference to the dually diagnosed population, i.e., the population diagnosed as both mentally retarded and suffering from a major psychiatric disorder as described in the *DSM-III: Diagnostic and Statistical Manual of Mental Disorders* (American Psychiatric Association 1980).

Component I. Rationale

The rationale for these studies is that the problems in diagnosis and assessment in the dually diagnosed population are sufficiently different from those of the nonretarded population as to require separate study. In this way, the dually diagnosed are similar to other groups (e.g., pediatric) who require separate study.

Component II. Aims

There are two essential aims of drug studies:

A. To demonstrate that the benefits of pharmacotherapy are significantly better than placebo.

B. To demonstrate that the benefits significantly outweigh the risks.

Component III. Long Range Goal

Historically, the administration of psychotropic drugs to the mentally retarded population has been directed toward the management of behavioral problems (e.g., aggression). The use of drugs for a concomitant *DSM-III* psychiatric diagnosis is an understudied area. In this respect, the dually diagnosed are similar to other groups (e.g., pediatric, geriatric) that require special consideration. For studies of dually diagnosed populations, aiming at a psychiatric disorder could potentially lessen the reported prevalence of nonspecific polypharmacy and of indefinite lengths of treatment.

Component IV. Preliminary Studies

Prior to undertaking the double-blind placebo-controlled studies necessary to fully evaluate the effectiveness and safety of a particular drug, one needs to investigate whether or not it is feasible to give these drugs in a systematic manner. These preliminary studies should include the following six areas:

A. Assessment instruments specific for both IQ and age range should be developed to establish the *DSM-III* psychiatric disorder diagnosis. Similarly, specific instruments need to be developed for monitoring severity at baseline and during the protocol.

B. IQ and age-specific instruments for measuring and monitoring side effects should be developed. Scales developed to assess and monitor symptoms and side effects in the dually diagnosed that are modifications of those used in the nonretarded population will facilitate comparison of data between the retarded and nonretarded populations. Further, the use of the pediatric technique of interviewing the subject and an observer (parent, guardian, nurse, etc.) to arrive at a rating should also be advantageous for the dually diagnosed.

C. Drugs selected to be used in studies of the dually diagnosed should have the same characteristics as those chosen for other special populations (e.g., pediatrics). These are:

1. They have been well studied in non-mentally retarded populations to avoid, as much as possible, confounding issues such as previously undescribed adverse effects.
2. Sedative effects are low relative to other drugs of their class so as to impair, as little

as possible, the already compromised cognitive abilities of the subjects.

3. The incidence of anticholinergic side effects should also be low because of the relative difficulty the retarded population may have in reporting those anticholinergic effects that are less observable (e.g., urinary retention).
4. Relatively low extrapyramidal and other neurological adverse effects are especially important for the dually diagnosed where prior extensive drug usage is frequent.

D. Open drug trials are useful in establishing:

1. The dose range for optimizing efficacy.
2. The dose range for minimizing side effects.
3. The half-life of various agents in this population—to be able to develop an appropriate dosage regimen.
4. Plasma level monitoring where it has been shown to be clinically useful in the nonretarded population.

E. The length of study used in open trials should be at least as long as that used with the nonretarded population. The investigator may wish to run a trial for a week or two longer, however, in order to be sure that the length of time to response in the dually diagnosed population is not longer than that in the nonretarded population.

F. Training the staff in psychoeducation is essential because the parents, spouses, and other relatives of the retarded population often maintain the expectation that when the psychiatric disorder improves, so will the patient's cognitive ability. Although cognitive ability may improve to a certain extent after recovery from the psychiatric disorder (because of better concentration, etc.), improvement is unlikely to be sufficient for the patient to gain normal cognition.

Component V. Defining the Study Population

The general purpose of defining the study population is to obtain a homogenous group of subjects in order to obtain generalizable data. Further, obtaining a homogenous group for study permits using similar assessment instruments for all the subjects. For example, if subjects from both the pediatric and geriatric age groups are included or subjects from different *DSM-III* mentally retarded groups are included, different assessment instruments will be needed. Both inclusion and exclusion criteria are needed in order to define the study population.

A. Inclusion criteria include the following:

1. Descriptive criteria should give the age range (pediatric, adult, geriatric), sex, socioeconomic status and residential status (inpatient, outpatient, group home, etc.) of the subjects.
2. Diagnostic criteria should include the *DSM-III* psychiatric disorder under study. A statement is also needed as to the inclusive IQ range and whether mentally retarded of all etiologies, or only certain ones, will be considered for study.
3. The length of time that the psychiatric disorder has been present in order for the subject to qualify for study should be specified.

B. Exclusion criteria address the following issues:

1. The IQ ranges and etiologies not included.
2. The exclusion of other *DSM-III* psychiatric disorders.
3. Exclusive medical conditions.
4. Exclusive neurological conditions.
5. Prior drug usage and how long the subjects need to be drug-free prior to entry into study. The latter is defined as the time it takes for the previous drugs to disappear from the body plus 1 week. Finding inactive metabolites of neuroleptics in the urine over a period of months is not ordinarily taken as an exclusion criterion.
6. Alcohol and other substance abusers should be excluded (unless they are the specific target population).
7. Because many patients in this population have been chronically treated with neuroleptics, some of them will have tardive dyskinesia or its variants. The investigator should specify which dyskinesias will be excluded. It may also be useful to aim for subjects who will have had equivalent amounts of neuroleptic exposure (i.e., the maximum total life dose of neuroleptic).

Component VI. Assessments

This category refers to the instruments to be used to screen subjects and to collect data. The following types of assessments are useful in psychopharmacology studies:

A. Diagnostic scales to establish the *DSM-III* psychiatric diagnosis.

B. Diagnostic scales to establish IQ and other cognitive abilities.

C. Scales that yield numerical values to measure the severity of the *DSM-III* psychiatric disorder under study. These are administered at baseline and then weekly or at other intervals during the protocol in order to monitor change over time.

D. Severity scales for monitoring IQ and cognitive measures during the protocol.

E. Instruments to measure adaptation in the residential, school, and/or work environments.

F. Psychosocial schedules, including items that measure life history events prior to and during the illness.

G. Physical measure scales used to monitor possible adverse effects (e.g., electrocardiogram tracings, height, and weight). These should specify the time of day and the conditions of eating and clothing.

H. Side-effect scales.

I. Family history schedules.

J. Baseline physical examination and screening laboratory measures (e.g., complete blood count, urinalysis, SMA 25, etc.).

Component VII. Issues in Assessment Implementation

To facilitate the use of assessment instruments and maximize the value of the data collected, the following are important:

A. Raters who are performing the assessment scales should have the appropriate experience and education, especially for clinical semi-structured interviews.

B. Interrater reliability among the raters for a particular study must be established. Even if the assessment scale has been used extensively by the investigator, it is important that new raters hired for a study be trained until they attain reliability.

C. Specifying the time of day that ratings are performed is important in terms of both the disorder being studied and the pharmacokinetics of the medications. For example, in disorders with a diurnal variation such as a major depressive disorder, performing some scales in the morning and some in the afternoon may provide nonvalid data because of the natural diurnal variation in the illness. For medications such as those used for the hyperactivity syndromes where improvement may correspond with peak plasma levels, it is important to state the time of day the drug is given and the time of day that ratings are given and to decide beforehand whether these will coincide.

D. The validity of the data is strengthened if baseline assessments and end-of-study assessments are performed by a different rater from the one who performs the ratings during the protocol.

Component VIII. Study Medication

Issues important in assuring that the patient is receiving the medication systematically include:

A. The specific hour(s) the drug will be administered should be scheduled.

B. The drug should be packaged in a way that makes it easy for the person giving the medication to follow instructions. This is especially important for those patients who will be in nonhospital residential settings.

C. Placebos should be prepared by the manufacturer or compounded in the facility pharmacy. Placebo medication prepared by placing a nonidentical tablet or capsule in an opaque capsule is an inadequate blinding technique for the mentally retarded population, where biting, chewing, or general curiosity may lead to breaking the blind.

D. The dispensing facility should be able to follow the protocol requirements for packaging and distribution.

Component IX. Compliance

To help ensure compliance with medication regimens:

A. Assure that the person who administers the drug to the patient is reliable. The retarded population should be treated similarly to the pediatric population and have all medication administered by another person.

B. Employ techniques that ensure swallowing, such as encouraging the person to swish water around in the mouth after taking the pill.

C. Dispense an exact number of pills for no longer than a week's period of time and perform pill counts to detect unused pills.

D. Monitor compliance by such direct measures as plasma and/or saliva levels which can be very helpful in detecting noncompliance in subjects and in caretakers who may not report their own noncompliance.

Component X. Double-Blind Placebo-Controlled Study Design

The two essential phases of a double-blind, placebo-controlled study begin after baseline studies have been completed.

Since psychopharmacological agents often have high placebo response rates, the *first phase* of the study should be a *2-week single-blind period* during which all subjects receive placebo. This will eliminate many placebo responders, permit a smaller number of subjects in the double-blind phase, and avoid administration of active medication to subjects who do not need it.

At the end of Weeks 1 and 2, subjects who are below the predecided criteria of recovery on the severity scales are discontinued.

The remaining subjects enter the *second phase*, the *double-blind, placebo-controlled protocol*, in *randomized* order. During this phase, interval monitoring should be performed. A sample of such a protocol for a theoretical 6-week study is given in Table 1.

The length of the double-blind, placebo-controlled study should be no shorter than the duration of similar studies of the drug in nonretarded populations.

Cross-over designs refer to protocols in which subjects sequentially receive active drug and placebo in randomized order. This type of investigation is useful for chronic, noncycling illnesses where natural recovery due to the length of time is not a factor.

Discontinuation studies are performed to determine the length of time a drug needs to be continuously administered following recovery in order for the recovery to be maintained. These protocols permit comparison of relapse rates after discontinuation at varying lengths of time.

TABLE 1. Sample Protocol for Double-Blind Placebo-Controlled Study.

	Phases							
	Single-Blind		Double-Blind Placebo-Controlled					
Weeks of Phase	1	2	1	2	3	4	5	6
Ratings								
Symptoms	X	X	X	X	X	X	X	X
Side Effects	X	X	X	X	X	X	X	X
Physical Measures	X	X	X	X	X	X	X	X
Plasma Measures	X	X	X	X	X	X	X	X
Week of Total Study	1	2	3	4	5	6	7	8

Component XI. Statistical Issues

A. It is imperative to perform *power analyses* to determine the number of subjects needed to detect a significant effect. For double-blind, placebo-controlled studies, it will be necessary to have expected rates of active and of placebo response during the protocol. For the dually diagnosed, the expected rates of response can be estimated from the reported studies of the nonretarded population.

B. The end of study analysis (e.g., χ^2 statistic) will compare active to placebo response rates based on predecided criteria of response on the severity scales.

C. Multivariate analyses should be performed to find predictors of response, which are important for future research and clinical work.

The components presented here are common to psychopharmacology studies. However, each clinical trial and every drug present unique problems that are the challenge to psychopharmacology investigators. Attention to standards of experimental design such as those offered here free the investigator to turn creative energy to the solution of those problems.

Treatment Outcome Research for Depression in Mentally Retarded Children and Youth: Methodological Issues

Johnny L. Matson, Ph.D.[1]

Diagnosis

Childhood depression is a topic that has only recently begun to receive much attention. As recently as 1978 there was debate on whether or not this phenomenon was evident in young persons (LefkoWitz & Burton 1978). However, the rapid change in views of professionals is evident since entire books and many articles have now been written on the topic (Cantwell & Carlson 1983). Initially, a very broad list of symptoms had been used to describe the syndrome. Thus, in addition to symptoms such as dysphoria, irritability, low self-esteem, self-deprecation, hopelessness, suicidal ideation, and social withdrawal, indirect responses such as aggression and noncompliance were noted. Current research, however, suggests that the symptoms of childhood depression are similar to those reported in adults. Using adult criteria, recent research suggests that a group of depressed children can clearly be delineated (Carlson & Cantwell 1980; Kazdin et al. 1983).

Also, related to the diagnosis of depression in children is the clear differential diagnosis of particular disorders. It has been demonstrated empirically that children identified as mentally retarded are less likely to have their symptoms of emotional disorders identified as such. Rather, clinicians typically attribute those behaviors to the child's mental retardation. This concept is defined as diagnostic *overshadowing* and it has been demonstrated empirically (Reiss & Szyszko 1983). It has been found that approximately 30 percent of a group of adolescents who were identified as conduct disordered and who could not function acceptably even in a behaviorally disordered class meet criteria for depression (Matson & Nieminen 1986; Nieminen & Matson 1985). It is this author's view that children may be afflicted with *multiple emotional problems simultaneously*. This conceptualization differs from previous points of view where the symptoms were attributed to the same disorder as in the case of masked depression. The conception of multiple disorders should enhance the accuracy of differential diagnosis and fits into the conceptualization of diagnostic *overshadowing* noted above. Also, there is no other well-delineated method of dealing with these overlapping symptoms.

Rate of Depression

Substantial numbers of emotionally disturbed children evince depression, and this has been noted by several researchers (Albert & Peck 1975; Carlson & Cantwell 1979). However, the group of depressed children and youth who are also mentally retarded is one that has been completely ignored. This group constitutes more than 3 percent of the total childhood population, and perhaps as much as 10 to 15 percent of the emotionally disturbed group. These handicapped children and youth exhibit the wide range of childhood psychopathology found in the population at large. In addition, the rates of emotional disturbance are much higher in these children. For example, Chazan (1964), who studied mildly mentally retarded children in school settings, found the rate of emotional disturbance to be twice that of the general population. Similarly, Chess and Hassibi (1970) studied 52 noninstitutionalized children aged 5 to 11 with IQs between 50 and 75 and found that over half of them evinced emotional problems. In the Isle of Wight studies, several thousand developmentally disabled children were rated and emotional disturbance was in excess of 30 percent, a rate four to five times that of the general population (Rutter et al. 1976). Many other studies of this type exist (Matson & Barrett 1982). What all of these studies show is that a serious problem is present, and that these children and youth are

much more likely to evince emotional problems than the general population of young children.

Methodology Issues

To date, little research on the treatment of depressed children has occurred, and no studies specific to the mentally retarded population have been reported. Yet there are issues specific to the mentally retarded population which should be considered in the development of effective treatments. Differential diagnosis and the development of methods sensitive to the evaluation of treatment effectiveness are of particular concern. These and related issues considered of importance in evaluating treatment outcome research will be reviewed. Also, the use of single case and control group outcome studies as means to evaluate treatment effectiveness will be discussed.

Assessment

The issue of assessment is a critical one in evaluating treatment outcome research both in establishing the severity and type of depression and in measuring all or at least many of the behaviors which are likely to be affected by a particular treatment. Thus, in conducting meaningful treatment research the first order of business is the development of measures for which the psychometric properties for the mentally retarded population have been established. Given that approximately 98 percent of the mentally retarded population is in the mild or moderate range and given that these persons typically have some verbal skills, retarded youth belonging to this group would seem to be the most likely candidates for initial research attention.

Differential Diagnosis

Differential diagnosis is particularly complex with the mentally retarded child. Involved are not only the typical developmental issues, but also diagnostic overshadowing. Thus, age, level and type of mental retardation, type and severity of mental retardation, and cultural and sex issues are among those which should be considered. In previous research the authors have demonstrated that with mildly to severely mentally retarded adults, reading and paraphrasing remarks to the patient are very important. Also, since persons with the milder forms of mental retardation are more likely to be socially deprived and poorly educated, these methods may also be employed with the parents in reports on their children. The authors have used simplified language, paraphrasing, examples the patients and/or their parents can identify with, and visual aids. The visual aids may include pictorial representations of differing types of affect. Similarly, with Likert 3 point scales (more points than 3 often are beyond the conceptual grasp of the patients) bar graphs taped on the wall have proven useful (Matson, Kazdin, et al. 1984). A small bar for 1, a larger bar for 2, and the largest bar for 3 are taped on the wall behind the tester, who uses them for illustrative purpose. These procedures are also recommended for younger, normal IQ children.

Treatment Outcome

Evaluating treatment outcome differs to some degree from differential diagnosis. The major consideration is that discrete responses are necessary in this latter situation to ensure that effects will be measurable. This problem has been common in much of the published literature. Also, it is critical that a wide range of responses across settings and raters be conducted. This method will ensure the broadest picture of the overall effects of the treatment. Matson (1983) proposes that among the dimensions measured should be chronic nature of the condition, the unipolar-bipolar continuum, and affect and social/interpersonal skills. Obviously, before adequate treatment outcome research can be attempted, the psychometric properties of a number of assessment instruments will need to be established for mentally retarded children and youth. Taking this factor into account, several measures are likely to prove useful and are proposed for study prior to initiation of an extensive program of treatment research.

At a minimum, treatment evaluation should include direct observation and checklists. Direct measures should include operationally defined behaviors which can be assessed on frequency and severity within a number of domains. Some of those include sadness, hopelessness, sleep disturbance, psychomotor retardation, loss of pleasure, low self-esteem, decreased concentration, suicidal statements, social disturbances, marked decreases in school performance, and somatic complaints (Connell 1972; Kuhn & Kuhn 1972; Matson 1983). These behaviors are best evaluated in naturalistic environments such as the school.

A substantial number of checklists have recently been developed to assess depression of children. It is recommended that self-report, teacher report, and parent measures be collected where possible. Among the many instruments currently used, some of those which may prove of value are the Child Depression Inventory (Kovacs & Beck 1977), Child Depression Scale (Reynolds 1985), and the Bellevue Index of Depression (Petti 1978).

It is also suggested that researchers measure a broad range of responses other than depression, being mindful that overlap in types of psychopathology may exist. General measures of child psychopathology may also be considered. One measure that has been extensively studied in the past is the Child Behavior Profile, which has been standardized and factor analyzed on 259 mildly and moderately mentally retarded adolescents (Cullinan et al. 1984; Matson, Epstein, et al. 1984). Given that this measure screens for a range of typical childhood conditions, it could prove useful in augmenting the overall profile of particular children. This measure is unlikely to be particularly sensitive to treatment effects, however.

Initial evaluative studies with single case methodology (Barlow & Hersen 1984) are suggested to develop pharmacological and psychological interventions. Considering the idiosyncratic nature of these problems in mentally retarded children, factors such as level of mental retardation, age, ability to communicate, severity and length of the depression, and a host of other variables dictating the potential efficacy of the treatment are needed. With mentally retarded children and youth it is recommended that psychological treatments be combined with pharmacotherapy when the latter approach is used, given the social and interpersonal problems evident with this population. Adapting treatments to these variables is best accomplished with initially small numbers of subjects. This method is of course more cost effective as well.

An example of a single case depression treatment study is presented by Frame, Matson, Sonis, Fialkov, and Kazdin (1982). They studied a 10-year-old boy with an IQ of 79. He evinced acute depression including a recent history of suicidal thoughts and gestures, violent temper outbursts, and poor school performance. He was hospitalized at Western Psychiatric Institute and Clinic, a component of the University of Pittsburgh School of Medicine. In this instance a much more extensive series of assessment measures was employed. In addition to meeting the criteria of *DSM-III: Diagnostic and Statistical Manual of Mental Disorders* (American Psychiatric Association 1980) for a major depressive episode, he completed the Child Depression Inventory, Child Behavior Profile, and the Bellevue Index of Depression [using Weinberg criteria (Weinberg et al. 1973)]. He far exceeded criteria for depression on all measures. Also, the Depression Adjective Checklist (Lubin 1965) was used on video-taped interviews to rate specific operationally defined behaviors, including inappropriate body position (hands over face, torso bent forward and/or away from interviewer), lack of eye contact, and poor speech quality. Two students independently rated these target responses and reliability ranged from .83 to .99 on Pearson Product Moment correlations for each target behavior. Treatment was psychological in nature with social learning components of instructions, modeling, role playing, performance feedback, and social reinforcement. Treatment proved to be highly effective.

The next step, once particular treatments have been demonstrated to be useful, is to initiate large scale experimental control group designs. The single case approach should also have proven useful in determining parameters of the group of mentally retarded depressed children and youth for study. Also, the parameters that are most important for matching children across conditions should be better established through previous single case research.

Given the transient nature of many forms of depression, severity and type of depression should also dictate length of treatment and followup. A sizable treatment and control group should be used since differences among characteristics and relief from symptoms in this cohort can be followed and evaluated also. Thus, it may be that some subgroups of depressed mentally retarded children are more amenable to certain treatments than others.

Conclusions

The emphasis in this paper has been on issues specific to conducting treatment research in childhood psychopathology. A conscious effort to avoid discussions of particular treatments and/or statistical approaches has been made. This approach has been taken since these latter topics have been covered extensively elsewhere. The major points made here have been that differential diagnosis and multiple measures of assessment are essential in determining the effectiveness of particular treatments and the extent of their effects across a range of problem behaviors. The fact that some children and youth may suffer from two or more emotional disorders further argues for this approach. It is suggested that a major shortcoming of a good deal of the treatment outcome research that has occurred in the child psychiatry and psychology literature is the failure to use more comprehensive and treatment-sensitive dependent variables. Such problems can lead to inaccurate or premature conclusions about treatment effectiveness. Also of concern is careful matching of subjects across treatment conditions. This issue is perhaps the most important to consider along with comprehensive assessment; it is often one of those most frequently overlooked.

Once measurement and intervention procedures have been worked out in single case studies, large group studies are needed. Of course large group studies are not possible in some areas of mental retardation research such as self-injurious behavior, where the cases are few and the problems are idiosyncratic. However, such would not seem to be the case with mildly and moderately mentally retarded children and youth, particularly with respect to unipolar depression. Also, given that spontaneous remission is likely for many persons who fit these criteria (conjecture only, since ample data with this group are not currently available) an *n* of 25 to 30 in the treatment and control groups would be optimal. In this way the course of the disorder could be followed more accurately, and a more realistic evaluation of treatment effectiveness could be obtained.

A final issue pertains to matching subjects in a yoking procedure with random assignment of one member to each condition employed in the study. This process is far from easy. Most importantly, a large number of children and adolescents will need to be screened to obtain adequate numbers of subjects. Some of these persons identified as depressed may not meet criteria for inclusion in the study. Alternate ways of ensuring treatment for these persons must be made available. Furthermore, it has been pointed out that the children and youth will need to be matched on a number of criteria including level of mental retardation, age, sex, severity and type of depressive symptoms, and chronicity of the disorder. A ranking system with point values given to each of these factors will be necessary to ensure that the closest fit (unlikely to be perfect) can be made. Statistical adjustments such as analysis of covariance can then be used. However, it should be strongly emphasized that no substitute exists for careful matching.

An effort has been made here to review some important methodological issues in treatment research of depression in mentally retarded children. It should be stressed that many of these same factors apply to other groups of people and problem behaviors. Much has been accomplished in the treatment of childhood emotional disorders in a short period of time. However, much is yet to be done and this paper addresses some points to consider in additional research in the area.

Summary: Challenges for Research

Eleanor D. Dibble, D.S.W.[1]

Studies have already shown that the mentally retarded may have the same range of psychiatric disorders as the non-mentally retarded (Sovner & Hurley 1983, Eaton & Menolascino 1982). What is at issue is differentiating whether the psychiatric behaviors are a continuation/exaggeration of mentally retarded behaviors or of the basic personality characteristics, or distinctly psychopathological. Determining whether a client is mentally ill as well as mentally retarded—a condition frequently referred to as "dually diagnosed"—presents a problem for both treatment and research. Increasingly, the problems of the mentally ill/mentally retarded are being given attention at the national level with conferences of large numbers of professionals and the establishment of the National Association for the Dually Diagnosed. The National Institute of Mental Health is also emphasizing the need for research with this under-researched population. To stimulate research was the goal of the workshop "Methodological Issues in Treatment Research of Mental Illness in the Mentally Retarded."

Research in pharmacologic treatment of the mentally retarded has not developed very far in the last 15 years despite the fact that available research reports that mentally retarded persons are particularly prone to develop severe and sometimes incapacitating behavior disorders (Gillberg et al. 1986). Dr. Lipman, chair of the workshop, made the first survey of psychotropic drug use in the institutionalized mentally retarded in 1968 (Lipman 1970). Other surveys followed in the early 1970s for both institutionalized and home and community care facilities. Little has been done since then. The National Strategy Conference on Mental Retardation and Mental Health convened by the President's Committee on Mental Retardation in October 1985 (unpublished transcript) made extensive recommendations about the research needed for this population. Recommendations included epidemiologic research on the prevalance of the disorders, development of nosology, and research on the effectiveness of various treatments. For this workshop NIMH chose to focus on what appears to be the primary methodological issue: the development of instruments for uniformity in sample selection and experimental design. As Aman (1983) reported, much of the research on neuroleptics in the mentally retarded is uninformative because of poor experimental controls and failure to assess specific functions.

In the first of the workshop papers presented here in the *Bulletin*, Dr. Lipman sets the stage by reviewing the state-of-the-art in pharmacological treatment. Dr. Sovner's paper addresses the research issue of using *DSM-III* criteria (American Psychiatric Association 1980) in differentiating and diagnosing mental illness in the mentally retarded. Dr. Sovner suggests that supplementary criteria are needed in assessing the mentally retarded to allow for their differences from normals. Dr. Menolascino, in the succeeding paper, suggests other criteria which must be considered in diagnosing mental illness in the mentally retarded.

The first research challenge then is to incorporate the appropriate diagnostic criteria and procedures into an instrument which will provide uniformity of diagnoses across research samples. One instrument which has been developed, the Psychopathology Instrument for Mentally Retarded Adults (PIMRA), was reviewed and its testing is reported by Dr. Aman. The PIMRA includes 57 items for diagnosing eight major psychiatric disorders. The PIMRA can be either a self-report or an informant report. Although evaluation of the instrument's self-report version showed similar test results for internal consistency and test-retest reliability to the original informant report version, the majority of the tests fell short of original levels. Further studies of the PIMRA are indicated. From this beginning the challenge is to develop an instrument which can assure more homogeneous study populations and thus provide more useful data.

The essentials of good experimental design in psychopharmacology studies are addressed in the papers by Dr. Geller and Dr. Matson. Dr. Geller has consolidated her experience in the study of pharmacologic treatments in a set of guidelines for psychopharmacology studies. Review of these guidelines may be useful to those designing research projects and measuring treatment outcome. Dr. Matson describes specific research approaches assessing pathology in mentally retarded children. These suggestions may also be helpful to researchers.

Investigators stimulated by these papers to do research with this population may find the proceedings of an earlier workshop conducted under NIMH sponsorship useful to review (Reatig 1985). In addition, consultation about research support (e.g., application procedures, protection of human subjects requirements, funding, etc.) is available both from NIMH, where emphasis is on research in mental illness in the mentally retarded, and from the National Institute of Child Health and Human Development (NICHHD), where emphasis is on basic research in mental retardation. Address inquiries to Dr. Eleanor Dibble at NIMH, and to Dr. Peter Vietze at NICHHD.

The papers presented here demonstrate that the current need is for basic diagnostic procedures in research experimental studies and the application of clinical trials methodology to this population. Eventually, researchers can begin to investigate possible etiologic relationships between specific causes of mental retardation and specific mental disorders. The fruits of this research may be more adequate treatment for those who are "dually diagnosed."

ANNOUNCEMENT

NCDEU ANNUAL MEETING

The annual meeting of the New Clinical Drug Evaluation Unit (NCDEU), sponsored by the Pharmacologic and Somatic Treatment Research Consortium, Division of Clinical Research of the National Institute of Mental Health (NIMH), will take place on May 26–28, 1987, in Key Biscayne, Florida.

This will be the 27th annual meeting of the NCDEU program. The program was established in 1959 by the NIMH as the Early Clinical Drug Evaluation Unit (ECDEU) program with 15 grantees. It has developed into the current format of planned symposia and free communications. Sessions focus on recent research findings in psychopharmacology, methodologic problems and advances in clinical trials in this area, and updates or reviews of significant issues in the field.

As in previous years, the Winter issue of the *Bulletin* will be devoted to summaries of papers presented at the NCDEU meeting. These summaries are designed to provide early availability of the substance of the meeting to *Bulletin* readers. Publication in the *Bulletin* does not prejudice formal publication of the full papers elsewhere at a later time.

To register for the meeting or for further information, contact:

Elaine G. Pearl, NCDEU Coordinator
Pharmacologic and Somatic Treatments
Research Consortium, NIMH
Room 10C–06
5600 Fishers Lane
Rockville, MD 20857.

Neuropeptides and Psychoneuroimmunology[1]

Neuropeptides as Modulators of Immune Function

John E. Morley, M.D.[2] and
Neil Kay, M.D.[3]

> *It is important and salutary to speak also of incomprehensible things.*
>
> —Carl Gustav Jung

The role of the central nervous system (CNS) as a potential modulator of disease was first recognized by Galen who felt that melancholy women were more prone to cancer than sanguine women. Sir William Osler pointed out that to predict the outcome of tuberculosis, it was more important to understand what was going on in a man's head than in his chest. The scientific basis of CNS regulation of the immune system was based on lesion studies such as that of Brooks and associates (1982) which demonstrated that lesions of the anterior hypothalamus decreased concanavalin A reactivity of spleen cells, whereas lesions of the amygdala increased it. Over the last decade an increasing number of studies have suggested that a number of neuropeptides are responsible for linking CNS function to immune function.

More recently, it has been recognized that the immune system makes peptides which not only modulate immune functions but also produce effects on the CNS. Thus, thymosin fraction 5 is a potent stimulator of adrenocorticotropic hormone (ACTH) and cortisol secretion (McGillis et al. 1985) and alpha-interferon produces analgesia and catatonia (Reyes-Vazquez et al. 1984). Woloski and associates (1985) found that monokines produced in response to inflammatory challenge, such as hepatocyte stimulating factor and interleukin-1, stimulate pituitary tumor cells (AtT-20) to produce ACTH. It should be pointed out that the role of the thymus as an endocrine modulator was first recognized as early as 1903 when C.E. de M. Sajous reported " . . . the thymus gland supplies some substances which directly or indirectly stimulate the secretory functions of the adrenals and thereby enhances the activity of the oxidation process."

Neuropeptides that have been reported to directly modify immune function include neurotensin, vasoactive intestinal peptide, porcine histidine isoleucine, substance P, somatostatin, bombesin, and opioid peptides.

Opioid Peptides and Immune Function

In 1974, Brown and associates found that peripheral blood lymphocytes have reduced proliferative responses to mitogens. Subsequently, multiple studies have demonstrated a modulatory effect of opioid peptides on a variety of immune functions (Table 1; *see* Teschemacher & Schweigerer, 1985, for a review). It would appear that a number of the effects of opioids on the immune system are mediated through prostaglandin release. Thus, Brown and Van Epps (1985) found that opioid-induced chemotaxis is inhibited by the prostaglandin inhibitor, indomethacin. Another particularly interesting effect of beta-endorphin and other opioids is their ability to activate superoxide dismutase and free radical generation in polymorphonuclear leukocytes and macrophages (Sharp et al. 1985). In view of the well-known release of beta-endorphin during stress (Morley 1981) and the possibility that free radical generation may accelerate the aging process (Gordon 1974), these findings suggest a linkage between stress, opioids, and the aging process.

The authors' interest in opioids and the immune system has centered on the role of endogenous opioids as activators of natural killer (NK) cells. Peripheral blood lymphocyte NK cell activity is a spontaneous cytotoxic function that is thought to be important in mediating host defense to viral and other infections and in natural resistance toward malignant cells. Of particular note is the fact that in patients with low or absent NK function, there is an increased incidence of primary or secondary malignancies (Kay & Zarling 1984). Studies by Kay, Allen, and Morley (1984) confirmed the original studies of Matthews and associates (1983) and Plotnikoff and associates (1985) that beta-endorphin and methionine-enkephalin enhanced NK activity. Gamma-endorphin was more potent than beta-endorphin in this system (Kay et al. 1984). Further studies showed that the des-tyrosine endorphins were more potent enhancers of NK activity than were either gamma- or beta-endorphins (Morley et al. 1985). The authors' fragment studies suggested that the NK stimulatory activity of endorphins rests predominantly in the (6–9) amino acid fragment, i.e., the alpha-helix portion of the molecule. As the NK activity of des-tyrosine endorphin (2–16) is blocked by naloxone, it appears that the NK-cell opioid receptor may be a two-site receptor with the (6–9) portion acting as the address site and the (1–5) portion representing the active opioid site. A similar double site receptor has been proposed for dynorphin based on *in vitro* (Chavkin & Goldstein 1981) and *in vivo* data (Morley & Levine 1983).

TABLE 1. Effects of Opioid Peptides on the Immune System.

1. C–terminal of beta-endorphin binds to complement SC5B-9 and 5B-9(m).
2. C–terminal of beta-endorphin modulates proliferative response of T-lymphocytes.
3. Methionine-enkephalin increases percentage of T-cell rosettes in normal and lymphoma patients.[a]
4. Beta-endorphin and methionine-enkephalin stimulate monocyte chemotaxis.[a]
5. Beta-endorphin and dynorphin stimulate superoxidase dismutase activity in polymorphonuclear lymphocytes and macrophages.[a]
6. Methionine-enkephalin enhances endothelial prostacyclin production and thus inhibits granulocyte adherence to endothelium.[a]
7. Methionine-enkephalin antagonizes prostaglandin inhibition of IgE-mediated serotonin release from mast cells.[a]
8. Opioids release histamine from mast cells.[a]
9. Opioids enhance natural killer cell activity.[a]

SOURCES: Data abstracted from Teschemacher and Schweigerer 1985, Morley et al. 1985, Plotnikoff et al. 1985, and Pert et al. 1985.
[a] Naloxone reversible.

In other studies the authors have demonstrated that recombinant alpha-interferon and recombinant interleukin-2 stimulation of NK cell activity was reversed by naloxone (Kay et al. 1984; Morley et al. 1985). Preliminary data suggest that beta-endorphin and interleukin-2 have synergistic effects on NK activity. Based on this data, the authors suggest that activation of NK cells is produced by a cascade in which interleukin-2 releases alpha-interferon which, in turn, releases beta-endorphin. This type of cascade is similar to that proposed for the neuropeptide regulation of appetite (Morley 1980; Morley & Levine 1985).

One further question suggested by these data is whether the release of pituitary beta-endorphin plays a physiological role in immune modulation. Beta-endorphin is increased during exercise and exercise transiently increases NK activity (Brahmi et al. 1985). Thus, it is possible that the pituitary release of opioids is responsible for the NK enhancement that occurs during exercise.

Other Neuropeptides and Immune Function

O'Dorisso and associates (1985) have demonstrated the presence of vasoactive intestinal peptide (VIP) receptors on molt 4B lymphocytes. These receptors cross-react with porcine histidine isoleucine (PHI) and growth hormone releasing factor. Both VIP and PHI activate cyclic adenosine monophosphate (AMP) in this cell line, while growth hormone releasing factor fails to produce activation of this second messenger. VIP enhances NK activity when preincubated with peripheral blood lymphocytes, but is inhibitory when added at the time of the assay (Rola-Pleszcywski et al. 1985).

Somatostatin has been demonstrated to bind specifically to monocytes and lymphocytes whereas glucagon binds specifically only to monocytes (Bhathena et al. 1981). Somatostatin inhibits the proliferation of T-lymphocytes (Payan et al. 1984), stimulates histamine release from mast cells (Theoharides & Douglas 1978), and inhibits its release from basophils (Goetzl et al. 1984). A number of other peptides stimulate histamine release from mast cells. These include neurotensin, VIP, substance P, and bradykinin (Shanahan et al. 1985).

Substance P meets many of the requirements of the mediator of the local inflammatory response. It produces vasodilatation, increases vascular permeability, produces margination and endothelial adherence of polymorphonuclear white cells and monocytes, and degranulates mast cells (Payan et al. 1984). Substance P cross-reacts with the chemotaxis receptor on rabbit neutrophils, orientates the neutrophil, and is chemotactic (Marasco et al. 1981). Ruff, Wahl, and associates (1985) reported that substance P is also chemotactic for human monocytes at concentrations as low as 10^{-13} M. Substance P also enhances ^{3}H-thymidine incorporation into stimulated T-lymphocytes (Payan et al. 1983). Payan and associates (1984) have suggested that substance P and somatostatin are the neurotransmitters released from peripheral nerves in response to local surgery.

Ruff, Schiffman, and associates (1985) have demonstrated that the tetradecapeptide bombesin is a potent chemo-attractant for human monocytes and small cell lung carcinoma cells. The closely related gastrin releasing peptide was also chemo-attractant for human tumor cells and monocytes. Ruff, Pert, and associates (1985) have also shown that there are high-affinity benzodiazepine sites on purified monocytes, and benzodiazepines enhance chemotactic activity. The endogenous ligand for the benzodiazepine receptor is a neuropeptide (Ferrero et al. 1984).

Conclusion

With the discovery of neuropeptides as linkages between the CNS and the immune system, the field of psychoneuroimmunology has taken a giant leap forward. It is clear that many of the acute effects of stress on the immune system are mediated by peptides acting either in a paracrine (local regulatory), humoral, or neurotransmitter mode. Pert and associates (1985) have named this system a "psychosomatic network." Human ability to piece together the jigsaw that represents the neuropeptide immunomodulatory system is at present rudimentary. It is thus useful to conclude this review by recalling the words of the English philosopher Emerson Pugh: "If the human brain were so simple that we could understand it, we would be so simple that we couldn't."

Life Events, Depression, and Natural Killer Cell Activity[1]

Michael Irwin, M.D.,[2] Marcia Daniels, M.D.,[3] Eda T. Bloom, Ph.D.,[4] and Herbert Weiner, M.D.[3]

Introduction

Both bereavement (Bartrop et al. 1977; Schleifer et al. 1983) and depression (Schleifer et al. 1984) are associated with impaired immune function. While these findings suggest that depression or "stress" may affect immune function (Guillemin et al. 1985; Tecoma & Huey 1985), measurement of lymphocyte responses to mitogens is a general immune parameter and may not have clinical significance (Guillemin et al. 1985). Another parameter of immune function is natural killer (NK) cell activity. NK cells are cytolytic cells that are considered important in the immunologic surveillance of tumor cells and cells infected with viruses (Herberman & Ortaldo 1981).

NK activity may be regulated by neural mechanisms (Tecoma & Huey 1985). An impairment of NK activity has been reported in depressed, anxious, and lonely persons (Locke et al. 1984; Kiecolt-Glaser, Ricker, et al. 1984; Kiecolt-Glaser, Garner, et al. 1984) and recently correlated with Hamilton ratings of depression in women anticipating and undergoing bereavement (Irwin et al. 1986). The effects of other life experiences on NK activity have not yet been clearly demonstrated. Some have reported life changes to have significant effects on NK activity (Kiecolt-Glaser, Ricker, et al. 1984), while others have not found this relationship (Kiecolt-Glaser, Garner, et al. 1984).

In this study the authors measured NK activity at several times in 38 women who differed in the severity of depression and in the magnitude of changes in their lives.

Methods

Sample

The subjects consisted of three groups of women: those whose husbands had died from lung cancer during the previous 6 months ($n = 12$); the wives of men alive but diagnosed with incurable lung cancer ($n = 16$); and women whose husbands were well and living with them ($n = 11$). The subjects were free of chronic medical disorders associated with alterations in immunity, and no subject was tested who had a recent (< 1 week) history of infectious disease. None were taking drugs known to affect immune function, nor abusing alcohol or other substances. Only 2 subjects smoked tobacco.

The subjects had a mean age of 59.3 (range 40–71) and were in the middle range of socioeconomic status. Thirty-two of the subjects were white, 6 were black.

Study Design

Each subject was interviewed to evaluate severity of depression, number of major life changes, and recent health status. Blood was drawn from the subjects at each interview. Subjects were tested over a 1- to 3-month period, and of the 38 subjects, 18 were tested three times, 15 were evaluated four to five times, and 5 were seen six or more times. All testing occurred in the morning between 9 and 11 a.m. At each session the subject met with a psychiatrist, who carried out a 30-minute struc-

tured interview consisting of the Social Readjustment Scale (SRS) of recent (< 1 month) life events (Holmes & Masuda 1974), the General Health Questionnaire (GHQ; Goldberg 1972), an evaluation of recent changes in health status or medication use, and the Hamilton Depression Rating Scale (Endicott et al. 1981). At the end of this interview the subject was weighed and a 10 cc blood sample was obtained by venipuncture.

Cell Isolation

Peripheral blood lymphocytes from subjects were isolated by sedimentation over ficoll-hypaque (Ficoll-Paque, Pharmacia, Piscataway, NJ) followed by treatment with carbonyl iron as described by Bloom and Korn (1983). This procedure yields a cell suspension that typically contains 99 percent lymphocytes (Bloom & Babbitt 1985). The medium used for suspending the cells throughout the assay was RPMI-1640 containing 10 percent fetal bovine serum (Sterile Systems, Logan, UT), 1 percent l-glutamine, and 0.1 percent gentamicin.

Cytotoxicity Assay

The 4-hour chromium release assay was performed in 0.2 mL volume in U-bottom microplates as described by Bloom and Babbitt (1985). Cell populations were titrated for cytolytic activity against 5000 51-chromium labeled K562 target calls. Effector cell suspensions were adjusted to 2×10^6 cells/mL; and effector:target cell ratios of 40:1, 20:1, 10:1, and 5:1 were tested in triplicate. Plates were centrifuged for 2 minutes at 500 × g prior to incubation for 4 hours at 37°C in 5 percent CO_2, and again prior to harvesting of 100 μL of supernatant from each well. Radioactivity in the supernatant was determined by a gamma counter and the percentage of 51-chromium released in each effector:target cell ratio was calculated.

Since it is crucial to measure and to express cytotoxic activities accurately, lytic units were obtained by fitting scale families of curves to our data (Bloom & Korn 1983). In this case, each curve was fit separately to the modified exponential family of equations. One lytic unit was defined as the number of effector cells killing 20 percent of the target cells. Data are presented as the number of lytic units in 10^6 cells.

Data Analysis

The mean of the measurement of life events (SRS), subjective symptoms (GHQ), depression (Hamilton score), and NK activity was determined for each individual. NK activity was related to life change, depression, and subjective symptoms using Kendall Tau correlations.

Results

The magnitude of changes in these women's lives was related to an impairment of NK function (r = .32, $p < .005$). When the subjects were divided into three groups that differed in the magnitude of changes in their lives, those women who had few changes in their lives had higher NK activity (mean ± SE = 40.2 ± 8.4) than did women with a moderate (10.9 ± 4.2) or severe number of life changes (21.9 ± 5.6) (Figure 1). Bereavement, per se, was not related to changes in NK activity even though NK activity tended to decrease in women anticipating or undergoing bereavement (Table 1). No subject had a weight change of 5 percent of her baseline body weight during the study period.

Impaired NK function was related to the Hamilton subscale item, depressed mood (r = .27, $p < .02$). While total Hamilton depression and subscales, including anxiety, insomnia, and somatic symptoms, were correlated with NK function in the same direction, they did not reach statistical significance. Self-report of symptoms on the GHQ was not related to changes in NK function.

Evaluation of depression with the Hamilton Scale was correlated with self-report of depressive symptoms (GHQ) (r = .56, $p <.0001$).

TABLE 1. Relation of Bereavement to Immune Function.

Variable	Not Bereaved ($n = 11$)	Anticipating Bereavement ($n = 16$)	Bereaved ($n = 12$)
NK Activity	29.7 ± 8.2	25.8 ± 4.5	18.2 ± 3.8

Values represent the mean ± SE.
Using Kruskal Wallis Test (χ^2 approximation), p = .41.

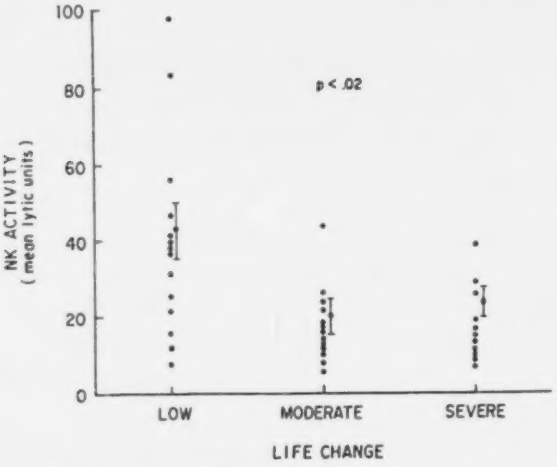

FIGURE 1. NK activity in peripheral blood lymphocytes. $N = 38$ women: 13 with few life changes; 14 with moderate changes; and 11 with severe changes in their lives.

Measures of life change were significantly related to depression ($r = .28$, $p < .01$), depressed mood ($r = .39$, $p < .001$), and somatic symptoms ($r = .32$, $p < .005$), but were not related to self-report of symptoms on the GHQ.

Discussion

Lymphocyte NK function of women who were depressed and experiencing major changes in their lives was compared with the function of matched subjects who had neither Hamilton depression nor major life changes. Hamilton depressed mood and magnitude of life changes were correlated with impaired NK activity. While measures of NK activity are known to fluctuate, repeated sampling of these two parameters minimizes the influence of this variability and strengthens our findings.

Hamilton depressed mood was related to impaired NK cell function, but the overall Hamilton score and scores on anxiety and insomnia were not. Others have described an association between impaired NK function and the self-report of depression and anxiety (Locke et al. 1984; Kiecolt-Glaser, Ricker, et al. 1984). In contrast, this study controlled for the use of tobacco and alcohol and changes in weight, rated depression by clinician observation (rather than self-report), and possibly studied a population that was less depressed and anxious. All of these subjects were only moderately depressed (Hamilton < 25). Schleifer and associates (1985) have found changes in lymphocyte responses to mitogens in severely depressed subjects but not in subjects with Hamilton scores less than 25.

The effects of depression on immune function may be relatively more important than effects associated with life events. Some moderate number of changes in the subjects' lives (such as illness of husband) was associated with lower NK activity, but severe changes including bereavement were not associated with further effects on NK activity. The authors have followed women longitudinally during bereavement and demonstrated in a recent study that severity of depression (but not the bereavement event) is related to impaired NK function (Irwin & Weiner in press). Locke and associates (1984) have also reported that lower cytotoxic activity is predicted by psychiatric symptoms but not by retrospective report of life change.

These results represent progress in understanding the association of depression and impaired immune function. NK function has been related to medical illnesses and is altered in women who are depressed. Whether these alterations in immunity are clinically significant and affect disease susceptibility is unknown but must be addressed in prospective evaluation of these women's health status. Moreover, the processes that modulate NK activity and link bereavement, depressive symptoms, and immune function remain largely unexplored.

Methionine Enkephalin: Immunomodulator in Normal Volunteers (*in Vivo*)[1]

Nicholas P. Plotnikoff, Ph.D.,[2] Gerald C. Miller, Ph.D.,[3] Suman K.T. Solomon, M.D.,[3] Robert E. Faith, D.V.M.,[2] Larry D. Edwards, M.D.,[4] and Anthony J. Murgo, M.D.[5]

Introduction

Methionine enkephalin (met-enkephalin) was originally discovered to be one of the endogenous ligands for morphine receptors (Hughes et al. 1975). However, Plotnikoff and associates (1976) discovered antidepressant, antianxiety, and anticonvulsant effects of the enkephalins, identifying a much broader spectrum of pharmacological effects than originally anticipated.

Earlier studies by several researchers have identified enkephalin receptors on human T-cells, granulocytes, complement, platelets, and B-cells (Hazum et al. 1979; Lopker et al. 1980; Schweigerer et al. 1982; Wybran et al. 1979). Plotnikoff and associates (Plotnikoff 1982; Plotnikoff & Miller 1983) explored the possibility that methionine enkephalin might have an immunomodulatory role. Other investigators studied similar effects with the endorphins (Blalock & Smith 1980; Gilman et al. 1982; Mathews et al. 1983). In mice, Plotnikoff and Miller (1983) identified enhanced lymphocyte blastogenesis with phytohemagglutinin and also increased size of thymus (Plotnikoff et al. 1985). In rats, Plotnikoff and associates (1984) showed similar effects on the thymus gland.

Studies in humans (*in vitro*) identified enhanced active T-cell rosettes and natural killer (NK) cell activity in normal volunteers as well as in cancer patients (Faith et al. 1984).

The present study is an evaluation of the *in vivo* effects of methionine enkephalin on levels and activities of T-cells in human volunteers.

Patients and Methods

Male subjects aged 21 to 39 were recruited and informed consent forms signed. Subjects abstained from all drugs, including alcohol and tobacco, for at least 3 weeks prior to the study. All subjects were within 20 percent of ideal body weight and free of acute and chronic cardiovascular, renal, metabolic, and neurological diseases. Those subjects satisfying admission criteria were admitted to the hospital the evening prior to the study, given the drug infusion in the morning of the second day, and discharged on the third day.

Methionine Enkephalin Formation

A sterile solution of met-enkephalin was prepared. Met-enkephalin (Sigma-Aldrich Chemical Co., St. Louis) was dissolved in sterile saline and filter sterilized by the pharmacy. Met-enkephalin has the following characteristics: molecular weight 574, water soluble and amino acid sequence Try-Gly-Gly-Phe-Met-OH. It was dissolved in 60 mL of saline at a concentration sufficient to infuse at 2 mL/min for 30 min to give a delivered dose of 1, 10, or 50 μg/kg body weight.

Immunologic Tests

Total and Active T Lymphocyte Rosette Determination

Peripheral blood was collected by antecubital venipuncture, diluted with RPMI 1640 me-

dium, layered over a Ficoll-Paque gradient and centrifuged for 30 min at 400 × g. The mononuclear band was collected, washed twice, and resuspended in RPMI 1640. Total T rosettes were quantified by mixing one million lymphocytes with sheep red blood cells in RPMI supplemented with 10 percent fetal calf serum at 4°C overnight. The cells were gently resuspended and the rosettes quantified. The active T-cells were determined by mixing 0.1 mL volume of 1 × 10^7 cells/mL and an equal volume of fetal calf serum and incubated at 37°C for 60 min. Sheep red blood cells (2 × 10^{-7}) were added, the cell suspension centrifuged at 200 × g for 5 min, gently resuspended, and rosette-forming cells quantified with a hemocytometer.

Results

Active T-Cell Rosettes

Significant increases in the levels of active T-cell rosettes were observed in all 6 volunteers at all dose levels (1, 10, and 50 μg/kg). The increases ranged from 26 to 633 percent over control levels (Table 1).

Total T-Cell Rosettes

Only a slight increase in total T-cell rosettes was seen in 5 of the volunteers. However, Volunteer 3 demonstrated a very marked increase of 98 and 82 percent over control levels (Table 2). A significant increase in 11 out of 12 (6 of 6 at 2 hours and 5 of 6 at 24 hours) volunteer samples was obtained with ranges of 4 to 35 percent.

Conclusion

The present *in vivo* study of met-enkephalin at doses of 1, 10, and 50 μg/kg confirms and extends the authors' original *in vivo* studies (Plotnikoff 1982; Plotnikoff & Miller 1983). In fact the minute doses of met-enkephalin employed (1, 10, and 50 μg/kg) correspond to 10^{-7} mg/mL blood, which was a high dose range of the authors' *in vitro* studies. Marked activity on T-cells and NK cells was seen at concentrations of 10^{-6} to 10^{-14} mg/mL blood.

Such increases in active T-cell rosettes may have implications in the immunomodulatory control of infectious and neoplastic diseases (Herberman 1982; Wybran & Fudenberg

1973). Certainly the elevations of blood levels of enkephalin in times of stress have now been documented by several researchers (Farrell et al. 1982; Gilman et al. 1982; Hanbauer et al. 1982; Udenfriend & Kilpatrick 1983; Viveros et al. 1980). It is possible that the enkephalins have a reciprocal relationship with the steroid hormones in modulating immune function in times of stress (Ader 1981; Besedovsky et al. 1983; Laszlo et al. 1983; Lotzova 1983; Miller et al. 1984; Prange et al. 1972; Riley 1981; Rossier et al. 1981; Targan et al. 1981; Vaught & Takemori 1979; Wybran et al. 1980).

It is hoped that the administration of met-enkephalin to patients with infections as well as cancerous tumor growth will be found useful in modulating the immune system, as measured by its restorative effects on T-cells.

ANNOUNCEMENT

INTERNATIONAL CONGRESS ON SCHIZOPHRENIA RESEARCH

An International Congress on Schizophrenia Research will be held March 28-April 1, 1987, at the Belleview-Biltmore Hotel in Clearwater, Florida. The meeting will host leading scientists actively working on basic and/or clinical research, who will present their work in paper or poster sessions. There has been a great increase in the enthusiasm of schizophrenia researchers recently, and the International Congress will provide a setting for both formal presentation of current research and informal discussion by attendees. In addition, the NIMH will sponsor a Young Investigators Program so that investigators early in their career can be supported to attend the meeting and present their work.

The meeting is being organized by Drs. Charles Schulz of NIMH and Carol Tamminga of the University of Maryland. For further information about the meeting contact:

Susan M. Nusbaum
Maryland Psychiatric Research Center
Box 21247
Baltimore, MD 21228.

The Forum

With this issue we inaugurate a new feature, **The Forum**, which will appear twice a year in issues 2 and 4. Its goal is to provide an opportunity for discussion on issues that are topical and new in psychopharmacology. Consider submitting comments on papers that have appeared in the *Bulletin* (e.g., the paper by Dr. Richard Milich and colleagues presented here). Raise questions that may stimulate responses from others. Material for **The Forum** should be submitted to:

The Forum
Psychopharmacology Bulletin
5600 Fishers Lane, Room 10C-06
Rockville, MD 20857 USA

Submissions will be reviewed by the *Bulletin* Associate Editors. We hope **The Forum** will be a place for lively debate.

Issues in the Diagnosis of Attention Deficit Disorder: A Cautionary Note on the Gordon Diagnostic System

Richard Milich, Ph.D.,[1] William E. Pelham, Ph.D.,[2] and Stephen P. Hinshaw, Ph.D.[3]

Introduction

In a recent paper Gordon (1986) has compared the strengths and weaknesses of traditional microcomputer-based assessment of attention deficit disorder (ADD) with those offered by the Gordon Diagnostic System (GDS; Gordon & McClure 1983; 1984). Not surprisingly, although careful not to overstate the case, he finds the GDS to be an improvement over the use of standard microcomputers. Nevertheless, several of his criticisms of microcomputers seem forced, and he tends to downplay some of the more serious concerns associated with the GDS. Given that the GDS is receiving widespread attention, with nationwide marketing procedures underway, it seems fitting to examine its strengths and weaknesses independently as compared to more traditional methods of assessment of attention deficit disorder. To facilitate this goal the history of the GDS will be reviewed, since in its relatively brief life several important events have already occurred.

In 1979 the first paper by Gordon in the area of ADD appeared. He presented the results of a study comparing 20 hyperactive

and 20 clinic-referred nonhyperactive children on a differential reinforcement of low-rate behavior (DRL) task. The results of this study were quite promising and, as Milich and Kramer (1984) note, offered an intriguing way in which to define and measure the problems in impulsivity exhibited by ADD children. Approximately 3 to 4 years following the publication of this first article, but before the appearance of any subsequent articles, a commercially marketed version of the GDS was made available (Clinical Diagnostics, Inc., 300 E. Mineral Ave., Littleton, CO 80122). Admittedly, Gordon was in the process of collecting large scale normative data, and within the last year an article has appeared replicating the results of the first study (Gordon & McClure 1984). Nevertheless, it does not seem too rash to state that the appearance of the GDS as a commercially available product was premature.

In its original format the GDS contained only the DRL. Halfway through the standardization process a continuous performance test (CPT), modeled after the one originally produced by Rosvold and associates (1956), was included. In its current format the GDS sells for $1295 (originally $2500). For an additional $150 a data analysis program compatible with either the Apple II or IBM-PC microcomputer is available. For an additional $18 a newsletter is available, published four times a year, that deals with attention deficit disorder in general and the GDS specifically.

Argument

Although Gordon (1986) discusses the flexibility of the GDS, basically the DRL and the CPT are the only two tasks that can be run on the machine. The question raised is whether the information obtained justifies the relatively high cost of the apparatus. It is important to keep in mind that for the same expenditure of funds one could purchase a relatively sophisticated microcomputer system with printer and two disc drives, at least. Such a system would give one markedly improved flexibility, in terms of software available for assessment procedures, word processing capabilities, and data analysis programs, to name just several of the common uses for microcomputers.

As noted, purchasing the Gordon Diagnostic System involves a relatively major financial investment, money that could perhaps be spent in a more cost-efficient fashion. Therefore, the question becomes whether the GDS is supplying valuable information that cannot be obtained in a more economical manner. To answer this question it may be helpful to examine the research available on the GDS. We will summarize briefly the research for the two different tasks: the Delay task, as the DRL is now called, and the Vigilance task, as the CPT task is named.

As noted, two published studies exist to date supporting the validity of the Delay task in differentiating, with a relatively high rate of accuracy, ADD and non-ADD clinic-referred children. However, as Gordon (1985) himself notes, the validity of an assessment instrument can be no greater than the measures employed to establish the criterion groups against which the new instrument is being validated. Thus, for example, when the criterion groups (ADD vs. non-ADD) were established by meeting cutoffs on three rating scales and one laboratory test (the Matching Familiar Figures Test), the Delay task was found to agree with the criterion measures on 15 of 16 cases (94%). When the children were classified as ADD or not by meeting criteria on three of the measures, agreement with the GDS was found in 29 of 32 cases (91%). Although such results certainly offer support for the sensitivity of the GDS in identifying ADD children, they also indicate that four relatively inexpensive and easily obtained measures can do a comparable job of identification.

There are two other aspects of the Delay task that are somewhat disquieting when considering its role in the assessment of ADD. First, the normative data (*see* Gordon & McClure 1983) have not found gender differences in performance on the Delay task. Such a finding contrasts markedly with the accepted prevalence figures for ADD, which range anywhere from 4:1 to 10:1, boys to girls. Whereas Gordon (1985) suggests that there may be many girls with significant deficits in attention who are being overlooked, the Delay task is one of the few measures in the ADD field that fails to find sex differences.

Furthermore, the Delay task has not consistently been shown to be drug sensitive. For example, Barkley (1985) found none of the three measures from the Delay task (rewards, responses, efficiency ratio) to differentiate among placebo and two dosages of methylphenidate (.3 and .5 mg/kg). In contrast, most of the other measures he collected, including parent and teacher ratings, playroom observations, and the Vigilance task, all showed evidence of drug sensitivity. Considering that most measures employed in the assessment of ADD routinely show sensitivity to drug effects, this lack of sensitivity of the Delay task gives one pause as to the utility of this procedure.

Along these lines, it is interesting to note that Gordon (1985), in one of his most recent presentations summarizing the current research on the GDS, focuses entirely on the Vigilance task. His motivation for this decision is not clear but it may well reflect this task's greater sensitivity to stimulant medication. In fact, in the Barkley (1985) study, the Vigilance task was one of the few measures also to differentiate low and high dosages of methylphenidate. It is certainly not surprising that the Vigilance task should exhibit such sensitivity; these procedures have been around for 30 years, and a wealth of studies have documented their drug sensitivity and ability to differentiate ADD and non-ADD children (*see* Douglas 1983). The questions then become whether the GDS Vigilance task offers a significant improvement over more conventional CPT procedures and whether its validity and utility justify its great expense. To answer these questions we will examine Gordon's (1986) criticisms of conventional microcomputer assessments.

Gordon (1986) notes basically three limitations of conventional microcomputers in the assessment of ADD: their size and cumbersomeness, the unreliability of administration, and their delicacy. It is obvious that the first and third points deal with issues of practicality and utility, rather than validity per se. Although at one time the GDS may have been more mobile and hence practical than portable microcomputers, the ones currently available are no more cumbersome, and considerably less expensive, than the GDS. For example, an Apple II-C, which is small and easily portable, can be obtained for approximately $700, and a number of relatively inexpensive CPT tasks compatible with the II-C are available in the public domain. Similarly, Gordon's third point regarding the delicacy of the machines does not seem to be a real issue. Altogether we have administered a variety of information processing tasks on Apple II microcomputers to several hundred ADD children, with no unusual problems and no damage to hardware or software.

Thus, the only substantive issue regarding microcomputer assessment raised by Gordon (1986) concerns the reliability of the evaluation. Here Gordon means that different systems present the stimuli in slightly different fashions and may require different responses (e.g., pressing a spacebar vs. a single letter). In one sense, Gordon is correct in that different CPT programs or microcomputers may produce slightly different response patterns, making it difficult to establish specific cutoff or criterion scores to arrive at a formal diagnosis. The GDS, which presents the same stimuli in a standardized fashion to anyone who uses the machine, could generate such criteria.

First, however, the issue of norms is crucial to such an endeavor. The standardization sample reported by Gordon and McClure (1984) contains 700 boys and girls from ages 3 through 16. Thus, at any given age and gender level, there may be fewer than 30 subjects. In addition, the cutoff scores presented by Gordon and McClure are not separated by gender, a problem noted earlier regarding the GDS. Thus, the viability of these norms for diagnostic use may be questionable.

Second, as Gordon (1986) himself notes, a diagnosis should not be based upon a single score on a single instrument. Instead, it must be derived from the convergence of multiple sources of data. From that perspective, the score on the GDS is, by itself, no more diagnostically significant than that obtained from teacher rating scales or systematic classroom observations. In fact, one could argue that the presentation of formalized normative data and cutoff scores may inadvertently encourage clinicians to rely primarily or even solely on such a measure, at the expense of other information. This is a realistic possibility, given the lack of standardized criteria in the field and given particularly the designation of "Diagnostic System" to the hardware and procedures of the GDS. The problems inherent in single-instrument diagnoses have been noted by Ullmann and associates (1985) with respect to the use of cutoff scores from the Conners (1973) Abbreviated Teacher Rating Scale to diagnose ADD. There is no reason to suspect that a single score from a continuous performance test will escape such problems.

Furthermore, although performance on a CPT task is currently thought to be useful in defining and thus diagnosing ADD, there is sufficient disagreement among professionals regarding the precise nature of the attention deficit in ADD children (*see* Douglas 1983) that currently popular versions of the CPT task, including Gordon's, may not be thought relevant in future diagnostic systems. If one uses a microcomputer to administer an attention task, one is able to acquire new software when accepted diagnostic tasks change. The GDS, however, lacks such flexibility.

Conclusion

The GDS, especially the Vigilance task, appears to have some utility in aiding with the diagnosis of ADD. However, legitimate concerns can be raised regarding the cost efficiency of purchasing such an apparatus, especially when apparently comparable information can be obtained at considerably less expense. Further, the apparent simplification of the diagnostic process may predispose clinicians to resort to simplistic assessment procedures. Finally, we feel the need to reiterate our concern regarding the aggressive nature in which the GDS has been marketed, especially given the relatively meager data available when the apparatus was first offered for sale and the inherent limitations of any single instrument for the purpose of diagnosis.

Psychopharmacology—A Recurring Bibliography

The bibliographies below are offered to our readers to alert them to recent papers on psychopharmacology from the world literature. They were computer-generated by the Medical-Literature Analysis and Retrieval System (MEDLARS) of the National Library of Medicine, National Institutes of Health, and represent papers which were entered into the system during the 9 months before the *Bulletin* went to press. Because the preceding issue (Vol. 22, No. 3) was unusually large, we did not include a bibliography in that issue. We are fortunate to be able to include in the current issue three bibliographies, from the second, third, and fourth quarters of 1986. The earliest culling from the *Index Medicus* appears first, followed by the more recent ones.

The subject headings from the *Index Medicus* were selected by the National Institute of Mental Health to reflect significant current interests of the international scientific community. Some nonrelevant citations may appear, and some relevant ones may be absent, but this is customary for machine-generated searches.

Differences between the release of radiolabelled and endogenous dopamine from superfused rat brain slices: effects of depolarizing stimuli, amphetamine and synthesis inhibition. Herdon H, et al. **Brain Res** 1985 Dec 2;348(2):309-20

Enduring enhancement in frontal cortex dopamine utilization in an animal model of amphetamine psychosis. Robinson TE, et al. **Brain Res** 1985 Sep 23;343(2):374-7

Analysis of dopamine D1 and D2 receptor involvement in d- and l-amphetamine-induced anorexia in rats. Gilbert DB, et al. **Brain Res Bull** 1985 Oct;15(4):385-9

Effect of methylphenidate pretreatment on the behavioral and biochemical responses to amphetamine. Kolta MG, et al. **Eur J Pharmacol** 1985 Nov 5;117(2):279-82

The acute effects of methamphetamine, amphetamine and p-chloroamphetamine on the cortical serotonergic system of the rat brain: evidence for differences in the effects of methamphetamine and amphetamine. Peat MA, et al. **Eur J Pharmacol** 1985 Oct 8; 116(1-2):11-6

Hyper-reactivity to amphetamine in rats with dopaminergic grafts. Herman JP, et al. **Exp Brain Res** 1985;60(3):521-6

Use of bonded-phase silica sorbents for rapid sampling of impurities in illicit amphetamine for high-performance liquid chromatographic analyses. Lambrechts M, et al. **J Chromatogr** 1985 Sep 6; 331(2):339-48

Analysis of the long-lasting antagonistic effect of caerulein on amphetamine hyperactivity in rats. Matsubara K, et al. **Jpn J Pharmacol** 1985 Aug;38(4):381-90

Time course of the development of the enhanced behavioral and biochemical responses to amphetamine after pretreatment with amphetamine. Kolta MG, et al. **Neuropharmacology** 1985 Sep; 24(9):823-9

Amphetamine, but not reserpine, protects mice against dopaminergic neurotoxicity of MPTP. Melamed E, et al. **Neuropharmacology** 1985 Sep;24(9):923-5

Stressor invoked exacerbation of amphetamine-elicited perseveration. Anisman H, et al. **Pharmacol Biochem Behav** 1985 Aug;23(2):173-83

Amphetamine-haloperidol discrimination: effects of chronic drug treatment. Haenlein M, et al. **Pharmacol Biochem Behav** 1985 Dec; 23(6):949-52

Haloperidol blocks amphetamine induced recovery of binocular depth perception after bilateral visual cortex ablation in cat. Hovda DA, et al. **Proc West Pharmacol Soc** 1985;28:209-11

A comparison between the growth hormone responses to amphetamine and clonidine [letter] Siever LJ, et al. **Psychiatry Res** 1985 Sep; 16(1):79-82

Depletion of brain serotonin by 5,7-dihydroxytryptamine alters the response to amphetamine and the habituation of locomotor activity in rats. Gately PF, et al. **Psychopharmacology (Berlin)** 1985;87(4):400-5

[Conditioned reactions of hippocampal neurons during amphetamine poisoning and its counteraction with haloperidol] Zhavoronkova LA, et al. **Zh Vyssh Nerv Deiat** 1985 Sep-Oct;35(5):957-63 (Eng. Abstr.) **(Rus)**

AMPHETAMINES

Information on 'Ecstasy' [letter] Greer G, et al. **Am J Psychiatry** 1985 Nov;142(11):1391

Techniques for the detection and identification of amphetamines and amphetamine-like substances. Rasmussen KE, et al. **Bull Narc** 1985 Jan-Mar;37(1):95-112 (63 ref.)

The acute effects of methamphetamine, amphetamine and p-chloroamphetamine on the cortical serotonergic system of the rat brain: evidence for differences in the effects of methamphetamine and amphetamine. Peat MA, et al. **Eur J Pharmacol** 1985 Oct 8; 116(1-2):11-6

The scheduling of MDMA: a pharmacist's perspective. Riedlinger JE. **J Psychoactive Drugs** 1985 Jul-Sep;17(3):167-71

A bit on the Wilde side: MDMA abuse. Mack RB. **NC Med J** 1985 Dec; 46(12):641-2

Serotonergic stimulation of prolactin and corticosterone secretion is mediated by different pathways from the mediobasal hypothalamus. Van de Kar LD, et al. **Neuroendocrinology** 1985 Nov;41(5):380-4

Method for the preparation of N-isopropyl-p-(1231)-iodoamphetamine with an assessment of radiochemical purity. Lyall D. **Nucl Med Commun** 1985 Aug;6(8):485-8

Mechanistic studies on DOM as a discriminative stimulus. Glennon RA, et al. **Pharmacol Biochem Behav** 1985 Dec;23(6):937-41

Comparison of 1-methyl-4-(p-chlorophenyl)-1,2,3,6-tetrahydropyridine, 1-methyl-4-phenyl-1 2,3,6-tetrahydropyridine (MPTP) and p-chloroamphetamine as monoamine depletors. Fuller RW, et al. **Res Commun Chem Pathol Pharmacol** 1985 Oct;50(1):57-65

ANGER

Carbamazepine treatment of a patient with Klüver-Bucy syndrome. Stewart JT. **J Clin Psychiatry** 1985 Nov;46(11):496-7

ANOREXIA NERVOSA

Alterations in vitamin A and thyroid hormone status in anorexia nervosa and associated disorders. Curran-Celentano J, et al.

Am J Clin Nutr 1985 Dec;42(6):1183-91

Anorexia nervosa. Elston T, et al. **Child Care Health Dev** 1985 Nov-Dec; 11(6):355-73 (102 ref.)

Anorexia nervosa and related eating disorders. Warren MP. **Clin Obstet Gynecol** 1985 Sep;28(3):588-97

Anorexia nervosa and bulimia: a review of clinical issues. Dickstein LJ. **Hosp Community Psychiatry** 1985 Oct;36(10):1086-92 (45 ref.)

Platelet alpha 2-adrenoceptor and adenylate cyclase in patients with anorexia nervosa and bulimia. Heufelder A, et al. **J Clin Endocrinol Metab** 1985 Dec;61(6):1053-60

The responses of plasma adrenocorticotropin and cortisol to corticotropin-releasing hormone (CRH) and cerebrospinal fluid immunoreactive CRH in anorexia nervosa patients. Hotta M, et al. **J Clin Endocrinol Metab** 1986 Feb;62(2):319-24

Response of ACTH and cortisol to corticotropin-releasing hormone in anorexia nervosa [letter] Cavagnini F, et al. **N Engl J Med** 1986 Jan 16;314(3):184-5

ANTIDEPRESSIVE AGENTS

Tolerance to antidepressants [letter] **Am J Psychiatry** 1985 Dec; 142(12):1519-20

Psychoses associated with bupropion treatment. Golden RN, et al. **Am J Psychiatry** 1985 Dec;142(12):1459-62

Continuation drug therapy for major depressive episodes: how long should it be maintained? Prien RF, et al. **Am J Psychiatry** 1986 Jan; 143(1):18-23

Behavioural pharmacology of imidazole, a potential antidepressant agent. Ferrari F. **Arch Int Pharmacodyn Ther** 1985 Oct;277(2):303-12

Effects of chlorpromazine and the antidepressant drugs amitriptyline, clomipramine and mianserin on the Ca-depleted rat uterus. Villar A, et al. **Arch Int Pharmacodyn Ther** 1985 Oct;277(2):264-71

Prescribing hints for the treatment of anxiety and depression. Horgan D. **Aust Fam Physician** 1985 Sep;14(9):872-5

A double-blind out-patient trial of indalpine vs mianserin. Naylor GJ, et al. **Br J Psychiatry** 1985 Sep;147:306-9

Clinical management of benzodiazepine dependence [letter] Marks J. **Br Med J [Clin Res]** 1985 Oct 26;291(6503):1201-2

Clinical management of benzodiazepine dependence [letter] Tyrer P. **Br Med J [Clin Res]** 1985 Nov 23;291(6507):1507

Interaction of antidepressant drugs with lipid bilayers studied by high-resolution carbon-13 (13C-) and high-power deuterium nuclear magnetic resonance (2H-NMR) spectroscopy: the manner of binding as deduced from the differential line-broadening of 13C-NMR signals. Tabeta R, et al. **Chem Pharm Bull (Tokyo)** 1985 May;33(5):1793-807

Pharmacokinetics of bupropion and its major basic metabolites in normal subjects after a single dose. Laizure SC, et al. **Clin Pharmacol Ther** 1985 Nov;38(5):586-9

The tolerance and antidepressive activity of fluvoxamine as a single dose compared to a twice daily dose. Siddiqui UA, et al. **Curr Med Res Opin** 1985;9(10):681-90

The disposition of bupropion and its metabolites in healthy male volunteers after single and multiple doses. Posner J, et al. **Eur J Clin Pharmacol** 1985;29(1):97-103

Prenatal exposure of rats to antidepressants enhances agonist affinity of brain dopamine receptors and dopamine-mediated behaviour. De Ceballos ML, et al. **Eur J Pharmacol** 1985 Oct 22;116(3):257-62

Phospholipid liposomes potentiate the inhibitory effect of antidepressant drugs on immobility of rats in a despair test (constrained swim). Drago F, et al. **Eur J Pharmacol** 1985 Sep 24;115(2-3):179-84

DMI, Wy-45,030, Wy-45,881 and ciramadol inhibit locus coeruleus neuronal activity. Haskins JT, et al. **Eur J Pharmacol** 1985 Sep 24; 115(2-3):139-46

3[H]-Sulpiride labels mesolimbic non-dopaminergic sites that bind antidepressant drugs. Csernansky JG, et al. **Experientia** 1985 Nov 15; 41(11):1419-21

Current treatment of depression. Bowden CL. **Hosp Community Psychiatry** 1985 Nov;36(11):1192-200

Evaluation of long-term use of antidepressant medication. Risse SC, et al. **Hosp Community Psychiatry** 1985 Nov;36(11):1215-6

Effect of anticonvulsants, centazolone and centpropazine, on gamma amino butyric acid metabolism in mouse brain. Tripathi LM, et al. **Indian J Exp Biol** 1985 Aug;23(8):452-5

Simultaneous panic and depressive disorder: response to antidepressant treatments. Grunhaus L, et al. **J Clin Psychiatry** 1986 Jan;47(1):4-7

Antidepressant effects of estrogen [letter] Price WA, et al. **J Clin Psychiatry** 1985 Nov;46(11):506

Antidepressant treatment of bulimia: a two-year follow-up study. Pope HG Jr, et al. **J Clin Psychopharmacol** 1985 Dec;5(6):320-7

3-Phenyl-1-indanamines. Potential antidepressant activity and potent inhibition of dopamine, norepinephrine, and serotonin uptake. Bøgesø KP, et al. **J Med Chem** 1985 Dec;28(12):1817-28

The effects of manipulation of presynaptic 5-HT nerve terminals on postsynaptic 5-HT1 and 5-HT2 binding sites of the rat brain. Hall H, et al. **J Neural Transm** 1985;64(2):129-43

Studies on the role of alpha 2-adrenoceptors in the control of synaptosomal [3H]5-hydroxytryptamine release: effects of antidepressant drugs. Ellison DW, et al. **J Neurochem** 1986 Jan; 46(1):218-23

Behavioral effects of perinatal administration of antidepressant drugs in the rat. Drago F, et al. **Neurobehav Toxicol Teratol** 1985 Sep-Oct; 7(5):493-7

Prenatal exposure of rats to antidepressant drugs down-regulates beta-adrenoceptors and 5-HT2 receptors in cerebral cortex. Lack of correlation between 5-HT2 receptors and serotonin-mediated behaviour. De Ceballos ML, et al. **Neuropharmacology** 1985 Oct; 24(10):947-52

Effects of neuroleptics displaying antidepressant activity on behavior of rats in the forced swimming test. Górka Z, et al. **Pharmacol Biochem Behav** 1985 Aug;23(2):203-6

Chronic administration of sulbutiamine improves long term memory formation in mice: possible cholinergic mediation. Micheau J, et al. **Pharmacol Biochem Behav** 1985 Aug;23(2):195-8

Increased low-affinity 3H-spiroperidol binding to rat cortical membranes after chronic antidepressant treatments. Antkiewicz-Michaluk L, et al. **Pol J Pharmacol Pharm** 1985 May-Jun;37(3):317-23

Central effects of repeated treatment with bupropion. Klimek V, et al. **Pol J Pharmacol Pharm** 1985 May-Jun;37(3):243-52

The efficiency of ECT: II. Correlation of specific treatment variables to response rate in unilateral ECT. Rich CL, et al. **Psychiatry Res** 1985 Oct;16(2):147-54

Clinical studies of the effect of (+) and (-)-oxaprotiline upon noradrenaline uptake. Checkley SA, et al. **Psychopharmacology (Berlin)** 1985;87(1):116-8

Effect of the experimental antidepressant AHR-9377 on performance during differential reinforcement of low response rate. O'Donnell JM, et al. **Psychopharmacology (Berlin)** 1985;87(3):283-5

Stability of bupropion and its major metabolites in human plasma. Laizure SC, et al. **Ther Drug Monit** 1985;7(4):447-50

[3 cases of agranulocytosis during polytherapy including indalpine] Laaban JP, et al. **Rev Med Interne** 1985 Oct;6(4):433-5 **(Fre)**

[Vivalan] Geysen F, et al. **Soins Psychiatr** 1985 Apr;(54):I-II **(Fre)**

[Adverse actions of antidepressives] Faust V, et al. **Med Monatsschr Pharm** 1985 Nov;8(11):336-40 **(Ger)**

[The activating effect of MCI-2016 (bifemelane hydrochloride) on EEG in cats] Egawa M, et al. **No To Shinkei** 1985 Aug;37(8):759-65 (Eng. Abstr.) **(Jpn)**

[Effect of antidepressants on the balance of biogenic amines and their metabolites in the rat brain] Kamysheva VA, et al. **Farmakol Toksikol** 1985 Sep-Oct;48(5):22-4 (Eng. Abstr.) **(Rus)**

ANXIETY

Comparison of paracetamol and aminophenazone plus diazepam suppositories for anxiety and pain relief after tonsillectomy in children. Lindgren L, et al. **Acta Anaesthesiol Scand** 1985 Oct;29(7):679-82

Anxiety and epinephrine in multiparous women in labor: relationship to duration of labor and fetal heart rate pattern. Lederman RP, et al. **Am J Obstet Gynecol** 1985 Dec 15;153(8):870-7

Clinical notes in therapeutics: pharmacoanxiolytic therapy in dentistry: the benzodiazepines. Terezhalmy GT, et al. **J Oral Med** 1985 Oct-Dec; 40(4):209-11

Trazodone and m-chlorophenylpiperazine. Concentration in brain and receptor activity in regions in the brain associated with anxiety. Smith TM, et al. **Neuropharmacology** 1985 Nov;24(11):1067-71

The effects of PK 11195, a ligand for benzodiazepine binding sites, in animal tests of anxiety and stress. File SE, et al. **Pharmacol Biochem Behav** 1985 Nov;23(5):737-41

Skin conductance reaction (SCR)-habituation test, a tool to detect anxiolytic activity. Its justification by the correlation between SCR-habituation test activities and specific binding potencies in benzodiazepines. Marcy R, et al. **Prog Neuropsychopharmacol Biol Psychiatry** 1985;9(4):387-91

Fear-enhanced acoustic startle is not attenuated by acute or chronic imipramine treatment in rats. Cassella JV, et al. **Psychopharmacology (Berlin)** 1985;87(3):278-82

Tolerance to the benzodiazepine diazepam in an animal model of anxiolytic activity. Stephens DN, et al. **Psychopharmacology (Berlin)** 1985;87(3):322-7

Current status of benzodiazepines in South Africa. Proceedings of a symposium on anxiety and its treatment. Johannesburg, June 1985. **S Afr Med J** 1985 Oct 26;Suppl:1-32

Other forms of treatment for anxiety. Pretorius HW. **S Afr Med J** 1985 Oct 26;Suppl:30-2

[Adrenaline, noradrenaline and dopamine excretion and anxiety levels in surgical patients] Barham O, et al. **Arch Psychol (Frankf)** 1985; 137(4):291-5 (Eng. Abstr.) **(Ger)**

ANXIETY DISORDERS

Early treatment response in anxious outpatients treated with diazepam. Downing RW, et al. **Acta Psychiatr Scand** 1985 Dec;72(6):522-8

Imipramine and chlordiazepoxide in depressive and anxiety disorders. II. Efficacy in anxious outpatients. Kahn RJ, et al.

Arch Gen Psychiatry 1986 Jan;43(1):79-85

Drug therapy of anxiety disorders. Desmond P, et al. **Aust Fam Physician** 1985 Sep;14(9):876-9

Prescribing hints for the treatment of anxiety and depression. Horgan D. **Aust Fam Physician** 1985 Sep;14(9):872-5

An approach to stress and anxiety in general practice. Manzie P. **Aust Fam Physician** 1985 Sep;14(9):894-5, 899-900

Randomized comparison of atenolol and placebo in the treatment of anxiety: a double-blind study. Saul P, et al. **Eur J Clin Pharmacol** 1985; 28 Suppl:109-10

Calcium channel blockers in the treatment of panic disorder [letter] Goldstein JA. **J Clin Psychiatry** 1985 Dec;46(12):546

Simultaneous panic and depressive disorder: response to antidepressant treatments. Grunhaus L, et al. **J Clin Psychiatry** 1986 Jan;47(1):4-7

Six-week trial with diazepam: some clinical observations. Rickels K, et al. **J Clin Psychiatry** 1985 Nov;46(11):470-4

Comparison of buspirone and diazepam in generalized anxiety disorder. Jacobson AF, et al. **Pharmacotherapy** 1985 Sep-Oct;5(5):290-6

[Depression, anxiety and neurotic disorders] Wilmotte J. **Acta Psychiatr Belg** 1985 Jul-Aug;85(4):469-79 (Eng. Abstr.) **(Fre)**

[New proposals for the development of the concepts of neurotic anxiety, major depression and panic attack] Xhenseval B. **Acta Psychiatr Belg** 1985 Jul-Aug;85(4):480-508 (68 ref.) (Eng. Abstr.) **(Fre)**

[Efficacy and kinetics of chlorazepate administered to anxious patients in a single daily dose] Duguay R, et al. **Can J Psychiatry** 1985 Oct; 30(6):414-7 (Eng. Abstr.) **(Fre)**

[Alprazolam vs. oxazepam in the treatment of anxious-neurotic patients] Pöldinger W. **Schweiz Rundsch Med Prax** 1985 Oct 29; 74(44):1199-203 (Eng. Abstr.) **(Ger)**

APOMORPHINE

Effect of domperidone on apomorphine inhibition of the copulatory response and exploratory behaviour in the female rat. Sietnieks A, et al. **Acta Pharmacol Toxicol (Copenh)** 1985 Sep;57(3):160-5

Rotational behaviour elicited by intracerebral injections of apomorphine and pergolide in 6-hydroxy-dopamine-lesioned rats. I: Comparison between systemic and intrastriatal injections. Herrera-Marschitz M, et al. **Acta Physiol Scand** 1985 Nov;125(3):519-27

Rotational behaviour elicited by intracerebral injections of apomorphine and pergolide in 6-hydroxy-dopamine-lesioned rats. II: The striatum of the rat is heterogeneously organized for rotational behaviour. Herrera-Marschitz M, et al. **Acta Physiol Scand** 1985 Nov; 125(3):529-35

Studies on the cardiovascular actions of apomorphine in dogs: central versus peripheral mechanisms and role of the adrenal medulla. Montastruc JL, et al. **Arch Int Pharmacodyn Ther** 1985 Sep; 277(1):92-103

Effect of a novel environment on locomotor hyperactivity of rats induced by apomorphine in the nucleus accumbens. Morgenstern R, et al. **Biomed Biochim Acta** 1985;44(10):1517-22

Homocysteine prevents apomorphine-induced decreases in dopamine metabolites. Saller CF, et al. **Brain Res** 1985 Dec 23;360(1-2):407-8

Mechanism of action of apomorphine on rat gastric secretion. Costall B, et al. **Eur J Pharmacol** 1985 Oct 22;116(3):279-85

SKF 38393 and apomorphine modify locomotion and exploration in rats placed on a holeboard by separate actions at dopamine D-1 and D-2 receptors. Fletcher GH, et al. **Eur J Pharmacol** 1985 Nov 19; 117(3):381-5

The enantiomers of SK&F 83566, a new selective D-1 dopamine antagonist, stereospecifically block stereotyped behaviour induced by apomorphine and by the selective D-2 agonist RU 24213. Molloy AG, et al. **Eur J Pharmacol** 1985 Oct 8;116(1-2):183-6

Benzamide potentiation of behavioral apomorphine-induced effects; mechanism involved. Piriou F, et al. **Experientia** 1985 Nov 15; 41(11):1409-10

Subchronic methamphetamine treatment selectively attenuates apomorphine-induced decrease in 3,4-dihydroxyphenylacetic acid level in mesolimbic dopaminergic regions. Watanabe H. **Life Sci** 1985 Dec 16;37(24):2319-25

Bilateral lesions of the striatum induced with 6-hydroxydopamine abolish apomorphine-induced yawning in rats. Dourish CT, et al. **Neuropharmacology** 1985 Nov;24(11):1051-5

Differential effects of thioridazine, clozapine and metoclopramide on the induction of adrenomedullary enzymes by apomorphine. Ekker M, et al. **Neuropharmacology** 1985 Nov;24(11):1063-6

Furosemide blocks the apomorphine-elicited Cl-channel activity of rat striatal dopamine receptors functionally reconstituted into bimolecular lipid membrane. Vodyanoy V, et al. **Neurosci Lett** 1985 Nov 20; 62(1):103-6

Different effects of apomorphine on climbing behavior and locomotor activity in three strains of mice. Cabib S, et al. **Pharmacol Biochem Behav** 1985 Oct;23(4):555-7

Chronic clorgyline and pargyline increase apomorphine-induced stereotypy in the rat. Campbell IC, et al. **Pharmacol Biochem Behav** 1985 Dec;23(6):921-5

Chin rub CRs are elicited by flavors associated with apomorphine, scopolamine, methscopolamine, physostigmine and neostigmine. Smith RJ, et al. **Pharmacol Biochem Behav** 1985 Oct;23(4):583-9

Effect of chronic treatment with morphine on the binding of 3H-N-n-propylnorapomorphine to striatal membranes of rats: influence of prolyl-leucyl-glycinamide. Das S, et al. **Pharmacology** 1985; 31(5):241-7

Effects of dopamine agonists on hypothalamic defensive attack in cats. Maeda H, et al. **Physiol Behav** 1985 Jul;35(1):89-92

Effects of some antidepressant drugs on apomorphine concentration in the central nervous system of rats and apomorphine-induced stereotypy. Rurak A, et al. **Pol J Pharmacol Pharm** 1985 Jul-Aug;37(4):509-15

The responsiveness of the endogenous inhibitor of cAMP-dependent protein kinase to apomorphine in rat striatum after prolonged treatment with nomifensin. Szmigielski A, et al. **Pol J Pharmacol Pharm** 1985 May-Jun;37(3):285-93

Apomorphine anorexia: a behavioural and neuropharmacological analysis. Willner P, et al. **Psychopharmacology (Berlin)** 1985;87(3):351-6

APPETITE

Dietary effects on brain serotonin synthesis: relationship to appetite regulation. Fernstrom JD. **Am J Clin Nutr** 1985 Nov; 42(5 Suppl):1072-82

Endogenous cholecystokinin and intestinal satiety. Collins SM, et al. **Am J Physiol** 1985 Dec;249(6 Pt 2):R667-71

Dynorphin, an endogenous stimulator of feeding. Morley JE, et al. **Prog Clin Biol Res** 1985;192:293-300

The effect of vagotomy on the increase in food intake induced by the cholecystokinin antagonist, proglumide. Shillabeer G, et al. **Regul Pept** 1985 Oct;12(2):91-9

AROMATIC AMINO ACID DECARBOXYLASES

Inhibition of monoamine oxidase selectively in brain monoamine nerves using the bioprecursor (E)-beta-fluoromethylene-m-tyrosine (MDL 72394), a substrate for aromatic L-amino acid decarboxylase. Palfreyman MG, et al. **J Neurochem** 1985 Dec;45(6):1850-60

AROUSAL

ACTH 4-9 analogue (Org 2766) in depressed elderly patients. II. Effect on memory and vigilance. Frederiksen SO, et al. **Acta Psychiatr Scand** 1985 Oct;72(4):349-57

Suppression of PCP-induced behavioral arousal in the rat by yohimbine pretreatment. Byron K, et al. **Eur J Pharmacol** 1985 Nov 5; 117(2):271-3

Exaggerated psychophysiological reactivity: issues in quantification and reliability. Seraganian P, et al. **J Psychosom Res** 1985;29(4):393-405

Stimulation of dopamine D-1 receptors by SKF 38393 induces EEG desynchronization and behavioral arousal. Ongini E, et al. **Life Sci** 1985 Dec 16;37(24):2327-33

Adrenaline, emotional arousal and memory. Christianson SA, et al. **Scand J Psychol** 1985;26(3):237-48

[The activating effect of MCI-2016 (bifemelane hydrochloride) on EEG in cats] Egawa M, et al. **No To Shinkei** 1985 Aug;37(8):759-65 (Eng. Abstr.) **(Jpn)**

ATTENTION

Benefits of correlating neuroleptic blood level and auditory distractibility [letter] Terkelsen KG. **Am J Psychiatry** 1985 Dec;142(12):1523-4

ATTENTION DEFICIT DISORDER WITH HYPERACTIVITY

Dysthymia and attention deficit disorder in adults [letter] Mattes JA. **Am J Psychiatry** 1986 Jan;143(1):114-5

Attention deficit disorders in adults. Gualtieri CT, et al. **Clin Neuropharmacol** 1985;8(4):343-56

Nortriptyline in attention deficit disorder [letter] Saul RC. **Clin Neuropharmacol** 1985;8(4):382-3

A developmental dose-response analysis of the effects of methylphenidate on the peer interactions of attention deficit disordered boys. Cunningham CE, et al. **J Child Psychol Psychiatry** 1985 Nov; 26(6):955-71

Attention deficit disorder with hyperactivity: differential effects of methylphenidate on impulsivity. Rapport MD, et al. **Pediatrics** 1985 Dec;76(6):938-43

Neuropharmacology of methylphenidate and a neural substrate for childhood hyperactivity. Gualtieri CT, et al. **Psychiatr Clin North Am** 1985 Dec;8(4):875-92

Treatment of attention deficit disorder with DL-phenylalanine. Wood DR, et al. **Psychiatry Res** 1985 Sep;16(1):21-6

AUDITORY PERCEPTION

Benefits of correlating neuroleptic blood level and auditory distractibility [letter] Terkelsen KG. **Am J Psychiatry** 1985 Dec;142(12):1523-4

AUTISM, INFANTILE

Fenfluramine therapy for autism [letter] Pranzatelli MR, et al. **J Autism Dev Disord** 1985 Dec;15(4):439-41

AVOIDANCE LEARNING

A comment on 'coyote control and taste aversion'. Burns RJ, et al. **Appetite** 1985 Sep;6(3):276-81

Coyote control and taste aversion: a predation problem or a people problem? Ellins SR. **Appetite** 1985 Sep;6(3):272-5

Research on forms of conditioned avoidance in coyotes. Lehner PN, et al. **Appetite** 1985 Sep;6(3):265-7

Coyote control and taste aversion. Quick DL, et al. **Appetite** 1985 Sep;6(3):253-64

Brief comments on 'coyote control and taste aversion'. Wade DA. **Appetite** 1985 Sep;6(3):268-71

Effects of preexposure flavor concentration on conditioned aversion and neophobia. Gilley DW, et al. **Behav Neural Biol** 1985 Nov;44(3):503-8

Noradrenergic changes and memory loss in aged mice. Leslie FM, et al. **Brain Res** 1985 Dec 16;359(1-2):292-9

Avfail in color avoidance learning by starlings (Sturnus vulgaris) and red-winged blackbirds (Agelaius phoeniceus). Mason JR, et al. **J Comp Psychol** 1985 Dec;99(4):403-10

The effects of histamine and some related compounds on conditioned avoidance response in rats. Tasaka K, et al. **Life Sci** 1985 Nov 25;37(21):2005-14

Effects of psychoactive drugs on conditioned avoidance response in Mongolian gerbils (Meriones unguiculatus): comparison with Wistar rats and dd mice. Kuribara H, et al. **Pharmacol Biochem Behav** 1985 Dec;23(6):1013-8

The effects of clozapine on shuttle-box avoidance responding in rats: comparisons with haloperidol and chlordiazepoxide. Sanger DJ. **Pharmacol Biochem Behav** 1985 Aug;23(2):231-6

Conditioned suppression of sexual behavior in stallions and reversal with diazepam. McDonnell SM, et al. **Physiol Behav** 1985 Jun;34(6):951-6

Is delay of reward mediated by shock-avoidance behavior a critical target for anti-punishment effects of diazepam in rats? Thiebot MH, et al. **Psychopharmacology (Berlin)** 1985;87(4):473-9

AZEPINES

Role of adenosine uptake and metabolism by blood cells in the antiplatelet actions of dipyridamole, dilazep and nitrobenzylthioinosine. Dawicki DD, et al. **Biochem Pharmacol** 1985 Nov 15;34(22):3965-72

Effects of dilazep on the electrophysiological properties of rabbit sinoatrial node cells. Kotake H, et al. **Eur J Pharmacol** 1985 Aug 27;114(3):291-6

Facilitated transport of sodium salicylate across an artificial lipid membrane by Azone. Hadgraft J, et al. **J Pharm Pharmacol** 1985 Oct;37(10):725-7

Relationship between alpha adrenoceptor occupancy and response for the alpha-1 adrenoceptor agonist, cirazoline, and the alpha-2 adrenoceptor agonist, B-HT 933, in canine saphenous vein. Ruffolo RR Jr, et al. **J Pharmacol Exp Ther** 1985 Dec;235(3):636-43

Evaluation of immune function in mice exposed to Ordram. Smialowicz RJ, et al. **Toxicology** 1985 Dec;37(3-4):307-14

[Clotiazepam, a new molecule among the anxiolytic agents] **Clin Ter** 1985 Jul 31;114(2):159-62 **(Ita)**

BEHAVIOR

The ethological approach to the assessment of depressive disorders. Fossi L, et al. **J Nerv Ment Dis** 1984 Jun;172(6):332-41

Scientists ponder diet's behavioral effects [news] Simmons K. **JAMA** 1985 Dec 27;254(24):3407-8

BEHAVIOR, ANIMAL

Rotational behaviour elicited by intracerebral injections of apomorphine and pergolide in 6-hydroxy-dopamine-lesioned rats. II: The striatum of the rat is heterogeneously organized for rotational behaviour. Herrera-Marschitz M, et al. **Acta Physiol Scand** 1985 Nov;125(3):529-35

Rotational behaviour elicited by intracerebral injections of apomorphine and pergolide in 6-hydroxy-dopamine-lesioned rats. I: Comparison between systemic and intrastriatal injections. Herrera-Marschitz M, et al. **Acta Physiol Scand** 1985 Nov;125(3):519-27

Behavioral depression after intraventricular infusion of octopamine in rats. Chance WT, et al. **Am J Surg** 1985 Nov;150(5):577-84

Behavioural pharmacology of imidazole, a potential antidepressant agent. Ferrari F. **Arch Int Pharmacodyn Ther** 1985 Oct;277(2):303-12

Differential effects of haloperidol decanoate, a long-acting neuroleptic, in behavioral and biochemical tests. Oka M, et al. **Arch Int Pharmacodyn Ther** 1985 Oct;277(2):289-302

Methyl methacrylate induced behavioural and neurochemical changes in rats. Husain R, et al. **Arch Toxicol** 1985 Oct;58(1):33-6

Age-related memory deficits in rats and mice: enhancement with peripheral injections of epinephrine. Sternberg DB, et al. **Behav Neural Biol** 1985 Sep;44(2):213-20

Effect of angiotensin II on some behavioral and neurochemical measures of the central serotonine system. Braszko JJ, et al. **Biomed Biochim Acta** 1985;44(9):1359-68

The functional importance of cerebral noradrenergic processes for the activating action of nootropic drugs in the behavioural despair test in mice. Schmidt J. **Biomed Biochim Acta** 1985;44(5):755-61

The effects of triazolobenzodiazepines in two animal tests of anxiety and in the holeboard. File SE, et al. **Br J Pharmacol** 1985 Nov;86(3):729-35

Monoaminergic involvement in the pharmacological actions of buspirone. Skolnick P, et al. **Br J Pharmacol** 1985 Nov;86(3):637-44

Reduced-5-hydroxytryptamine-dependent behavior in rats following chronic corticosterone treatment. Dickinson SL, et al. **Brain Res** 1985 Oct 14;345(1):10-8

Behavioral and neurochemical effect of daily injection with neurotensin into the ventral tegmental area. Kalivas PW, et al. **Brain Res** 1985 Dec 9;358(1-2):70-6

Dominant social status facilitates the behavioral effects of serotonergic agonists. Raleigh MJ, et al. **Brain Res** 1985 Dec 2;348(2):274-82

Behavioral, autonomic and motor effects of neuroleptic drugs in cats: motor impairment and aggression. Beleslin DB, et al. **Brain Res Bull** 1985 Sep;15(3):353-6

Prenatal exposure of rats to antidepressants enhances agonist affinity of brain dopamine receptors and dopamine-mediated behaviour. De Ceballos ML, et al. **Eur J Pharmacol** 1985 Oct 22;116(3):257-62

Modification of behavioral response to intra-hippocampal injections of noradrenaline and adrenoceptor agonists by chronic treatment with desipramine and citalopram: functional aspects of adaptive receptor changes. Plaznik A, et al. **Eur J Pharmacol** 1985 Nov 5;117(2):245-52

Hyper-reactivity to amphetamine in rats with dopaminergic grafts. Herman JP, et al. **Exp Brain Res** 1985;60(3):521-6

Benzamide potentiation of behavioral apomorphine-induced effects: mechanism involved. Piriou F, et al. **Experientia** 1985 Nov 15;41(11):1409-10

Behavior and kainic acids differential behavioral and biochemical effects of kainic acid and allokainic acid injections in rats. Molla-Hosseini C, et al. **J Pharmacol** 1985 Apr-Jun;16(2):191-6

Modulation of action of kainic acid on the behavior of rats by p-chlorophenylalanine and by gaba-mimetic drugs. Biochemical correlation between behavior and treatments. Molla-Hosseini C, et al. **J Pharmacol** 1985 Jul-Sep;16(3):299-312

Evidence that D-1 dopamine receptors contribute to the supersensitive behavioral responses induced by L-dihydroxyphenylalanine in rats treated neonatally with 6-hydroxydopamine. Breese GR, et al. **J Pharmacol Exp Ther** 1985 Nov;235(2):287-95

Effects of chronic dietary lithium on behavioral indices of dopamine denervation supersensitivity in the rat. Swerdlow NR, et al. **J Pharmacol Exp Ther** 1985 Nov;235(2):324-9

delta 9-Tetrahydrocannabinol elicited ipsilateral circling behavior in rats with unilateral nigral lesion. Sakurai Y, et al. **Life Sci** 1985 Dec 9;37(23):2181-5

Substance K, a novel tachykinin injected bilaterally into the ventral tegmental area of rats increases behavioral response. Takano Y, et al. **Life Sci** 1985 Dec 30;37(26):2507-14

Behavioral dependence in rhesus monkeys following chronic THC administration. Beardsley PM, et al. **Natl Inst Drug Abuse Res Monogr Ser** 1984;55:111-7

Correlating behavior with neural activity: an approach to study the action of drugs in the behaving animal. Deadwyler SA. **Natl Inst Drug Abuse Res Monogr Ser** 1985;62:63-76

Comparative evaluation of the behavioural consequences of prenatal and early postnatal exposure to haloperidol in rats. Cuomo V, et al. **Neurobehav Toxicol Teratol** 1985 Sep-Oct;7(5):489-92

Behavioral effects of perinatal administration of antidepressant drugs in the rat. Drago F, et al. **Neurobehav Toxicol Teratol** 1985 Sep-Oct;7(5):493-7

Time course of the development of the enhanced behavioral and biochemical responses to amphetamine after pretreatment with amphetamine. Kolta MG, et al. **Neuropharmacology** 1985 Sep;24(9):823-9

Intrathecal somatostatin modulates spinal sensory and reflex mechanisms: behavioral and electrophysiological studies in the rat. Wiesenfeld-Hallin Z. **Neurosci Lett** 1985 Nov 20;62(1):69-74

Neuropeptide effects on brain development to be expected from behavioral teratology. Boer GJ, et al. **Peptides (Fayetteville)** 1985;6 Suppl 2:21-8 (121 ref.)

Different effects of apomorphine on climbing behavior and locomotor activity in three strains of mice. Cabib S, et al. **Pharmacol Biochem Behav** 1985 Oct;23(4):555-7

Effects of neuroleptics displaying antidepressant activity on behavior of rats in the forced swimming test. Górka Z, et al. **Pharmacol Biochem Behav** 1985 Aug;23(2):203-6

Differences between calcium channel inhibitors in their effects on phencyclidine-induced behavioral stimulation in mice. Grebb JA, et al. **Pharmacol Biochem Behav** 1985 Oct;23(4):613-8

Changes in drug sensitivity following acute and chronic exercise. McMaster SB, et al. **Pharmacol Biochem Behav** 1985 Aug; 23(2):191-4

Role of dopaminergic system(s) in mediation of the behavioural effects of bombesin. Merali Z, et al. **Pharmacol Biochem Behav** 1985 Aug; 23(2):243-8

Phencyclidine-induced dopamine-dependent behaviors in chronic haloperidol-treated rats. Yamaguchi K, et al. **Pharmacol Biochem Behav** 1985 Nov;23(5):803-9

Dopaminergic behavior in frontal decorticated rats. Itoh S, et al. **Physiol Behav** 1985 Jul;35(1):109-12

Central effects of repeated treatment with bupropion. Klimek V, et al. **Pol J Pharmacol Pharm** 1985 May-Jun;37(3):243-52

Mesolimbic noradrenaline but not dopamine is responsible for organization of rat behavior in the forced swim test and an anti-immobilizing effect of desipramine. Plaźnik A, et al. **Pol J Pharmacol Pharm** 1985 May-Jun; 37(3):347-57

Behavioral effects of non-opioid fragments of beta-endorphin. van Ree JM, et al. **Prog Clin Biol Res** 1985;192:277-84

Acute and chronic effects of dextropropoxyphene on behaviour and central inhibitory neurotransmission in the rat. Foster-Smith K, et al. **Prog Neuropsychopharmacol Biol Psychiatry** 1985;9(4):361-7

Interaction of dietary tryptophan and social isolation on territorial aggression, motor activity, and neurochemistry in mice. Lasley SM, et al. **Psychopharmacology (Berlin)** 1985;87(3):313-21

Behavioral effects of vasopressin and oxytocin within the medial preoptic area of the golden hamster. Albers HE, et al. **Regul Pept** 1985 Nov 7;12(3):257-60

[Effect of lithium, carbamazepine, ca-valproate and diazepam on changes in social isolation-induced behavior in mice] Oehler J, et al. **Biomed Biochim Acta** 1985;44(10):1523-30 (Eng. Abstr.) **(Ger)**

[Behavioral and neurochemical changes in pups prenatally treated with methamphetamine] Fujiwara Y. **Yakubutsu Seishin Kodo** 1985 Sep; 5(3):251-9 (Eng. Abstr.) **(Jpn)**

[Chronological change in abnormal behavior produced by long-term methamphetamine administration in the rat] Kashihara K, et al. **Yakubutsu Seishin Kodo** 1985 Sep;5(3):261-70 (Eng. Abstr.) **(Jpn)**

[Synthesis and the study of the effect of new 3,4,5-trimethoxybenzoic acid derivatives on the central nervous system] Glinka R, et al. **Acta Pol Pharm** 1985;42(2):117-22 (Eng. Abstr.) **(Pol)**

BENACTYZINE

The effects of atropine, benactyzine, and physostigmine on a repeated acquisition baseline in monkeys. Penetar DM. **Psychopharmacology (Berlin)** 1985;87(1):69-76

[Effect of diazepam, meprobamate and amizyl on the emotional reactions of the rabbit to hypothalamic stimulation] Davituliani DS, et al. **Zh Vyssh Nerv Deiat** 1985 Sep-Oct;35(5):952-6 (Eng. Abstr.) **(Rus)**

BENZAZEPINES

Pharmacokinetics of diltiazem and other calcium entry blockers. Hermann P, et al. **Acta Pharmacol Toxicol (Copenh)** 1985;57 Suppl 2:10-20 (62 ref.)

Calcium blocker diltiazem inhibits platelet activation and stimulates vascular prostacyclin synthesis. Mehta J, et al. **Am J Med Sci** 1986 Jan;291(1):20-4

Effects of diltiazem on the TEA-induced plateau of nodose ganglion action potentials. Ito H, et al. **Arch Int Pharmacodyn Ther** 1985 Sep; 277(1):28-38

The peripheral vascular effects of diltiazem--dose-response characteristics. Finch MB, et al. **Br J Clin Pharmacol** 1985 Nov; 20(5):447-51

SKF 38393 and apomorphine modify locomotion and exploration in rats placed on a holeboard by separate actions at dopamine D-1 and D-2 receptors. Fletcher GH, et al. **Eur J Pharmacol** 1985 Nov 19; 117(3):381-5

The enantiomers of SK&F 83566, a new selective D-1 dopamine antagonist, stereospecifically block stereotyped behaviour induced by apomorphine and by the selective D-2 agonist RU 24213. Molloy AG, et al. **Eur J Pharmacol** 1985 Oct 8;116(1-2):183-6

Structural determinants of selective affinity for brain D-1 dopamine receptors within a series of 1-phenyl-1H-3-benzazepine analogues of SK&F 38393 and SCH 23390. O'Boyle KM, et al. **Eur J Pharmacol** 1985 Sep 24;115(2-3):291-5

The effects of diltiazem and captopril on glycerol-induced acute renal failure in the rat. Functional, pathologic, and microangiographic studies. Lee SM, et al. **Invest Radiol** 1985 Dec;20(9):961-70

The influence of diltiazem and nifedipine on the haemodynamic and tubular responses of the rat kidney to renal nerve stimulation. Herod JJ, et al. **J Auton Pharmacol** 1985 Sep;5(3):251-60

Quantification of R-(+)-7-chloro-8-hydroxy-1-phenyl-2,3,4,5-tetrahydro-1H-3-meth benzazepine in brain and blood by use of reversed-phase high-performance liquid chromatography with electrochemical detection. Kilts CD, et al. **J Chromatogr** 1985 Aug 9;342(2):452-7

Calcium channel blockers in the treatment of panic disorder [letter] Goldstein JA. **J Clin Psychiatry** 1985 Dec;46(12):546

Selective alpha-2 adrenoceptor blockade by SK&F 86466: in vitro characterization of receptor selectivity. Hieble JP, et al. **J Pharmacol Exp Ther** 1986 Jan;236(1):90-6

Synaptic facilitation by 3-aminopyridine and its antagonism by verapamil and diltiazem. Riker WK, et al. **J Pharmacol Exp Ther** 1985 Nov; 235(2):431-5

A comparison between dopamine-stimulated adenylate cyclase and 3H-SCH 23390 binding in rat striatum. Andersen PH, et al. **Life Sci** 1985 Nov 25;37(21):1971-83

Stimulation of dopamine D-1 receptors by SKF 38393 induces EEG desynchronization and behavioral arousal. Ongini E, et al. **Life Sci** 1985 Dec 16;37(24):2327-33

Reduction of central epinephrine concentrations is consistent with the continued occurrence of ovulation in rats treated with an inhibitor (LY 134046) of phenylethanolamine N-methyltransferase. Sheaves R, et al. **Neuroendocrinology** 1985 Nov;41(5):432-6

Treatment of mania using a calcium antagonist--preliminary trial. Caillard V. **Neuropsychobiology** 1985;14(1):23-6

The D1 dopamine agonist SKF 38393 functions as a discriminative stimulus in rats. Kamien JB, et al. **Psychopharmacology (Berlin)** 1985; 87(3):368-70

Effects of the putative D-1 antagonist SCH 23390 on stereotyped behaviour induced by the D-2 agonist RU24213. Pugh MT, et al. **Psychopharmacology (Berlin)** 1985;87(3):308-12

[Inhibition of mastocyte granulation by 2 calcium antagonists: verapamil and diltiazem] Manso G, et al. **Arch Farmacol Toxicol** 1985 Aug; 11(2):85-90 (Eng. Abstr.) **(Spa)**

BENZODIAZEPINE TRANQUILIZERS

A third view on benzodiazepines and sleep latency [letter] Rosenbaum JF. **Am J Psychiatry** 1985 Dec;142(12):1524

Another case of alprazolam withdrawal syndrome [letter] Vital-Herne J, et al. **Am J Psychiatry** 1985 Dec;142(12):1515

Combination alprazolam-neuroleptic treatment of the positive and negative symptoms of schizophrenia. Wolkowitz OM, et al. **Am J Psychiatry** 1986 Jan;143(1):85-7

Does the benzodiazepine antagonist Ro 15-1788 reverse the actions of picrotoxin and pentylenetetrazole on social and exploratory behaviour? File SE, et al. **Arch Int Pharmacodyn Ther** 1985 Oct;277(2):272-9

Tofisopam and midazolam: differences in clinical effects and in changes of CSF monoamine metabolites. Hovi-Viander M, et al. **Br J Clin Pharmacol** 1985 Nov;20(5):492-6

The effect of repeated doses of temazepam and nitrazepam on human psychomotor performance. Tedeschi G, et al. **Br J Clin Pharmacol** 1985 Oct;20(4):361-7

The effects of triazolobenzodiazepines in two animal tests of anxiety and in the holeboard. File SE, et al. **Br J Pharmacol** 1985 Nov; 86(3):729-35

Abuse potential of benzodiazepines. Ciraulo DA. **Bull NY Acad Med** 1985 Oct;61(8):728-41

Evidence for the pharmacological relevance of benzodiazepine receptors to anticonvulsant activity. Fisher TE, et al. **Can J Physiol Pharmacol** 1985 Nov;63(11):1477-9

Effects of chronic benzodiazepine administration on neuropsychological performance. Bornstein RA, et al. **Clin Neuropharmacol** 1985; 8(4):357-61

Pharmacodynamic evaluation of the benzodiazepine-oral contraceptive interaction. Kroboth PD, et al. **Clin Pharmacol Ther** 1985 Nov; 38(5):525-32

Effect of alprazolam on digoxin kinetics and creatinine clearance. Ochs HR, et al. **Clin Pharmacol Ther** 1985 Nov;38(5):595-8

Sublingual use of benzodiazepines [letter] Calis KA, et al. **Drug Intell Clin Pharm** 1985 Nov;19(11):839-40

Effect of benzodiazepine hypnotics on all-night sleep EEG spectra. Borbely AA, et al. **Hum Neurobiol** 1985;4(3):189-94

Preliminary report on the application of a high performance liquid chromatographic method for alprazolam in postmortem blood specimens. Edinboro LE, et al. **J Anal Toxicol** 1985 Sep-Oct; 9(5):207-8

Evaluation of EMIT-TOX Enzyme Immunoassay for the analysis of benzodiazepines in serum: usefulness and limitations in an emergency laboratory. Manchon M, et al. **J Anal Toxicol** 1985 Sep-Oct; 9(5):209-12

Pharmacodynamic interaction between midazolam and a specific benzodiazepine antagonist in humans. Klotz U, et al.

J Clin Pharmacol 1985 Sep;25(6):400-6
Clinical notes in therapeutics: pharmacoanxiolytic therapy in dentistry: the benzodiazepines. Terezhalmy GT, et al. **J Oral Med** 1985 Oct-Dec; 40(4):209-11
Flumezapine and zotepine: 5-hydroxytryptamine antagonism not involved in the lack of synergism of these antipsychotic drugs with amfonelic acid in rats. Fuller RW, et al. **J Pharm Pharmacol** 1985 Oct; 37(10):755-6
Caerulein antagonism by benzodiazepines in the food intake in mice. Kubota K, et al. **Jpn J Pharmacol** 1985 Sep;39(1):120-2
CGS 8216 and CGS 9896, novel pyrazoloquinoline benzodiazepine ligands with benzodiazepine agonist and antagonist properties. Boast CA, et al. **Pharmacol Biochem Behav** 1985 Oct;23(4):639-44
Benzodiazepine-induced hyperphagia in the nondeprived rat: comparisons with CL 218,872, zopiclone, tracazolate and phenobarbital. Cooper SJ, et al. **Pharmacol Biochem Behav** 1985 Aug;23(2):169-72
Specific antagonism by RO 15-1788 of benzodiazepine-induced increases in food intake in rhesus monkeys. Foltin RW, et al. **Pharmacol Biochem Behav** 1985 Aug;23(2):249-52
Autoradiographic demonstration of the selectivity of two 1-N-trifluoroethyl benzodiazepines for the BZD-1 receptors in the rat brain. Wamsley JK, et al. **Pharmacol Biochem Behav** 1985 Dec; 23(6):973-8
Skin conductance reaction (SCR)-habituation test, a tool to detect anxiolytic activity. Its justification by the correlation between SCR-habituation test activities and specific binding potencies in benzodiazepines. Marcy R, et al. **Prog Neuropsychopharmacol Biol Psychiatry** 1985;9(4):387-91
Benzodiazepines in the control of anxiety-induced depression. Fairhurst MM. **S Afr Med J** 1985 Oct 26;Suppl:29
Pharmacodynamics of benzodiazepines. Stahmer SD. **S Afr Med J** 1985 Oct 26;Suppl:14-22 (46 ref.)
Pharmacokinetics of the benzodiazepines. Van Rooyen JM, et al. **S Afr Med J** 1985 Oct 26;Suppl:10-3 (18 ref.)

[Study of the hereditary differences in the cyclic nucleotide content of the blood serum in mice after exposure to stress and administration of phenazepam] Seredinin SB, et al. **Biull Eksp Biol Med** 1985 Nov; 100(11):586-8 (Eng. Abstr.) **(Rus)**

BENZODIAZEPINONES

Does the benzodiazepine antagonist Ro 15-1788 reverse the actions of picrotoxin and pentylenetetrazole on social and exploratory behaviour? File SE, et al. **Arch Int Pharmacodyn Ther** 1985 Oct;277(2):272-9
Postprandial pancreatic exocrine secretion in dogs after oral administration of pirenzepine dihydrochloride. Madrid JA, et al. **Arzneimittelforschung** 1985;35(10):1560-2
Muscarinic receptors discriminated by pirenzepine are involved in the regulation of neurotransmitter release in rat nucleus accumbens. de Belleroche J, et al. **Br J Pharmacol** 1985 Oct;86(2):505-8
Muscarinic cholinergic mediation of LHRH-induced LH and FSH secretion in normal men. Chiodera P, et al. **Clin Endocrinol (Oxf)** 1985 Oct;23(4):361-6
Central effects in man of the novel schistosomicidal benzodiazepine meclonazepam. O'Boyle C, et al. **Eur J Clin Pharmacol** 1985; 29(1):105-8
Spectrophotometric determination of pirenzepine dihydrochloride using delta A method. Wahbi AM, et al. **Farmaco [Prat]** 1985 Oct; 40(10):334-8
Determination of clobazam, N-desmethylclobazam and their hydroxy metabolites in plasma and urine by high-performance liquid chromatography. Tomasini JL, et al. **J Chromatogr** 1985 Oct 11; 343(2):369-77
Pharmacodynamic interaction between midazolam and a specific benzodiazepine antagonist in humans. Klotz U, et al. **J Clin Pharmacol** 1985 Sep;25(6):400-6
Mixed bipolar disorder responsive to lithium and clonazepam [letter] Adler LW. **J Clin Psychiatry** 1986 Jan;47(1):49-50
Studies on muscarinic binding sites in human brain identified with [3H]pirenzepine. Lin SC, et al. **J Neurochem** 1986 Jan;46(1):274-9
Imaging of [11C]-labelled Ro 15-1788 binding to benzodiazepine receptors in the human brain by positron emission tomography. Persson A, et al. **J Psychiatr Res** 1985;19(4):609-22
Attenuating effect of diazepam on stress-induced increases in noradrenaline turnover in specific brain regions of rats: antagonism by Ro 15-1788. Ida Y, et al. **Life Sci** 1985 Dec 30;37(26):2491-8
Behavioral effects and benzodiazepine antagonist activity of Ro 15-1788 (flumazepil) in pigeons. Witkin JM, et al. **Life Sci** 1985 Oct 28; 37(17):1587-95
Clonazepam-induced up-regulation of serotonin1 binding sites in frontal cortex of rat. Wagner HR, et al. **Neuropharmacology** 1985 Oct; 24(10):953-6
Specific antagonism by RO 15-1788 of benzodiazepine-induced increases in food intake in rhesus monkeys. Foltin RW, et al. **Pharmacol Biochem Behav** 1985 Aug;23(2):249-52
Autoradiographic demonstration of the selectivity of two 1-N-trifluoroethyl benzodiazepines for the BZD-1 receptors in the rat brain. Wamsley JK, et al. **Pharmacol Biochem Behav** 1985 Dec; 23(6):973-8
Endogenous inhibitors of [3H] Ro 5-4864 binding to 'peripheral-type' binding sites for benzodiazepines are present in peripheral tissues and brain. Mantione CR, et al. **Prog Clin Biol Res** 1985;192:167-73
Are 'peripheral-type' binding sites for benzodiazepines in brain related to the convulsant actions of Ro 5-4864? Weissman BA, et al. **Prog Clin Biol Res** 1985;192:197-203
Pharmacodynamics of benzodiazepines. Stahmer SD. **S Afr Med J** 1985 Oct 26;Suppl:14-22 (46 ref.)
Action of pirenzepine, a new muscarinic antagonist drug, on human pancreatic secretion. Nishimura S, et al. **Scand J Gastroenterol** 1985 Oct;20(8):990-4
[Study of the hereditary differences in the cyclic nucleotide content of the blood serum in mice after exposure to stress and administration of phenazepam] Seredinin SB, et al. **Biull Eksp Biol Med** 1985 Nov; 100(11):586-8 (Eng. Abstr.) **(Rus)**
[Relation between the dynamics of EEG indices after a single dose of the tranquilizer phenazepam and its efficacy during a course of treatment of patients with borderline neuropsychological disorders] Uvarova LG, et al. **Zh Nevropatol Psikhiatr** 1985;85(11):1701-9 (Eng. Abstr.) **(Rus)**

BIOGENIC AMINES

Methyl methacrylate induced behavioural and neurochemical changes in rats. Husain R, et al. **Arch Toxicol** 1985 Oct;58(1):33-6
Tofisopam and midazolam: differences in clinical effects and in changes of CSF monoamine metabolites. Hovi-Viander M, et al. **Br J Clin Pharmacol** 1985 Nov;20(5):492-6
Biogenic amines in the snail brain of Helicella virgata (Gastropoda, Pulmonata). Franchini A, et al. **Brain Res** 1985 Nov 11;347(1):132-4
Highly sensitive high-performance liquid chromatographic technique for the simultaneous measurement of histamine, 1-methylhistamine and other biogenic amines. Devalia JL, et al. **J Chromatogr** 1985 Oct 11; 343(2):407-12
Repeated determination of cerebrospinal fluid amine metabolites by automated direct sampling from an implanted cannula in freely moving rats. De La Riva CF, et al. **J Neurosci Methods** 1985 Sep; 14(4):233-40
Cocaine abuse: neurochemistry, phenomenology, and treatment. Gold MS, et al. **Natl Inst Drug Abuse Res Monogr Ser** 1985;61:130-50
Amino acid and monoamine transport in primary astroglial cultures from defined brain regions. Hansson E, et al. **Neurochem Res** 1985 Oct; 10(10):1335-41
Studies on brain monoamine neurotransmitters in mice after prenatal exposure to barbiturate. Yanai J, et al. **Pharmacol Biochem Behav** 1985 Aug;23(2):215-9
Distribution of non-opioid peptides in the mammalian CNS: relationship to monoamine neurotransmitter systems. Westlund KN. **Prog Clin Biol Res** 1985;192:395-402
Interaction of dietary tryptophan and social isolation on territorial aggression, motor activity, and neurochemistry in mice. Lasley SM, et al. **Psychopharmacology (Berlin)** 1985;87(3):313-21
Comparison of 1-methyl-4-(p-chlorophenyl)-1,2,3,6-tetrahydropyridine, 1-methyl-4-phenyl-1,2,3,6-tetrahydropyridine (MPTP) and p-chloroamphetamine as monoamine depletors. Fuller RW, et al. **Res Commun Chem Pathol Pharmacol** 1985 Oct;50(1):57-65
[Circadian rhythm of central monoamine neurotransmitters in mammals] Ye WL. **Sheng Li Ko Hsueh Chin Chan** 1984 Oct;15(4):316-20 **(Chi)**
[Sleep--2. Substances in the mechanism of sleep and wakefulness] Nagasaki H, et al. **Nippon Rinsho** 1985 Jul;43(7):1384-9 (19 ref.) **(Jpn)**
[The response of monoamines in the rat brain to local vibration exposure] Yamaguchi Y. **Sangyo Igaku** 1985 Mar;27(2):73-82 (Eng. Abstr.) **(Jpn)**
[Electrochemical means of determining monoamines in the brain] Gilinskii MA, et al. **Fiziol Zh SSSR** 1985 Oct;71(10):1302-5 **(Rus)**

BIPOLAR DISORDER

Effect of carbamazepine on neuroleptic plasma levels and efficacy [letter] Fast DK, et al. **Am J Psychiatry** 1986 Jan;143(1):117-8

NMR chemistry analysis of red blood cell constituents in normal subjects and lithium-treated psychiatric patients. Domino EF, et al. **Biol Psychiatry** 1985 Dec;20(12):1277-83

Drug treatment of bipolar depression and mania. Cookson JC. **Br J Hosp Med** 1985 Sep;34(3):172-5 (92 ref.)

A double-blind out-patient trial of indalpine vs mianserin. Naylor GJ, et al. **Br J Psychiatry** 1985 Sep;147:306-9

Social support and long-term lithium outcome. O'Connell RA, et al. **Br J Psychiatry** 1985 Sep;147:272-5

Personality diagnosis and illness diagnosis. Brown JH, et al. **Can J Psychiatry** 1985 Oct;30(6):428-33

Affective disorder in an adolescent. Fisman S, et al. **Can J Psychiatry** 1985 Nov;30(7):530-4

Lithium-carbamazepine versus lithium-neuroleptic prophylaxis in bipolar illness. Shukla S, et al. **J Affective Disord** 1985 Nov;9(3):219-22

Mixed bipolar disorder responsive to lithium and clonazepam [letter] Adler LW. **J Clin Psychiatry** 1986 Jan;47(1):49-50

Carbamazepine in bipolar-depressed disorder complicated by tricyclic antidepressant switching: case report. Nurnberg HG, et al. **J Clin Psychiatry** 1985 Nov;46(11):487-8

Treatment of mania using a calcium antagonist--preliminary trial. Caillard V. **Neuropsychobiology** 1985;14(1):23-6

CSF somatostatin in affective illness and normal volunteers. Rubinow DR, et al. **Prog Neuropsychopharmacol Biol Psychiatry** 1985; 9(4):393-400

Amineptine in the management of the depressive syndromes. Scarzella L, et al. **Prog Neuropsychopharmacol Biol Psychiatry** 1985; 9(4):429-39

Prophylaxis and the lithium ratio in bipolar patients. Yassa R, et al. **Prog Neuropsychopharmacol Biol Psychiatry** 1985;9(4):423-8

Cerebrospinal fluid monoamine and monoamine metabolite concentrations in melancholia. Roy A, et al. **Psychiatry Res** 1985 Aug;15(4):281-92

Effect of lysine vasopressin in depressed patients on mood and 24-hour rhythm of growth hormone, cortisol, melatonin and prolactin. Zohar J, et al. **Psychoneuroendocrinology** 1985;10(3):273-9

MHPG excretion in endogenous depression: relationship to clinical state and the effects of ECT. Joseph MH, et al. **Psychopharmacology (Berlin)** 1985;87(4):442-8

[Prophylactic efficacy of lithium in recurrent bipolar affective disorders] Yang YY, et al. **Taiwan I Hsueh Hui Tsa Chih** 1985 Jun; 84(6):722-6 (Eng. Abstr.) **(Chi)**

[Lithium prophylaxis, o.k., but for how long?] Slooff CJ, et al. **Ned Tijdschr Geneeskd** 1985 Sep 7;129(36):1729-33 (Eng. Abstr.) **(Dut)**

[Preventive effect of valproic acid amide in affective diseases] Kłosiewicz L. **Psychiatr Pol** 1985 Jan-Feb;19(1):23-9 (Eng. Abstr.) **(Pol)**

BLOOD-BRAIN BARRIER

Permeability of the blood-cerebrospinal fluid and blood-brain barriers to thyrotropin-releasing hormone. Zloković BV, et al. **Brain Res** 1985 Dec 9;358(1-2):191-9

Brain concentrations of cocaine and benzoylecgonine in fatal cases. Spiehler VR, et al. **J Forensic Sci** 1985 Oct;30(4):1003-11

Aging and the blood-brain barrier: changes in the carrier-mediated transport of peptides in rats. Banks WA, et al. **Neurosci Lett** 1985 Oct 24;61(1-2):171-5

BOMBESIN

Release of an insulin-like peptide from perfused extirpated cat legs in response to electrical stimulation of the sciatic and brachial nerves and to administration of ACh, bombesin, oxytocin and glibenclamide. Posloncec B, et al. **Acta Physiol Scand** 1985 Oct;125(2):195-203

A peptide that inhibits the mitogenic stimulation of Swiss 3T3 cells by bombesin or vasopressin. Corps AN, et al. **Biochem J** 1985 Nov 1; 231(3):781-4

Deafferentation causes a loss of presynaptic bombesin receptors and supersensitivity of substance P receptors in the dorsal horn of the cat spinal cord. Massari VJ, et al. **Brain Res** 1985 Sep 23;343(2):268-74

Spantide: failure to antagonize bombesin-induced stimulation of gastrin secretion in dogs. Pappas T, et al. **Peptides (Fayetteville)** 1985 Sep-Oct; 6(5):1001-3

Influence of CCK and bombesin on ACTH and cortisol secretion in the conscious dog. Thomas RM, et al. **Peptides (Fayetteville)** 1985 Jul-Aug; 6(4):703-7

Role of dopaminergic system(s) in mediation of the behavioural effects of bombesin. Merali Z, et al. **Pharmacol Biochem Behav** 1985 Aug; 23(2):243-8

Trophic effect of some regulatory peptides on gastric exocrine and endocrine cells of the rat. Lehy T. **Scand J Gastroenterol [Suppl]** 1984; 101:27-30

BRADYKININ

Effect of leukotrienes, 12-HETE, histamine, bradykinin, and 5-hydroxytryptamine on in vivo rabbit cerebral arteriolar diameter. Kamitani T, et al. **J Cereb Blood Flow Metab** 1985 Dec;5(4):554-9

BUTYLAMINES

The effect of terodiline treatment in women with motor urge incontinence. Results from a double-blind study and long-term treatment. Ulmsten U, et al. **Am J Obstet Gynecol** 1985 Nov 15;153(6):619-22

Allosteric effects of diprobutine on acetylcholine receptors. Chemouilli P, et al. **Eur J Pharmacol** 1985 Nov 5;117(2):205-14

Terodiline in the treatment of urinary frequency and motor urge incontinence. Workshop in Düsseldorf, August 28-29, 1983. **Scand J Urol Nephrol [Suppl]** 1984;87:1-61

Clinical pharmacology of terodiline. Andersson KE. **Scand J Urol Nephrol [Suppl]** 1984;87:13-20

Terodiline in children with diurnal enuresis. Elmér M. **Scand J Urol Nephrol [Suppl]** 1984;87:59-61

Evaluation of long-term safety and clinical benefit of terodiline in women with urgency/urge incontinence. A multicentre study. Fischer-Rasmussen W. **Scand J Urol Nephrol [Suppl]** 1984;87:35-47

The effect of terodiline on patients with detrusor instability. Macfarlane JR, et al. **Scand J Urol Nephrol [Suppl]** 1984;87:51-4

Terodiline in the treatment of urinary frequency and motor urge incontinence. A controlled multicentre trial. Peters D. **Scand J Urol Nephrol [Suppl]** 1984;87:21-33

A symptomatic and cystometric comparison of terodiline with emepronium in the treatment of women with frequency, urgency and incontinence. Sole GM, et al. **Scand J Urol Nephrol [Suppl]** 1984; 87:55-7

BUTYROPHENONE TRANQUILIZERS

Intramuscular haloperidol decanoate for neuroleptic maintenance therapy. arap Mengech HN, et al. **East Afr Med J** 1984 Jun;61(6):435-8

BUTYROPHENONES

In vivo stereospecific [3H]spiperone binding in rat brain: characteristics, regional distribution, kinetics and pharmacological properties. Barone D, et al. **Eur J Pharmacol** 1985 Oct 8;116(1-2):63-74

Spiperone differentiates multiple 5-hydroxytryptamine responses in rat hippocampal slices in vitro. Beck SG, et al. **Eur J Pharmacol** 1985 Oct 8;116(1-2):195-7

In vivo quantitative imaging of dopamine receptors in human brain using positron emission tomography and [76Br]bromospiperone. Mazière B, et al. **Eur J Pharmacol** 1985 Aug 27;114(3):267-72

Chronic administration of D-amphetamine increases [3H]spiroperidol binding in cat brain. Trulson ME, et al. **Eur J Pharmacol** 1985 Nov 5;117(2):267-70

Changes in 3H-spiperone, 3H-WB 4101 and 3H-dihydroalprenolol bindings to brain membranes produced by postnatal pretreatment with chlorpromazine in adult rats. Hayashi T, et al. **Jpn J Pharmacol** 1985 Sep;39(1):45-50

D2 dopamine receptor-mediated inhibition of forskolin-stimulated adenylate cyclase activity in rat striatum. Battaglia G, et al. **Neurosci Lett** 1985 Aug 30;59(2):177-82

Increased low-affinity 3H-spiroperidol binding to rat cortical membranes after chronic antidepressant treatments. Antkiewicz-Michaluk L, et al. **Pol J Pharmacol Pharm** 1985 May-Jun;37(3):317-23

CARBAMAZEPINE

Effect of carbamazepine on neuroleptic plasma levels and efficacy [letter] Fast DK, et al. **Am J Psychiatry** 1986 Jan;143(1):117-8

Antidepressant effects of carbamazepine. Post RM, et al. **Am J Psychiatry** 1986 Jan;143(1):29-34

Free thyroxin and free triiodothyronine as measured by equilibrium dialysis and analog radioimmunoassay in serum of patients taking phenytoin and carbamazepine. Liewendahl K, et al. **Clin Chem** 1985 Dec;31(12):1993-6

Direct homogeneous phosphoroimmunoassay for carbamazepine in serum. Sidki AM, et al. **Clin Chem** 1986 Jan;32(1 Pt 1):53-6

Free concentration of carbamazepine and carbamazepine-10,11-epoxide in children and adults. Influence of age and phenobarbitone co-medication. Riva R, et al. **Clin Pharmacokinet** 1985 Nov-Dec; 10(6):524-31

Lithium-carbamazepine versus lithium-neuroleptic prophylaxis in bipolar illness. Shukla S, et al. **J Affective Disord** 1985 Nov;9(3):219-22

Simultaneous determination of carbamazepine and its epoxide metabolite in plasma and urine by high-performance liquid chromatography. Chan K. **J Chromatogr** 1985 Aug 9;342(2):341-7

Carbamazepine in bipolar-depressed disorder complicated by tricyclic antidepressant switching: case report. Nurnberg HG, et al. **J Clin Psychiatry** 1985 Nov;46(11):487-8

CARBAMAZEPINE

Carbamazepine treatment of a patient with Klüver–Bucy syndrome. Stewart JT. **J Clin Psychiatry** 1985 Nov;46(11):496–7

Side–effects of carbamazepine: drug or metabolite? [letter] Tomson T, et al. **Lancet** 1985 Nov 2;2(8462):1010

Effects of carbamazepine on noradrenergic mechanisms in affectively ill patients. Post RM, et al. **Psychopharmacology (Berlin)** 1985; 87(1):59–63

CARBIDOPA

The effect of an increased ratio of carbidopa to levodopa on the pharmacokinetics of levodopa. Kaakkola S, et al. **Acta Neurol Scand** 1985 Oct;72(4):385–91

Sinemet 'abusers'. Nausieda PA. **Clin Neuropharmacol** 1985;8(4):318–27

Effect of L–dopa with and without inhibition of extra cerebral dopa decarboxylase on gastric acid secretion and gastrin release in man. Caldara R, et al. **Gut** 1985 Oct;26(10):1014–7

L–dopa in the treatment of negative schizophrenic symptoms: a single–subject experimental study. Kay SR, et al. **Int J Psychiatry Med** 1985–86;15(3):293–8

CATATONIA

Lorazepam use and catatonic syndrome [letter] Peterson GN. **J Clin Psychopharmacol** 1985 Dec;5(6):359–60

CATECHOL ESTROGENS

Normal and recombinant human growth hormone administered by constant infusion feminize catechol estrogen formation by rat liver microsomes. Jellinck PH, et al. **Endocrinology** 1985 Dec; 117(6):2274–8

Catechol estrogen formation by pig blastocysts during the preimplantation period: biochemical characterization of estrogen–2/4–hydroxylase and correlation with aromatase activity. Mondschein JS, et al. **Endocrinology** 1985 Dec;117(6):2339–46

Estrogen effects on nigral glutamic acid decarboxylase activity: a possible role for catecholestrogen. Nicoletti F, et al. **Eur J Pharmacol** 1985 Sep 24;115(2–3):297–300

CATECHOLAMINES

The kinetics of adrenal catecholamine secretion elicited by splanchnic nerve stimulation or by Ach is consistent with non–exocytotic, multivesicular release on cation exchange basis. Uvnäs B, et al. **Acta Physiol Scand** 1985 Mar;123(3):249–59

Effects of pregnancy and magnesium sulfate infusion on blood pressure and plasma catecholamines. Lee MI, et al. **Am J Perinatol** 1985 Oct; 2(4):325–7

Co–release of neuropeptide Y and catecholamines during physical exercise in man. Lundberg JM, et al. **Biochem Biophys Res Commun** 1985 Nov 27;133(1):30–6

Calcium–independent desensitization of rises in intracellular free Ca2+ concentration and catecholamine release in cultured adrenal chromaffin cells. Sasakawa N, et al. **Biochem Biophys Res Commun** 1985 Nov 27; 133(1):147–53

Relation of substance P to catecholamine metabolism and stress. Oehme P. **Biomed Biochim Acta** 1985;44(10):1401–9 (36 ref.)

The synthesis and metabolism of catecholamines in the spinal cord of the rat after acute and chronic transections. Commissiong JW. **Brain Res** 1985 Nov 11;347(1):104–11

Differential ontogeny of three putative catecholamine cell types in the postnatal rat retina. Foster GA, et al. **Brain Res** 1985 Oct; 354(2):187–96

Autoradiography of high affinity uptake of catecholamines by primary astrocyte cultures. Semenoff D, et al. **Brain Res** 1985 Nov 25; 348(1):125–36

Plasma catecholamines in the lamprey: intrinsic cardiovascular messengers? Dashow L, et al. **Comp Biochem Physiol [C]** 1985; 82(1):119–22

Plasma catecholamines and erythrocyte swelling following capture stress in a marine teleost fish. Ling N, et al. **Comp Biochem Physiol [C]** 1985; 82(1):231–4

Evidence for gamma–aminobutyric acid modulation of ovarian hormonal effects on luteinizing hormone secretion and hypothalamic catecholamine activity in the female rat. Adler BA, et al. **Endocrinology** 1986 Jan;118(1):91–7

Endocrinological effects of intrathecal morphine. Sebel PS, et al. **Eur J Anaesthesiol** 1985 Sep;2(3):291–6

Long–term application of some catecholamines elevates levels of other catecholamines in rats. Porta S, et al. **Exp Pathol** 1985;28(3):181–6

Effects of protease inhibitors and calmodulin inhibitors on Ca2+ influx and catecholamine secretion in isolated bovine adrenal medullary cells. Nishibe S, et al. **Gen Pharmacol** 1985;16(5):455–62

Blood sugar in relation to endocrine hormones during hemorrhagic shock in dogs. Malliwah JA, et al. **Hiroshima J Med Sci** 1985 Sep; 34(3):281–90

Effect of hydrocortisone on catecholamines evoked cardiovascular responses. Parle MK, et al. **Indian J Exp Biol** 1985 Aug; 23(8):437–40

Modulation of oxytocin evoked uterine responses with phosphodiesterase active agents and catecholamines. Singh M, et al. **Indian J Exp Biol** 1985 Aug;23(8):441–6

Fat cell adrenoceptors: inter– and intraspecific differences and hormone regulation. Lafontan M, et al. **Int J Obes** 1985;9 Suppl 1:117–27 (58 ref.)

Effects of L–dopa supplementation on concentrations of brain catechols, dopamine receptor binding and the incidence of pale, soft and exudative meat in stress–susceptible pigs. Erlander MG, et al. **J Anim Sci** 1985 Oct;61(4):914–23

Reconstitution of catecholamine–stimulated adenylate cyclase activity using three purified proteins. May DC, et al. **J Biol Chem** 1985 Dec 15;260(29):15829–33

Ascorbic acid and catecholamine release from digitonin–treated chromaffin cells. Morita K, et al. **J Biol Chem** 1985 Dec 5; 260(28):15112–6

Estimation of adrenal catecholamines by elevated–temperature liquid chromatography with amperometric detection. Gagner JP, et al. **J Chromatogr** 1985 Aug 9;342(2):363–9

High–performance liquid chromatographic assay of free norepinephrine, epinephrine, dopamine, vanillylmandelic acid and homovanillic acid. Gerlo E, et al. **J Chromatogr** 1985 Sep 13;343(1):9–20

Estimation of catecholamines by ion–exchange chromatography on Asahipak ES–502C using glycylglycine as the post–derivatizing agent. Seki T, et al. **J Chromatogr** 1985 Sep 20;332:9–13

Distribution of central cholinergic neurons in the baboon (Papio papio). II. A topographic atlas correlated with catecholamine neurons. Satoh K, et al. **J Comp Neurol** 1985 Jun 8;236(2):215–33

Colocalization of neuropeptide Y immunoreactivity in brainstem catecholaminergic neurons that project to the paraventricular nucleus of the hypothalamus. Sawchenko PE, et al. **J Comp Neurol** 1985 Nov 8;241(2):138–53

Synthesis and utilization of catecholamines in the rat superior cervical ganglion following changes in the nerve impulse flow. Anden NE, et al. **J Neural Transm** 1985;64(2):81–92

Nerve growth factor and dexamethasone modulate synthesis and storage of catecholamines in cultured rat adrenal medullary cells: dependence on postnatal age. Müller TH, et al. **J Neurochem** 1986 Feb; 46(2):516–24

Involvement of peripheral and central catecholamine systems in neural–immune interactions. Livnat S, et al. **J Neuroimmunol** 1985 Nov; 10(1):5–30 (123 ref.)

An in vivo steady–state method for the determination of catecholamine biosynthesis in the rat brain using high–performance liquid chromatography with electrochemical detection. Harris PE, et al. **J Neurosci Methods** 1985 Sep;14(4):221–32

The pharmacological characterization of 3,4–dihydroxyphenylimino–2–imidazolidine (DPI) as a potent mixed alpha 1/alpha 2–adrenoceptor agonist rather than as a dopamine receptor agonist. van Oene JC, et al. **J Pharm Pharmacol** 1985 Nov; 37(11):844–7

Dihydropyridine BAY K 8644 enables reduction of Ca concentration to induce catecholamine secretion from the perfused cat adrenal. Sorimachi M, et al. **Jpn J Physiol** 1985;35(5):871–4

Determination of catecholamines in tissue and body fluids using microbore HPLC with amperometric detection. Durkin TA, et al. **Life Sci** 1985 Nov 11;37(19):1803–10

Determination of the endogenous and evoked release of catecholamines from the hypothalamus and caudate nucleus of the conscious and unrestrained rat. Ruwe WD, et al. **Life Sci** 1985 Nov 11; 37(19):1749–56

Plasma catecholamine measurements in resting and stressed conscious rats, using high performance liquid chromatography with electrochemical detection. Siri FM, et al. **Life Sci** 1985 Nov 18;37(20):1923–31

Effects of prostaglandin E1 on adrenal medulla chromaffin cells: model for studies of catecholamine release. Hariri NI, et al. **Methods Find Exp Clin Pharmacol** 1985 Jun;7(6):297–302

Atrial natriuretic factor, catecholamines, and natriuresis [letter] Racz K, et al. **N Engl J Med** 1986 Jan 30;314(5):321–2

Electrophysiological and neurochemical correlates of the neurotoxic effects of 1–methyl–4–phenyl–1,2,3,6–tetrahydropyridine (MPTP) on central catecholamine neurons in the mouse. Jonsson G, et al. **Naunyn Schmiedebergs Arch Pharmacol** 1985 Oct;331(1):1–6

Cysteamine effects on monoamines, dopamine–beta–hydroxylase and the hypothalamic–pituitary axis. Terry LC, et al. **Neuroendocrinology** 1985 Dec;41(6):467–75

Adrenal release of catecholamines and Met–enkephalin before and after stress as measured by a novel in vivo dialysis method in the rat. Jarry H, et al. **Neurosci Lett** 1985 Oct 10;60(3):273–8

The prefrontal 'cortex' in the pigeon catecholamine histofluorescence. Divac I, et al. **Neuroscience** 1985 Jul;15(3):677–82

Diffusion coefficients of neurotransmitters and their metabolites in brain extracellular fluid space. Rice ME, et al. **Neuroscience** 1985 Jul;

15(3):891-902

Organization of LHRH cells: differential apposition of neurotensin, substance P and catecholamine axons. Hoffman GE. **Peptides (Fayetteville)** 1985 May-Jun;6(3):439-61

Autoxidation of catechol(amine)s. Schüsler-van Hees MT, et al. **Pharm Weekbl [Sci]** 1985 Dec 13;7(6):245-51

Operantly conditioned running: effects on brain catecholamine concentrations and receptor densities in the rat. de Castro JM, et al. **Pharmacol Biochem Behav** 1985 Oct;23(4):495-500

Genes for neurotransmitter synthesis, storage and release. Joh TH. **Prog Clin Biol Res** 1985;192:423-9

The effect of pindolol on exercise-induced increase in plasma vasoactive prostanoids and catecholamines in healthy men. Laustiola K, et al. **Prostaglandins Leukotrienes Med** 1985 Nov;20(2):111-20

Catecholamines in different areas of brain during the ovulatory cycle in the hen and their relationship to egg traits. Moudgal RP, et al. **Zentralbl Veterinarmed [A]** 1985 Sep;32(8):573-80

[Studies on the feedback regulation of pulsatile luteinizing hormone secretion. II. Role of the catecholaminergic system in estrogen-induced suppression of the frequency of pulsatile LH secretion in ovariectomized rats] Tadokoro Y. **Nippon Naibunpi Gakkai Zasshi** 1985 Jul 20; 61(7):765-74 (Eng. Abstr.) **(Jpn)**

[The subnucleus gelatinosus of the nucleus tractus solitarii is a catecholaminergic nucleus--immunohistochemical and ultrastructural studies in human fetuses] Takahashi H. **No To Shinkei** 1985 Aug; 37(8):815-24 (Eng. Abstr.) **(Jpn)**

[Electrochemical detection method] Iriyama K, et al. **Seikagaku** 1985 Jul; 57(7):607-9 **(Jpn)**

[Effect of intraoral surgical trauma on the catecholamine depletion rate in the brain and adrenal medulla in rats] Kim KW. **Taehan Chikkwa Uisa Hyophoe Chi** 1985 Jul;23(7):603-16 **(Kor)**

[Effect of antidepressants on the balance of biogenic amines and their metabolites in the rat brain] Kamysheva VA, et al. **Farmakol Toksikol** 1985 Sep-Oct;48(5):22-4 (Eng. Abstr.) **(Rus)**

[Comparative analysis of concentrations of corticosteroids and catecholamines in the urine of persons in different vocationals] Smirnov KM, et al. **Fiziol Cheloveka** 1985 Sep-Oct;11(5):834-8 **(Rus)**

[Cytoreceptors in the molecular mechanisms of hormone action] Rozen VB. **Probl Endokrinol (Mosk)** 1985 Sep-Oct;31(5):21-6 (Eng. Abstr.) **(Rus)**

CHILD BEHAVIOR DISORDERS

Effective management with lithium of a persistent, post-traumatic hypomania in a 10-year-old child. Joshi P, et al. **J Dev Behav Pediatr** 1985 Dec;6(6):352-4

CHILD DEVELOPMENT DISORDERS

Longisectional interaction structure analysis (LISA) in psychopharmacology and developmental psychopathology. Lienert GA, et al. **Neuropsychobiology** 1985;14(1):27-34

CHLORDIAZEPOXIDE

Imipramine and chlordiazepoxide in depressive and anxiety disorders. II. Efficacy in anxious outpatients. Kahn RJ, et al. **Arch Gen Psychiatry** 1986 Jan;43(1):79-85

Imipramine and chlordiazepoxide in depressive and anxiety disorders. I. Efficacy in depressed outpatients. Lipman RS, et al. **Arch Gen Psychiatry** 1986 Jan;43(1):68-77

Benzodiazepine receptors modulate circulating plasma vasopressin concentration. Wible JH Jr, et al. **Brain Res** 1985 Dec 16; 359(1-2):368-70

Chlordiazepoxide and morphine reduce pressor response to brain stimulation in awake rats. Brandão ML, et al. **Pharmacol Biochem Behav** 1985 Dec;23(6):1069-71

The effects of clozapine on shuttle-box avoidance responding in rats: comparisons with haloperidol and chlordiazepoxide. Sanger DJ. **Pharmacol Biochem Behav** 1985 Aug;23(2):231-6

Involvement of the N4-oxide group in the phototoxicity of chlordiazepoxide in the rat. Bakri A, et al. **Photodermatol** 1985 Aug; 2(4):205-12

Neuropeptide modulation of the behavioral effects of drugs. Barrett JE, et al. **Prog Clin Biol Res** 1985;192:37-50

P-CHLOROPHENYLALANINE

Modulation of action of kainic acid on the behavior of rats by p-chlorophenylalanine and by gaba-mimetic drugs. Biochemical correlation between behavior and treatments. Molla-Hosseini C, et al. **J Pharmacol** 1985 Jul-Sep;16(3):299-312

Biochemical and behavioral changes in rats after prolonged treatment with desipramine: interaction with p-chlorophenylalanine. Brunello N, et al. **Naunyn Schmiedebergs Arch Pharmacol** 1985 Oct;331(1):20-2

Evidence of norepinephrine-mediated suppression of para-chlorophenylalanine-induced muricidal behavior. Pucilowski O, et al. **Pharmacol Res Commun** 1985 Oct;17(10):983-9

CHLORPROMAZINE

Determination of chlorpromazine and its sulphoxide in pharmaceutical dosage forms by third-order derivative ultraviolet spectroscopy. Fasanmade AA, et al. **Analyst** 1985 Sep;110(9):1117-24

Construction of ion-selective electrodes for chlorpromazine, amitriptyline, propantheline and meperidine: analytical study and application to pharmaceutical analysis. Mitsana-Papazoglou A, et al. **Analyst** 1985 Sep; 110(9):1091-4

Effects of chlorpromazine and the antidepressant drugs amitriptyline, clomipramine and mianserin on the Ca-depleted rat uterus. Villar A, et al. **Arch Int Pharmacodyn Ther** 1985 Oct;277(2):264-71

Effects of psychotropic drugs on thermal responses to radiofrequency radiation. Jauchem JR, et al. **Aviat Space Environ Med** 1985 Dec; 56(12):1183-8

Kinetic study of the transient phase of a second-order chemical reaction coupled to an enzymic step: application to the oxidation of chlorpromazine by peroxidase-hydrogen peroxide. Escribano J, et al. **Biochim Biophys Acta** 1985 Oct 18;831(3):313-20

ESR spectral changes induced by chlorpromazine in spin-labeled erythrocyte ghost membranes. Yamaguchi T, et al. **Biochim Biophys Acta** 1985 Nov 7;820(2):157-64

Studies of contents of norepinephrine and 5-hydroxytryptamine in brain--II. Effect of sodium barbitone and chlorpromazine. Rahman TA, et al. **Comp Biochem Physiol [C]** 1985;82(1):159-63

Sex-related hyperthermic response to chlorpromazine in the offspring of rats treated with imipramine. Fujii T, et al. **Dev Pharmacol Ther** 1985;8(6):364-73

Electron microscopic morphometric studies on synaptic vesicles of long-term CPZ-administered rat striatum. Takeichi M. **Folia Psychiatr Neurol Jpn** 1985;39(2):185-91

Neuroleptic drug-induced coagulopathy: mechanism of reaction and duration of effect. Zengotita HE, et al. **J Clin Psychiatry** 1986 Jan; 47(1):35-7

Changes in 3H-spiperone, 3H-WB 4101 and 3H-dihydroalprenolol bindings to brain membranes produced by postnatal pretreatment with chlorpromazine in adult rats. Hayashi T, et al. **Jpn J Pharmacol** 1985 Sep;39(1):45-50

Photo-CIDNP in nucleic acid bases and their nucleotides induced by chlorpromazine and analogs. Marko J, et al. **Photochem Photobiol** 1985 Sep;42(3):213-21

Therapeutic monitoring of chlorpromazine II: Pitfalls in whole blood analysis. McKay G, et al. **Ther Drug Monit** 1985;7(4):472-7

[Dehalogenation and N-dealkylation of chlorpromazine in patients undergoing chronic treatment] Ninci R, et al. **Boll Soc Ital Biol Sper** 1985 Aug 30;61(8):1101-4 (Eng. Abstr.) **(Ita)**

CHOICE BEHAVIOR

[Delayed spatial choice in the monkey with different probabilities of signal presentation] Nikitin VS. **Zh Vyssh Nerv Deiat** 1985 Sep-Oct; 35(5):968-70 **(Rus)**

CLOMIPRAMINE

Response to sequential administration of clomipramine and lithium carbonate in treatment-resistant depression. Schrader GD, et al. **Br J Psychiatry** 1985 Nov;147:573-5

Clomipramine prescribing doctors beware [letter] Links PS, et al. **Can Med Assoc J** 1986 Jan 1;134(1):15

Amineptine in the management of the depressive syndromes. Scarzella L, et al. **Prog Neuropsychopharmacol Biol Psychiatry** 1985; 9(4):429-39

Some effects of chlorimipramine and imipramine on the schedule-controlled behavior of the pigeon. Lamb RJ, et al. **Psychopharmacology (Berlin)** 1985;87(1):7-11

[Plasma levels of clomipramine and its metabolites in hospitalized depressed patients] Debray Q, et al. **Ann Med Psychol (Paris)** 1985 May; 143(5):464-74 **(Fre)**

COCAINE

Impaired pharmacists: seek treatment [letter] **Am J Hosp Pharm** 1985 Oct; 42(10):2142, 2144

Neuroendocrine findings in a chronic cocaine abusers: a preliminary report. Gawin FH, et al. **Br J Psychiatry** 1985 Nov;147:569-73

Topics in the chemistry of cocaine. Schlesinger HL. **Bull Narc** 1985 Jan-Mar;37(1):63-78

The role of food deprivation in the maintenance and reinstatement of cocaine-seeking behavior in rats. Carroll ME. **Drug Alcohol Depend** 1985 Nov;16(2):95-109

Cocaine: an overview of current issues. Grabowski J, et al. **Int J Addict** 1985 Jun-Jul;20(6-7):1065-88 (86 ref.)

Bromocriptine treatment for cocaine abuse: the dopamine depletion hypothesis. Dackis CA, et al. **Int J Psychiatry Med** 1985-86; 15(2):125-35

Enhanced interpretation of nonverbal cues in male cocaine abusers. Giannini AJ, et al. **Int J Psychiatry Med** 1985-86;15(1):41-5

The urinary excretion of cocaine and metabolites in humans: a kinetic analysis of published data. Ambre J. **J Anal Toxicol** 1985 Nov-Dec; 9(6):241-5

Use of DB-1 capillary columns in the GC/FID analysis of benzoylecgonine. Falk PM, et al. **J Anal Toxicol** 1985 Nov-Dec; 9(6):273-4

Disposition of cocaine in fatal poisoning in man. Poklis A, et al. **J Anal Toxicol** 1985 Sep-Oct;9(5):227-9

Brain concentrations of cocaine and benzoylecgonine in fatal cases. Spiehler VR, et al. **J Forensic Sci** 1985 Oct;30(4):1003-11

Binding sites for [3H]cocaine in mouse striatum and cerebral cortex have different dissociation kinetics. Reith ME, et al. **J Neurochem** 1986 Jan; 46(1):309-12

Acute tolerance development to the cardiovascular and subjective effects of cocaine. Fischman MW, et al. **J Pharmacol Exp Ther** 1985 Dec; 235(3):677-82

Cocaine in herbal tea [letter] Siegel RK, et al. **JAMA** 1986 Jan 3; 255(1):40

Cocaine use in America: epidemiologic and clinical perspectives. **Natl Inst Drug Abuse Res Monogr Ser** 1985;61:1-226

Cocaine use in America: Introduction and overview. Adams EH, et al. **Natl Inst Drug Abuse Res Monogr Ser** 1985;61:1-7

Food deprivation produces persistent increases in self-administration behavior during cocaine extinction. Carroll ME. **Natl Inst Drug Abuse Res Monogr Ser** 1984;55:125-31

Patterns and consequences of cocaine use. Chitwood DD. **Natl Inst Drug Abuse Res Monogr Ser** 1985;61:111-29

Reinforcement and rapid delivery systems: understanding adverse consequences of cocaine. Cohen S. **Natl Inst Drug Abuse Res Monogr Ser** 1985;61:151-7

Platelet serotonin transporter in cocaine patients. Dackis CA, et al. **Natl Inst Drug Abuse Res Monogr Ser** 1984;55:164-9

Cocaine use in a treatment: population: patterns and diagnostic distinctions. Gawin FH, et al. **Natl Inst Drug Abuse Res Monogr Ser** 1985;61:182-92

Parameters of intracranial self-administration of cocaine into the medial prefrontal cortex. Goeders NE, et al. **Natl Inst Drug Abuse Res Monogr Ser** 1984;55:132-7

Cocaine abuse: neurochemistry, phenomenology, and treatment. Gold MS, et al. **Natl Inst Drug Abuse Res Monogr Ser** 1985;61:130-50

Cocaine use in young adulthood: patterns of use and psychosocial correlates. Kandel DB, et al. **Natl Inst Drug Abuse Res Monogr Ser** 1985;61:76-110

Characteristics of cocaine abusers presenting for treatment. Schnoll SH, et al. **Natl Inst Drug Abuse Res Monogr Ser** 1985;61:171-81

Characteristics of humans volunteering for a cocaine research project. Schuster CR, et al. **Natl Inst Drug Abuse Res Monogr Ser** 1985; 61:158-70

New patterns of cocaine use: changing doses and routes. Siegel RK. **Natl Inst Drug Abuse Res Monogr Ser** 1985;61:204-20

Double-blind comparison of desipramine and placebo in withdrawal from cocaine dependence. Tennant FS Jr, et al. **Natl Inst Drug Abuse Res Monogr Ser** 1984;55:159-63

The 800-COCAINE helpline: survey of 500 callers. Washton AM, et al. **Natl Inst Drug Abuse Res Monogr Ser** 1984;55:224-30

Cocaine: treatment perspectives. Wesson DR, et al. **Natl Inst Drug Abuse Res Monogr Ser** 1985;61:193-203

New concepts in cocaine addiction: the dopamine depletion hypothesis. Dackis CA, et al. **Neurosci Biobehav Rev** 1985 Fall;9(3):469-77 (83 ref.)

Locomotor effects of cocaine, cocaine congeners, and local anesthetics in mice. Reith ME, et al. **Pharmacol Biochem Behav** 1985 Nov; 23(5):831-6

Cocaine potentiates the disruptive effects of phencyclidine on repeated acquisition in monkeys. Thompson DM, et al. **Pharmacol Biochem Behav** 1985 Nov;23(5):823-9

One-way generalization of clonidine to the discriminative stimulus produced by cocaine. Wood DM, et al. **Pharmacol Biochem Behav** 1985 Oct;23(4):529-33

Disruption of cocaine and heroin self-administration following kainic acid lesions of the nucleus accumbens. Zito KA, et al. **Pharmacol Biochem Behav** 1985 Dec;23(6):1029-36

Reinforcing stimulus properties of endocoids. Goeders NE, et al. **Prog Clin Biol Res** 1985;192:63-9

Cocaine: effects on acoustic startle and startle elicited electrically from the cochlear nucleus. Harty TP, et al. **Psychopharmacology (Berlin)** 1985; 87(4):396-9

COGNITION

Cognitive therapy and pharmacotherapy for depression. Sustained improvement over one year. Simons AD, et al. **Arch Gen Psychiatry** 1986 Jan;43(1):43-8

Alpha 2-adrenergic mechanisms in prefrontal cortex associated with cognitive decline in aged nonhuman primates. Arnsten AF, et al. **Science** 1985 Dec 13;230(4731):1273-6

COGNITION DISORDERS

Concentrations of glycine and serine in cerebrospinal fluid during disturbed consciousness; a study of the therapeutic effect of thyrotropin-releasing hormone on the consciousness level. Yanai Y, et al. **Eur Neurol** 1986;25(1):19-25

COLOR PERCEPTION

Avfail in color avoidance learning by starlings (Sturnus vulgaris) and red-winged blackbirds (Agelaius phoeniceus). Mason JR, et al. **J Comp Psychol** 1985 Dec;99(4):403-10

COMPULSIVE BEHAVIOR

Obsessive-compulsive symptoms following stimulants [letter] Koizumi HM. **Biol Psychiatry** 1985 Dec;20(12):1332-3

CONDITIONING (PSYCHOLOGY)

The conditioned place preference paradigm in rats: effect of bupropion. Ortmann R. **Life Sci** 1985 Nov 25;37(21):2021-7

Behavioral effects and benzodiazepine antagonist activity of Ro 15-1788 (flumazepil) in pigeons. Witkin JM, et al. **Life Sci** 1985 Oct 28; 37(17):1587-95

Neuropeptide modulation of the behavioral effects of drugs. Barrett JE, et al. **Prog Clin Biol Res** 1985;192:37-50

Some effects of chlorimipramine and imipramine on the schedule-controlled behavior of the pigeon. Lamb RJ, et al. **Psychopharmacology (Berlin)** 1985;87(1):7-11

CONDITIONING, CLASSICAL

Pharmacological manipulations of the nucleus accumbens: effects on classically conditioned responses and locomotor activity in the cat. Wilson WJ, et al. **Acta Neurobiol Exp (Warsz)** 1985;45(3-4):91-105

A comment on 'coyote control and taste aversion'. Burns RJ, et al. **Appetite** 1985 Sep;6(3):276-81

Coyote control and taste aversion: a predation problem or a people problem? Ellins SR. **Appetite** 1985 Sep;6(3):272-5

Research on forms of conditioned avoidance in coyotes. Lehner PN, et al. **Appetite** 1985 Sep;6(3):265-7

Coyote control and taste aversion. Quick DL, et al. **Appetite** 1985 Sep; 6(3):253-64

Brief comments on 'coyote control and taste aversion'. Wade DA. **Appetite** 1985 Sep;6(3):268-71

Avfail in color avoidance learning by starlings (Sturnus vulgaris) and red-winged blackbirds (Agelaius phoeniceus). Mason JR, et al. **J Comp Psychol** 1985 Dec;99(4):403-10

The effects of pimozide on the establishment of conditioned reinforcement as a function of the amount of conditioning. Hoffman DC, et al. **Psychopharmacology (Berlin)** 1985;87(4):454-60

Extinguishing conditioned inhibition in flavour-aversion learning: effects of repeated testing and extinction of the excitatory element. Best MR, et al. **Q J Exp Psychol [B]** 1985 Nov;37(4):359-78

[Influence of intracaudate injection of muscimol on the conditioning performance and EEG in rabbits] Huang YY, et al. **Chung Kuo Yao Li Hsueh Pao** 1985 Jun;6(2):77-8 (Eng. Abstr.)**(Chi)**

[Conditioned reactions of hippocampal neurons during amphetamine poisoning and its counteraction with haloperidol] Zhavoronkova LA, et al. **Zh Vyssh Nerv Deiat** 1985 Sep-Oct;35(5):957-63 (Eng. Abstr.) **(Rus)**

CONDITIONING, OPERANT

A comparison of peripheral and central effects of CCK8 on water-reinforced operant responding. Cohen SL, et al. **Eur J Pharmacol** 1985 Oct 22;116(3):229-38

Stressor invoked exacerbation of amphetamine-elicited perseveration. Anisman H, et al. **Pharmacol Biochem Behav** 1985 Aug;23(2):173-83

Operantly conditioned running: effects on brain catecholamine concentrations and receptor densities in the rat. de Castro JM, et al. **Pharmacol Biochem Behav** 1985 Oct;23(4):495-500

Effects of d-amphetamine and of beta-phenylethylamine on fixed interval responding maintained by self-regulated lateral hypothalamic stimulation in rats. Greenshaw AJ, et al. **Pharmacol Biochem Behav** 1985 Oct;23(4):519-23

Effects of pesticides and drugs on working memory in rats: continuous delayed response. Heise GA, et al. **Pharmacol Biochem Behav** 1985 Oct; 23(4):591-8

Methamphetamine, physostigmine, atropine and mecamylamine: effects on force lever performance. Preston KL, et al. **Pharmacol Biochem Behav** 1985 Nov;23(5):781-8

Pyrazoloquinoline benzodiazepine receptor ligands: effects on schedule-controlled behavior in dogs. Shannon HE, et al. **Pharmacol Biochem Behav** 1985 Aug;23(2):317-23

Delta-9-tetrahydrocannabinol potentiates the disruptive effects of phencyclidine on repeated acquisition in monkeys. Thompson DM, et al. **Pharmacol Biochem Behav** 1985 Dec;23(6):1051-7

Cocaine potentiates the disruptive effects of phencyclidine on repeated acquisition in monkeys. Thompson DM, et al. **Pharmacol Biochem Behav** 1985 Nov;23(5):823-9

ACTH1-24 effects on d-amphetamine self-administration and the dynamics of brain dopamine in rats. Leccese AP, et al. **Prog Clin Biol Res** 1985;192:71-81

Effect of the experimental antidepressant AHR-9377 on performance during differential reinforcement of low response rate. O'Donnell JM, et al. **Psychopharmacology (Berlin)** 1985;87(3):283-5

The effects of atropine, benactyzine, and physostigmine on a repeated acquisition baseline in monkeys. Penetar DM. **Psychopharmacology (Berlin)** 1985;87(1):69-76

The effect of peripheral noradrenaline depletion on responding on a schedule of differential reinforcement of low rates of response (DRL). Salmon P, et al. **Psychopharmacology (Berlin)** 1985;87(1):77-80

CONSCIOUSNESS

Neurochemical regulation of the states of alertness. Gaillard JM. **Ann Clin Res** 1985;17(5):175-84 (59 ref.)

CORTICOSTERONE

Corticosterone: narrow range required for normal body and thymus weight and ACTH. Akana SF, et al. **Am J Physiol** 1985 Nov; 249(5 Pt 2):R527-32

Corticosteroids and plasma restitution after hemorrhage and hypothalamic lesions. Bealer SL. **Am J Physiol** 1986 Jan;250(1 Pt 2):R18-23

Alpha 2-noradrenergic feeding rhythm in paraventricular nucleus: relation to corticosterone. Bhakthavatsalam P, et al. **Am J Physiol** 1986 Jan; 250(1 Pt 2):R83-8

Interaction of light and corticosterone on food intake and brown adipose tissue of the rat. Fukushima M, et al. **Am J Physiol** 1985 Dec; 249(6 Pt 2):R753-7

Interaction of prolactin with adrenal hormones in blood pressure regulation in rats. Mills DE, et al. **Am J Physiol** 1985 Dec; 249(6 Pt 1):E614-8

The effect of catabolic doses of corticosterone on heat production in the growing rat. Coyer P, et al. **Br J Nutr** 1985 May;53(3):491-9

Effect of dietary factors on the responses of chicks to corticosterone injections. Bartov I. **Br Poult Sci** 1985 Oct;26(4):473-81

Reduced-5-hydroxytryptamine-dependent behavior in rats following chronic corticosterone treatment. Dickinson SL, et al. **Brain Res** 1985 Oct 14;345(1):10-8

Glucocorticoid toxicity in the hippocampus: temporal aspects of neuronal vulnerability. Sapolsky RM. **Brain Res** 1985 Dec 16;359(1-2):300-5

A complex noncoordinate regulation of alpha-lactalbumin and 25 K beta-casein by corticosterone, prolactin, and insulin in long term cultures of normal rat mammary cells. Ray DB, et al. **Endocrinology** 1986 Jan;118(1):393-407

Stimulation of corticosterone production by atrial natriuretic polypeptide in hypophysectomized rats. Nakamura M, et al. **Eur J Pharmacol** 1985 Nov 5;117(2):285-6

Glucocorticoid hormones inhibit DNA synthesis in glial cells cultured in chemically defined medium. Kniss DA, et al. **Exp Cell Res** 1985 Nov;161(1):29-40

Acute changes in plasma steroids and agonistic behavior in male Japanese quail. Ramenofsky M. **Gen Comp Endocrinol** 1985 Oct;60(1):116-28

The effect of exposure to 40 degrees on the heat production and the serum concentrations of triiodothyronine, thyroxine, and corticosterone in immature domestic fowl. Williamson RA, et al. **Gen Comp Endocrinol** 1985 Nov;60(2):178-86

Distribution of 18-hydroxycorticosterone between red blood cells and plasma. Zager PG, et al. **J Clin Endocrinol Metab** 1986 Jan; 62(1):84-9

Effect of atrial peptides on aldosterone production. Atarashi K, et al. **J Clin Invest** 1985 Nov;76(5):1807-11

The significance of receptor physiology for corticosterone-induced cleft palate in A/J mice. Brown KS, et al. **J Craniofac Genet Dev Biol [Suppl]** 1985;1:299-304

Vasopressin secretion as a possible target of the gamma-aminobutyric acid-mediated component of the corticosteroid feedback effect. Acs Z, et al. **J Endocrinol** 1985 Dec;107(3):303-7

Participation of the nucleus reticularis gigantocellularis in the morphine-induced elevation of plasma corticosterone in rats. Kishioka S, et al. **Jpn J Pharmacol** 1985 Jul;38(3):334-6

The effects of the acute administration of phencyclidine hydrochloride (PCP) on the release of corticosterone, growth hormone and prolactin in the rat. Pechnick RN, et al. **Life Sci** 1986 Jan 20;38(3):291-6

Dietary tyrosine suppresses the rise in plasma corticosterone following acute stress in rats. Reinstein DK, et al. **Life Sci** 1985 Dec 9; 37(23):2157-63

Serotonergic stimulation of prolactin and corticosterone secretion is mediated by different pathways from the mediobasal hypothalamus. Van de Kar LD, et al. **Neuroendocrinology** 1985 Nov;41(5):380-4

Changes induced by corticosterone and adrenalectomy in synaptosomal and platelet uptake and binding of 5-HT. The relationship to [3H]imipramine binding. Lee PH, et al. **Neuropharmacology** 1985 Nov; 24(11):1043-50

Plasma norepinephrine, epinephrine and corticosterone stress responses to restraint in individual male and female rats, and their correlations. Livezey GT, et al. **Neurosci Lett** 1985 Nov 20;62(1):51-6

The effects of putative anxiolytic compounds (PK 8165, PK 9084 and tracazolate) on the rat corticosterone response. File SE, et al. **Physiol Behav** 1985 Oct;35(4):583-6

Flavor, forced choice and deprivation affect corticosterone selection by the adrenalectomized rat. Willer VK, et al. **Physiol Behav** 1985 Jul; 35(1):53-9

Serum corticosterone levels in embryos, newly hatched, and young turkey poults. Wentworth BC, et al. **Poult Sci** 1985 Nov;64(11):2195-201

The role of prostaglandins in aldosterone and corticosterone secretion by isolated perfused rat zona glomerulosa cells. Hindawi RK, et al. **Prostaglandins Leukotrienes Med** 1985 Nov;20(2):121-8

Structure-activity studies with ACTH/alpha-MSH fragments on corticosteroid secretion of isolated zona glomerulosa and fasciculata cells. Szalay KS, et al. **Regul Pept** 1985 Jul;11(3):187-92

CORTICOTROPIN

ACTH 4-9 analogue (Org 2766) in depressed elderly patients. I. Effect on depressed mood. Frederiksen SO, et al. **Acta Psychiatr Scand** 1985 Oct;72(4):341-8

ACTH 4-9 analogue (Org 2766) in depressed elderly patients. II. Effect on memory and vigilance. Frederiksen SO, et al. **Acta Psychiatr Scand** 1985 Oct;72(4):349-57

Corticosterone: narrow range required for normal body and thymus weight and ACTH. Akana SF, et al. **Am J Physiol** 1985 Nov; 249(5 Pt 2):R527-32

Endocrine correlates of susceptibility to motion sickness. Kohl RL. **Aviat Space Environ Med** 1985 Dec;56(12):1158-65

The influence of tetracosactide and adrenal steroids on renal kallikrein activity and urinary kallikrein excretion in rats. Marin-Grez M. **Biochem Pharmacol** 1985 Nov 15;34(22):4013-7

Involvement of protein kinase C in the regulation of adrenocorticotropin release from rat anterior pituitary cells. Abou-Samra AB, et al. **Endocrinology** 1986 Jan;118(1):212-7

Corticotropin-releasing factor stimulates the release of adrenocorticotropin from domestic fowl pituitary cells. Carsia RV, et al. **Endocrinology** 1986 Jan;118(1):143-8

Inhibitory effect of adrenocorticotropin on corticotropin- releasing factor release from rat hypothalamus in vitro. Suda T, et al. **Endocrinology** 1986 Jan;118(1):459-61

Proopiomelanocortin-derived peptides in testicular interstitial fluid: characterization and changes in secretion after human chorionic gonadotropin or luteinizing hormone-releasing hormone analog treatment. Valenca MM, et al. **Endocrinology** 1986 Jan;118(1):32-7

Somatostatin stimulates ACTH release in brown trout (Salmo trutta L.). Langhorne P. **Gen Comp Endocrinol** 1986 Jan;61(1):71-5

Dexamethasone suppresses cortisol but not ACTH and beta-endorphin plasma concentration in healthy man. Lypka A, et al. **Horm Metab Res** 1985 Oct;17(10):547

Effect of dopamine on ACTH-induced glucocorticoid secretion in rat adrenal suspended cells. Matsuki M, et al. **Horm Metab Res** 1985 Aug; 17(8):429-31

Effect of ovine corticotropin releasing factor and arginine vasopressin on ACTH and aldosterone secretion in sheep. Redekopp C, et al. **Horm Metab Res** 1985 Aug;17(8):428-9

Distinct behavior of beta-endorphin and corticotropin toward leucine aminopeptidase action. Li CH, et al. **Int J Pept Protein Res** 1985 Aug; 26(2):113-7

Effects of ACTH and prednisone on mood: incidence and time of onset. Cameron OG, et al. **Int J Psychiatry Med** 1985-86;15(3):213-23

Dermorphin reduces the metyrapone-evoked release of adrenocorticotropin, beta-endorphin, and beta-lipotropin in man. Degli Uberti EC, et al. **J Clin Endocrinol Metab** 1985 Dec;61(6):1018-22

The responses of plasma adrenocorticotropin and cortisol to corticotropin-releasing hormone (CRH) and cerebrospinal fluid immunoreactive CRH in anorexia nervosa patients. Hotta M, et al. **J Clin Endocrinol Metab** 1986 Feb;62(2):319-24

Regulation of beta-endorphin and ACTH in brain by estradiol. Wardlaw SL, et al. **Life Sci** 1985 Nov 18;37(20):1941-7

Response of ACTH and cortisol to corticotropin-releasing hormone in anorexia nervosa [letter] Cavagnini F, et al. **N Engl J Med** 1986 Jan 16;314(3):184-5

Corticotropin-releasing activity of the renin-angiotensin system peptides in rat and in man. Gaillard RC, et al. **Neuroendocrinology** 1985 Dec; 41(6):511-7

Intravenous application of ovine and human corticotropin releasing factor (CRF): ACTH, cortisol and CRF levels. Stalla GK, et al. **Neuroendocrinology** 1986;42(1):1-5

ACTH neuromodulation of the developing motor system and neonatal learning in the rat. Acker GR, et al. **Peptides (Fayetteville)** 1985; 6 Suppl 2:41-9

Influence of CCK and bombesin on ACTH and cortisol secretion in the conscious dog. Thomas RM, et al. **Peptides (Fayetteville)** 1985 Jul-Aug; 6(4):703-7

ACTH 1-24-induced potentiation of norepinephrine contractile responses in aortic strips from spontaneously hypertensive (SH) and normotensive (WKY) rats. Vergona RA, et al. **Peptides (Fayetteville)** 1985 Jul-Aug; 6(4):581-4

Hormone secretagogues increase cytosolic calcium by increasing cAMP in corticotropin-secreting cells. Luini A, et al. **Proc Natl Acad Sci USA** 1985 Dec;82(23):8034-8

Corticotropin-releasing factor-induced adrenocorticotropin hormone release and synthesis is blocked by incorporation of the inhibitor of cyclic AMP-dependent protein kinase into anterior pituitary tumor cells by liposomes. Reisine T, et al. **Proc Natl Acad Sci USA** 1985 Dec; 82(23):8261-5

ACTH1-24 effects on d-amphetamine self-administration and the dynamics of brain dopamine in rats. Leccese AP, et al. **Prog Clin Biol Res** 1985;192:71-81

Analysis of the dual mechanism of ACTH release by arginine vasopressin and its analogs in conscious rats. Mormède P, et al. **Regul Pept** 1985 Nov 7;12(3):175-84

Structure-activity studies with ACTH/alpha-MSH fragments on corticosteroid secretion of isolated zona glomerulosa and fasciculata cells. Szalay KS, et al. **Regul Pept** 1985 Jul;11(3):187-92

[Effects of cigarette smoking on endocrine function in man] Yao M, et al. **Masui** 1985 Aug;34(8):1105-14 (Eng. Abstr.) **(Jpn)**

[The study of opioid peptides in the normal menstrual cycle, pregnancy and labor] Takayama S, et al. **Nippon Sanka Fujinka Gakkai Zasshi** 1985 Sep;37(9):1813-9 (Eng. Abstr.) **(Jpn)**

CORTICOTROPIN RELEASING HORMONE

Immunocytochemical observations of corticotropin-releasing-factor-containing neurons in the rat hypothalamus with special reference to neuronal communication. Shioda S, et al. **Acta Anat (Basel)** 1985;124(1-2):58-64

Binding sites for corticotropin releasing factor in sensory areas of the rat hindbrain and spinal cord. Skofitsch G, et al. **Brain Res Bull** 1985 Nov;15(5):519-22

Changes in pituitary responses to synthetic ovine corticotrophin releasing factor in fetal sheep. Norman LJ, et al. **Can J Physiol Pharmacol** 1985 Nov;63(11):1398-403

Corticotropin-releasing factor stimulates the release of adrenocorticotropin from domestic fowl pituitary cells. Carsia RV, et al. **Endocrinology** 1986 Jan;118(1):143-8

Glucocorticoid modulation of corticotropin-releasing factor desensitization in cultured rat anterior pituitary cells. Ceda GP, et al. **Endocrinology** 1986 Jan;118(1):58-62

Involvement of corticotropin-releasing factor and somatostatin in stress-induced inhibition of growth hormone secretion in the rat. Rivier C, et al. **Endocrinology** 1985 Dec;117(6):2478-82

Inhibitory effect of adrenocorticotropin on corticotropin- releasing factor release from rat hypothalamus in vitro. Suda T, et al. **Endocrinology** 1986 Jan;118(1):459-61

Cloning and sequence analysis of cDNA for rat corticotropin-releasing factor precursor. Jingami H, et al. **FEBS Lett** 1985 Oct 21; 191(1):63-6

The hypothalamo-hypophysial system in acipenseridae. X. Corticoliberin-like immunoreactivity in the hypothalamus and hypophysis of Acipenser ruthenus L. Belenky MA, et al. **Gen Comp Endocrinol** 1985 Oct;60(1):20-6

Effect of ovine corticotropin releasing factor and arginine vasopressin on ACTH and aldosterone secretion in sheep. Redekopp C, et al. **Horm Metab Res** 1985 Aug;17(8):428-9

Solid phase synthesis of ovine corticotropin releasing factor. Morell JL, et al. **Int J Pept Protein Res** 1985 Jul;26(1):49-54

The responses of plasma adrenocorticotropin and cortisol to corticotropin-releasing hormone (CRH) and cerebrospinal fluid immunoreactive CRH in anorexia nervosa patients. Hotta M, et al. **J Clin Endocrinol Metab** 1986 Feb;62(2):319-24

Development of the hypothalamic-pituitary-axis in the ovine fetus: ontogeny of action of ovine corticotropin-releasing factor. MacIsaac RJ, et al. **J Dev Physiol** 1985 Oct;7(5):329-38

Corticotropin-releasing factor in plasma of depressed patients and controls [letter] Charlton BG, et al. **Lancet** 1986 Jan 18;1(8473):161-2

Dexamethasone suppresses pituitary-adrenal but not behavioral effects of centrally administered CRF. Britton DR, et al. **Life Sci** 1986 Jan 20;38(3):211-6

Combined administration of human corticotropin-releasing factor and lysine vasopressin induces cortisol escape from dexamethasone suppression in healthy subjects. von Bardeleben U, et al. **Life Sci** 1985 Oct 28;37(17):1613-8

Response of ACTH and cortisol to corticotropin-releasing hormone in anorexia nervosa [letter] Cavagnini F, et al. **N Engl J Med** 1986 Jan 16;314(3):184-5

Functional corticotropin releasing factor receptors in the primate peripheral sympathetic nervous system. Udelsman R, et al. **Nature** 1986 Jan 9-15;319(6049):147-50

Corticotropin-releasing activity of the renin-angiotensin system peptides in rat and in man. Gaillard RC, et al. **Neuroendocrinology** 1985 Dec; 41(6):511-7

Involvement of hypothalamic somatostatin in the suppression of growth hormone secretion by central corticotropin-releasing factor in conscious male rats. Katakami H, et al. **Neuroendocrinology** 1985 Nov; 41(5):390-3

Release of pro-opiomelanocortin-derived peptides from the pars intermedia and pars distalis of the rat pituitary: effect of corticotrophin-releasing factor and somatostatin. Kraicer J, et al. **Neuroendocrinology** 1985 Nov;41(5):363-73

Intravenous application of ovine and human corticotropin releasing factor (CRF): ACTH, cortisol and CRF levels. Stalla GK, et al. **Neuroendocrinology** 1986;42(1):1-5

CRF immunoreactive peptides in the human hypophysis: a cautionary note. Beny JL, et al. **Peptides (Fayetteville)** 1985 Jul-Aug;6(4):661-7

Behavioral investigation of the coexistence of substance P, corticotropin releasing factor, and acetylcholinesterase in lateral dorsal tegmental neurons projecting to the medial frontal cortex of the rat. Crawley JN, et al. **Peptides (Fayetteville)** 1985 Sep-Oct;6(5):891-901

Effects of corticotropin releasing factor on locomotor activity in hypophysectomized rats. Eaves M, et al. **Peptides (Fayetteville)** 1985 Sep-Oct;6(5):923-6

Relationship of CRF-immunostained cells and magnocellular neurons in the paraventricular nucleus of rat hypothalamus. Piekut DT, et al. **Peptides (Fayetteville)** 1985 Sep-Oct;6(5):873-82

Effects of intravenous and intraventricular injection of antisera directed against corticotropin-releasing factor on the secretion of anterior pituitary hormones. Ono N, et al. **Proc Natl Acad Sci USA** 1985 Nov; 82(22):7787-90

Isolation and amino acid sequence of corticotropin-releasing factor from pig hypothalami. Patthy M, et al. **Proc Natl Acad Sci USA** 1985 Dec; 82(24):8762-6

Corticotropin-releasing factor-induced adrenocorticotropin hormone release and synthesis is blocked by incorporation of the inhibitor of cyclic AMP-dependent protein kinase into anterior pituitary tumor cells by liposomes. Reisine T, et al. **Proc Natl Acad Sci USA** 1985 Dec; 82(23):8261-5

The physiology of corticotropin-releasing factor (CRF). Raux-Demay MC, et al. **Reprod Nutr Dev** 1985;25(5):931-43 (67 ref.)

[Coexpression of immunoreactivity with an anti-corticoliberin immune serum and immunoreactivity with an anti-vasopressin immune serum in human hypothalamic neurons] Clavequin MC, et al. **Ann Endocrinol (Paris)** 1985;46(1):64-6 (Eng. Abstr.) **(Fre)**

[Corticotropin-releasing hormone] Emeric de Sauval E. **Medicina (B Aires)** 1984;44(4):422-9 **(Spa)**

DANSYL COMPOUNDS

Mitochondrial nicotinamide nucleotide transhydrogenase: inhibition by ethoxyformic anhydride, dansyl chloride, and pyridoxal phosphate. Yamaguchi M, et al. **Arch Biochem Biophys** 1985 Nov 15; 243(1):20-7

Ca2+-specific fluorescence changes in N-dansylaminoethyl-labelled oncomodulin. Mutus B, et al. **Can J Biochem Cell Biol** 1985 Sep; 63(9):998-1002

Measurement of neutral sugars in glycoproteins as dansyl derivatives by automated high-performance liquid chromatography. Eggert FM, et al. **J Chromatogr** 1985 Sep 27;333(1):123-31

[Determination of adenine nucleotides by thin-layer chromatography combined with the dansylation reaction] Tkachenko AG, et al. **Prikl Biokhim Mikrobiol** 1985 Jul-Aug;21(4):553-7 (Eng. Abstr.) **(Rus)**

DELUSIONS

AIDS and homosexual panic [letter] Rapaport M, et al. **Am J Psychiatry** 1985 Dec;142(12):1516

Delusional hypochondriasis, depression, and amoxapine [letter] Tollefson G. **Am J Psychiatry** 1985 Dec;142(12):1518-9

Depression, drugs, and delusions. Howarth BG, et al. **Arch Gen Psychiatry** 1985 Dec;42(12):1145-7

DEPRESSION

A double-blind evaluation of trazodone in the treatment of depression in the elderly. Ather SA, et al. **Br J Clin Pract** 1985 May; 39(5):192-9

Pharmacological strategies in depression. Katona CL, et al. **Br J Hosp Med** 1985 Sep;34(3):168-71

Lithium potentiation of imipramine in treatment resistant depression [letter] Roy A, et al. **Br J Psychiatry** 1985 Nov;147:582-3

Response to sequential administration of clomipramine and lithium carbonate in treatment-resistant depression. Schrader GD, et al. **Br J Psychiatry** 1985 Nov;147:573-5

Plasma immunoglobulins in depressed and lithium-treated patients [letter] Wood K, et al. **Br J Psychiatry** 1985 Nov;147:581-2

Use of specific serotonin uptake inhibitors as antidepressants. Lemberger L, et al. **Clin Neuropharmacol** 1985;8(4):299-317 (142 ref.)

The tolerance and antidepressive activity of fluvoxamine as a single dose compared to a twice daily dose. Siddiqui UA, et al. **Curr Med Res Opin** 1985;9(10):681-90

Psychostimulant treatment of depressive disorders secondary to medical illness. Woods SW, et al. **J Clin Psychiatry** 1986 Jan;47(1):12-5

Tyrosine for the treatment of depression. Gelenberg AJ, et al. **Nutr Health** 1984;3(3):163-73 (44 ref.)

Benzodiazepines in the control of anxiety-induced depression. Fairhurst MM. **S Afr Med J** 1985 Oct 26;Suppl:29

[Controlled trial of amitriptyline in a group of patients with so-called functional pseudorheumatic pain (letter)] Limon J, et al. **Presse Med** 1985 Nov 30;14(41):2107 **(Fre)**

DEPRESSIVE DISORDER

A double blind study in out-patients with primary non-agitated depression treated with imipramine in combination with placebo, diazepam or dixyrazine. Feet PO, et al. **Acta Psychiatr Scand** 1985 Oct; 72(4):334-40

ACTH 4-9 analogue (Org 2766) in depressed elderly patients. II. Effect on memory and vigilance. Frederiksen SO, et al. **Acta Psychiatr Scand** 1985 Oct;72(4):349-57

ACTH 4-9 analogue (Org 2766) in depressed elderly patients. I. Effect on depressed mood. Frederiksen SO, et al. **Acta Psychiatr Scand** 1985 Oct;72(4):341-8

Tricyclic blood levels [letter] Boyer WT. **Am J Psychiatry** 1985 Nov; 142(11):1388

ECT versus tricyclic antidepressants [letter] Fogel BS. **Am J Psychiatry** 1986 Jan;143(1):121-2

Using MMPI lithium response scales [letter] Lane JB. **Am J Psychiatry** 1985 Nov;142(11):1388-9

Dysthymia and attention deficit disorder in adults [letter] Mattes JA. **Am J Psychiatry** 1986 Jan;143(1):114-5

Antidepressant effects of carbamazepine. Post RM, et al. **Am J Psychiatry** 1986 Jan;143(1):29-34

Continuation drug therapy for major depressive episodes: how long should it be maintained? Prien RF, et al. **Am J Psychiatry** 1986 Jan; 143(1):18-23

Delusional hypochondriasis, depression, and amoxapine [letter] Tollefson G. **Am J Psychiatry** 1985 Dec;142(12):1518-9

Depression, drugs, and delusions. Howarth BG, et al. **Arch Gen Psychiatry** 1985 Dec;42(12):1145-7

Imipramine and chlordiazepoxide in depressive and anxiety disorders. I. Efficacy in depressed outpatients. Lipman RS, et al. **Arch Gen Psychiatry** 1986 Jan;43(1):68-77

The outcome of antidepressant use in the medically ill. Popkin MK, et al. **Arch Gen Psychiatry** 1985 Dec;42(12):1160-3

Exaggerated orthostatic responsivity of plasma norepinephrine in depression. Rudorfer MV, et al. **Arch Gen Psychiatry** 1985 Dec; 42(12):1186-92

Cognitive therapy and pharmacotherapy for depression. Sustained improvement over one year. Simons AD, et al. **Arch Gen Psychiatry** 1986 Jan;43(1):43-8

Treatment outcome validation of DSM-III depressive subtypes. Clinical usefulness in outpatients with mild to moderate depression. Stewart JW, et al. **Arch Gen Psychiatry** 1985 Dec;42(12):1148-53

Prescribing hints for the treatment of anxiety and depression. Horgan D. **Aust Fam Physician** 1985 Sep;14(9):872-5

Platelet 3H-imipramine binding in depressed elderly patients. Schneider LS, et al. **Biol Psychiatry** 1985 Nov;20(11):1234-7

Drug treatment of bipolar depression and mania. Cookson JC. **Br J Hosp Med** 1985 Sep;34(3):172-5 (92 ref.)

Adrenergic receptors in depression. Effects of electroconvulsive therapy. Cooper SJ, et al. **Br J Psychiatry** 1985 Jul;147:23-9

Lithium in severe depression [letter] Fraser AA, et al. **Br J Psychiatry** 1985 Sep;147:324

A double-blind out-patient trial of indalpine vs mianserin. Naylor GJ, et al. **Br J Psychiatry** 1985 Sep;147:306-9

L-5HTP in depression resistant to re-uptake inhibitors. An open comparative study with tranylcypromine. Nolen WA, et al. **Br J Psychiatry** 1985 Jul;147:16-22

The effect of desipramine upon melatonin and cortisol secretion in depressed and normal subjects. Thompson C, et al. **Br J Psychiatry** 1985 Oct;147:389-93

Liquid chromatographic determination of inhibition of monoamine oxidase activity in platelet rich plasma of depressed patients treated with phenelzine. Gupta RN, et al. **Clin Chim Acta** 1985 Oct 31; 152(1-2):63-9

Nomifensine: an antidepressant with a difference? Ereshefsky L. **Clin Pharm** 1985 Nov-Dec;4(6):673-4

A controlled trial of amitriptyline and cianopramine in major depression. Mellsop GW, et al. **Clin Ther** 1985;7(6):699-703 (8 ref.)

A double-blind trial comparing mianserin and maprotiline in depressed inpatients. Palha AP, et al. **Clin Ther** 1985;7(5):584-92

Depression in the intensive care unit. Bronheim HE, et al. **Crit Care Med** 1985 Nov;13(11):985-8

Self-rating data as a selecting factor in clinical trials of psychotropic drugs. Baumann U, et al. **Eur Arch Psychiatry Neurol Sci** 1985; 235(2):65-70

Current treatment of depression. Bowden CL. **Hosp Community Psychiatry** 1985 Nov;36(11):1192-200

Evaluation of long-term use of antidepressant medication. Risse SC, et al. **Hosp Community Psychiatry** 1985 Nov;36(11):1215-6

Effects of ACTH and prednisone on mood: incidence and time of onset. Cameron OG, et al. **Int J Psychiatry Med** 1985-86;15(3):213-23

Methylphenidate for medical in-patients. Fisch RZ. **Int J Psychiatry Med** 1985-86;15(1):75-9

Empirical study on an inpatient psychogeriatric unit: biological treatment in patients with depressive illness. Meyers BS, et al. **Int J Psychiatry Med** 1985-86;15(2):111-24

Peripheral adrenoceptors and serotonin receptors in depression. Changes associated with response to treatment with trazodone or amitriptyline. Healy D, et al. **J Affective Disord** 1985 Nov;9(3):285-96

Plasma tyrosine/neutral amino acid ratio correlated with clinical response to nortriptyline in endogenously depressed patients. Møller SE, et al. **J Affective Disord** 1985 Nov;9(3):223-9

Measurement of reinforcement in depression: a pilot study. Hughes JR, et al. **J Behav Ther Exp Psychiatry** 1985 Sep;16(3):231-6

Clinical significance, evaluation, and management of secondary depression in schizophrenia. Becker RE, et al. **J Clin Psychiatry** 1985 Nov; 46(11 Pt 2):26-32

Are antidepressant trials too short? A case report. Eisenberg J, et al. **J Clin Psychiatry** 1986 Jan;47(1):38-9

Treatment of depression in outpatients: a controlled comparison of the onset of action of amoxapine and maprotiline. Fabre LF. **J Clin Psychiatry** 1985 Dec;46(12):521-4

Simultaneous panic and depressive disorder: response to antidepressant treatments. Grunhaus L, et al. **J Clin Psychiatry** 1986 Jan;47(1):4-7

Methylphenidate in mild depression: a double-blind controlled trial. Mattes JA. **J Clin Psychiatry** 1985 Dec;46(12):525-7

Acute response to methylphenidate as a predictor of outcome of treatment with TCAs in the elderly. Spar JA, et al. **J Clin Psychiatry** 1985 Nov; 46(11):466-9

Psychostimulant treatment of depressive disorders secondary to medical illness. Woods SW, et al. **J Clin Psychiatry** 1986 Jan;47(1):12-5

The ethological approach to the assessment of depressive disorders. Fossi L, et al. **J Nerv Ment Dis** 1984 Jun;172(6):332-41

Sulfate and glucuronide conjugates of 3-methoxy-4-hydroxyphenylglycol (MHPG) in urine of depressed patients: central and peripheral influences. Peyrin L, et al. **J Neural Transm** 1985;63(3-4):255-69

Platelet alpha 2-adrenoceptors in major depression: relationship with urinary 4-hydroxy-3-methoxyphenylglycol and age at onset. Sacchetti E, et al. **J Psychiatr Res** 1985;19(4):579-86

Influence of personality on response to monoamine oxidase inhibitors and tricyclic antidepressants. Shawcross CR, et al. **J Psychiatr Res** 1985; 19(4):557-62

Corticotropin-releasing factor in plasma of depressed patients and controls [letter] Charlton BG, et al. **Lancet** 1986 Jan 18;1(8473):161-2

Depression and the general practitioner. Carney MW, et al. **Practitioner** 1985 Nov;229(1409):1017-25

CSF somatostatin in affective illness and normal volunteers. Rubinow DR, et al. **Prog Neuropsychopharmacol Biol Psychiatry** 1985; 9(4):393-400

Amineptine in the management of the depressive syndromes. Scarzella L, et al. **Prog Neuropsychopharmacol Biol Psychiatry** 1985; 9(4):429-39

The efficiency of ECT: II. Correlation of specific treatment variables to response rate in unilateral ECT. Rich CL, et al. **Psychiatry Res** 1985 Oct;16(2):147-54

Cerebrospinal fluid monoamine and monoamine metabolite concentrations in melancholia. Roy A, et al. **Psychiatry Res** 1985 Aug;15(4):281-92

A comparison between the growth hormone responses to amphetamine and clonidine [letter] Siever LJ, et al. **Psychiatry Res** 1985 Sep; 16(1):79-82

Variation in human platelet 3H-imipramine binding. Tang SW, et al. **Psychiatry Res** 1985 Oct;16(2):141-6

Lower 3H-imipramine binding in platelets from untreated depressed patients compared to healthy controls. Wägner A, et al. **Psychiatry Res** 1985 Oct;16(2):131-9

Effect of lysine vasopressin in depressed patients on mood and 24-hour rhythm of growth hormone, cortisol, melatonin and prolactin. Zohar J, et al. **Psychoneuroendocrinology** 1985;10(3):273-9

Specificity and nonspecificity--a major problem in biologically oriented psychopathology. Heimann H. **Psychopathology** 1985;18(2-3):82-7

MHPG excretion in endogenous depression: relationship to clinical state and the effects of ECT. Joseph MH, et al. **Psychopharmacology (Berlin)** 1985;87(4):442-8

Combined use of TCAs and MAOIs [letter] Stewart JW. **Psychosomatics** 1985 Nov;26(11):879

[Lithium prophylaxis, o.k., but for how long?] Slooff CJ, et al. **Ned Tijdschr Geneeskd** 1985 Sep 7;129(36):1729-33 (Eng. Abstr.) **(Dut)**

[Depression, anxiety and neurotic disorders] Wilmotte J. **Acta Psychiatr Belg** 1985 Jul-Aug;85(4):469-79 (Eng. Abstr.) **(Fre)**

[New proposals for the development of the concepts of neurotic anxiety, major depression and panic attack] Xhenseval B. **Acta Psychiatr Belg** 1985 Jul-Aug;85(4):480-508 (68 ref.) (Eng. Abstr.) **(Fre)**

[Plasma levels of clomipramine and its metabolites in hospitalized depressed patients] Debray Q, et al. **Ann Med Psychol (Paris)** 1985 May;143(5):464-74 **(Fre)**

[Correlation between serum levels of amitriptyline and the Hamilton scale of depression using high-pressure liquid chromatography] Cruz Igartúa A, et al. **Bol Asoc Med PR** 1985 Sep;77(9):375-80 **(Spa)**

[Relation of blood levels of amoxapine and its active metabolites to its pharmacologic response and toxicity] Calvo MB, et al. **Med Clin (Barc)** 1985 Sep 14;85(7):269-72 (Eng. Abstr.) **(Spa)**

DEPTH PERCEPTION

Haloperidol blocks amphetamine induced recovery of binocular depth perception after bilateral visual cortex ablation in cat. Hovda DA, et al. **Proc West Pharmacol Soc** 1985;28:209-11

DESIPRAMINE

Selective antidepressants and cerebrospinal fluid. Lack of specificity on norepinephrine and serotonin metabolites. Potter WZ, et al. **Arch Gen Psychiatry** 1985 Dec;42(12):1171-7

Obsessive-compulsive disorder and serotonin: is there a connection? Insel TR, et al. **Biol Psychiatry** 1985 Nov;20(11):1174-88

The effect of desipramine upon melatonin and cortisol secretion in depressed and normal subjects. Thompson C, et al. **Br J Psychiatry** 1985 Oct;147:389-93

Modification of behavioral response to intra-hippocampal injections of noradrenaline and adrenoceptor agonists by chronic treatment with desipramine and citalopram: functional aspects of adaptive receptor changes. Płaźnik A, et al. **Eur J Pharmacol** 1985 Nov 5;117(2):245-52

Are antidepressant trials too short? A case report. Eisenberg J, et al. **J Clin Psychiatry** 1986 Jan;47(1):38-9

Double-blind comparison of desipramine and placebo in withdrawal from cocaine dependence. Tennant FS Jr, et al. **Natl Inst Drug Abuse Res Monogr Ser** 1984;55:159-63

Biochemical and behavioral changes in rats after prolonged treatment with desipramine: interaction with p-chlorophenylalanine. Brunello N, et al. **Naunyn Schmiedebergs Arch Pharmacol** 1985 Oct;331(1):20-2

Chronic dosage of imipramine in animal experiment: concentrations of imipramine and desipramine in the rat brain after various modes of dosage. Melzacka M, et al. **Pol J Pharmacol Pharm** 1985 Jul-Aug;37(4):525-32

Mesolimbic noradrenaline but not dopamine is responsible for organization of rat behavior in the forced swim test and an anti-immobilizing effect of desipramine. Płaźnik A, et al. **Pol J Pharmacol Pharm** 1985 May-Jun;37(3):347-57

Effects of some antidepressant drugs on apomorphine concentration in the central nervous system of rats and apomorphine-induced stereotypy. Rurak A, et al. **Pol J Pharmacol Pharm** 1985 Jul-Aug;37(4):509-15

DESOXYCORTICOSTERONE

The hypertensinogenic activity of 19-nor-deoxycorticosterone in the adrenalectomized spontaneously hypertensive rat. Gorsline J, et al. **J Steroid Biochem** 1985 Oct;23(4):535-6

Intrahypothalamic effects of progestin agonists on estrous behavior and progestin receptor binding. Glaser JH, et al. **Physiol Behav** 1985 Jun;34(6):871-7

DEXTROAMPHETAMINE

Obsessive-compulsive symptoms following stimulants [letter] Koizumi HM. **Biol Psychiatry** 1985 Dec;20(12):1332-3

Modulation of terminal excitability of mesolimbic dopaminergic neurons by D-amphetamine and haloperidol. Mereu G, et al. **Brain Res** 1985 Dec 16;359(1-2):88-96

Individual differences in non-regulatory ingestive behavior and catecholamine systems. Mittleman G, et al. **Brain Res** 1985 Nov 25;348(1):112-7

Analysis of dopamine D1 and D2 receptor involvement in d- and l-amphetamine-induced anorexia in rats. Gilbert DB, et al. **Brain Res Bull** 1985 Oct;15(4):385-9

Chronic administration of D-amphetamine increases [3H]spiroperidol binding in cat brain. Trulson ME, et al. **Eur J Pharmacol** 1985 Nov 5;117(2):267-70

Salbutamol, d-amphetamine and d-fenfluramine reduce sucrose intake in freely fed rats by acting on different neurochemical mechanisms. Borsini F, et al. **Int J Obes** 1985;9(4):277-83

Psychostimulant treatment of depressive disorders secondary to medical illness. Woods SW, et al. **J Clin Psychiatry** 1986 Jan;47(1):12-5

Iron deficiency induces reversal of dopamine dependent circadian cycles: differential response to d-amphetamine and TRH. Youdim MB, et al. **Peptides (Fayetteville)** 1985 Sep-Oct;6(5):851-5

Effects of d-amphetamine and of beta-phenylethylamine on fixed interval responding maintained by self-regulated lateral hypothalamic stimulation in rats. Greenshaw AJ, et al. **Pharmacol Biochem Behav** 1985 Oct;23(4):519-23

The role of the midbrain reticular formation in the expression of two opposing nigral denervation syndromes. Vaccarino FJ, et al. **Physiol Behav** 1985 Nov;35(5):749-52

ACTH1-24 effects on d-amphetamine self-administration and the dynamics of brain dopamine in rats. Leccese AP, et al. **Prog Clin Biol Res** 1985;192:71-81

Different pattern of association of beta-endorphin and cortisol responses to dextroamphetamine in postmenopausal women and young men. Halbreich U, et al. **Psychiatry Res** 1985 Sep;16(1):11-9

Lithium attenuates the activation-euphoria but not the psychosis induced by d-amphetamine in schizophrenia. van Kammen DP, et al. **Psychopharmacology (Berlin)** 1985;87(1):111-5

Effects of L-tyrosine on brain monoamines in rats given intravenous amphetamine. Smith DG, et al. **Subst Alcohol Actions Misuse** 1984-85;5(6):293-8

DIAZEPAM

Comparison of paracetamol and aminophenazone plus diazepam suppositories for anxiety and pain relief after tonsillectomy in children. Lindgren L, et al. **Acta Anaesthesiol Scand** 1985 Oct;29(7):679-82

Myorelaxant effect of diazepam. Interactions with neuromuscular blocking agents and cholinergic drugs. Wali FA. **Acta Anaesthesiol Scand** 1985 Nov;29(8):785-9

Early treatment response in anxious outpatients treated with diazepam. Downing RW, et al. **Acta Psychiatr Scand** 1985 Dec;72(6):522-8

A double blind study in out-patients with primary non-agitated depression treated with imipramine in combination with placebo, diazepam or dixyrazine. Feet PO, et al. **Acta Psychiatr Scand** 1985 Oct;72(4):334-40

The influence of diazepam on the pharmacokinetics of intravenous and epidural bupivacaine in the rhesus monkey. Thompson GA, et al. **Anesth Analg** 1986 Feb;65(2):151-5

Physostigmine: an antidote for excessive central nervous system depression or paradoxical rage reactions resulting from intravenous diazepam. Jastak JT. **Anesth Prog** 1985 May-Jun;32(3):87-92

Effect of diazepam on drug absorption and gastric emptying in man. Adelhøj B, et al. **Br J Anaesth** 1985 Nov;57(11):1107-9

The effects of diazepam on the auditory brain stem responses. Adams DA, et al. **Br J Audiol** 1985 Nov;19(4):277-80

Specific changes in local cerebral glucose utilization in the rat brain induced by acute and chronic diazepam. Ableitner A, et al. **Brain Res** 1985 Dec 16;359(1-2):49-56

Severe withdrawal syndrome after substitution of a short-acting benzodiazepine for a long-acting benzodiazepine. Bond WS, et al. **Drug Intell Clin Pharm** 1985 Oct;19(10):742-4

Famotidine, a new H2-receptor antagonist, does not affect hepatic elimination of diazepam or tubular secretion of procainamide. Klotz U, et al. **Eur J Clin Pharmacol** 1985;28(6):671-5

Development of tolerance to the anticonvulsant effect of diazepam in amygdala-kindled rats. Löscher W, et al. **Exp Neurol** 1985 Nov;90(2):373-84

Omeprazole inhibits oxidative drug metabolism. Studies with diazepam and phenytoin in vivo and 7-ethoxycoumarin in vitro. Gugler R, et al. **Gastroenterology** 1985 Dec;89(6):1235-41

The effect of diazepam on body temperature change in humans during cold exposure. Martin SM. **J Clin Pharmacol** 1985 Nov-Dec;25(8):611-3

Six-week trial with diazepam: some clinical observations. Rickels K, et al. **J Clin Psychiatry** 1985 Nov;46(11):470-4

Modification of the inotropic effect of digoxin by diazepam in rat left atria. Castillo-Ferrando JR, et al. **J Pharm Pharmacol** 1985 Nov;37(11):828-9

Differential diazepam-antagonist effects of the benzodiazepine receptor ligand CGS 9895 in rodents. Katzman NJ, et al. **J Pharmacol Exp Ther** 1985 Dec;235(3):589-95

Imaging of [11C]-labelled Ro 15-1788 binding to benzodiazepine receptors in the human brain by positron emission tomography. Persson A, et al. **J Psychiatr Res** 1985;19(4):609-22

Nimodipine's interactions with other drugs: II. Diazepam. Draski LJ, et al. **Life Sci** 1985 Dec 2;37(22):2123-8

Attenuating effect of diazepam on stress-induced increases in noradrenaline turnover in specific brain regions of rats: antagonism by Ro 15-1788. Ida Y, et al. **Life Sci** 1985 Dec 30;37(26):2491-8

Effects of diazepam at the neuromuscular junction. Wali FA. **Life Sci** 1985 Oct 28;37(17):1559-61 (19 ref.)

The provision of diazepam to psychiatric patients [letter] Hammett E. **Milit Med** 1985 Nov;150(11):625

Dose effect and preference comparison of diazepam and oxazepam. Griffiths RR, et al. **Natl Inst Drug Abuse Res Monogr Ser** 1984; 55:97-8

Effect of short-term swimming stress and diazepam on 3,4-dihydroxyphenylacetic acid (DOPAC) and 5-hydroxyindoleacetic acid (5-HIAA) levels in the caudate nucleus: an in vivo voltammetric study. Ikeda M, et al. **Naunyn Schmiedebergs Arch Pharmacol** 1985 Oct; 331(1):23-6

Non-benzodiazepine anxiolytics: potential activity of phenylpiperazines without 3H-diazepam displacing action. Lloyd KG, et al. **Pharmacol Biochem Behav** 1985 Oct;23(4):645-52

Comparison of buspirone and diazepam in generalized anxiety disorder. Jacobson AF, et al. **Pharmacotherapy** 1985 Sep-Oct;5(5):290-6

Conditioned suppression of sexual behavior in stallions and reversal with diazepam. McDonnell SM, et al. **Physiol Behav** 1985 Jun;34(6):951-6

On the brain endocoid for benzodiazepine recognition sites. Guidotti A, et al. **Prog Clin Biol Res** 1985;192:477-84

Tolerance to the benzodiazepine diazepam in an animal model of anxiolytic activity. Stephens DN, et al. **Psychopharmacology (Berlin)** 1985;87(3):322-7

Is delay of reward mediated by shock-avoidance behavior a critical target for anti-punishment effects of diazepam in rats? Thiébot MH, et al. **Psychopharmacology (Berlin)** 1985;87(4):473-9

Intra-arterial diazepam. A report of 2 cases. Schulenburg CE, et al. **S Afr Med J** 1985 Dec 7;68(12):891-2

Social effects of diazepam use: a longitudinal field study. Caplan RD, et al. **Soc Sci Med** 1985;21(8):887-98

[Physostigmine: an antidote in diazepam poisoning] Pedersen JE. **Ugeskr Laeger** 1985 Nov 4;147(45):3586-7 (Eng. Abstr.) **(Dan)**

[Functional synergism of beta-adrenomimetics and seduxen during action on the uterine contractile function in an experiment] Gersamiia TV, et al. **Akush Ginekol (Mosk)** 1985 Aug;(8):65-6 **(Rus)**

[Effect of diazepam, meprobamate and amizyl on the emotional reactions of the rabbit to hypothalamic stimulation] Davituliani DS, et al. **Zh Vyssh Nerv Deiat** 1985 Sep-Oct;35(5):952-6 (Eng. Abstr.) **(Rus)**

DIBENZAZEPINES

Effects of haloperidol and low dose clozapine on the acetylcholine turnover rate in rat forebrain structures. Bluth R, et al. **Biomed Biochim Acta** 1985;44(10):1531-9

A double-blind out-patient trial of indalpine vs mianserin. Naylor GJ, et al. **Br J Psychiatry** 1985 Sep;147:306-9

Possible mechanism for mianserin induced neutropenia associated with saturable elimination kinetics. O'Donnell JL, et al. **Br Med J [Clin Res]** 1985 Nov 16;291(6506):1375-6

A double-blind trial comparing mianserin and maprotiline in depressed inpatients. Palha AP, et al. **Clin Ther** 1985;7(5):584-92

Octopamine receptors in the molluscan aortic bulb: effects of clozapine and chlordimeform. Dougan DF, et al. **Comp Biochem Physiol [C]** 1985; 82(1):193-7

Metapramine overdose: report of two cases and analytical determinations. Rouquette C, et al. **J Anal Toxicol** 1985 Nov-Dec;9(6):275-7

The effect of phenothiazine and dibenzazepine pretreatment on the metabolism of methamphetamine in rats. Mori M, et al. **J Pharm Pharmacol** 1985 Nov;37(11):819-20

Neutropenia and mianserin [letter] Forgan-Smith J, et al. **Med J Aust** 1985 Oct 28;143(9):398

Differential effects of thioridazine, clozapine and metoclopramide on the induction of adrenomedullary enzymes by apomorphine. Ekker M, et al. **Neuropharmacology** 1985 Nov;24(11):1063-6

The effects of clozapine on shuttle-box avoidance responding in rats: comparisons with haloperidol and chlordiazepoxide. Sanger DJ. **Pharmacol Biochem Behav** 1985 Aug;23(2):231-6

DIBENZOTHIEPINS

Prolonged inhibition of striatal dopamine receptor sites by isofloxythepin. Lau YS, et al. **Eur J Pharmacol** 1985 Oct 8;116(1-2):25-31

Flumezapine and zotepine: 5-hydroxytryptamine antagonism not involved in the lack of synergism of these antipsychotic drugs with amfonelic acid in rats. Fuller RW, et al. **J Pharm Pharmacol** 1985 Oct; 37(10):755-6

DIBENZOXAZEPINES

Delusional hypochondriasis, depression, and amoxapine [letter] Tollefson G. **Am J Psychiatry** 1985 Dec;142(12):1518-9

How effective is loxapine? [letter] Tuason VB, et al. **Am J Psychiatry** 1986 Jan;143(1):116-7

Effect of loxapine and amoxapine on oxidative metabolism of rat brain 'in vitro'. Velasco Martin A, et al. **Arch Farmacol Toxicol** 1985 Aug; 11(2):117-25

Treatment of depression in outpatients: a controlled comparison of the onset of action of amoxapine and maprotiline. Fabre LF. **J Clin Psychiatry** 1985 Dec;46(12):521-4

Amoxapine overdose [letter] Weaver KE. **J Clin Psychiatry** 1985 Dec; 46(12):545

Dopamine receptor binding of a novel dibenzodioxazocine derivative, EGYT-2509. Gyüre K, et al. **Pol J Pharmacol Pharm** 1985 May-Jun; 37(3):253-61

[Relation of blood levels of amoxapine and its active metabolites to its pharmacologic response and toxicity] Calvo MB, et al. **Med Clin (Barc)** 1985 Sep 14;85(7):269-72 (Eng. Abstr.) **(Spa)**

DIETHYLAMINES

[Determining secondary aliphatic amines in the air using the dithiocarbamate formation test] Iakimova VP, et al. **Gig Tr Prof Zabol** 1985 Oct;(10):55-6 **(Rus)**

DISCRIMINATION (PSYCHOLOGY)

Mechanistic studies on DOM as a discriminative stimulus. Glennon RA, et al. **Pharmacol Biochem Behav** 1985 Dec;23(6):937-41

Amphetamine-haloperidol discrimination: effects of chronic drug treatment. Haenlein M, et al. **Pharmacol Biochem Behav** 1985 Dec; 23(6):949-52

Discriminative stimulus properties and brain distribution of phencyclidine in rats following administration by injection and smoke inhalation. Wessinger WD, et al. **Pharmacol Biochem Behav** 1985 Oct; 23(4):607-12

One-way generalization of clonidine to the discriminative stimulus produced by cocaine. Wood DM, et al. **Pharmacol Biochem Behav** 1985 Oct;23(4):529-33

DISCRIMINATION LEARNING

Alternation behavior, spatial discrimination, and reversal disturbances following 6-hydroxydopamine lesions in the nucleus accumbens of the rat. Taghzouti K, et al. **Behav Neural Biol** 1985 Nov;44(3):354-63

N-Ethyl-17(R,S)-methyl-(6aR,10aR)-delta 8-tetrahydrocannabinol-18-oic amide. Brain pharmacokinetics in mice, triglyceride/phospholipid partitioning and generalization to the discriminative stimulus properties of delta 9-THC in rats. Franke I, et al. **Biochem Pharmacol** 1985 Nov 15;34(22):3983-6

Discriminative stimulus properties of valproic acid in the pigeon. Picker M, et al. **Psychopharmacology (Berlin)** 1985;87(4):449-53

DOPA

A pulse radiolysis investigation of the oxidation of the melanin precursors 3,4-dihydroxyphenylalanine (dopa) and the cysteinyldopas. Thompson A, et al. **Biochim Biophys Acta** 1985 Nov 22;843(1-2):49-57

gamma-L-Glutamyl-L-dopa is a dopamine pro-drug, relatively specific for the kidney in normal subjects. Worth DP, et al. **Clin Sci** 1985 Aug; 69(2):207-14

New synthesis of fluorine-18-labeled 6-fluoro-L-dopa by cleaving the carbon-silicon bond with fluorine. Diksic M, et al. **J Nucl Med** 1985 Nov;26(11):1314-8

Evidence that D-1 dopamine receptors contribute to the supersensitive behavioral responses induced by L-dihydroxyphenylalanine in rats treated neonatally with 6-hydroxydopamine. Breese GR, et al. **J Pharmacol Exp Ther** 1985 Nov;235(2):287-95

DOPAMINE

Autoradiography of 1-methyl-4-phenyl-1,2,3,6-tetrahydropyridine (MPTP): uptake in the monoaminergic pathways and in melanin containing tissues. Lydén A, et al. **Acta Pharmacol Toxicol (Copenh)** 1985 Aug;57(2):130-5

Effect of rate of hemorrhage on sympathoadrenal catecholamine release in cats. Bereiter DA, et al. **Am J Physiol** 1986 Jan; 250(1 Pt 1):E69-75

Mania, clonidine, and dopamine [letter] Shen WW. **Am J Psychiatry** 1986 Jan;143(1):127

Extractive acylation and mass spectrometric assay of 3-methoxytyramine, normetanephrine, and metanephrine in cerebrospinal fluid. Beck O, et al. **Anal Biochem** 1985 Sep;149(2):492-500

A genetic analysis of stereotypy in the mouse: dopaminergic plasticity following chronic stress. Cabib S, et al. **Behav Neural Biol** 1985 Sep;

44(2):239-48

Alternation behavior, spatial discrimination, and reversal disturbances following 6-hydroxydopamine lesions in the nucleus accumbens of the rat. Taghzouti K, et al. **Behav Neural Biol** 1985 Nov;44(3):354-63

Persistent depletion of striatal dopamine in mice by 1-methyl-4-(2-thienyl)-1,2,3,6-tetrahydropyridine (MTTP). Fuller RW, et al. **Biochem Pharmacol** 1986 Jan 15;35(2):143-4

Effect of phosphatase inhibition of in vitro dopamine sulfation and 3'-phosphoadenosine-5'-phosphosulfate catabolism in human brain. Whittemore RM, et al. **Biochem Pharmacol** 1985 Nov 1; 34(21):3853-6

Quantitation of a mass action of dopaminergic neurones regulating temporal damping of linear electrocortical waves. Wright JJ, et al. **Biol Cybern** 1985;52(5):281-90

Excitatory neuronal responses to dopamine in the cerebral cortex: involvement of D2 but not D1 dopamine receptors. Bradshaw CM, et al. **Br J Pharmacol** 1985 Oct;86(2):483-90

Prevention of dopaminergic toxicity of MPTP in mice by phenylethylamine, a specific substrate of type B monoamine oxidase. Melamed E, et al. **Br J Pharmacol** 1985 Nov;86(3):529-31

Dopaminergic modulation of sensory responses of striatal neurons: single unit studies. Abercrombie ED, et al. **Brain Res** 1985 Dec 9; 358(1-2):27-33

Modulation of the endogenous acetylcholine release from rat striatal slices. Alberch J, et al. **Brain Res** 1985 Nov 4;346(2):353-6

In vitro dopamine biosynthesis in the median eminence of rat hypothalamic slices: involvement of voltage-dependent Ca2+ channels. Arita J, et al. **Brain Res** 1985 Nov 18;347(2):299-305

Strain differences in pituitary prolactin content: relationship to number of hypothalamic dopamine neurons. Baker H, et al. **Brain Res** 1985 Dec 9;358(1-2):16-26

Topographical dopamine and serotonin distribution and turnover in rat striatum. Beal MF, et al. **Brain Res** 1985 Dec 9;358(1-2):10-5

Modification of electroretinograms in dopamine-depleted retinas. Citron MC, et al. **Brain Res** 1985 Oct 14;345(1):186-91

Growth hormone-releasing factor modifies dopaminergic but not serotonergic activity in the arcuate nucleus of hypothalamus in the rat, as recorded in vivo by differential pulse voltammetry. Crespi F, et al. **Brain Res** 1985 Dec 2;348(2):367-70

Differences between the release of radiolabelled and endogenous dopamine from superfused rat brain slices: effects of depolarizing stimuli, amphetamine and synthesis inhibition. Herdon H, et al. **Brain Res** 1985 Dec 2;348(2):309-20

Increase of dopamine turnover in bilateral striata after unilateral injection of haloperidol into substantia nigra of unrestrained rats. Ishii K, et al. **Brain Res** 1985 Dec 16;359(1-2):260-6

Stimulation of retinal dopamine biosynthesis in vivo by exogenous tetrahydrobiopterin: relationship to tyrosine hydroxylase activation. Iuvone PM, et al. **Brain Res** 1985 Dec 16;359(1-2):392-6

Behavioral and neurochemical effect of daily injection with neurotensin into the ventral tegmental area. Kalivas PW, et al. **Brain Res** 1985 Dec 9;358(1-2):70-6

Modulation of dopaminergic activity in the nucleus accumbens following facilitation or blockade of the dopaminergic transmission in the amygdala: a study by in vivo differential pulse voltammetry. Louilot A, et al. **Brain Res** 1985 Oct 28;346(1):141-5

Dopamine inhibition of neurotensin-induced increase in Ca2+ influx into rat pituitary cells. Memo M, et al. **Brain Res** 1985 Nov 18; 347(2):253-7

Dopamine decreases cell excitability in rat striatal neurons by pre- and postsynaptic mechanisms. Mercuri N, et al. **Brain Res** 1985 Dec 9; 358(1-2):110-21

Modulation of terminal excitability of mesolimbic dopaminergic neurons by D-amphetamine and haloperidol. Mereu G, et al. **Brain Res** 1985 Dec 16;359(1-2):88-96

Correlation between adenosine triphosphate levels, dopamine release and electrical activity in the carotid body: support for the metabolic hypothesis of chemoreception. Obeso A, et al. **Brain Res** 1985 Nov 25;348(1):64-8

Dopaminergic regulation of GABA release from the intact goldfish retina. O'Brien DR, et al. **Brain Res** 1985 Dec 23;360(1-2):41-50

Effects of water deprivation and administration of hypertonic saline on dopamine concentrations in posterior pituitary and vasopressin release in rats. Oki Y, et al. **Brain Res** 1985 Nov 25;348(1):9-14

Presynaptic inhibition of dopamine synthesis in rat striatum: effects of chronic dopamine depletion and receptor blockade. Reches A, et al. **Brain Res** 1985 Nov 18;347(2):346-9

Enduring enhancement in frontal cortex dopamine utilization in an animal model of amphetamine psychosis. Robinson TE, et al. **Brain Res** 1985 Sep 23;343(2):374-7

Homocysteine prevents apomorphine-induced decreases in dopamine metabolites. Saller CF, et al. **Brain Res** 1985 Dec 23;360(1-2):407-8

GABA axons in synaptic contact with dopamine neurons in the substantia nigra: double immunocytochemistry with biotin-peroxidase and protein A-colloidal gold. van den Pol AN, et al. **Brain Res** 1985 Nov 25; 348(1):146-54

Dopamine-dependent contralateral circling induced by neurotensin applied unilaterally to the ventral tegmental area in rats. Holmes LJ, et al. **Brain Res Bull** 1985 Nov;15(5):537-8

Dopamine-stimulated parathyroid hormone release in vitro: further evidence for a two-pool model of parathyroid hormone secretion. Hanley DA, et al. **Can J Physiol Pharmacol** 1985 Sep;63(9):1139-44

Radioenzymatic microassay for simultaneous estimations of dopamine, norepinephrine, and epinephrine in plasma, urine, and tissues. Hussain MN, et al. **Clin Chem** 1985 Nov;31(11):1861-4

Effect of low-dose dopamine infusion on basal and stimulated TSH and prolactin concentrations in man. Connell JM, et al. **Clin Endocrinol (Oxf)** 1985 Aug;23(2):185-92

The role of plasma osmolality, angiotensin II and dopamine in vasopressin release in man. Morton JJ, et al. **Clin Endocrinol (Oxf)** 1985 Aug; 23(2):129-38

Epinephrine, norepinephrine and dopamine concentrations in amphibian brain. Cooney MM, et al. **Comp Biochem Physiol** [C] 1985; 82(2):395-7

The effects of adrenalectomy on the ontogenesis of brain: noradrenaline and dopamine content. Leret ML, et al. **Comp Biochem Physiol** [C] 1985;82(2):475-7

Dopamine: a prolactin-inhibiting hormone. Ben-Jonathan N. **Endocr Rev** 1985 Fall;6(4):564-89 (281 ref.)

Does endogenous dopamine modulate human sympathetic activity through DA2 receptors? Mannelli M, et al. **Eur J Clin Pharmacol** 1985; 29(2):159-64

Prenatal exposure of rats to antidepressants enhances agonist affinity of brain dopamine receptors and dopamine-mediated behaviour. De Ceballos ML, et al. **Eur J Pharmacol** 1985 Oct 22;116(3):257-62

17 beta-Estradiol at a physiological dose acutely increases dopamine turnover in rat brain. Di Paolo T, et al. **Eur J Pharmacol** 1985 Nov 5;117(2):197-203

Phencyclidine binding sites in the nucleus accumbens and phencyclidine-induced hyperactivity are decreased following lesions of the mesolimbic dopamine system. French ED, et al. **Eur J Pharmacol** 1985 Oct 8;116(1-2):1-9

Prevention of MPTP-induced neurotoxicity by AGN-1133 and AGN-1135, selective inhibitors of monoamine oxidase-B. Heikkila RE, et al. **Eur J Pharmacol** 1985 Oct 22;116(3):313-7

The effect of dopamine upon oxidative metabolism of brown fat adipocytes. Maxwell G, et al. **Eur J Pharmacol** 1985 Oct 22; 116(3):293-7

Dopamine but not norepinephrine or serotonin uptake inhibitors protect mice against neurotoxicity of MPTP. Melamed E, et al. **Eur J Pharmacol** 1985 Oct 8;116(1-2):179-81

Dopaminergic inhibition of the action of vasopressin on the cortical collecting tubule. Muto S, et al. **Eur J Pharmacol** 1985 Aug 27; 114(3):393-7

Stimulation of D-2 dopamine receptors in rat mesocortical areas inhibits the release of [3H]dopamine. Plantje JF, et al. **Eur J Pharmacol** 1985 Aug 27;114(3):401-2

Hyper-reactivity to amphetamine in rats with dopaminergic grafts. Herman JP, et al. **Exp Brain Res** 1985;60(3):521-6

Influence of cerebroventricular injection of dopamine on plasma prolactin and LH levels of postlaying and broody turkey hens. Hargis BM, et al. **Gen Comp Endocrinol** 1986 Jan;61(1):142-7

A biochemical study of cholinergic-dopaminergic interactions in the central nervous system. De Souza H, et al. **Gen Pharmacol** 1985; 16(5):533-6

The effects of estradiol and progesterone on the concentration of striatal dopamine and tyramine in ovariectomized mice. Yeung SC, et al. **Gen Pharmacol** 1985;16(5):517-9

Effect of dopamine on ACTH-induced glucocorticoid secretion in rat adrenal suspended cells. Matsuki M, et al. **Horm Metab Res** 1985 Aug; 17(8):429-31

Involvement of hypothalamic dopamine in the regulation of prolactin secretion. Reymond MJ, et al. **Horm Res** 1985;22(3):142-52 (76 ref.)

Bromocriptine treatment for cocaine abuse: the dopamine depletion hypothesis. Dackis CA, et al. **Int J Psychiatry Med** 1985-86; 15(2):125-35

Effects of chemical sympathectomy on dopamine and noradrenaline content of the dog gastrointestinal tract. Esplugues JV, et al. **J Auton Pharmacol** 1985 Sep;5(3):189-95

Hydroxyl radical attack on dopamine. Slivka A, et al. **J Biol Chem** 1985 Dec 15;260(29):15466-72

Calcium permeability changes and neurotransmitter release in cultured brain neurons. II. Temporal analysis of neurotransmitter release. Yarom M, et al. **J Biol Chem** 1985 Dec 25;260(30):16294-302

Determination of dopamine-3- and 4-O-sulphate in human plasma and urine by anion-exchange high-performance liquid chromatography with fluorimetric detection. Yamamoto T, et al. **J Chromatogr** 1985 Aug 9; 342(2):261-7

Increased dopaminergic inhibition of prolactin in the hypoprolactinaemic IPL nude rat. Cohen H, et al. **J Endocrinol** 1985 Dec;107(3):325-9

Dopamine decreases release of luteinizing hormone releasing hormone from superfused rat mediobasal hypothalamus. Tasaka K, et al.

J Endocrinol Invest 1985 Aug;8(4):373-6

Circadian regulation of retinomotor movements. I. Interaction of melatonin and dopamine in the control of cone length. Pierce ME, et al. **J Gen Physiol** 1985 Nov;86(5):671-89

3-Phenyl-1-indanamines. Potential antidepressant activity and potent inhibition of dopamine, norepinephrine, and serotonin uptake. Bøgesø KP, et al. **J Med Chem** 1985 Dec;28(12):1817-28

Comparative chronic effects of buspirone or neuroleptics on rat brain dopaminergic neurotransmission. McMillen BA. **J Neural Transm** 1985; 64(1):1-12

Detection of 5-S-cysteinyldopamine in human brain. Rosengren E, et al. **J Neural Transm** 1985;63(3-4):247-53

N-Methyl-4-phenyl-1,2,3,6-tetrahydropyridine increases acetylcholine and decreases dopamine in mouse striatum: both responses are blocked by anticholinergic drugs. Hadjiconstantinou M, et al. **J Neurochem** 1985 Dec;45(6):1957-9

Dopamine metabolites in rat cisternal cerebrospinal fluid: major contribution from extrastriatal dopamine neurones. Hutson PH, et al. **J Neurochem** 1986 Jan;46(1):186-90

Synthesis of gamma-glutamyldopamine and other peptidoamines in the nervous system of Aplysia californica. McCaman MW, et al. **J Neurochem** 1985 Dec;45(6):1828-35

Presynaptic dopamine autoreceptors control tyrosine hydroxylase activation in depolarized striatal dopaminergic terminals. el Mestikawy S, et al. **J Neurochem** 1986 Jan;46(1):12-22

Deprenyl protects dopamine neurons from the neurotoxic effect of 1-methyl-4-phenylpyridinium ion. Mytilineou C, et al. **J Neurochem** 1985 Dec;45(6):1951-3

Interactions between vasoactive intestinal peptide and dopamine in the rabbit retina: stimulation of a common adenylate cyclase. Pachter JA, et al. **J Neurochem** 1986 Jan;46(1):257-64

Chronic use of intracerebral dialysis for the in vivo measurement of 3,4-dihydroxyphenylethylamine and its metabolite 3,4-dihydroxyphenylacetic acid. Westerink BH, et al. **J Neurochem** 1986 Jan;46(1):181-5

Acute effects of 1-methyl-4-phenyl-1,2,3,6-tetrahydropyridine on dopamine metabolism in mouse and rat striatum. Pileblad E, et al. **J Pharm Pharmacol** 1985 Oct;37(10):707-11

Direct evidence for brain-specific release of dopamine from a redox delivery system. Simpkins JW, et al. **J Pharm Sci** 1985 Oct; 74(10):1033-6

Rapid tolerance to neuroleptic-induced stimulation of dopamine release in freely moving rats. Di Chiara G, et al. **J Pharmacol Exp Ther** 1985 Nov;235(2):487-94

Adrenergic and dopaminergic control of the canine paw microcirculation. Endean ED, et al. **J Surg Res** 1986 Jan;40(1):49-54

Dopamine and isoproterenol in imipramine intoxication in the dog. Sangster B, et al. **J Toxicol Clin Toxicol** 1985;23(4-6):407-20

Peripheral origin of plasma dopamine. Yoneda S, et al. **Jpn Circ J** 1985 Sep;49(9):1028-34

The inotropic effects of dopamine and its precursor levodopa on isolated human ventricular myocardium. Brown L, et al. **Klin Wochenschr** 1985 Nov 4;63(21):1117-23

Plasma and brain catecholamines in experimental uremia: acute and chronic studies. Ali F, et al. **Life Sci** 1985 Nov 11;37(19):1757-64

A comparison between dopamine-stimulated adenylate cyclase and 3H-SCH 23390 binding in rat striatum. Andersen PH, et al. **Life Sci** 1985 Nov 25;37(21):1971-83

Effects of L-dopa and L-tyrosine on release of free and conjugated dopamine, homovanillic acid and dihydroxyphenylacetic acid from slices of rat striatum. Tyce GM, et al. **Life Sci** 1985 Dec 23; 37(25):2439-48

The dopaminergic innervation of the intermediate lobe and of the neural lobe of the pituitary gland. Holzbauer M, et al. **Med Biol** 1985; 63(3):97-116 (131 ref.)

1-methyl-4-phenylpyridine is neurotoxic to the nigrostriatal dopamine pathway. Bradbury AJ, et al. **Nature** 1986 Jan 2-8;319(6048):56-7

Is inhibition of striatal synaptosomal tyrosine hydroxylation by dopamine agonists a measure of dopamine autoreceptor function? Fowler CJ, et al. **Naunyn Schmiedebergs Arch Pharmacol** 1985 Oct;331(1):12-9

Striatal dopamine and motor activity changes observed shortly after lithium administration. Otero Losada ME, et al. **Naunyn Schmiedebergs Arch Pharmacol** 1985 Sep;330(3):169-74

Acute restraint stress decreases dopamine synthesis and turnover in the median eminence: a model for the study of the inhibitory neuronal influences on tuberoinfundibular dopaminergic neurons. Demarest KT, et al. **Neuroendocrinology** 1985 Nov;41(5):437-44

Acute restraint stress decreases tuberoinfundibular dopaminergic neuronal activity: evidence for a differential response in male versus female rats. Demarest KT, et al. **Neuroendocrinology** 1985 Dec;41(6):504-10

Absence of inhibitory dopaminergic control of the rabbit pituitary gland intermediate lobe. Schimchowitsch S, et al. **Neuroendocrinology** 1986; 42(1):71-4

Mesolimbic dopamine lesions produce an augmented behavioral response to enkephalin. Kalivas PW, et al. **Neuropharmacology** 1985 Oct; 24(10):931-6

Cathinone affects dopamine and 5-hydroxytryptamine neurons in vivo as measured by changes in metabolites and synthesis in four forebrain regions in the rat. Nielsen JA. **Neuropharmacology** 1985 Sep; 24(9):845-52

The discriminant dopamine antagonist property of benzamides is observed at various times after their systemic or intracerebroventricular administration. Protais P, et al. **Neuropharmacology** 1985 Sep; 24(9):861-7

Drug-induced field potential changes in dopaminergic target areas after electrical stimulation of the rat mesencephalon. Dimpfel W. **Neuropsychobiology** 1985;14(1):42-52

Interactions between neuropeptides and dopamine neurons in the ventromedial mesencephalon. Kalivas PW. **Neurosci Biobehav Rev** 1985 Winter;9(4):573-87 (216 ref.)

Dopamine and thermoregulation: an evaluation with special reference to dopaminergic pathways. Lee TF, et al. **Neurosci Biobehav Rev** 1985 Winter;9(4):589-98

Effects of neurotoxic and mechanical lesions of the mesostriatal dopamine pathway on striatal polyamine levels in the rat: modulation by chronic ganglioside GM1 treatment. Agnati LF, et al. **Neurosci Lett** 1985 Nov 11;61(3):339-44

Tyrosine availability determines stimulus-evoked dopamine release from rat striatal slices. Milner JD, et al. **Neurosci Lett** 1985 Aug 30; 59(2):215-20

Kindling of dopaminergic pathways modifies the effect of substantia nigra lesions on rotational behaviour. Mintz M, et al. **Neurosci Lett** 1985 Oct 24;61(1-2):7-11

Dopamine uptake blockers protect against the dopamine depleting effect of 1-methyl-4-phenyl-1,2,3,6-tetrahydropyridine (MPTP) in the mouse striatum. Ricaurte GA, et al. **Neurosci Lett** 1985 Sep 6;59(3):259-64

Ascorbic acid does not modulate stimulated dopamine release: in vivo voltammetric data in the rat. Stamford JA, et al. **Neurosci Lett** 1985 Oct 10;60(3):357-62

Changes in catecholamine concentrations in the hypothalamus and region of the midbrain raphe in male and female rats during postnatal development. Stanley HF, et al. **Neurosci Lett** 1985 Nov 20; 62(1):75-80

Evidence for species differences between rats and gerbils in striatal dopamine content and dopamine metabolism. Upchurch M. **Neurosci Lett** 1985 Aug 30;59(2):159-63

Effects of dopamine superfusion on the activity of rabbit carotid chemoreceptors in vitro. Leitner LM, et al. **Neuroscience** 1985 Oct; 16(2):431-8

Responses of rat pallidum cells to cortex stimulation and effects of altered dopaminergic activity. Toan DL, et al. **Neuroscience** 1985 Jul; 15(3):683-94

Regulation of biosynthesis and release of pars intermedia peptides in Rana ridibunda: dopamine affects both acetylation and release of alpha-MSH. Jenks BG, et al. **Peptides (Fayetteville)** 1985 Sep-Oct;6(5):913-21

Food-related stimuli increase the ratio of 3,4-dihydroxyphenylacetic acid to dopamine in the hypothalamus. Simansky KJ, et al. **Pharmacol Biochem Behav** 1985 Aug;23(2):253-8

Phencyclidine-induced dopamine-dependent behaviors in chronic haloperidol-treated rats. Yamaguchi K, et al. **Pharmacol Biochem Behav** 1985 Nov;23(5):803-9

Dopaminergic behavior in frontal decorticated rats. Itoh S, et al. **Physiol Behav** 1985 Jul;35(1):109-12

Effects of dopamine agonists on hypothalamic defensive attack in cats. Maeda H, et al. **Physiol Behav** 1985 Jul;35(1):89-92

Hungarian and Polish Pharmacological Societies. 7th joint symposium: Dopamine. Zakopane 12-15 September 1984, Poland. **Pol J Pharmacol Pharm** 1985 May-Jun;37(3):227-443

Dopaminergic inhibition of sympathetic activity in the cat. Doda M, et al. **Pol J Pharmacol Pharm** 1985 May-Jun;37(3):397-404

Effect of dopamine on the transmembrane potentials of guinea-pig heart preparations. Kecskemeti V, et al. **Pol J Pharmacol Pharm** 1985 May-Jun;37(3):411-9

Depolarisation-evoked release of dopamine and histamine from brain tissue and studies on presynaptic dopamine-histamine interaction. Nowak JZ. **Pol J Pharmacol Pharm** 1985 May-Jun;37(3):359-81 (111 ref.)

Mesolimbic noradrenaline but not dopamine is responsible for organization of rat behavior in the forced swim test and an anti-immobilizing effect of desipramine. Plaźnik A, et al. **Pol J Pharmacol Pharm** 1985 May-Jun; 37(3):347-57

Stimulation of hippocampal dopaminergic receptors: behavioral and electrophysiological effects. Smiałowski A. **Pol J Pharmacol Pharm** 1985 May-Jun;37(3):333-45

Taurine and its derivatives alter brain dopamine metabolism similarly to GABA in mice and rats. Ahtee L, et al. **Prog Clin Biol Res** 1985; 179:331-41

Behavioral evidence for cholecystokinin modulation of dopamine in the mesolimbic pathway. Crawley JH. **Prog Clin Biol Res** 1985; 192:131-8

Substance P modulation of the mesolimbic dopamine system. Kalivas P. **Prog Clin Biol Res** 1985;192:403-8

ACTH1-24 effects on d-amphetamine self-administration and the dynamics of brain dopamine in rats. Leccese AP, et al. **Prog Clin Biol Res** 1985;192:71-81

Cholecystokinin-dopamine receptor interactions as studied with cholecystokinin receptor antagonists. Murphy RB. **Prog Clin Biol Res** 1985;192:105-13

Electrophysiological effects of cholecystokinin: central dopaminergic systems. Wang RY, et al. **Prog Clin Biol Res** 1985;192:95-103

Cerebrospinal fluid monoamine and monoamine metabolite concentrations in melancholia. Roy A, et al. **Psychiatry Res** 1985 Aug;15(4):281-92

The effects of pimozide on the establishment of conditioned reinforcement as a function of the amount of conditioning. Hoffman DC, et al. **Psychopharmacology (Berlin)** 1985;87(4):454-60

Neurotensin effect on calcium transport and dopamine release in rat striatum. Battaini F, et al. **Regul Pept [Suppl]** 1985;4:188-90

Failure of branched-chain amino acids to affect synaptosomal uptake of norepinephrine and dopamine. Cobert BJ, et al. **Res Commun Chem Pathol Pharmacol** 1985 Dec;50(3):455-8

[Adrenaline, noradrenaline and dopamine excretion and anxiety levels in surgical patients] Barham O, et al. **Arch Psychol (Frankf)** 1985; 137(4):291-5 (Eng. Abstr.) **(Ger)**

[Effect of dopamine and dopamine mimetics on Na, K-ATPase of corpus striatum synaptosomes] Komissarov IV, et al. **Biull Eksp Biol Med** 1985 Oct;100(10):400-3 (Eng. Abstr.) **(Rus)**

[Role of cyclic AMP in the action of dopamine on the spontaneous and glutamate-induced activity of neostriatal neurons in the rat] Godukhin OV, et al. **Neirofiziologiia** 1985;17(5):614-9 (Eng. Abstr.) **(Rus)**

DOPAMINE BETA-HYDROXYLASE

Effects of calcium and limited proteolysis on membrane-bound and releasable dopamine beta-hydroxylase in adrenomedullary catecholamine granules. Helle KB, et al. **Acta Physiol Scand** 1985 Nov; 125(3):423-7

Fumarate is the cause of the apparent ping-pong kinetics of dopamine beta-hydroxylase. Palatini P. **Biochem Int** 1985 Oct;11(4):565-72

Inhibition of the retrograde axonal transport of dopamine-beta-hydroxylase antibodies by the calcium ionophore A23187. Lees GJ. **Brain Res** 1985 Oct 14;345(1):62-7

Sympathoadrenal activity and plasma glucose effects on plasma dopamine-beta-hydroxylase levels in rats. Muñoz JA, et al. **Clin Chim Acta** 1985 Nov 15;152(3):243-52

Segregation analysis of dopamine-beta-hydroxylase (DBH) and catechol-O-methyltransferase (COMT): identification of major locus and polygenic components. Goldin LR. **Genet Epidemiol** 1985; 2(3):317-25

Distribution of dopamine-beta-hydroxylase-like immunoreactivity in the rat pineal organ. Schröder H, et al. **Histochemistry** 1985; 83(4):375-80

Differential roles of raphe nuclei in the regulation of dopamine beta-hydroxylase in the adrenal gland of the rat. Lima L, et al. **J Neurochem** 1986 Jan;46(1):317-20

Plasma norepinephrine, epinephrine, and dopamine beta-hydroxylase activity during exercise in man. Péronnet F, et al. **Med Sci Sports Exerc** 1985 Dec;17(6):683-8

Cell nuclear accumulation of estrogen receptors in rat brain and pituitary gland after treatment with a dopamine-beta-hydroxylase inhibitor. Blaustein JD. **Neuroendocrinology**, 1986;42(1):44-50

Cysteamine effects on monoamines, dopamine-beta-hydroxylase and the hypothalamic-pituitary axis. Terry LC, et al. **Neuroendocrinology** 1985 Dec;41(6):467-75

Genes for neurotransmitter synthesis, storage and release. Joh TH. **Prog Clin Biol Res** 1985;192:423-9

DOXEPIN

Excretion of doxepin and N-desmethyldoxepin in human milk. Kemp J, et al. **Br J Clin Pharmacol** 1985 Nov;20(5):497-9

DRUG SCREENING

Distress vocalization in rat pups. A simple screening method for anxiolytic drugs. Gardner CR. **J Pharmacol Methods** 1985 Nov;14(3):181-7

ELECTROCONVULSIVE THERAPY

ECT versus tricyclic antidepressants [letter] Fogel BS. **Am J Psychiatry** 1986 Jan;143(1):121-2

Adrenergic receptors in depression. Effects of electroconvulsive therapy. Cooper SJ, et al. **Br J Psychiatry** 1985 Jul;147:23-9

Empirical study on an inpatient psychogeriatric unit: biological treatment in patients with depressive illness. Meyers BS, et al. **Int J Psychiatry Med** 1985-86;15(2):111-24

Noninvasive assessment of electroconvulsive-induced changes in cardiac function. Mulgaokar GD, et al. **J Clin Psychiatry** 1985 Nov; 46(11):479-82

The efficiency of ECT: II. Correlation of specific treatment variables to response rate in unilateral ECT. Rich CL, et al. **Psychiatry Res** 1985 Oct;16(2):147-54

MHPG excretion in endogenous depression: relationship to clinical state and the effects of ECT. Joseph MH, et al. **Psychopharmacology (Berlin)** 1985;87(4):442-8

ELECTROENCEPHALOGRAPHY

A study of the mediator spectrum of delta-9 tetrahydrocanabinol effects on cerebral bioelectric activity. Machula AI, et al. **Drug Alcohol Depend** 1985 Aug;15(4):383-8

Sleep and electroencephalography: points of interest and points of controversy. Guilleminault C, et al. **J Clin Neurophysiol** 1984 Jul; 1(3):275-91 (115 ref.)

The effects of entorhinal cortex lesions on type 1 and type 2 theta. Montoya CP, et al. **Physiol Behav** 1985 Jul;35(1):121-6

Effect of propranolol on brain electrical activity during hyperbaric oxygenation in the rat. Torbati D. **Undersea Biomed Res** 1985 Dec; 12(4):423-9

[Influence of intracaudate injection of muscimol on the conditioning performance and EEG in rabbits] Huang YY, et al. **Chung Kuo Yao Li Hsueh Pao** 1985 Jun;6(2):77-8 (Eng. Abstr.) **(Chi)**

ELECTROLYTES

Characterization of a Na : K : 2C1 cotransport system in the apical membrane of a renal epithelial cell line (LLC-PK1). Brown CD, et al. **J Membr Biol** 1985;87(2):131-9

Endocrine control of renal handling of solutes and water in vertebrates. Nishimura H. **Renal Physiol** 1985;8(4-5):279-300 (125 ref.)

EMOTIONS

[Effect of diazepam, meprobamate and amizyl on the emotional reactions of the rabbit to hypothalamic stimulation] Davituliani DS, et al. **Zh Vyssh Nerv Deiat** 1985 Sep-Oct;35(5):952-6 (Eng. Abstr.) **(Rus)**

ENDORPHINS

Sex-dependent effects of neonatally administered morphiceptin and D-ala-D-leu-enkephalin on maze learning in rats. de Avila A, et al. **Behav Neural Biol** 1985 Nov;44(3):393-402

Action of (D-Pro4)-beta-casomorphin1-5 on processes of synaptic transmission. Kammerer E, et al. **Biomed Biochim Acta** 1985; 44(9):1379-87

Biosynthesis of beta-endorphin in pancreatic islets of neonatal Wistar rats. Niendorf WR, et al. **Biomed Biochim Acta** 1985;44(9):K51-4

Effects of beta-casomorphin on dentate hippocampal field potentials in freely moving rats. Reymann KG, et al. **Biomed Biochim Acta** 1985; 44(5):749-54

The interaction of endogenous opiates with autonomic circulatory control in the dog. Caffrey JL, et al. **Circ Shock** 1985;17(3):233-42

The effects of acclimation temperature on pituitary and plasma beta-endorphin in rats at 32.5 degrees C. Gwosdow AR, et al. **Comp Biochem Physiol [C]** 1985;82(2):269-72

Gastroduodenal bicarbonate secretion in mucosal protection. Possible role of vasoactive intestinal peptide and opiates. Flemström G, et al. **Dig Dis Sci** 1985 Nov;30(11 Suppl):63S-68S

gamma-Endorphin-generating endopeptidase: distribution in body tissues and cellular localization in rat testis. Lebouille JL, et al. **Endocrinology** 1986 Jan;118(1):372-6

gamma-Aminobutyric acid inhibits beta-endorphin secretion from the anterior pituitary but not the neurointermediate lobe in the rat. Petraglia F, et al. **Endocrinology** 1986 Jan;118(1):360-6

Proopiomelanocortin-derived peptides in testicular interstitial fluid: characterization and changes in secretion after human chorionic gonadotropin or luteinizing hormone-releasing hormone analog treatment. Valenca MM, et al. **Endocrinology** 1986 Jan;118(1):32-7

Beta-endorphin and met-enkephalin in peritoneal and ovarian follicular fluids of fertile and postmenopausal women. Petraglia F, et al. **Fertil Steril** 1985 Nov;44(5):615-21

Occurrence of beta-endorphin-like immunoreactivity in the brain of the teleost, Boops boops. Vallarino M. **Gen Comp Endocrinol** 1985 Oct;60(1):63-9

Effects of chronically elevated intake of sweet solutions on sexual behavior of male rats. Lieblich I, et al. **Horm Behav** 1985 Sep;19(3):278-91

Dexamethasone suppresses cortisol but not ACTH and beta-endorphin plasma concentration in healthy man. Lypka A, et al. **Horm Metab Res** 1985 Oct;17(10):547

Influence of beta-endorphin on phytohemagglutinin-induced lymphocyte proliferation and on the expression of mononuclear cell surface antigens in vitro. Puppo F, et al. **Immunopharmacology** 1985 Oct;10(2):119-25

Studies on opioid receptor selectivity of beta-endorphin antagonists. Hammonds RG Jr, et al. **Int J Pept Protein Res** 1985 Aug;26(2):118-20

Distinct behavior of beta-endorphin and corticotropin toward leucine aminopeptidase action. Li CH, et al. **Int J Pept Protein Res** 1985 Aug;26(2):113-7

Comparison of the effect of insulin hypoglycemia and clonidine on secretion of growth hormone, cortisol and beta-endorphin in children and adolescents. Gil-Ad I, et al. **Isr J Med Sci** 1985 Nov;21(11):912-4

Dermorphin reduces the metyrapone-evoked release of adrenocorticotropin, beta-endorphin, and beta-lipotropin in man. Degli Uberti EC, et al. **J Clin Endocrinol Metab** 1985 Dec;61(6):1018-22

Time of origin of opioid peptide-containing neurons in the rat hypothalamus. Khachaturian H, et al. **J Comp Neurol** 1985 Jun 22;236(4):538-46

Endogenous opioid peptides and hypothalamic neuroendocrine neurones. Bicknell RJ. **J Endocrinol** 1985 Dec;107(3):437-46 (100 ref.)

Endogenous opioids and related peptides: from molecular biology to clinical medicine. The Sir Henry Dale lecture for 1985. Imura H, et al. **J Endocrinol** 1985 Nov;107(2):147-57

Effect of alpha-endorphin on the antigen-induced primary antibody response of human blood B cells in vitro. Heijnen CJ, et al. **J Immunol** 1986 Jan;136(1):213-6

Synthesis and activity profiles of novel cyclic opioid peptide monomers and dimers. Schiller PW, et al. **J Med Chem** 1985 Dec;28(12):1766-71

Purification of peptides derived from proenkephalin A on Bio-Rex 70. Wilson SP. **J Neurosci Methods** 1985 Oct-Nov;15(2):155-63

Regulation of beta-endorphin and ACTH in brain by estradiol. Wardlaw SL, et al. **Life Sci** 1985 Nov 18;37(20):1941-7

Menopausal syndrome: plasma levels of beta-endorphin in post-menopausal women measured by a specific radioimmunoassay. Aleem FA, et al. **Maturitas** 1985 Nov;7(4):329-34

Has morphine a physiological function in the animal kingdom? [news] Kosterlitz HW. **Nature** 1985 Oct 24-30;317(6039):671-2

Effect of indolamines on beta-endorphin release by rat anterior pituitary cells. Abou Samra AB, et al. **Neuroendocrinology** 1985 Dec;41(6):490-3

A subset of beta-endorphin- or dynorphin-containing neurons in the medial basal hypothalamus accumulates estradiol. Morrell JI, et al. **Neuroendocrinology** 1985 Nov;41(5):417-26

Metabolic profiling of opioid peptides in tooth pulp by HPLC and radioreceptor assay. Desiderio DM, et al. **Neuropeptides** 1985 Sep;6(5):463-9

Depletion of noradrenaline in the hypothalamus reduces the febrile responses induced by prostaglandin E2, thyrotropin-releasing hormone and beta-endorphin in rats. Lin MT, et al. **Neuropharmacology** 1985 Nov;24(11):1039-42

Opioid activity of pro-enkephalin-derived peptides in mouse vas deferens and guinea pig ileum. Sánchez-Blázquez P, et al. **Neurosci Lett** 1985 Nov 11;61(3):267-71

Contrast medium cause the apparent increase in beta-endorphin levels in human CSF following brain stimulation [letter] Akil H, et al. **Pain** 1985 Nov;23(3):301-4

Characterization of opioid peptides from maternal and fetal sheep adrenal glands. Dunlap CE 3d, et al. **Peptides (Fayetteville)** 1985 May-Jun;6(3):483-9

Mediation by gonadal steroids of plasma beta-endorphin and LH in castrated female and male rats. Forman LJ, et al. **Peptides (Fayetteville)** 1985 Sep-Oct;6(5):835-9

Acetylation of alpha MSH and beta-endorphin by rat neurointermediate pituitary secretory granule-associated acetyltransferase. Gibson TR, et al. **Peptides (Fayetteville)** 1985 Jul-Aug;6(4):615-20

Experimental dissociation of food intake and plasma beta-endorphin following 2-deoxy-D-glucose in rats. Lowy MT, et al. **Peptides (Fayetteville)** 1985 May-Jun;6(3):569-73

Continuous social defeat induces an increase of endogenous opioids in discrete brain areas of the mongolian gerbil. Raab A, et al. **Peptides (Fayetteville)** 1985 May-Jun;6(3):387-91

Demonstration of beta-casomorphin immunoreactive materials in in vitro digests of bovine milk and in small intestine contents after bovine milk ingestion in adult humans. Svedberg J, et al. **Peptides (Fayetteville)** 1985 Sep-Oct;6(5):825-30

Effect of oral contraceptives on the rat brain and pituitary opioid peptides. Tejwani GA, et al. **Peptides (Fayetteville)** 1985 May-Jun;6(3):555-61

Degradation of alpha and beta neo-endorphin by rat brain membrane peptidases. Ulrich C, et al. **Peptides (Fayetteville)** 1985 May-Jun;6(3):475-82

Des-Tyr1-gamma-endorphin (DT gamma E) and des-enkephalin-gamma-endorphin (DE gamma E): plasma profile and brain uptake after systemic administration in the rat. Verhoef JC, et al. **Peptides (Fayetteville)** 1985 May-Jun;6(3):467-74

Endocoids. Proceedings of an International Symposium. Fort Worth, Texas, May 23-26, 1984. **Prog Clin Biol Res** 1985;192:1-541

Brain endocoid identification as a strategy for the development of a new generation of psychoactive drugs. Costa E. **Prog Clin Biol Res** 1985;192:29-36

Identification and secretion of gamma-endorphin and beta-endorphin-like peptides from the neurointermediate pituitary of the rat. Dorsa DM, et al. **Prog Clin Biol Res** 1985;192:285-92

Behavioral effects of cholecystokinin and its related peptides in rats. Itoh S, et al. **Prog Clin Biol Res** 1985;192:139-45

Opiate receptor mediated effects of IFN-alpha and lymphocyte derived endorphin-like peptides. Smith EM, et al. **Prog Clin Biol Res** 1985;192:259-64

Behavioral effects of non-opioid fragments of beta-endorphin. van Ree JM, et al. **Prog Clin Biol Res** 1985;192:277-84

Different pattern of association of beta-endorphin and cortisol responses to dextroamphetamine in postmenopausal women and young men. Halbreich U, et al. **Psychiatry Res** 1985 Sep;16(1):11-9

Demonstration of a beta-casomorphin immunoreactive material in the plasma of newborn calves after milk intake. Umbach M, et al. **Regul Pept** 1985 Nov 7;12(3):223-30

Effect of a beta-casomorphin analog on ion transport in rabbit ileum: evidence for a cholinergic mediation. Hautefeuille M, et al. **Regul Pept [Suppl]** 1985;4:219-20

Recent developments in the bioassay of opioids. Kosterlitz HW, et al. **Regul Pept [Suppl]** 1985;4:1-7

Changes of plasma beta-endorphin like immunoreactivity induced by aging. Laorden ML, et al. **Rev Esp Fisiol** 1985 Sep;41(3):357-8

[Biosynthesis of endogenous opiates] Haubold G. **Med Monatsschr Pharm** 1985 Oct;8(10):301-3 (Eng. Abstr.) **(Ger)**

[The effects of dopamine on the release of immunoreactive beta-endorphin-like peptide from the dispersed cells of the rat neurointermediate lobe] Furuki Y, et al. **Nippon Naibunpi Gakkai Zasshi** 1985 Jul 20;61(7):744-52 (Eng. Abstr.) **(Jpn)**

[The study of opioid peptides in the normal menstrual cycle, pregnancy and labor] Takayama S, et al. **Nippon Sanka Fujinka Gakkai Zasshi** 1985 Sep;37(9):1813-9 (Eng. Abstr.) **(Jpn)**

[The immunologic and enkephalin-endorphin systems] Chmielarczyk W, et al. **Pol Tyg Lek** 1985 Sep 8;40(36):1027-30 (60 ref.) **(Pol)**

[Beta-endorphin-like immunoreactivity of the blood plasma of hamadryas baboons and its changes] Golanov EV, et al. **Biull Eksp Biol Med** 1985 Dec;100(12):677-9 (Eng. Abstr.) **(Rus)**

[Levels of 5-HIAA and beta-endorphin in CSF after intrathecal morphine] González Navarro A, et al. **Arch Neurobiol (Madr)** 1985 Jul-Aug;48(4):211-3 (Eng. Abstr.) **(Spa)**

ENKEPHALIN, LEUCINE

Enkephalin degradation by human erythrocytes and hemolysates studied using 1H NMR spectroscopy. Vandenberg JI, et al. **Arch Biochem Biophys** 1985 Nov 1;242(2):515-22

Sex-dependent effects of neonatally administered morphiceptin and D-ala-D-leu-enkephalin on maze learning in rats. de Avila A, et al. **Behav Neural Biol** 1985 Nov;44(3):393-402

Hydrolysis of leucine enkephalin in the nasal cavity of the rat--a possible factor in the low bioavailability of nasally administered peptides. Hussain A, et al. **Biochem Biophys Res Commun** 1985 Dec 31;133(3):923-8

Opioid peptides in rat islets of Langerhans. Immunoreactive met- and leu-enkephalins and BAM-22P. Timmers KI, et al. **Diabetes** 1986 Jan;

35(1):52-7

Leucine-enkephalin-like immunoreactive fibers in the medial preoptic area of the rat: their distribution and origin. Yamano M, et al. **Exp Brain Res** 1985;60(3):535-41

Some species differences in cardiovascular responses to intravenously injected leucine-enkephalin. Koyama S, et al. **Experientia** 1985 Nov 15;41(11):1394-6

High-performance liquid chromatographic analysis of pulmonary metabolites of Leu- and Met-enkephalins in isolated perfused rat lung. Crooks PA, et al. **J Pharm Sci** 1985 Sep;74(9):1010-2

Enkephalin binding systems in human plasma. II: Leu-enkephalin serum albumin interaction. De Marco V, et al. **Neurochem Res** 1985 Oct;10(10):1355-69

Mechanisms of leu-enkephalin hydrolysis in human plasma. Roscetti G, et al. **Neurochem Res** 1985 Oct;10(10):1393-404

Regional differences in mu 1-binding of [3H][D-Ala2,D-Leu5]-enkephalin: comparisons of thalamus and cortex in the rat. Goodman RR, et al. **Neurosci Lett** 1985 Aug 30;59(2):155-8

Leucine-enkephalin-like immunoreactive afferent fibers to pudendal motoneurons in the cat. Konishi A, et al. **Neurosci Lett** 1985 Oct 24;61(1-2):109-13

[Effect of enkephalins on morphologic and hormonal manifestations of the stress reaction] Lishmanov IuB, et al. **Patol Fiziol Eksp Ter** 1985 Sep-Oct;(5):14-7 (Eng. Abstr.) **(Rus)**

ENKEPHALIN, METHIONINE

Sex-dependent effects of neonatally administered morphiceptin and D-ala-D-leu-enkephalin on maze learning in rats. de Avila A, et al. **Behav Neural Biol** 1985 Nov;44(3):393-402

Calorimetric and fluorescence characterization of interactions between enkephalins and liposomal and synaptic plasma membranes containing gangliosides. Myers M, et al. **Biochemistry** 1985 Jul 16;24(15):4076-82

Central effects of D-Ala2-met-enkephalinamide on the blood pressure of rats after central chemical sympathectomy or serotoninectomy. Brus R, et al. **Biomed Biochim Acta** 1985;44(5):779-83

Distribution of enkephalin-immunoreactive neurons in the forebrain and upper brainstem of the squirrel monkey. Inagaki S, et al. **Brain Res** 1985 Dec 16;359(1-2):267-80

Interaction between epinephrine, prostaglandin E, and met-enkephalin in the regulation of insulin release in man. Giugliano D, et al. **Diabete Metab** 1985 Oct;11(5):295-302

Opioid peptides in rat islets of Langerhans. Immunoreactive met- and leu-enkephalins and BAM-22P. Timmers KI, et al. **Diabetes** 1986 Jan;35(1):52-7

Beta-endorphin and met-enkephalin in peritoneal and ovarian follicular fluids of fertile and postmenopausal women. Petraglia F, et al. **Fertil Steril** 1985 Nov;44(5):615-21

Photoreactive enkephalin analogue: [D-Ala2, p-N3-Phe4-Met5]-enkephalin. Synthesis, purification by high performance liquid chromatography and characterization. Yeung CW. **Int J Pept Protein Res** 1985 Jul;26(1):63-9

High-performance liquid chromatographic analysis of pulmonary metabolites of Leu- and Met-enkephalins in isolated perfused rat lung. Crooks PA, et al. **J Pharm Sci** 1985 Sep;74(9):1010-2

Somatostatin, substance P and [Lys]-vasopressin interfere with the binding of [3H][D-Ala2, Met5]enkephalinamide to rat brain membranes. Maruyame M. **Jpn J Pharmacol** 1985 Aug;38(4):445-7

Mesolimbic dopamine lesions produce an augmented behavioral response to enkephalin. Kalivas PW, et al. **Neuropharmacology** 1985 Oct;24(10):931-6

Adrenal release of catecholamines and Met-enkephalin before and after stress as measured by a novel in vivo dialysis method in the rat. Jarry H, et al. **Neurosci Lett** 1985 Oct 10;60(3):273-8

Response of plasma proenkephalin peptide F to exercise. Kraemer W, et al. **Peptides (Fayetteville)** 1985;6 Suppl 2:167-9

Satiety, hunger and regional brain content of cholecystokinin/gastrin and met-enkephalin immunoreactivity in sheep. Scallet AC, et al. **Peptides (Fayetteville)** 1985 Sep-Oct;6(5):937-43

Do neuropeptide systems mediate some of the effects of antipsychotic drugs? Bissette G, et al. **Prog Clin Biol Res** 1985;192:349-53

Reinforcing stimulus properties of endocoids. Goeders NE, et al. **Prog Clin Biol Res** 1985;192:63-9

[Met-enkephalin-Arg-Gly-Leu-like immunoreactivity-containing nerve elements in the guinea-pig intestine. An immunohistochemical study using whole mount preparations] Shimosegawa T, et al. **Nippon Naibunpi Gakkai Zasshi** 1985 Aug 20;61(8):802-15 (Eng. Abstr.) **(Jpn)**

ENKEPHALINS

NADH-dehydrogenase reaction in combination with immunoperoxidase (PAP) staining for light microscopic observation on the interneuronal relations of the enteric nervous system of the pig. Scheuermann DW, et al. **Acta Anat (Basel)** 1985;124(1-2):31-4

Decreased plasma enkephalins in copper deficiency in man. Bhathena SJ, et al. **Am J Clin Nutr** 1986 Jan;43(1):42-6

Electron microscopic localization of N-terminal proenkephalin (synenkephalin) immunostaining in the guinea pig organ of Corti. Eybalin M, et al. **Brain Res** 1985 Dec 9;358(1-2):354-9

The coexistence of two neuroactive peptides in a subpopulation of retinal amacrine cells. Li HB, et al. **Brain Res** 1985 Oct 14;345(1):176-80

In vitro and in vivo effects of kelatorphan on enkephalin metabolism in rodent brain. Waksman G, et al. **Eur J Pharmacol** 1985 Nov 5;117(2):233-43

High enkephalyl peptide degradation, due to angiotensin-converting enzyme-like activity in human CSF. Lantz I, et al. **FEBS Lett** 1985 Nov 25;193(1):31-4

Delta and mu opiate receptor probes: fluorescent enkephalins with high receptor affinity and specificity. Mihara H, et al. **FEBS Lett** 1985 Nov 25;193(1):35-8

Immunohistochemistry of beta-neoendorphin and dynorphin in the endocrine pancreas of rat and man. Cetin Y. **Histochemistry** 1985;83(4):369-73

Localization of enkephalin-like immunoreactive amacrine cells in the larval tiger salamander retina: a light and electron microscopic study. Watt CB, et al. **J Comp Neurol** 1985 Nov 8;241(2):171-9

Co-localization and characterization of immunoreactive peptides derived from two opioid precursors in guinea pig adrenal glands. Evans CJ, et al. **J Neurosci** 1985 Dec;5(12):3423-7

Reserpine changes the dynamic state of enkephalin stores in rat striatum and adrenal medulla by different mechanisms. Mocchetti I, et al. **J Neurosci** 1985 Dec;5(12):3379-85

Purification of peptides derived from proenkephalin A on Bio-Rex 70. Wilson SP. **J Neurosci Methods** 1985 Oct-Nov;15(2):155-63

Enkephalin-degrading activity in arthropode hemolymphe. Coletti-Previero MA, et al. **Neuropeptides** 1985 Sep;6(5):405-15

Elevated potassium stimulates enkephalin biosynthesis in bovine chromaffin cells. Siegel RE, et al. **Neuropeptides** 1985 Dec;6(6):543-52

Detection of preprocholecystokinin and preproenkephalin A mRNAs in rat brain by hybridization histochemistry using complementary RNA probes. Siegel RE, et al. **Neuropeptides** 1985 Dec;6(6):573-80

Isolation and characterization of an enkephalin-hydrolyzing dipeptidyl-aminopeptidase from calf-brain striatum. van Buuren KJ, et al. **Neuropeptides** 1985 Sep;6(5):381-9

Localization of peptides in nerve terminals in the paracervical ganglion of the rat by light and electron microscopic immunohistochemistry: enkephalin and atrial natriuretic factor. Papka RE, et al. **Neurosci Lett** 1985 Nov 11;61(3):285-90

Distribution of human leumorphin-like immunoreactivity in the monkey spinal cord revealed by immunocytochemistry. Uda K, et al. **Neurosci Lett** 1985 Nov 20;62(1):39-44

Steady state levels of pro-dynorphin-related end products in the striatum and substantia nigra of the adult rhesus monkey. Dores RM, et al. **Peptides (Fayetteville)** 1985;6 Suppl 2:143-8

Prodynorphin peptide immunocytochemistry in rhesus monkey brain. Khachaturian H, et al. **Peptides (Fayetteville)** 1985;6 Suppl 2:155-66

Expression of preproenkephalin-like mRNA and its peptide products in mammalian testis and ovary. Kilpatrick DL, et al. **Proc Natl Acad Sci USA** 1985 Nov;82(21):7467-9

Depolarization regulates adrenal preproenkephalin mRNA. LaGamma EF, et al. **Proc Natl Acad Sci USA** 1985 Dec;82(23):8252-5

[Molecular structures of preproenkephalins and nicotinic acetylcholine receptor] Noda M. **Seikagaku** 1985 Jun;57(6):447-71 (100 ref.) **(Jpn)**

[Cytochemical research on the effect of a synthetic enkephalin analog on the protein content and enzyme activity of neurons] Gershtein LM, et al. **Tsitologiia** 1985 Sep;27(9):1059-63 (Eng. Abstr.) **(Rus)**

ENURESIS

Maprotiline in nocturnal enuresis [letter] Gillman MA, et al. **J Clin Psychiatry** 1985 Dec;46(12):546

Successful treatment of nocturnal enuresis: a practical approach. Maizels M, et al. **Primary Care** 1985 Dec;12(4):621-35 (45 ref.)

Terodiline in children with diurnal enuresis. Elmér M. **Scand J Urol Nephrol [Suppl]** 1984;87:59-61

[Sydnocarb as the method of choice in persistent enuresis? Findings after 2 years of administration] Simlová M, et al. **Cesk Psychiatr** 1985 Oct;81(5):312-3 (Eng. Abstr.) **(Cze)**

EPHEDRINE

Determination of sodium, ephedrine and procaine in pharmaceuticals by capillary isotachophoresis. Fanali S, et al. **J Chromatogr** 1985 Aug 23;330(2):436-8

Cardiovascular teratogenicity of ephedrine in chick embryos. Nishikawa T, et al. **Toxicol Lett** 1985 Dec;29(1):59-63

[Bronchomotor effects of (-) ephedrine, (+/-) ephedrine and (+) pseudoephedrine in guinea pigs] Floch A, et al. **Ann Pharm Fr** 1985;43(1):31-8 (Eng. Abstr.) **(Fre)**

[Development of reverse tolerance to the ambulation-increasing effect of ephedrine after repeated administration in mice] Hirabayashi M, et al. **Yakubutsu Seishin Kodo** 1985 Sep;5(3):231-41 (Eng. Abstr.) **(Jpn)**

EPINEPHRINE

Comparison of adrenaline and phenylephrine in out-of-hospital cardiopulmonary resuscitation. A double-blind study. Silfvast T, et al. **Acta Anaesthesiol Scand** 1985 Aug;29(6):610-3

Anxiety and epinephrine in multiparous women in labor: relationship to duration of labor and fetal heart rate pattern. Lederman RP, et al. **Am J Obstet Gynecol** 1985 Dec 15;153(8):870-7

Potentiation of hemorrhage-evoked catecholamine release by prior blood loss in cats. Bereiter DA, et al. **Am J Physiol** 1986 Jan; 250(1 Pt 1):E18-23

Effect of rate of hemorrhage on sympathoadrenal catecholamine release in cats. Bereiter DA, et al. **Am J Physiol** 1986 Jan; 250(1 Pt 1):E69-75

Interaction of prolactin with adrenal hormones in blood pressure regulation in rats. Mills DE, et al. **Am J Physiol** 1985 Dec; 249(6 Pt 1):E614-8

Extractive acylation and mass spectrometric assay of 3-methoxytyramine, normetanephrine, and metanephrine in cerebrospinal fluid. Beck O, et al. **Anal Biochem** 1985 Sep;149(2):492-500

Endocrine correlates of susceptibility to motion sickness. Kohl RL. **Aviat Space Environ Med** 1985 Dec;56(12):1158-65

Age-related memory deficits in rats and mice: enhancement with peripheral injections of epinephrine. Sternberg DB, et al. **Behav Neural Biol** 1985 Sep;44(2):213-20

Epinephrine facilitation of appetitive learning: attenuation with adrenergic receptor antagonists. Sternberg DB, et al. **Behav Neural Biol** 1985 Nov; 44(3):447-53

Epinephrine decreases low density lipoprotein processing and lipid synthesis in cultured human fibroblasts. Mazière C, et al. **Biochem Biophys Res Commun** 1985 Dec 31;133(3):958-63

Evidence for adrenergic control of transcellular calcium distribution in liver. Hill CE, et al. **Biochem J** 1985 Sep 15;230(3):733-7

Studies on the activation of rat liver pyruvate dehydrogenase and 2-oxoglutarate dehydrogenase by adrenaline and glucagon. Role of increases in intramitochondrial Ca2+ concentration. McCormack JG. **Biochem J** 1985 Nov 1;231(3):597-608

Immunohistochemical and biochemical study on the development of the noradrenaline- and adrenaline-storing cells of the adrenal medulla of the rat. Verhofstad AA, et al. **Cell Tissue Res** 1985;242(2):233-43

Radioenzymatic microassay for simultaneous estimations of dopamine, norepinephrine, and epinephrine in plasma, urine, and tissues. Hussain MN, et al. **Clin Chem** 1985 Nov;31(11):1861-4

Simultaneous determination of epinephrine and norepinephrine in urine by derivative synchronous fluorescence spectroscopy. Valcárcel M, et al. **Clin Chem** 1985 Nov;31(11):1790-4

Effects of exogenous catecholamines and exercise on plasma magnesium concentrations. Joborn H, et al. **Clin Endocrinol (Oxf)** 1985 Sep; 23(3):219-26

The effect of adrenaline upon cardiovascular and metabolic functions in man. Fellows IW, et al. **Clin Sci** 1985 Aug;69(2):215-22

The distribution of catecholamines between platelets and plasma in normal human subjects. Smith CC, et al. **Clin Sci** 1985 Jul;69(1):1-6

Comparison of basal metabolic activities and hormonal sensitivities between mesenteric and epididymal adipocytes. Tshuchimoto M, et al. **Comp Biochem Physiol** [A] 1985;82(2):377-83

Epinephrine, norepinephrine and dopamine concentrations in amphibian brain. Cooney MM, et al. **Comp Biochem Physiol** [C] 1985; 82(2):395-7

Epinephrine lowers subcutaneous wound oxygen tension. Jensen JA, et al. **Curr Surg** 1985 Nov-Dec;42(6):472-4

Interaction between epinephrine, prostaglandin E, and met-enkephalin in the regulation of insulin release in man. Giugliano D, et al. **Diabete Metab** 1985 Oct;11(5):295-302

Release of catecholamines follows suckling or electrical stimulation of mammary nerve in lactating rats. Clapp C, et al. **Endocrinology** 1985 Dec;117(6):2498-504

Alpha 2-adrenoceptor coupling to adenylate cyclase in adrenaline insensitive human platelets. Swart SS, et al. **Eur J Pharmacol** 1985 Oct 8;116(1-2):113-9

Effect of ascorbic acid and adrenergic receptor blockers on adrenaline induced in vitro follicular atresia in white Leghorn hens. Moudgal RP, et al. **Indian J Exp Biol** 1985 Jun;23(6):343-4

Age-related augmentation of plasma catecholamines during dynamic exercise in healthy males. Fleg JL, et al. **J Appl Physiol** 1985 Oct; 59(4):1033-9

Stimulation of 1,2-diacylglycerol accumulation in hepatocytes by vasopressin, epinephrine, and angiotensin II. Bocckino SB, et al. **J Biol Chem** 1985 Nov 15;260(26):14201-7

Phorbol esters inhibit alpha 1-adrenergic effects and decrease the affinity of liver cell alpha 1-adrenergic receptors for (-)-epinephrine. Corvera S, et al. **J Biol Chem** 1986 Jan 15;261(2):520-6

Inhibitors of Na+/H+ exchange block stimulus-provoked arachidonic acid release in human platelets. Selective effects on platelet activation by epinephrine, ADP, and lower concentrations of thrombin. Sweatt JD, et al. **J Biol Chem** 1985 Oct 25;260(24):12910-9

Fluid temperature and volume dependence of the dissociated plasma epinephrine and norepinephrine response to drinking. Puddey IB, et al. **J Clin Endocrinol Metab** 1986 Feb;62(2):438-40

Ontogeny of phenylethanolamine N-methyltransferase- and tyrosine hydroxylase-like immunoreactivity in presumptive adrenaline neurones of the foetal rat central nervous system. Foster GA, et al. **J Comp Neurol** 1985 Jun 15;236(3):348-81

Epinephrine decreases the potassium requirements of hamster sperm capacitation: furosemide blocks the effect of epinephrine. Bize I, et al. **J Exp Zool** 1985 Aug;235(2):261-7

Adrenergic responses of the cardiovascular system of the eel, Anguilla australis, in vivo. Hipkins SF. **J Exp Zool** 1985 Jul;235(1):7-20

Peripheral origin of plasma dopamine. Yoneda S, et al. **Jpn Circ J** 1985 Sep;49(9):1028-34

Alpha-methyladrenaline: a possible active metabolite of alpha-methyldopa in the rat brain. Himeno A, et al. **Jpn J Pharmacol** 1985 Sep;39(1):91-8

Plasma and brain catecholamines in experimental uremia: acute and chronic studies. Ali F, et al. **Life Sci** 1985 Nov 11;37(19):1757-64

Plasma norepinephrine, epinephrine, and dopamine beta-hydroxylase activity during exercise in man. Péronnet F, et al. **Med Sci Sports Exerc** 1985 Dec;17(6):683-8

Mechanism of epinephrine's glycogenolytic effect in isolated canine hepatocytes. Steiner KE, et al. **Metabolism** 1985 Nov;34(11):1020-3

Epinephrine-stimulated maintained rubidium efflux from guinea pig hepatocytes may involve alpha 1- and alpha 2-adrenoceptors. Henley JM. **Mol Pharmacol** 1985 Nov;28(5):431-5

Platelet-aggregation response to single or paired aggregating stimuli after low-dose aspirin [letter] Cerletti C, et al. **N Engl J Med** 1986 Jan 30; 314(5):316-8

Reduction of central epinephrine concentrations is consistent with the continued occurrence of ovulation in rats treated with an inhibitor (LY 134046) of phenylethanolamine N-methyltransferase. Sheaves R, et al. **Neuroendocrinology** 1985 Nov;41(5):432-6

Plasma norepinephrine, epinephrine and corticosterone stress responses to restraint in individual male and female rats, and their correlations. Livezey GT, et al. **Neurosci Lett** 1985 Nov 20;62(1):51-6

Partial liver denervations dissociate the inhibitory effects of pancreatic glucagon and epinephrine on feeding. MacIsaac L, et al. **Physiol Behav** 1985 Aug;35(2):233-7

Management of Vipera berus adder bite. Jones TI, et al. **Practitioner** 1985 Nov;229(1409):956-8

Psychoneuroendocrine stress responses and mood as related to the menstrual cycle. Collins A, et al. **Psychosom Med** 1985 Nov-Dec; 47(6):512-27

Adrenaline, emotional arousal and memory. Christianson SA, et al. **Scand J Psychol** 1985;26(3):237-48

Effects of adrenaline infusion on platelet number, volume and release reaction. Lande K, et al. **Thromb Haemost** 1985 Aug 30;54(2):450-3

Studies of alpha 2-adrenergic receptors of intact and functional washed human platelets by binding of 3H-dihydroergocryptine and 3H-yohimbine--correlation of 3H-yohimbine binding with the potentiation by adrenaline of ADP-induced aggregation. Lanza F, et al. **Thromb Haemost** 1985 Aug 30;54(2):402-8

[Adrenaline, noradrenaline and dopamine excretion and anxiety levels in surgical patients] Barham O, et al. **Arch Psychol (Frankf)** 1985; 137(4):291-5 (Eng. Abstr.) **(Ger)**

[The influence of pipemidic acid on epinephrine and collagen induced platelet aggregation in vitro] Reuter HD, et al. **Arzneimittelforschung** 1985;35(8):1326-9 (Eng. Abstr.) **(Ger)**

[Effects of repeated injections of epinephrine on lipolysis in rats] Shibata H. **Jikken Dobutsu** 1985 Jul;34(3):315-8 (Eng. Abstr.) **(Jpn)**

[Receptors on the platelet membrane] Watanabe K, et al. **Rinsho Byori** 1985 Jul;33(7):726-33 (22 ref.) **(Jpn)**

[Excretion of catecholamines in relation to personality types A and B] Zaleska T, et al. **Pol Tyg Lek** 1985 Jul 15;40(28):781-3 (Eng. Abstr.) **(Pol)**

[Catecholamine content in the adrenals of rats developing under hypokinesia and muscle training] Abzalov RA. **Biol Nauki** 1985; (10):55-8 (Eng. Abstr.) **(Rus)**

[Analysis of the factors determining the change in cardiac output during administration of catecholamines] Osadchii LI, et al. **Biull Eksp Biol Med** 1985 Oct;100(10):387-90 (Eng. Abstr.) **(Rus)**

ESCAPE REACTION

A stimulatory effect of intraaccumbens injections of noradrenaline on the behavior of rats in the forced swim test. Płaźnik A, et al. **Psychopharmacology (Berlin)** 1985;87(1):119-23

Attenuated response to nomifensine in rats during a swim test following lesion of the habenula complex. Thornton EW, et al. **Psychopharmacology (Berlin)** 1985;87(1):81-5

[Pharmaco-ethological analysis of agonistic behavior between resident and intruder mice: effects of adrenergic beta-blockers] Yoshimura H, et al. **Yakubutsu Seishin Kodo** 1985 Sep;5(3):223-9 (Eng. Abstr.) **(Jpn)**

ESTRADIOL

The depressing (negative) effect of oestradiol benzoate on the in vitro secretion of LH and FSH by the pituitary gland of the LRH-pretreated long-term ovariectomized rat changes into the augmentative (positive) effect after discontinuation of the LRH-pretreatment. Schuiling GA, et al. **Acta Endocrinol (Copenh)** 1985 Nov;110(3):329-37

Uterine changes on removal of submaxillary glands in rats (histological changes/uterine peroxidase/blood estradiol level). Bhattacharyya J, et al. **Biochem Biophys Res Commun** 1985 Dec 17;133(2):462-7

Effect of alterations in pulsatile luteinizing hormone release on ovarian follicular atresia and steroid secretion on diestrus 1 in the rat estrous cycle. Devorshak-Harvey E, et al. **Biol Reprod** 1985 Aug;33(1):103-11

Does the seasonal increase in estradiol negative feedback prevent luteinizing hormone surges in anestrous ewes by suppressing hypothalamic gonadotropin-releasing hormone pulse frequency? Legan SJ, et al. **Biol Reprod** 1985 Aug;33(1):117-31

Simultaneous measurement of luteinizing hormone-releasing hormone and luteinizing hormone during estradiol-induced luteinizing hormone surges in the ovariectomized ewe. Schillo KK, et al. **Biol Reprod** 1985 Oct;33(3):644-52

Rostral hypothalamic microinfusions of 5,7 dihydroxytryptamine produce anatomically and neurochemically selective depletions of hippocampal serotonin and increase the influence of estrogen and food deprivation on locomotor activity. Waldbillig RJ, et al. **Brain Res** 1985 Nov 11;347(1):149-53

Evidence for gamma-aminobutyric acid modulation of ovarian hormonal effects on luteinizing hormone secretion and hypothalamic catecholamine activity in the female rat. Adler BA, et al. **Endocrinology** 1986 Jan;118(1):91-7

Regulation of pituitary gonadotropin-releasing hormone (GnRH) receptors by pulsatile GnRH in female rats: effects of estradiol and prolactin. Duncan JA, et al. **Endocrinology** 1986 Jan;118(1):320-7

17 beta-Estradiol at a physiological dose acutely increases dopamine turnover in rat brain. Di Paolo T, et al. **Eur J Pharmacol** 1985 Nov 5;117(2):197-203

The effects of estradiol and progesterone on the concentration of striatal dopamine and tyramine in ovariectomized mice. Yeung SC, et al. **Gen Pharmacol** 1985;16(5):517-9

Estrogen uptake capacity of individual pituitary cell types from male and female rats one, fourteen and fifty days after castration. Smith PF, et al. **Horm Metab Res** 1985 Nov;17(11):583-7

Steroid and thyroid hormone profiles following a single injection of partly purified salmon gonadotropin or GnRH analogues in male and female sea lamprey. Sower SA, et al. **J Exp Zool** 1985 Sep;235(3):403-8

Stimulation of hypothalamic LHRH levels and release by gonadal steroids. Kalra PS. **J Steroid Biochem** 1985 Nov;23(5B):725-31

Regulation of beta-endorphin and ACTH in brain by estradiol. Wardlaw SL, et al. **Life Sci** 1985 Nov 18;37(20):1941-7

Luteinizing hormone releasing hormone enhances proceptivity in a primate. Kendrick KM, et al. **Neuroendocrinology** 1985 Dec;41(6):449-53

Estrogen exposure affects the post-ovariectomy increases in both LH and FSH release in female rats. Matt DW, et al. **Neuroendocrinology** 1986;42(1):21-7

A subset of beta-endorphin- or dynorphin-containing neurons in the medial basal hypothalamus accumulates estradiol. Morrell JI, et al. **Neuroendocrinology** 1985 Nov;41(5):417-26

[Hormonal response following the use of gonadotropin-releasing hormone, estradiol and gestil in sheep] Batzhargalin E. **Vet Med Nauki** 1985;22(9):60-6 (Eng. Abstr.) **(Bul)**

[Studies on the feedback regulation of pulsatile luteinizing hormone secretion. II. Role of the catecholaminergic system in estrogen-induced suppression of the frequency of pulsatile LH secretion in ovariectomized rats] Tadokoro Y. **Nippon Naibunpi Gakkai Zasshi** 1985 Jul 20;61(7):765-74 (Eng. Abstr.) **(Jpn)**

[Direct and indirect hormonal effects on the function of the adenohypophysis] Fedotov VP. **Probl Endokrinol (Mosk)** 1985 Sep-Oct;31(5):27-30 (Eng. Abstr.) **(Rus)**

EUPHORIA

Lithium attenuates the activation-euphoria but not the psychosis induced by d-amphetamine in schizophrenia. van Kammen DP, et al. **Psychopharmacology (Berlin)** 1985;87(1):111-5

EXPLORATORY BEHAVIOR

Effect of domperidone on apomorphine inhibition of the copulatory response and exploratory behaviour in the female rat. Sietnieks A, et al. **Acta Pharmacol Toxicol (Copenh)** 1985 Sep;57(3):160-5

Does the benzodiazepine antagonist Ro 15-1788 reverse the actions of picrotoxin and pentylenetetrazole on social and exploratory behaviour? File SE, et al. **Arch Int Pharmacodyn Ther** 1985 Oct;277(2):272-9

SKF 38393 and apomorphine modify locomotion and exploration in rats placed on a holeboard by separate actions at dopamine D-1 and D-2 receptors. Fletcher GH, et al. **Eur J Pharmacol** 1985 Nov 19;117(3):381-5

Effect of an atypical barbiturate, the 2-allophanyl-2-allyl-4-valerolactone (valofan), on exploratory behaviour and brain serotonin concentrations in mice. Traversa U, et al. **J Pharmacol** 1985 Jul-Sep;16(3):279-90

EXTINCTION (PSYCHOLOGY)

Extinguishing conditioned inhibition in flavour-aversion learning: effects of repeated testing and extinction of the excitatory element. Best MR, et al. **Q J Exp Psychol [B]** 1985 Nov;37(4):359-78

FEAR

AIDS and homosexual panic [letter] Rapaport M, et al. **Am J Psychiatry** 1985 Dec;142(12):1516

Calcium channel blockers in the treatment of panic disorder [letter] Goldstein JA. **J Clin Psychiatry** 1985 Dec;46(12):546

Simultaneous panic and depressive disorder: response to antidepressant treatments. Grunhaus L, et al. **J Clin Psychiatry** 1986 Jan;47(1):4-7

Fear-enhanced acoustic startle is not attenuated by acute or chronic imipramine treatment in rats. Cassella JV, et al. **Psychopharmacology (Berlin)** 1985;87(3):278-82

[New proposals for the development of the concepts of neurotic anxiety, major depression and panic attack] Xhenseval B. **Acta Psychiatr Belg** 1985 Jul-Aug;85(4):480-508 (68 ref.) (Eng. Abstr.) **(Fre)**

[Panic attacks in adolescents] Dugas M, et al. **Presse Med** 1985 Nov 9;14(38):1951-4 (Eng. Abstr.) **(Fre)**

FENFLURAMINE

Serotonergic regulation of prolactin and growth hormone secretion in man. Lewis DA, et al. **Acta Endocrinol (Copenh)** 1985 Oct;110(2):152-7

Pharmacokinetics of fenfluramine and norfenfluramine in volunteers given D- and DL-fenfluramine for 15 days. Caccia S, et al. **Eur J Clin Pharmacol** 1985;29(2):221-4

Salbutamol, d-amphetamine and d-fenfluramine reduce sucrose intake in freely fed rats by acting on different neurochemical mechanisms. Borsini F, et al. **Int J Obes** 1985;9(4):277-83

Fenfluramine therapy for autism [letter] Pranzatelli MR, et al. **J Autism Dev Disord** 1985 Dec;15(4):439-41

Down-regulation of [3H]5-hydroxytryptamine binding sites in chick embryo brain by monoamine oxidase inhibitors or fenfluramine and potentiation by d,l-5-hydroxytryptophan. Soblosky JS, et al. **J Neurochem** 1985 Dec;45(6):1923-31

Effects of initial body weight on anorexia and tolerance to fenfluramine in rats. Carlton J, et al. **Pharmacol Biochem Behav** 1985 Oct;23(4):551-4

Effect of fenfluramine on GDP-binding to brown adipose tissue mitochondria. Lupien JR, et al. **Pharmacol Biochem Behav** 1985 Oct;23(4):509-11

FK 33-824

Interaction between epinephrine, prostaglandin E, and met-enkephalin in the regulation of insulin release in man. Giugliano D, et al. **Diabete Metab** 1985 Oct;11(5):295-302

FLUPHENAZINE

Combination alprazolam-neuroleptic treatment of the positive and negative symptoms of schizophrenia. Wolkowitz OM, et al. **Am J Psychiatry** 1986 Jan;143(1):85-7

Neuroleptic drug-induced coagulopathy: mechanism of reaction and duration of effect. Zengotita HE, et al. **J Clin Psychiatry** 1986 Jan;47(1):35-7

Plasma levels of neuroleptic in patients receiving depot fluphenazine. Cohen BM, et al. **J Clin Psychopharmacol** 1985 Dec;5(6):328-32

Prolixin group. Can nursing intervention groups lower recidivism? Selander JM, et al. **J Psychosoc Nurs Ment Health Serv** 1985 Nov;23(11):16-20

Characteristics of D-1 dopamine receptors labelled by [3H]fluphenazine in homogenates of rat neostriatum. Cincotta M, et al. **Neurosci Lett** 1985 Oct 24;61(1-2):85-9

Depot fluphenazine and plasma prolactin. Gift T, et al. **Prog Neuropsychopharmacol Biol Psychiatry** 1985;9(4):407-12

Early unwanted effects of fluphenazine esters related to plasma fluphenazine concentrations in schizophrenic patients. Altamura AC, et al. **Psychopharmacology (Berlin)** 1985;87(1):30-3

Plasma levels of fluphenazine during fluphenazine decanoate treatment in schizophrenia. Chang SS, et al. **Psychopharmacology (Berlin)** 1985;87(1):55-8

FLURAZEPAM

Anticonvulsant and convulsant properties of flurazepam. Kalichman MW.

Neuropharmacology 1985 Nov;24(11):1127-30

FOOD DEPRIVATION

Influence of hormones and undernutrition on brain development in newborn rats. Pascual-Leone AM, et al. **Biol Neonate** 1985; 48(4):228-36

The role of food deprivation in the maintenance and reinstatement of cocaine-seeking behavior in rats. Carroll ME. **Drug Alcohol Depend** 1985 Nov;16(2):95-109

Food deprivation produces persistent increases in self-administration behavior during cocaine extinction. Carroll ME. **Natl Inst Drug Abuse Res Monogr Ser** 1984;55:125-31

FSH

Regulation of gonadotrophin secretion in male mice from birth to adulthood. Response to LRH injection, castration and testosterone replacement therapy. Jean-Faucher C, et al. **Acta Endocrinol (Copenh)** 1985 Oct;110(2):193-9

The depressing (negative) effect of oestradiol benzoate on the in vitro secretion of LH and FSH by the pituitary gland of the LRH-pretreated long-term ovariectomized rat changes into the augmentative (positive) effect after discontinuation of the LRH-pretreatment. Schuiling GA, et al. **Acta Endocrinol (Copenh)** 1985 Nov;110(3):329-37

Follicle-stimulating hormone within and secreted from anterior pituitaries of female golden hamsters during the estrous cycle and after ovariectomy. Cameron JL, et al. **Biol Reprod** 1985 Aug;33(1):132-9

Postcastration rise in plasma gonadotropins is blocked by a luteinizing hormone-releasing hormone antagonist. Condon TP, et al. **Biol Reprod** 1985 Oct;33(3):715-21

Active immunization of gilts against gonadotropin-releasing hormone: effects on secretion of gonadotropins, reproductive function, and responses to agonists of gonadotropin-releasing hormone. Esbenshade KL, et al. **Biol Reprod** 1985 Oct;33(3):569-77

Cholinergic inhibition of follicle-stimulating hormone-induced progestin production by cultured rat granulosa cells. Kasson BG, et al. **Biol Reprod** 1985 Dec;33(5):1158-67

Effects of intermittent pulsatile infusion of luteinizing hormone-releasing hormone on dihydrotestosterone-suppressed gonadotropin secretion in castrate rams. Schanbacher BD. **Biol Reprod** 1985 Oct;33(3):603-11

Muscarinic cholinergic mediation of LHRH-induced LH and FSH secretion in normal men. Chiodera P, et al. **Clin Endocrinol (Oxf)** 1985 Oct;23(4):361-6

Dose-related changes in LH bioactivity with intranasal GnRH agonist administration. Chiang RS, et al. **Contraception** 1985 Oct; 32(4):347-57

Effects of gonadectomy and steroid treatment on plasma gonadotropins and the response of superfused pituitaries to gonadotropin-releasing hormone in the turtle Sternotherus odoratus. Licht P, et al. **Gen Comp Endocrinol** 1985 Dec;60(3):441-9

Suppression of plasma gonadotropins and testosterone in adult male monkeys (Macaca fascicularis) by a potent inhibitory analog of gonadotropin-releasing hormone. Adams LA, et al. **J Clin Endocrinol Metab** 1986 Jan;62(1):58-63

Individual variations in FSH release after a GnRH challenge and relationship with semen output in young bulls. Abdel Malak G, et al. **J Reprod Fertil** 1985 Nov;75(2):345-50

Central effects of an antagonist and an antiserum to substance P on serum gonadotropin and prolactin secretion. Dees WL, et al. **Life Sci** 1985 Oct 28;37(17):1627-31

Inhibition of gonadotropin secretion induced by cholecystokinin implants in the medial preoptic area by the dopamine receptor blocker, pimozide, in the rat. Hashimoto R, et al. **Neuroendocrinology** 1986;42(1):32-7

Estrogen exposure affects the post-ovariectomy increases in both LH and FSH release in female rats. Matt DW, et al. **Neuroendocrinology** 1986;42(1):21-7

GABA

Inhibitory effect of GABA on phrenic discharge activity of rabbit through microinjection into nucleus tractus solitarii. Huang CJ, et al. **Acta Acad Med Wuhan** 1985;5(3):147-52

GABA inhibits inhalation anaesthetic-induced membrane fluidization: a spin label study in synaptic and phospholipid membranes. Rosenberg PH, et al. **Acta Pharmacol Toxicol (Copenh)** 1985 Sep;57(3):154-9

GABA-mediated baroreceptor inhibition of reticulospinal neurons. Sun MK, et al. **Am J Physiol** 1985 Dec;249(6 Pt 2):R672-80

Inhibitory amino acid effects upon cortical evoked potentials. Rossi ST, et al. **An Acad Bras Cienc** 1985 Mar;57(1):111-3

Neurons and terminals in the retrohippocampal region in the rat's brain identified by anti-gamma-aminobutyric acid and anti-glutamic acid decarboxylase immunocytochemistry. Köhler C, et al. **Anat Embryol (Berl)** 1985;173(1):35-44

Neurotoxic insecticides inhibit GABA-dependent chloride uptake by mouse brain vesicles. Bloomquist JR, et al. **Biochem Biophys Res Commun** 1985 Nov 27;133(1):37-43

Possible involvement of K+-conductance in the action of gamma-aminobutyric acid in the guinea-pig hippocampus. Inoue M, et al. **Br J Pharmacol** 1985 Oct;86(2):515-24

Identification of extrasynaptic binding sites for [3H]GABA in peripheral nerve. Barolet AW, et al. **Brain Res** 1985 Dec 9;358(1-2):104-9

Mushroom body feedback interneurones in the honeybee show GABA-like immunoreactivity. Bicker G, et al. **Brain Res** 1985 Dec 23;360(1-2):394-7

Evaluation of the electrophysiological consequences of GABA removal from the synaptic cleft by Na+ ion transport-coupled neuronal uptake. Cupello A, et al. **Brain Res** 1985 Dec 9;358(1-2):364-6

GABA-immunoreactive neurons in the rat dorsal lateral geniculate nucleus: light microscopical observations. Gabbott PL, et al. **Brain Res** 1985 Oct 28;346(1):171-5

Colocalization of [3H]muscimol and antisera to GABA and glutamic acid decarboxylase within the same neurons in monkey retina. Hendrickson A, et al. **Brain Res** 1985 Dec 2;348(2):391-6

Postnatal development of GABA- and glycine-mediated inhibition of feline retinal ganglion cells in the area centralis. Ikeda H, et al. **Brain Res** 1985 Nov;355(1):1-17

Contralateral circling behavior induced by intranigral microinjections of taurine and GABA in rats. Kamata K, et al. **Brain Res** 1985 Sep 23; 343(2):275-82

Local stimulation induced GABAergic response in rat striatal slice preparations: intracellular recordings on QX-314 injected neurons. Kita T, et al. **Brain Res** 1985 Dec 23;360(1-2):304-10

Localization of gamma-aminobutyric acid and glutamic acid decarboxylase in rhesus monkey retina. Nishimura Y, et al. **Brain Res** 1985 Dec 16;359(1-2):351-5

Dopaminergic regulation of GABA release from the intact goldfish retina. O'Brien DR, et al. **Brain Res** 1985 Dec 23;360(1-2):41-50

Folic acid has a disinhibitory action in the rat hippocampal slice preparation. Otis LC, et al. **Brain Res** 1985 Nov 4;346(2):281-6

Responses to gamma-aminobutyric acid applied to cell bodies and dendrites of rat visual cortical neurons. Scharfman HE, et al. **Brain Res** 1985 Dec 9;358(1-2):385-9

GABA axons in synaptic contact with dopamine neurons in the substantia nigra: double immunocytochemistry with biotin-peroxidase and protein A-colloidal gold. van den Pol AN, et al. **Brain Res** 1985 Nov 25; 348(1):146-54

Selectivity of the uptake of glutamate and GABA in two morphologically distinct insect neuromuscular synapses. van Marle J, et al. **Brain Res** 1985 Nov 25;348(1):107-11

Projection of olfactory bulb efferents to layer I GABAergic neurons in the entorhinal area. Combination of anterograde degeneration and immunoelectron microscopy in rat. Wouterlood FG, et al. **Brain Res** 1985 Sep 23;343(2):283-96

Localization in the brain of the inhibition by GABA of luteinizing hormone release that follows orchidectomy in rats. Donoso AO. **Braz J Med Biol Res** 1985;18(1):97-100

Studies of the role of gamma-aminobutyric acid in the hypothalamic control of feed intake in sheep. Girard CL, et al. **Can J Physiol Pharmacol** 1985 Oct;63(10):1297-301

Spontaneous and GABA-induced single channel currents in cultured murine spinal cord neurons. Mathers DA. **Can J Physiol Pharmacol** 1985 Oct;63(10):1228-33

Interactions of gamma-aminobutyric acid (GABA), pentobarbital, and homopantothenic acid (HOPA) on internally perfused frog sensory neurons. Akaike N, et al. **Cell Mol Neurobiol** 1985 Sep;5(3):245-55

Benzodiazepine binding sites in rat submaxillary gland: absence of markers of GABA system. Pérez C, et al. **Comp Biochem Physiol [C]** 1985; 82(2):451-6

Development of a high-affinity GABA uptake system in embryonic amphibian spinal neurons. Lamborghini JE, et al. **Dev Biol** 1985 Nov; 112(1):167-76

Evidence for gamma-aminobutyric acid modulation of ovarian hormonal effects on luteinizing hormone secretion and hypothalamic catecholamine activity in the female rat. Adler BA, et al. **Endocrinology** 1986 Jan;118(1):91-7

Endocrine modulation of gamma-aminobutyric acidergic innervation in the rat fallopian tube. Celotti F, et al. **Endocrinology** 1986 Jan; 118(1):334-9

gamma-Aminobutyric acid inhibits beta-endorphin secretion from the anterior pituitary but not the neurointermediate lobe in the rat. Petraglia F, et al. **Endocrinology** 1986 Jan;118(1):360-6

GABAergic regulation of melanocyte-stimulating hormone secretion from the pars intermedia of Xenopus laevis: immunocytochemical and physiological evidence. Verburg-van Kemenade BM, et al. **Endocrinology** 1986 Jan;118(1):260-7

Regulation of [35S]t-butylbicyclophosphorothionate binding sites in rat brain by GABA, pyrethroid and barbiturate. Seifert J, et al. **Eur J Pharmacol** 1985 Sep 24;115(2-3):191-8

Involvement of bicuculline-insensitive receptors in the hypothermic effect of GABA and its agonists. Serrano JS, et al. **Gen Pharmacol** 1985; 16(5):505-8

Effect of anticonvulsants, centazolone and centpropazine, on gamma amino butyric acid metabolism in mouse brain. Tripathi LM, et al. **Indian J Exp Biol** 1985 Aug;23(8):452-5

Kinetic studies of ox-liver glutamate dehydrogenase oxidative deamination of two glutamate analogues, L-threo-gamma-methylglutamate and L-alpha-amino-gamma-nitraminobutyrate, in the presence of the allosteric effector ADP. Hornby DP, et al. **Int J Biochem** 1985; 17(7):851-4

The medullary cardiovascular effects of imidazolines and some GABA analogues: a review. Bousquet P, et al. **J Auton Nerv Syst** 1985 Nov; 14(3):263-70 (39 ref.)

Selective retrograde labeling with D-[3H]-aspartate in afferents to the mammalian superior colliculus. Matute C, et al. **J Comp Neurol** 1985 Nov 1;241(1):34-49

Vasopressin secretion as a possible target of the gamma-aminobutyric acid-mediated component of the corticosteroid feedback effect. Acs Z, et al. **J Endocrinol** 1985 Dec;107(3):303-7

GABA agonists. Resolution, absolute stereochemistry, and enantioselectivity of (S)-(+)- and (R)-(-)-dihydromuscimol. Krogsgaard-Larsen P, et al. **J Med Chem** 1985 Nov;28(11):1612-7

Synthesis of alkyl-substituted arecoline derivatives as gamma-aminobutyric acid uptake inhibitors. Müller-Uri C, et al. **J Med Chem** 1986 Jan;29(1):125-32

Effect of adrenalectomy on gamma-aminobutyric acid concentrations in the central nervous system. David S, et al. **J Neurochem** 1986 Jan; 46(1):161-5

Induced release of gamma-aminobutyric acid by a carrier-mediated, high-affinity uptake of L-glutamate in cultured chick retina cells. do Nascimento JL, et al. **J Neurochem** 1985 Dec;45(6):1820-7

Distribution of gamma-aminobutyric acid and glutamate decarboxylase in the layers of rat oviduct. Murashima YL, et al. **J Neurochem** 1986 Jan;46(1):166-72

Development of the gamma-aminobutyric acid neurotransmitter system in the rat cerebral cortex during repeated administration of the GABA-transaminase inhibitor ethanolamine O-sulphate. Sykes CC, et al. **J Neurochem** 1986 Jan;46(1):213-7

Pharmacological properties of gamma-aminobutyric acid-, glutamate-, and aspartate-induced depolarizations in cultured astrocytes. Kettenmann H, et al. **J Neurosci** 1985 Dec;5(12):3295-301

Dual ultrastructural localization of two neurotransmitter-related antigens: colloidal gold-labeled neurophysin-immunoreactive supraoptic neurons receive peroxidase-labeled glutamate decarboxylase- or gold-labeled GABA-immunoreactive synapses. van den Pol AN. **J Neurosci** 1985 Nov;5(11):2940-54

Modulation of action of kainic acid on the behavior of rats by p-chlorophenylalanine and by gaba-mimetic drugs. Biochemical correlation between behavior and treatments. Molla-Hosseini C, et al. **J Pharmacol** 1985 Jul-Sep;16(3):299-312

Noradrenergic modulation of cortical acetylcholine release is both direct and gamma-aminobutyric acid-mediated. Beani L, et al. **J Pharmacol Exp Ther** 1986 Jan;236(1):230-6

Gamma-aminobutyric acid uptake and the termination of inhibitory synaptic potentials in the rat hippocampal slice. Dingledine R, et al. **J Physiol (Lond)** 1985 Sep;366:387-409

GABA, depressants and chloride ions affect the rate of dissociation of 35S-t-butylbicyclophosphorothionate binding. Maksay G, et al. **Life Sci** 1985 Dec 9;37(23):2173-80

gamma-Aminobutyric acid in peripheral tissues. Tanaka C. **Life Sci** 1985 Dec 16;37(24):2221-35 (115 ref.)

Potentiation of Na+-dependent uptake of gamma-aminobutyric acid in mouse brain particles by buffer-mediated proton removal. Roberts E, et al. **Neurochem Res** 1985 Aug;10(8):1025-46

Numerical estimation of gamma-aminobutyric acid (GABA)-containing neurons in three thalamic nuclei of the cat: direct GABA immunocytochemistry. Madarasz M, et al. **Neurosci Lett** 1985 Oct 24; 61(1-2):73-8

Pentobarbital promotes bursts of gamma-aminobutyric acid-activated single channel currents in cultured mouse central neurons. Mathers DA. **Neurosci Lett** 1985 Sep 30;60(2):121-6

Studies on the depression of gamma-aminobutyric acid potentials by phloridzin in cat dorsal root ganglion cells in vitro. Stevens DR, et al. **Neurosci Lett** 1985 Sep 30;60(2):115-9

Immunohistochemical localization of GABAergic cells in the developing human dorsal lateral geniculate nucleus. Wadhwa S, et al. **Neurosci Lett** 1985 Oct 24;61(1-2):97-101

Factors controlling the release of GABA from goldfish retinal horizontal cells. Yazulla S. **Neurosci Res [Suppl]** 1985;2:S147-65

gamma-Aminobutyrate sensitivity does not change during long-term potentiation in rat hippocampal slices. Scharfman HE, et al. **Neuroscience** 1985 Jul;15(3):695-702

Excitatory transmitter release induced by high concentrations of gamma-aminobutyric acid (GABA) in crayfish neuromuscular junctions. Finger W. **Pflugers Arch** 1985 Oct;405(3):265-73

Elicitation of conspecific attack or defense in the male rat by intraventricular injection of a GABA agonist or antagonist. Depaulis A, et al. **Physiol Behav** 1985 Sep;35(3):447-53

Avoidance of GABA-containing diets by olfactory bulbectomized rats. Tews JK, et al. **Physiol Behav** 1985 Jun;34(6):983-6

Taurine and its derivatives alter brain dopamine metabolism similarly to GABA in mice and rats. Ahtee L, et al. **Prog Clin Biol Res** 1985; 179:331-41

Gamma-aminobutyric acid and chloride channels: regulation by neuropeptides. Guidotti A, et al. **Regul Pept [Suppl]** 1985;4:172-81

The content and release of endogenous GABA in isolated horizontal cells of the goldfish retina. Ayoub GS, et al. **Vision Res** 1985; 25(9):1187-93

[Concentrations of free and bound 4-aminobutyric acid in human serum: reference values] Uhlhaas S, et al. **J Clin Chem Clin Biochem** 1985 Sep; 23(9):525-8 (Eng. Abstr.) **(Ger)**

[Structuro-functional organization of intracortical inhibition] Batuev AS. **Fiziol Zh** 1985 Sep-Oct;31(5):530-8 (Eng. Abstr.) **(Rus)**

GALVANIC SKIN RESPONSE

Skin conductance reaction (SCR)-habituation test, a tool to detect anxiolytic activity. Its justification by the correlation between SCR-habituation test activities and specific binding potencies in benzodiazepines. Marcy R, et al. **Prog Neuropsychopharmacol Biol Psychiatry** 1985;9(4):387-91

GENERALIZATION, STIMULUS

Effects of preexposure flavor concentration on conditioned aversion and neophobia. Gilley DW, et al. **Behav Neural Biol** 1985 Nov; 44(3):503-8

N-Ethyl-17(R,S)-methyl-(6aR,10aR)-delta 8-tetrahydrocannabinol-18-oic amide. Brain pharmacokinetics in mice, triglyceride/phospholipid partitioning and generalization to the discriminative stimulus properties of delta 9-THC in rats. Franke I, et al. **Biochem Pharmacol** 1985 Nov 15;34(22):3983-6

One-way generalization of clonidine to the discriminative stimulus produced by cocaine. Wood DM, et al. **Pharmacol Biochem Behav** 1985 Oct;23(4):529-33

GLUCURONIDASE

Cellulose and pectin alter intestinal beta-glucuronidase (EC 3.2.1.31) in the rat. Lindop R, et al. **Br J Nutr** 1985 Jul;54(1):21-6

Phorbol myristate acetate enhances human polymorphonuclear neutrophil release of granular enzymes but inhibits chemokinesis. Hoult JR, et al. **Br J Pharmacol** 1985 Nov;86(3):533-7

The use of gene fusions to study the expression of uidR, a negative regulatory gene of Escherichia coli K-12. Blanco C, et al. **Gene** 1985; 36(1-2):159-67

Properties of rat and mouse beta-glucuronidase mRNA and cDNA, including evidence for sequence polymorphism and genetic regulation of mRNA levels. Watson G, et al. **Gene** 1985;36(1-2):15-25

Egasyn, a protein which determines the subcellular distribution of beta-glucuronidase, has esterase activity. Medda S, et al. **J Biol Chem** 1985 Dec 15;260(29):15802-8

GONADOTROPINS, PITUITARY

Gonadotrophin release and meat consumption in vegetarian women. Hill PB, et al. **Am J Clin Nutr** 1986 Jan;43(1):37-41

[The effects of bromocriptine on the pulsatile pattern and the circadian profile of gonadotropins and testosterone secretion in normal adult men] Aisaka K, et al. **Nippon Naibunpi Gakkai Zasshi** 1985 Jun 20; 61(6):701-9 (Eng. Abstr.) **(Jpn)**

GUANETHIDINE

Effects of guanethidine and phenethylguanidine on the frog neuromuscular junction. Enomoto K, et al. **Eur J Pharmacol** 1985 Nov 5;117(2):187-96

HABITUATION (PSYCHOPHYSIOLOGY)

Depletion of brain serotonin by 5,7-dihydroxytryptamine alters the response to amphetamine and the habituation of locomotor activity in rats. Gately PF, et al. **Psychopharmacology (Berlin)** 1985;87(4):400-5

HALOPERIDOL

Effect of carbamazepine on neuroleptic plasma levels and efficacy [letter] Fast DK, et al. **Am J Psychiatry** 1986 Jan;143(1):117-8

Treatment of intractable hiccups with intramuscular haloperidol. Ives TJ, et al. **Am J Psychiatry** 1985 Nov;142(11):1368-9

Differential effects of haloperidol decanoate, a long-acting neuroleptic, in behavioral and biochemical tests. Oka M, et al. **Arch Int Pharmacodyn Ther** 1985 Oct;277(2):289-302

Effects of psychotropic drugs on thermal responses to radiofrequency radiation. Jauchem JR, et al. **Aviat Space Environ Med** 1985 Dec; 56(12):1183-8

Antisera raised against the drug haloperidol. Juszczak R, et al. **Biochem Pharmacol** 1985 Nov 15;34(22):3959-63

Effects of haloperidol and low dose clozapine on the acetylcholine turnover rate in rat forebrain structures. Bluth R, et al. **Biomed Biochim Acta** 1985;44(10):1531-9

Sulpiride and haloperidol in schizophrenia: a double-blind cross-over study of therapeutic effect, side effects and plasma concentrations. Gerlach J, et al. **Br J Psychiatry** 1985 Sep;147:283-8

Synaptic rearrangements in medial prefrontal cortex of haloperidol-treated rats. Benes FM, et al. **Brain Res** 1985 Nov 25; 348(1):15-20

Increase of dopamine turnover in bilateral striata after unilateral injection of haloperidol into substantia nigra of unrestrained rats. Ishii K, et al. **Brain Res** 1985 Dec 16;359(1-2):260-6

Modulation of terminal excitability of mesolimbic dopaminergic neurons by D-amphetamine and haloperidol. Mereu G, et al. **Brain Res** 1985 Dec 16;359(1-2):88-96

Intramuscular haloperidol decanoate for neuroleptic maintenance therapy. arap Mengech HN, et al. **East Afr Med J** 1984 Jun;61(6):435-8

Haloperidol-induced suppression of carotid chemoreception in vitro. Nolan WF, et al. **J Appl Physiol** 1985 Sep;59(3):814-20

Treatment of phenylcyclohexylpyrrolidine (PHP) psychosis with haloperidol. Giannini AJ, et al. **J Toxicol Clin Toxicol** 1985; 23(2-3):185-9

Comparative evaluation of the behavioural consequences of prenatal and early postnatal exposure to haloperidol in rats. Cuomo V, et al. **Neurobehav Toxicol Teratol** 1985 Sep-Oct;7(5):489-92

The effect of dopamine receptor agonist treatment on haloperidol-induced supersensitivity in mice. Fayle P, et al. **Pharmacol Biochem Behav** 1985 Nov;23(5):715-20

Amphetamine-haloperidol discrimination: effects of chronic drug treatment. Haenlein M, et al. **Pharmacol Biochem Behav** 1985 Dec; 23(6):949-52

Relative effectiveness of pimozide, haloperidol and trifluoperazine on self-stimulation rate-intensity functions. Lynch MR, et al. **Pharmacol Biochem Behav** 1985 Nov;23(5):777-80

The effects of clozapine on shuttle-box avoidance responding in rats: comparisons with haloperidol and chlordiazepoxide. Sanger DJ. **Pharmacol Biochem Behav** 1985 Aug;23(2):231-6

Phencyclidine-induced dopamine-dependent behaviors in chronic haloperidol-treated rats. Yamaguchi K, et al. **Pharmacol Biochem Behav** 1985 Nov;23(5):803-9

Haloperidol blocks amphetamine induced recovery of binocular depth perception after bilateral visual cortex ablation in cat. Hovda DA, et al. **Proc West Pharmacol Soc** 1985;28:209-11

Neuropeptide modulation of the behavioral effects of drugs. Barrett JE, et al. **Prog Clin Biol Res** 1985;192:37-50

Haloperidol and thyroid-binding globulin [letter] Lawlor BA, et al. **South Med J** 1985 Dec;78(12):1525

[Determination of blood haloperidol levels by radioimmunoassay--a methodological study] Zhou DF. **Chung Hua Shen Ching Ching Shen Ko Tsa Chih** 1985 Jun; 18(3):155-7 (Eng. Abstr.) **(Chi)**

[Conditioned reactions of hippocampal neurons during amphetamine poisoning and its counteraction with haloperidol] Zhavoronkova LA, et al. **Zh Vyssh Nerv Deiat** 1985 Sep-Oct;35(5):957-63 (Eng. Abstr.) **(Rus)**

HEXOBARBITAL

Selected ion monitoring analysis of pseudoracemic hexobarbital and its major metabolites in blood and urine of rats. van der Graaff M, et al. **Biomed Mass Spectrom** 1985 Sep;12(9):464-9

Direct effect of carbon monoxide on hexobarbital metabolism in the isolated perfused liver in the absence of hemoglobin. Takano T, et al. **J Toxicol Environ Health** 1985;15(6):847-54

HISTAMINE

Increased permeability of microcarrier-cultured endothelial monolayers in response to histamine and thrombin. A model for the in vitro study of increased vasopermeability. Killackey JJ, et al. **Am J Pathol** 1986 Jan;122(1):50-61

Accumulation of inositol phosphates and cyclic AMP in guinea-pig cerebral cortical preparations. Effects of norepinephrine, histamine, carbamylcholine and 2-chloroadenosine. Hollingsworth EB, et al. **Biochim Biophys Acta** 1985 Nov 20;847(2):207-16

Experimental allergic orchitis in mice. II. Association of disease susceptibility with the locus controlling Bordetella pertussis-induced sensitivity to histamine. Teuscher C. **Immunogenetics** 1985; 22(5):417-25

Effect of Rumex nepalensis extracts on histamine, acetylcholine and carbachol evoked responses on isolated guinea pig ileum, frog rectus abdominis muscle, rabbit heart and blood pressure of dog. Aggarwal P, et al. **Indian J Exp Biol** 1985 Aug;23(8):447-51

Effect of leukotrienes, 12-HETE, histamine, bradykinin, and 5-hydroxytryptamine on in vivo rabbit cerebral arteriolar diameter. Kamitani T, et al. **J Cereb Blood Flow Metab** 1985 Dec;5(4):554-9

Highly sensitive high-performance liquid chromatographic technique for the simultaneous measurement of histamine, 1-methylhistamine and other biogenic amines. Devalia JL, et al. **J Chromatogr** 1985 Oct 11; 343(2):407-12

Analysis of cheese for histamine, tyramine, tryptamine, histidine, tyrosine, and tryptophane. Chang SF, et al. **J Dairy Sci** 1985 Nov; 68(11):2840-6

Phencyclidine and the dynamics of mouse brain histamine. Itoh Y, et al. **J Pharmacol Exp Ther** 1985 Dec;235(3):788-92

The effects of histamine and some related compounds on conditioned avoidance response in rats. Tasaka K, et al. **Life Sci** 1985 Nov 25; 37(21):2005-14

Changes in body temperature after administration of acetylcholine, histamine, morphine, prostaglandins and related agents: II. Clark WG, et al. **Neurosci Biobehav Rev** 1985 Fall;9(3):479-552 (741 ref.)

Involvement of brain histamine in delta 9-tetrahydrocannabinol tolerance and withdrawal. Verberne AJ, et al. **Pharmacol Biochem Behav** 1985 Aug;23(2):153-9

Histamine and serotonin independently elicit drinking in the rat. Kraly FS, et al. **Physiol Behav** 1985 Jun;34(6):963-7

Depolarisation-evoked release of dopamine and histamine from brain tissue and studies on presynaptic dopamine-histamine interaction. Nowak JZ. **Pol J Pharmacol Pharm** 1985 May-Jun;37(3):359-81 (111 ref.)

[Effects of serotonin (5HT) and histamine on the pulmonary circulation with particular reference to arterial and venous segment resistance--comparison between an experimental study and model circuit analysis] Yamashita H, et al. **Nippon Kyobu Shikkan Gakkai Zasshi** 1985 Jul;23(7):767-75 (Eng. Abstr.) **(Jpn)**

[Effect of histamine on motor and vascular effects on the small intestine induced by acetylcholine] Lavrova ZS, et al. **Fiziol Zh SSSR** 1985 Sep; 71(9):1156-63 (Eng. Abstr.) **(Rus)**

[Functional activity of serotonin- and histaminergic systems in humans during long-term antiorthostatic hypokinesia] Davydova NA, et al. **Kosm Biol Aviakosm Med** 1985 Sep-Oct;19(5):27-30 (Eng. Abstr.) **(Rus)**

HOMOVANILLIC ACID

Selective antidepressants and cerebrospinal fluid. Lack of specificity on norepinephrine and serotonin metabolites. Potter WZ, et al. **Arch Gen Psychiatry** 1985 Dec;42(12):1171-7

Homovanillic acid, vanillylmandelic acid and 5-hydroxyindole-3-acetic acid are undetectable in urine of the muskrat. Yoshioka M, et al. **Chem Pharm Bull (Tokyo)** 1985 May;33(5):2145-8

Fusaric acid-induced elevation of homovanillic acid in the CSF as an index of brain noradrenaline synthesis. Elghozi JL, et al. **Eur J Pharmacol** 1985 Nov 19;117(3):363-7

Determination of homovanillic acid in human plasma by high-performance liquid chromatography with electrochemical detection. Yoshida A, et al. **J Chromatogr** 1985 Sep 13;343(1):155-9

Effects of L-dopa and L-tyrosine on release of free and conjugated dopamine, homovanillic acid and dihydroxyphenylacetic acid from slices of rat striatum. Tyce GM, et al. **Life Sci** 1985 Dec 23; 37(25):2439-48

Brain ventricular size and CSF monoamine metabolites in an adolescent inpatient population. Jennings WS Jr, et al. **Psychiatry Res** 1985 Oct; 16(2):87-94

Dexamethasone increases plasma HVA but not MHPG in normal humans. Wolkowitz OM, et al. **Psychiatry Res** 1985 Oct;16(2):101-9

HUNGER

Satiety, hunger and regional brain content of cholecystokinin/gastrin and met-enkephalin immunoreactivity in sheep. Scallet AC, et al. **Peptides (Fayetteville)** 1985 Sep-Oct;6(5):937-43

[Neuromediator sensitivity of neurons of the reticular formation and orbital cortex in hungry and satiated rabbits] Borisova EV. **Zh Vyssh Nerv Deiat** 1985 Sep-Oct;35(5):907-13 (Eng. Abstr.) **(Rus)**

HYDANTOINS

Mephenytoin hydroxylation polymorphism: characterization of the enzymatic deficiency in liver microsomes of poor metabolizers phenotyped in vivo. Meier UT, et al. **Clin Pharmacol Ther** 1985 Nov; 38(5):488-94

High-performance liquid chromatographic support for the baseline separation of all phenylthiohydantoin amino acids. Kruggel WG, et al. **J Chromatogr** 1985 Aug 9;342(2):376-9

[Ultrastructural changes in Mycobacterium rubrum cells exposed to sulfochloranthine] Poglazova MN, et al. **Mikrobiologiia** 1985 Jul-Aug; 54(4):628-33 (Eng. Abstr.) **(Rus)**

HYDRAZINES

Spin trapping of a free radical intermediate formed during microsomal metabolism of hydrazine. Noda A, et al. **Biochem Biophys Res Commun** 1985 Dec 31;133(3):1086-91

Dopaminergic drugs improve human visual contrast sensitivity. Domenici L, et al. **Hum Neurobiol** 1985;4(3):195-7

Internalization and delivery to lysosomes of hydrazide horseradish peroxidase, a covalent membrane probe. Storrie B, et al. **J Histochem Cytochem** 1985 Nov;33(11):1145-52

Increased life expectancy resulting from addition of L-deprenyl to Madopar treatment in Parkinson's disease: a longterm study. Birkmayer W, et al. **J Neural Transm** 1985;64(2):113-27

Pharmacokinetics of the toxic hydrazino metabolites formed from isoniazid in humans. Lauterburg BH, et al. **J Pharmacol Exp Ther** 1985 Dec;235(3):566-70

HYDROXYBUTYRATES

Use of alcohol oxidase to measure the methanol produced during the hydrolysis of D- and L-methyl-3-hydroxybutyric acid. Herzberg GR, et al. **Anal Biochem** 1985 Sep;149(2):354-7

Mitochondrial alterations in embryos exposed to B-hydroxybutyrate in whole embryo culture. Horton WE Jr, et al. **Anat Rec** 1985 Sep; 213(1):94-101

Effects of insulin on the metabolism of acetate, beta-hydroxybutyrate and triglycerides by the bovine mammary gland. Laarveld B, et al. **Comp Biochem Physiol [B]** 1985;82(2):265-7

Mathematical model for determining the effects of intracytoplasmic inclusions on volume and density of microorganisms. Mas J, et al. **J Bacteriol** 1985 Nov;164(2):749-56

Gammahydroxybutyric acid: central biochemical and behavioral effects in neonatal rats. Hedner T, et al. **Pharmacol Biochem Behav** 1985 Aug; 23(2):185-9

HYDROXYDOPAMINES

Rotational behaviour elicited by intracerebral injections of apomorphine and pergolide in 6-hydroxy-dopamine-lesioned rats. II: The striatum of the rat is heterogeneously organized for rotational behaviour. Herrera-Marschitz M, et al. **Acta Physiol Scand** 1985 Nov; 125(3):529-35

Rotational behaviour elicited by intracerebral injections of apomorphine and pergolide in 6-hydroxy-dopamine-lesioned rats. I: Comparison between systemic and intrastriatal injections. Herrera-Marschitz M, et al. **Acta Physiol Scand** 1985 Nov;125(3):519-27

Effects of morphine on sprouting of locus coeruleus fibers in the neonatal rat. Bardo MT, et al. **Brain Res** 1985 Oct;354(2):161-8

Separation of the motor consequences from other actions of unilateral 6-hydroxydopamine lesions in the nigrostriatal neurones of rat brain. Hamilton MH, et al. **Brain Res** 1985 Dec 2;348(2):220-8

Evidence that D-1 dopamine receptors contribute to the supersensitive behavioral responses induced by L-dihydroxyphenylalanine in rats treated neonatally with 6-hydroxydopamine. Breese GR, et al. **J Pharmacol Exp Ther** 1985 Nov;235(2):287-95

Effects of chronic dietary lithium on behavioral indices of dopamine denervation supersensitivity in the rat. Swerdlow NR, et al. **J Pharmacol Exp Ther** 1985 Nov;235(2):324-9

Bilateral lesions of the striatum induced with 6-hydroxydopamine abolish apomorphine-induced yawning in rats. Dourish CT, et al. **Neuropharmacology** 1985 Nov;24(11):1051-5

Effects of 6-OHDA lesions of the central medial nucleus accumbens on rat intravenous morphine self-administration. Smith JE, et al. **Pharmacol Biochem Behav** 1985 Nov;23(5):843-9

Intraventricular 6-hydroxydopamine increases thyrotropin-releasing hormone (TRH) content in regions of rat brain. Engber TM, et al. **Regul Pept** 1985 Sep;12(1):51-7

HYDROXYINDOLEACETIC ACID

Selective antidepressants and cerebrospinal fluid. Lack of specificity on norepinephrine and serotonin metabolites. Potter WZ, et al. **Arch Gen Psychiatry** 1985 Dec;42(12):1171-7

Anterior cerebellar vermal stimulation: effect on behavior and basal forebrain neurochemistry in rat. Albert TJ, et al. **Biol Psychiatry** 1985 Dec;20(12):1267-76

Homovanillic acid, vanillylmandelic acid and 5-hydroxyindole-3-acetic acid are undetectable in urine of the muskrat. Yoshioka M, et al. **Chem Pharm Bull (Tokyo)** 1985 May;33(5):2145-8

Analytical considerations for quantitative determination of serotonin and its metabolically related products in biological matrices. Mailman RB, et al. **Clin Chem** 1985 Nov;31(11):1849-54

Effects of saltwater adaptation on serotonin metabolite concentrations in the cerebrospinal fluid of rainbow trout (Salmo gairdneri). Mazeaud MM, et al. **Comp Biochem Physiol [C]** 1985;82(1):109-13

Effect of short-term swimming stress and diazepam on 3,4-dihydroxyphenylacetic acid (DOPAC) and 5-hydroxyindoleacetic acid (5-HIAA) levels in the caudate nucleus: an in vivo voltammetric study. Ikeda M, et al. **Naunyn Schmiedebergs Arch Pharmacol** 1985 Oct; 331(1):23-6

Brain ventricular size and CSF monoamine metabolites in an adolescent inpatient population. Jennings WS Jr, et al. **Psychiatry Res** 1985 Oct; 16(2):87-94

[Effect of prolonged interaction of mice with aggressive and submissive types of behavior on the concentration of serotonin, 5-hydroxyindoleacetic acid and noradrenalin in the brain] Kudriavtseva NN, et al. **Zh Vyssh Nerv Deiat** 1985 Sep-Oct;35(5):879-83 (Eng. Abstr.) **(Rus)**

[Levels of 5-HIAA and beta-endorphin in CSF after intrathecal morphine] González Navarro A, et al. **Arch Neurobiol (Madr)** 1985 Jul-Aug;48(4):211-5 (Eng. Abstr.) **(Spa)**

HYDROXYTRYPTOPHAN

Anterior cerebellar vermal stimulation: effect on behavior and basal forebrain neurochemistry in rat. Albert TJ, et al. **Biol Psychiatry** 1985 Dec;20(12):1267-76

Modulation of 5-hydroxytryptamine-induced head-twitch response by drugs acting at GABA and related receptors. Handley SL, et al. **Br J Pharmacol** 1985 Sep;86(1):297-303

L-5HTP in depression resistant to re-uptake inhibitors. An open comparative study with tranylcypromine. Nolen WA, et al. **Br J Psychiatry** 1985 Jul;147:16-22

Analytical considerations for quantitative determination of serotonin and its metabolically related products in biological matrices. Mailman RB, et al. **Clin Chem** 1985 Nov;31(11):1849-54

Peripheral serotonin2 receptor blockade does not inhibit 5-hydroxytryptophan-induced aldosterone stimulation. Shenker Y, et al. **J Clin Endocrinol Metab** 1985 Dec;61(6):1201-4

Down-regulation of [3H]5-hydroxytryptamine binding sites in chick embryo brain by monoamine oxidase inhibitors or fenfluramine and potentiation by d,l-5-hydroxytryptophan. Soblosky JS, et al. **J Neurochem** 1985 Dec;45(6):1923-31

HYDROXYZINE

Possible potentiation by hydroxyzine of metoclopramide's undesirable side effects [letter] Fouilladieu JL, et al. **Anesth Analg** 1985 Dec; 64(12):1227-8

HYPOCHONDRIASIS

Delusional hypochondriasis, depression, and amoxapine [letter] Tollefson G. **Am J Psychiatry** 1985 Dec;142(12):1518-9

IMIPRAMINE

A double blind study in out-patients with primary non-agitated depression treated with imipramine in combination with placebo, diazepam or dixyrazine. Feet PO, et al. **Acta Psychiatr Scand** 1985 Oct; 72(4):334-40

No purging, no binge eating: a mechanism for imipramine's action in bulimia? [letter] Claman JM, et al. **Am J Psychiatry** 1985 Dec; 142(12):1515-6

Hyperpyrexia following psychotropic drug overdose. Peebles-Brown AE. **Anaesthesia** 1985 Nov;40(11):1097-9

Imipramine for the treatment of fibrositis: a therapeutic trial. Wysenbeek AJ, et al. **Ann Rheum Dis** 1985 Nov;44(11):752-3

Imipramine and chlordiazepoxide in depressive and anxiety disorders. II. Efficacy in anxious outpatients. Kahn RJ, et al. **Arch Gen Psychiatry** 1986 Jan;43(1):79-85

Imipramine and chlordiazepoxide in depressive and anxiety disorders. I. Efficacy in depressed outpatients. Lipman RS, et al. **Arch Gen Psychiatry** 1986 Jan;43(1):68-77

Platelet 3H-imipramine binding in depressed elderly patients. Schneider LS, et al. **Biol Psychiatry** 1985 Nov;20(11):1234-7

Unchanged platelet 3H-imipramine binding in normal subjects after imipramine administration. Suranyi-Cadotte BE, et al. **Biol Psychiatry** 1985 Nov;20(11):1240-3

Lithium potentiation of imipramine in treatment resistant depression [letter] Roy A, et al. **Br J Psychiatry** 1985 Nov;147:582-3

A controlled trial of amitriptyline and cianopramine in major depression. Mellsop GW, et al. **Clin Ther** 1985;7(6):699-703 (8 ref.)

Sex-related hyperthermic response to chlorpromazine in the offspring of rats treated with imipramine. Fujii T, et al. **Dev Pharmacol Ther** 1985;8(6):364-73

Cooperativity in inhibition of coupled and uncoupled respiration in rat liver and brain mitochondria by imipramine. Rajan RR, et al. **Indian J Biochem Biophys** 1985 Apr;22(2):71-7

Effect of imipramine hydrochloride on cardiac conduction system. Sabherwal U, et al. **Indian J Med Res** 1985 Oct;82:353-8

Tritiated imipramine binding to platelets in manic subjects. Lewis DA, et al. **J Affective Disord** 1985 Nov;9(3):207-11

Possible artefacts in imipramine binding assays [letter] Whitaker PM.

J Neurochem 1985 Dec;45(6):1960

Effect of phenobarbitone on the distribution and elimination of imipramine in rats. Lin TH, et al. **J Pharm Pharmacol** 1985 Oct;37(10):735-8

Dopamine and isoproterenol in imipramine intoxication in the dog. Sangster B, et al. **J Toxicol Clin Toxicol** 1985;23(4-6):407-20

Changes induced by corticosterone and adrenalectomy in synaptosomal and platelet uptake and binding of 5-HT. The relationship to [3H]imipramine binding. Lee PH, et al. **Neuropharmacology** 1985 Nov; 24(11):1043-50

Chronic dosage of imipramine in animal experiment: concentrations of imipramine and desipramine in the rat brain after various modes of dosage. Melzacka M, et al. **Pol J Pharmacol Pharm** 1985 Jul-Aug; 37(4):525-32

Characterization of endogenous inhibitors of [3H]-imipramine binding and [3H]-serotonin uptake from rat serum. Angel I, et al. **Prog Clin Biol Res** 1985;192:457-64

Characterization of the endocoid for imipramine recognition sites. Barbaccia ML, et al. **Prog Clin Biol Res** 1985;192:431-40

5-methoxytryptoline and close analogs as candidates for the endogenous ligand of the 3H-imipramine recognition site. Langer SZ, et al. **Prog Clin Biol Res** 1985;192:441-55

Demonstration of an imipramine endacoid in rat brain. Rehavi M, et al. **Prog Clin Biol Res** 1985;192:465-72

Cardiovascular peripheric effects of a new tricyclic antidepressant, cianopramine (Ro 11-2465) in dogs. Cicardo VH, et al. **Prog Neuropsychopharmacol Biol Psychiatry** 1985;9(4):381-6

Variation in human platelet 3H-imipramine binding. Tang SW, et al. **Psychiatry Res** 1985 Oct;16(2):141-6

Lower 3H-imipramine binding in platelets from untreated depressed patients compared to healthy controls. Wägner A, et al. **Psychiatry Res** 1985 Oct;16(2):131-9

Fear-enhanced acoustic startle is not attenuated by acute or chronic imipramine treatment in rats. Cassella JV, et al. **Psychopharmacology (Berlin)** 1985;87(3):278-82

Some effects of chlorimipramine and imipramine on the schedule-controlled behavior of the pigeon. Lamb RJ, et al. **Psychopharmacology (Berlin)** 1985;87(1):7-11

IMPRINTING (PSYCHOLOGY)

Neurochemical studies on imprinting behavior in chick and duckling. Takamatsu K, et al. **Neurochem Res** 1985 Oct;10(10):1371-91

INHIBITION (PSYCHOLOGY)

Extinguishing conditioned inhibition in flavour-aversion learning: effects of repeated testing and extinction of the excitatory element. Best MR, et al. **Q J Exp Psychol [B]** 1985 Nov;37(4):359-78

LEARNING

Electrolytic, but not 5,7-dihydroxytryptamine, lesions of the nucleus medianus raphe impair acquisition of a radial maze task. Asin KE, et al. **Behav Neural Biol** 1985 Nov;44(3):415-24

Sex-dependent effects of neonatally administered morphiceptin and D-ala-D-leu-enkephalin on maze learning in rats. de Avila A, et al. **Behav Neural Biol** 1985 Nov;44(3):393-402

Post-training brain catecholamine levels: lack of response to water-motivated training. Gold PE, et al. **Behav Neural Biol** 1985 Nov; 44(3):425-33

Epinephrine facilitation of appetitive learning: attenuation with adrenergic receptor antagonists. Sternberg DB, et al. **Behav Neural Biol** 1985 Nov; 44(3):447-53

On-demand platform improves accuracy of the Morris water maze procedure. Burešová O, et al. **J Neurosci Methods** 1985 Oct; 15(1):63-72

ACTH neuromodulation of the developing motor system and neonatal learning in the rat. Acker GR, et al. **Peptides (Fayetteville)** 1985; 6 Suppl 2:41-9

[Memory--2. Neurophysiologic studies of learning] Tsukahara N. **Nippon Rinsho** 1985 Jul;43(7):1314-20 (20 ref.) **(Jpn)**

[Memory--4. Physiological and biochemical studies in memory and learning] Yamamoto C. **Nippon Rinsho** 1985 Jul;43(7):1332-5 **(Jpn)**

LEVODOPA

The effect of an increased ratio of carbidopa to levodopa on the pharmacokinetics of levodopa. Kaakkola S, et al. **Acta Neurol Scand** 1985 Oct;72(4):385-91

Sinemet 'abusers'. Nausieda PA. **Clin Neuropharmacol** 1985;8(4):318-27

Effect of L-dopa with and without inhibition of extra cerebral dopa decarboxylase on gastric acid secretion and gastrin release in man. Caldara R, et al. **Gut** 1985 Oct;26(10):1014-7

Dopaminergic drugs improve human visual contrast sensitivity. Domenici L, et al. **Hum Neurobiol** 1985;4(3):195-7

L-dopa in the treatment of negative schizophrenic symptoms: a single-subject experimental study. Kay SR, et al. **Int J Psychiatry Med** 1985-86;15(3):293-8

Effects of L-dopa supplementation on concentrations of brain catechols, dopamine receptor binding and the incidence of pale, soft and exudative meat in stress-susceptible pigs. Erlander MG, et al. **J Anim Sci** 1985 Oct;61(4):914-23

Copper(II) and nickel(II) ternary complexes of L-dopa and related compounds. Kiss T, et al. **J Inorg Biochem** 1985 Dec;25(4):247-59

Increased life expectancy resulting from addition of L-deprenyl to Madopar treatment in Parkinson's disease: a longterm study. Birkmayer W, et al. **J Neural Transm** 1985;64(2):113-27

The inotropic effects of dopamine and its precursor levodopa on isolated human ventricular myocardium. Brown L, et al. **Klin Wochenschr** 1985 Nov 4;63(21):1117-23

Effects of L-dopa and L-tyrosine on release of free and conjugated dopamine, homovanillic acid and dihydroxyphenylacetic acid from slices of rat striatum. Tyce GM, et al. **Life Sci** 1985 Dec 23; 37(25):2439-48

LH

Regulation of gonadotrophin secretion in male mice from birth to adulthood. Response to LRH injection, castration and testosterone replacement therapy. Jean-Faucher C, et al. **Acta Endocrinol (Copenh)** 1985 Oct;110(2):193-9

The depressing (negative) effect of oestradiol benzoate on the in vitro secretion of LH and FSH by the pituitary gland of the LRH-pretreated long-term ovariectomized rat changes into the augmentative (positive) effect after discontinuation of the LRH-pretreatment. Schuiling GA, et al. **Acta Endocrinol (Copenh)** 1985 Nov;110(3):329-37

GnRH-stimulated LH release from rat anterior pituitary cells in culture: refractoriness and recovery. Jinnah HA, et al. **Am J Physiol** 1985 Dec; 249(6 Pt 1):E619-25

cAMP augmentation of secretagogue-induced luteinizing hormone secretion. Turgeon JL, et al. **Am J Physiol** 1986 Jan; 250(1 Pt 1):E62-8

Effects of calmodulin and lipoxygenase inhibitors on LH (lutropin)- and LHRH (luliberin)-agonist-stimulated steroidogenesis in rat Leydig cells. Sullivan MH, et al. **Biochem J** 1985 Nov 15;232(1):55-9

The role of endogenous gonadotropin-releasing hormone in the control of luteinizing hormone and testosterone secretion in the juvenile male monkey, Macaca fascicularis. Cameron JL, et al. **Biol Reprod** 1985 Aug; 33(1):147-56

Postcastration rise in plasma gonadotropins is blocked by a luteinizing hormone-releasing hormone antagonist. Condon TP, et al. **Biol Reprod** 1985 Oct;33(3):715-21

Effect of alterations in pulsatile luteinizing hormone release on ovarian follicular atresia and steroid secretion on diestrus 1 in the rat estrous cycle. Devorshak-Harvey E, et al. **Biol Reprod** 1985 Aug; 33(1):103-11

Active immunization of gilts against gonadotropin-releasing hormone: effects on secretion of gonadotropins, reproductive function, and responses to agonists of gonadotropin-releasing hormone. Esbenshade KL, et al. **Biol Reprod** 1985 Oct;33(3):569-77

Serotonergic influences on pituitary gland and hypothalamic induction of prolactin and luteinizing hormone release in the young turkey (Meleagris gallopavo). Fehrer SC, et al. **Biol Reprod** 1985 Dec; 33(5):1064-72

Does the seasonal increase in estradiol negative feedback prevent luteinizing hormone surges in anestrous ewes by suppressing hypothalamic gonadotropin-releasing hormone pulse frequency? Legan SJ, et al. **Biol Reprod** 1985 Aug;33(1):117-31

Effects of intermittent pulsatile infusion of luteinizing hormone-releasing hormone on dihydrotestosterone-suppressed gonadotropin secretion in castrate rams. Schanbacher BD. **Biol Reprod** 1985 Oct;33(3):603-11

Simultaneous measurement of luteinizing hormone-releasing hormone and luteinizing hormone during estradiol-induced luteinizing hormone surges in the ovariectomized ewe. Schillo KK, et al. **Biol Reprod** 1985 Oct;33(3):644-52

Changes of the release of luteinizing hormone (LH) on the day of proestrus after lesions or stimulation of the raphe nuclei in rats. Morello H, et al. **Brain Res** 1985 Dec 23;360(1-2):311-7

Electrochemical stimulation of plasma LH and hypothalamic norepinephrine concentrations at short- and long-term intervals after hypothalamic knife cuts. Phelps CP, et al. **Brain Res** 1985 Nov 18; 347(2):328-35

The role of endogenous serotonin in phasic LH release. Meyer DC, et al. **Brain Res Bull** 1985 Sep;15(3):283-6

Localization in the brain of the inhibition by GABA of luteinizing hormone release that follows orchidectomy in rats. Donoso AO. **Braz J Med Biol Res** 1985;18(1):97-100

Cellular mechanisms of acute estrogen negative feedback on LH secretion: pituitary responsiveness to LHRH and estradiol receptor kinetics in the pituitary, preoptic hypothalamic area, and the caudal hypothalamic area of the rat brain. Johnston CA, et al. **Braz J Med Biol Res** 1985; 18(1):125-30

Muscarinic cholinergic mediation of LHRH-induced LH and FSH secretion in normal men. Chiodera P, et al. **Clin Endocrinol (Oxf)** 1985

Oct;23(4):361-6

Dose-related changes in LH bioactivity with intranasal GnRH agonist administration. Chiang RS, et al. **Contraception** 1985 Oct; 32(4):347-57

Evidence for gamma-aminobutyric acid modulation of ovarian hormonal effects on luteinizing hormone secretion and hypothalamic catecholamine activity in the female rat. Adler BA, et al. **Endocrinology** 1986 Jan;118(1):91-7

Developmental changes in the positive feedback effect of estrogen on luteinizing hormone release in ovariectomized female rhesus monkeys. Terasawa E. **Endocrinology** 1985 Dec;117(6):2490-7

Influence of cerebroventricular injection of dopamine on plasma prolactin and LH levels of postlaying and broody turkey hens. Hargis BM, et al. **Gen Comp Endocrinol** 1986 Jan;61(1):142-7

Effects of gonadectomy and steroid treatment on plasma gonadotropins and the response of superfused pituitaries to gonadotropin-releasing hormone in the turtle Sternotherus odoratus. Licht P, et al. **Gen Comp Endocrinol** 1985 Dec;60(3):441-9

Suppression of plasma gonadotropins and testosterone in adult male monkeys (Macaca fascicularis) by a potent inhibitory analog of gonadotropin-releasing hormone. Adams LA, et al. **J Clin Endocrinol Metab** 1986 Jan;62(1):58-63

Dopamine decreases release of luteinizing hormone releasing hormone from superfused rat mediobasal hypothalamus. Tasaka K, et al. **J Endocrinol Invest** 1985 Aug;8(4):373-6

Hormonal responses to gonadotrophin releasing hormone during testicular development in male African green monkeys. Brady AG, et al. **J Med Primatol** 1985;14(6):293-304

Fetal Leydig cell culture--an in vitro system for the study of trophic hormone and GnRH receptors and actions. Dufau ML, et al. **J Steroid Biochem** 1985 Nov;23(5B):743-55 (84 ref.)

Mechanism of action of gonadotropin releasing hormone: role of lipoxygenase products of arachidonic acid in luteinizing hormone release. Naor Z, et al. **J Steroid Biochem** 1985 Nov;23(5B):711-7

Luteinizing hormone releasing activity of [Gln8]-LHRH and [His5, Trp7, Tyr8]-LHRH in the cockerel, in vivo and in vitro. Chou HF, et al. **Life Sci** 1985 Dec 30;37(26):2459-65

Central effects of an antagonist and an antiserum to substance P on serum gonadotropin and prolactin secretion. Dees WL, et al. **Life Sci** 1985 Oct 28;37(17):1627-31

Inhibition of gonadotropin secretion induced by cholecystokinin implants in the medial preoptic area by the dopamine receptor blocker, pimozide, in the rat. Hashimoto R, et al. **Neuroendocrinology** 1986;42(1):32-7

Estrogen exposure affects the post-ovariectomy increases in both LH and FSH release in female rats. Matt DW, et al. **Neuroendocrinology** 1986;42(1):21-7

Neural signals for oxytocin and LH release. Dyer RG. **Oxf Rev Reprod Biol** 1985;7:223-60 (104 ref.)

Mediation by gonadal steroids of plasma beta-endorphin and LH in castrated female and male rats. Forman LJ, et al. **Peptides (Fayetteville)** 1985 Sep-Oct;6(5):835-9

Effects of in vivo pretreatment with D-Trp-6-LH-RH on prolactin and LH secretion by pituitary glands in vitro. Torres-Aleman I, et al. **Peptides (Fayetteville)** 1985 Sep-Oct;6(5):993-5

[Studies on the feedback regulation of pulsatile luteinizing hormone secretion. II. Role of the catecholaminergic system in estrogen-induced suppression of the frequency of pulsatile LH secretion in ovariectomized rats] Tadokoro Y. **Nippon Naibunpi Gakkai Zasshi** 1985 Jul 20; 61(7):765-74 (Eng. Abstr.) **(Jpn)**

LH-FSH RELEASING HORMONE

Regulation of gonadotrophin secretion in male mice from birth to adulthood. Response to LRH injection, castration and testosterone replacement therapy. Jean-Faucher C, et al. **Acta Endocrinol (Copenh)** 1985 Oct;110(2):193-9

The depressing (negative) effect of oestradiol benzoate on the in vitro secretion of LH and FSH by the pituitary gland of the LRH-pretreated long-term ovariectomized rat changes into the augmentative (positive) effect after discontinuation of the LRH-pretreatment. Schuiling GA, et al. **Acta Endocrinol (Copenh)** 1985 Nov;110(3):329-37

GnRH-stimulated LH release from rat anterior pituitary cells in culture: refractoriness and recovery. Jinnah HA, et al. **Am J Physiol** 1985 Dec; 249(6 Pt 1):E619-25

Possible vascular effects of an LH-RH agonist on the peripheral circulation of the rat testes. Habenicht UF, et al. **Andrologia** 1985 Sep-Oct;17(5):440-3

Changes in LHRH in human maternal plasma during pregnancy. Kawamura Y, et al. **Asia Oceania J Obstet Gynaecol** 1985 Sep; 11(3):437-40

Gonadotropin releasing hormone activation is mediated by dimerization of occupied receptors. Hazum E, et al. **Biochem Biophys Res Commun** 1985 Dec 17;133(2):449-56

Calcium-independent phosphatidylinositol response in gonadotropin-releasing-hormone-stimulated pituitary cells. Naor Z, et al. **Biochem J** 1985 Oct 1;231(1):19-23

Postcastration rise in plasma gonadotropins is blocked by a luteinizing hormone-releasing hormone antagonist. Condon TP, et al. **Biol Reprod** 1985 Oct;33(3):715-21

Active immunization of gilts against gonadotropin-releasing hormone: effects on secretion of gonadotropins, reproductive function, and responses to agonists of gonadotropin-releasing hormone. Esbenshade KL, et al. **Biol Reprod** 1985 Oct;33(3):569-77

Effects of intermittent pulsatile infusion of luteinizing hormone-releasing hormone on dihydrotestosterone-suppressed gonadotropin secretion in castrate rams. Schanbacher BD. **Biol Reprod** 1985 Oct;33(3):603-11

Simultaneous measurement of luteinizing hormone-releasing hormone and luteinizing hormone during estradiol-induced luteinizing hormone surges in the ovariectomized ewe. Schillo KK, et al. **Biol Reprod** 1985 Oct;33(3):644-52

Cellular mechanisms of acute estrogen negative feedback on LH secretion: pituitary responsiveness to LHRH and estradiol receptor kinetics in the pituitary, preoptic hypothalamic area, and the caudal hypothalamic area of the rat brain. Johnston CA, et al. **Braz J Med Biol Res** 1985; 18(1):125-30

Inhibition of testosterone production with ketoconazole alone and in combination with a gonadotropin releasing hormone analogue in the rat. English HF, et al. **Cancer Res** 1986 Jan;46(1):38-42

Ependymoneuronal specializations between LHRH fibers and cells of the cerebroventricular system. Kozlowski GP, et al. **Cell Tissue Res** 1985; 242(2):301-11

Muscarinic cholinergic mediation of LHRH-induced LH and FSH secretion in normal men. Chiodera P, et al. **Clin Endocrinol (Oxf)** 1985 Oct;23(4):361-6

Dose-related changes in LH bioactivity with intranasal GnRH agonist administration. Chiang RS, et al. **Contraception** 1985 Oct; 32(4):347-57

Species differences in the sensitivity to a GnRH antagonist. Limonta P, et al. **Contraception** 1985 Jul;32(1):75-85

Regulation of pituitary gonadotropin-releasing hormone (GnRH) receptors by pulsatile GnRH in female rats: effects of estradiol and prolactin. Duncan JA, et al. **Endocrinology** 1986 Jan;118(1):320-7

Proopiomelanocortin-derived peptides in testicular interstitial fluid: characterization and changes in secretion after human chorionic gonadotropin or luteinizing hormone-releasing hormone analog treatment. Valenca MM, et al. **Endocrinology** 1986 Jan;118(1):32-7

Alternative indications for pulsatile gonadotropin-releasing hormone therapy in infertile women. Phansey SA, et al. **Fertil Steril** 1985 Nov; 44(5):589-94

Immunoreactive gonadotropin-releasing hormone-like material in the brain and the pituitary gland during the periovulatory period in the brown trout (Salmo trutta L.): relationships with the plasma and pituitary gonadotropin. Breton B, et al. **Gen Comp Endocrinol** 1986 Jan; 61(1):109-19

In vitro study of the direct ovarian effects of gonadotropin-releasing hormone (GnRH) in the frogs, Rana pipiens and Rana catesbeiana. Hubbard GM, et al. **Gen Comp Endocrinol** 1985 Nov;60(2):154-61

Projections of luteinizing hormone-releasing hormone and vasotocin fibers to the anterior part of the preoptic nucleus in the toad, Bufo japonicus. Jokura Y, et al. **Gen Comp Endocrinol** 1985 Dec; 60(3):390-7

Effect of mammalian luteinizing hormone-releasing hormone on plasma testosterone in male alligators, with observations on the nature of alligator hypothalamic gonadotropin-releasing hormone. Lance VA, et al. **Gen Comp Endocrinol** 1985 Nov;60(2):138-43

In vivo and in vitro responses to gonadotropin releasing hormone in the turtle, Chrysemys picta, in relation to sex and reproductive stage. Licht P, et al. **Gen Comp Endocrinol** 1985 Oct;60(1):75-85

Stress-induced inhibition of reproduction: evidence of suppressed secretion of LH-RH in an amphibian. Moore FL, et al. **Gen Comp Endocrinol** 1985 Nov;60(2):252-8

Topical absorption of gonadotropin-releasing hormone (GnRH) in goldfish. Sherwood NM, et al. **Gen Comp Endocrinol** 1986 Jan; 61(1):13-9

Effects of dibutyryl cyclic AMP and gonadotropin-releasing hormone added prior to filter sterilization of the media and variation in oxygen partial pressure on output of human chorionic gonadotropin from term placental explants. Haning RV Jr, et al. **Gynecol Obstet Invest** 1985; 20(2):74-7

Luteinizing hormone-releasing hormone facilitates the display of sexual behavior in male voles (Microtus canicaudus). Boyd SK, et al. **Horm Behav** 1985 Sep;19(3):252-64

Studies of a controlled-release microcapsule formulation of an LH-RH agonist (D-Trp-6-LH-RH) in the rhesus monkey menstrual cycle. Asch RH, et al. **Int J Fertil** 1985;30(2):19-26

Suppression of plasma gonadotropins and testosterone in adult male monkeys (Macaca fascicularis) by a potent inhibitory analog of gonadotropin-releasing hormone. Adams LA, et al. **J Clin Endocrinol Metab** 1986 Jan;62(1):58-63

Characterization of a gonadotropin-releasing hormone receptor site in term placenta and chorionic villi. Iwashita M, et al. **J Clin Endocrinol Metab** 1986 Jan;62(1):127-33

Administration of low dose pulsatile gonadotropin-releasing hormone

(GnRH) to GnRH-deficient men regulates free alpha-subunit secretion. Spratt DI, et al. **J Clin Endocrinol Metab** 1986 Jan;62(1):102-8

In-vivo activity of the LH-releasing hormone pulse generator in castrated and intact male rats. Dluzen DE, et al. **J Endocrinol** 1985 Dec; 107(3):331-40

LRFD6a has a dose-related stimulatory or inhibitory effect on the ovary in normal luteal phase women. Barnea ER, et al. **J Endocrinol Invest** 1985 Aug;8(4):297-302

Dopamine decreases release of luteinizing hormone releasing hormone from superfused rat mediobasal hypothalamus. Tasaka K, et al. **J Endocrinol Invest** 1985 Aug;8(4):373-6

Steroid and thyroid hormone profiles following a single injection of partly purified salmon gonadotropin or GnRH analogues in male and female sea lamprey. Sower SA, et al. **J Exp Zool** 1985 Sep;235(3):403-8

Luteinizing hormone releasing hormone (LHRH): I. A new ovulation-inducing agent. Rojanasakul A, et al. **J Med Assoc Thai** 1985 Oct;68(10):528-33

Ovulation induction and pregnancy in women with hypothalamic amenorrhea treated with intermittent gonadotropin-releasing hormone. Corenblum B, et al. **J Reprod Med** 1985 Oct;30(10):736-40

Potentiation of GnRH response by clomiphene citrate. Goerzen J, et al. **J Reprod Med** 1985 Oct;30(10):749-52

Unexplained infertility and its treatment with intermittent GnRH application. Bohnet HG. **J Steroid Biochem** 1985 Nov;23(5B):863-5

Molecular mechanism of gonadotropin releasing hormone action. Conn PM, et al. **J Steroid Biochem** 1985 Nov;23(5B):703-10

Pregnancy interfering action of LHRH and anti-LHRH. Das C, et al. **J Steroid Biochem** 1985 Nov;23(5B):803-6

Fetal Leydig cell culture--an in vitro system for the study of trophic hormone and GnRH receptors and actions. Dufau ML, et al. **J Steroid Biochem** 1985 Nov;23(5B):743-55 (84 ref.)

Gonadotropin-releasing hormone as a paracrine hormone and neurotransmitter in extra-pituitary sites. Hsueh AJ, et al. **J Steroid Biochem** 1985 Nov;23(5B):757-64

Effect of LHRH agonists and antagonists in male and female bonnet monkeys (Macaca radiata). Jagannadha Rao A, et al. **J Steroid Biochem** 1985 Nov;23(5B):807-9

Stimulation of hypothalamic LHRH levels and release by gonadal steroids. Kalra PS. **J Steroid Biochem** 1985 Nov;23(5B):725-31

In the central role of GnRH in the regulation of reproductive functions: mechanism of action and practical results. Keri G, et al. **J Steroid Biochem** 1985 Nov;23(5B):719-23 (9 ref.)

Gonadotropin-releasing hormone as a modulator of ovarian function. Knecht M, et al. **J Steroid Biochem** 1985 Nov;23(5B):771-8 (61 ref.)

Antigonadotropic actions of GnRH agonist on ovarian cells in vivo and in vitro. Maruo T, et al. **J Steroid Biochem** 1985 Nov;23(5B):765-70

Mechanism of action of gonadotropin releasing hormone: role of lipoxygenase products of arachidonic acid in luteinizing hormone release. Naor Z, et al. **J Steroid Biochem** 1985 Nov;23(5B):711-7

Gonadotropin releasing hormone analogs for female contraception by inhibition of ovulation. Nillius SJ. **J Steroid Biochem** 1985 Nov; 23(5B):849-54

Inhibition of sex-steroid hormone induced ornithine decarboxylase and poly(A)-polymerase activities by a GnRH agonist in the rat kidney. Prasad MS, et al. **J Steroid Biochem** 1985 Nov;23(5B):793-4

Direct inhibitory actions of GnRH on accessory reproductive organs of rat. Reddy PR, et al. **J Steroid Biochem** 1985 Nov;23(5B):819-22

The dominant role of amide group at C-terminus for recognition by antibody in primates against gonadotropin releasing hormone. Singh V, et al. **J Steroid Biochem** 1985 Nov;23(5B):801-2

Hormonal effects of GnRH agonist in the human male: an approach to male contraception using combined androgen and GnRH agonist treatment. Swerdloff RS, et al. **J Steroid Biochem** 1985 Nov; 23(5B):855-61

Immunobiology of gonadotropin-releasing hormone. Talwar GP. **J Steroid Biochem** 1985 Nov;23(5B):795-800 (37 ref.)

Species differences in the sensitivity to GnRH analogs. Thau RB, et al. **J Steroid Biochem** 1985 Nov;23(5B):811-7

Comparisons of the potential utility of LHRH agonists and antagonists for fertility control. Vickery BH. **J Steroid Biochem** 1985 Nov; 23(5B):779-91 (83 ref.)

Recent developments in female contraception: LHRH. Vijayan E. **J Steroid Biochem** 1985 Nov;23(5B):827-31

Luteinizing hormone releasing activity of [Gln8]-LHRH and [His5, Trp7, Tyr8]-LHRH in the cockerel, in vivo and in vitro. Chou HF, et al. **Life Sci** 1985 Dec 30;37(26):2459-65

Sexually dimorphic age-related changes in the distribution of immunoreactive luteinizing hormone releasing hormone in the platyfish. Schreibman MP, et al. **Mech Ageing Dev** 1985 Dec;33(1):29-37

The isolation and measurement of luteinizing hormone-releasing hormone (LHRH) from the rat testis. Hedger MP, et al. **Mol Cell Endocrinol** 1985 Sep;42(2):163-74

Effects of castration and maturational age of male rats on the process of copper-stimulated release of luteinizing hormone releasing hormone from median eminence explants: evidence that androgens increase the affinity of the copper-interactive sites for copper. Colombani-Vidal M, et al. **Neuroendocrinology** 1985 Dec;41(6):454-61

Luteinizing hormone releasing hormone enhances proceptivity in a primate. Kendrick KM, et al. **Neuroendocrinology** 1985 Dec; 41(6):449-53

FSH- and LH-releasing activity in the hypothalamus of female hamsters during proestrus and estrus: effects of arcuate nucleus lesions. Lamperti AA. **Neuroendocrinology** 1985 Nov;41(5):374-9

Neural signals for oxytocin and LH release. Dyer RG. **Oxf Rev Reprod Biol** 1985;7:223-60 (104 ref.)

Organization of LHRH cells: differential apposition of neurotensin, substance P and catecholamine axons. Hoffman GE. **Peptides (Fayetteville)** 1985 May-Jun;6(3):439-61

Multiple molecular forms of gonadotropin-releasing hormone in teleost fish brain. King JA, et al. **Peptides (Fayetteville)** 1985 Jul-Aug; 6(4):689-94

Neuronal responsiveness to gonadotropin-releasing hormone and its correlation with sexual receptivity in the rat. Rothfeld JM, et al. **Peptides (Fayetteville)** 1985 Jul-Aug;6(4):603-8

LH-RH antagonist inhibits gonadal steroid secretion in vitro. Spona J, et al. **Peptides (Fayetteville)** 1985 May-Jun;6(3):379-82

Effects of in vivo pretreatment with D-Trp-6-LH-RH on prolactin and LH secretion by pituitary glands in vitro. Torres-Alemán I, et al. **Peptides (Fayetteville)** 1985 Sep-Oct;6(5):993-5

Isolation of the gene and hypothalamic cDNA for the common precursor of gonadotropin-releasing hormone and prolactin release-inhibiting factor in human and rat. Adelman JP, et al. **Proc Natl Acad Sci USA** 1986 Jan;83(1):179-83

Characterization of pituitary calcium-activated, phospholipid-dependent protein kinase: redistribution by gonadotropin-releasing hormone. Naor Z, et al. **Proc Natl Acad Sci USA** 1985 Dec;82(23):8203-7

Inhibition of gonadotropin-induced granulosa cell differentiation by activation of protein kinase C. Shinohara O, et al. **Proc Natl Acad Sci USA** 1985 Dec;82(24):8518-22

Manipulation of the hypothalamo-pituitary gonadal axis in the juvenile rainbow trout: influence of pituitary transplantation and LHRH analogue treatment. Weil C, et al. **Reprod Nutr Dev** 1985; 25(5):895-907

[Peptidergic transmission and late slow EPSP in sympathetic ganglion cells] Jiang ZG. **Sneng Li Ko Hsueh Chin Chan** 1984 Oct; 15(4):301-5 **(Chi)**

LIPOTROPIN

Dermorphin reduces the metyrapone-evoked release of adrenocorticotropin, beta-endorphin, and beta-lipotropin in man. Degli Uberti EC, et al. **J Clin Endocrinol Metab** 1985 Dec;61(6):1018-22

[The study of opioid peptides in the normal menstrual cycle, pregnancy and labor] Takayama S, et al. **Nippon Sanka Fujinka Gakkai Zasshi** 1985 Sep;37(9):1813-9 (Eng. Abstr.) **(Jpn)**

LITHIUM

Diurnal variations in serum lithium and renal lithium clearance in rats given lithium as a single small dose or as multiple high doses. Olesen OV, et al. **Acta Pharmacol Toxicol (Copenh)** 1985 Sep;57(3):171-5

Lithium and hair texture. McCreadie RG, et al. **Acta Psychiatr Scand** 1985 Oct;72(4):387-8

Lithium and bulimia: the role of the dopaminergic and opiatergic systems [letter] Gillman MA, et al. **Am J Psychiatry** 1985 Dec; 142(12):1522-3

Using MMPI lithium response scales [letter] Lane JB. **Am J Psychiatry** 1985 Nov;142(11):1388-9

A comment on 'coyote control and taste aversion'. Burns RJ, et al. **Appetite** 1985 Sep;6(3):276-81

Coyote control and taste aversion: a predation problem or a people problem? Ellins SR. **Appetite** 1985 Sep;6(3):272-5

Research on forms of conditioned avoidance in coyotes. Lehner PN, et al. **Appetite** 1985 Sep;6(3):265-7

Coyote control and taste aversion. Quick DL, et al. **Appetite** 1985 Sep; 6(3):253-64

Brief comments on 'coyote control and taste aversion'. Wade DA. **Appetite** 1985 Sep;6(3):268-71

Lithium and RBC water permeability [letter] Ballast CL, et al. **Biol Psychiatry** 1985 Dec;20(12):1336-7

NMR chemistry analysis of red blood cell constituents in normal subjects and lithium-treated psychiatric patients. Domino EF, et al. **Biol Psychiatry** 1985 Dec;20(12):1277-83

Does lithium stabilize muscarinic receptors? [letter] Lerer B, et al. **Biol Psychiatry** 1985 Nov;20(11):1247-50

Interhelical effects on the low-frequency modes and phase transitions of Li- and Na-DNA. Demarco C, et al. **Biopolymers** 1985 Nov; 24(11):2035-40

Lithium in severe depression [letter] Fraser AA, et al. **Br J Psychiatry** 1985 Sep;147:324

Social support and long-term lithium outcome. O'Connell RA, et al. **Br J Psychiatry** 1985 Sep;147:272-5

Lithium potentiation of imipramine in treatment resistant depression [letter] Roy A, et al. **Br J Psychiatry** 1985 Nov;147:582-3

Response to sequential administration of clomipramine and lithium carbonate in treatment-resistant depression. Schrader GD, et al. **Br J Psychiatry** 1985 Nov;147:573-5

Plasma immunoglobulins in depressed and lithium-treated patients [letter] Wood K, et al. **Br J Psychiatry** 1985 Nov;147:581-2

Behavioural structure and mechanisms of anorexia: calibration of natural and abnormal inhibition of eating. Blundell JE, et al. **Brain Res Bull** 1985 Oct;15(4):371-6

Lithium effects on selected circadian rhythms in rats. McEachron DL, et al. **Brain Res Bull** 1985 Sep;15(3):347-50

Thermodynamic characterization of the partially denatured states of ribonuclease A in calcium chloride and lithium chloride. Ahmad F. **Can J Biochem Cell Biol** 1985 Oct;63(10):1058-63

Effect of fluoride, lithium or strontium on acid production by pelleted human dental plaque (short communication). Eisenberg AD, et al **Caries Res** 1985;19(5):454-7

Li as exogenous marker for urine volume determinations [letter] Larsen CE. **Clin Chem** 1986 Jan;32(1 Pt 1):222

Lithium suppresses hibernation in the Turkish hamster. Giedke H, et al. **Experientia** 1985 Nov 15;41(11):1391-2

Effect of long term lithium therapy on red blood cell choline transport in neutropenic patients. Falezza G, et al. **Haematologica (Pavia)** 1985 May-Jun;70(3):202-4

Production of LiF:Ti thermoluminescence dosimeter material. Aypar A, et al. **Int J Appl Radiat Isot** 1985 Jul;36(7):566-8

Lithium and impairment of renal concentrating ability. Miller AL, et al. **J Affective Disord** 1985 Sep;9(2):115-9

Lithium-carbamazepine versus lithium-neuroleptic prophylaxis in bipolar illness. Shukla S, et al. **J Affective Disord** 1985 Nov;9(3):219-22

Coupling of Li+ distribution to the plasma membrane potential of rat cortical synaptosomes. Schmalzing G. **J Biol Chem** 1986 Jan 15; 261(2):650-6

Mixed bipolar disorder responsive to lithium and clonazepam [letter] Adler LW. **J Clin Psychiatry** 1986 Jan;47(1):49-50

Lithium carbonate and the 'cycloid spectrum' [letter] Novae A. **J Clin Psychiatry** 1985 Nov;46(11):504-5

Failure of sulindac to increase serum lithium levels. Ragheb MA, et al. **J Clin Psychiatry** 1986 Jan;47(1):33-4

Ordinary conditions for indefinite continuation of lithium therapy [letter] Sandifer MG. **J Clin Psychiatry** 1985 Nov;46(11):505

Effective management with lithium of a persistent, post-traumatic hypomania in a 10-year-old child. Joshi P, et al. **J Dev Behav Pediatr** 1985 Dec;6(6):352-4

Resolution of the competitive inhibitory effects of lithium and AMPPNP on the beat frequency of ATP-reactivated, demembranated, sea urchin sperm flagella. Pate EF et al. **J Muscle Res Cell Motil** 1985 Aug; 6(4):507-12

Effects of chronic dietary lithium on behavioral indices of dopamine denervation supersensitivity in the rat. Swerdlow NR et al. **J Pharmacol Exp Ther** 1985 Nov;235(2):324-9

Reduction of temperature and lithium poisoning [letter] Follézou JY, et al. **N Engl J Med** 1985 Dec 19;313(25):1609

Striatal dopamine and motor activity changes observed shortly after lithium administration. Otero Losada ME, et al. **Naunyn Schmiedebergs Arch Pharmacol** 1985 Sep;330(3):169-74

Membranes, methylation and lithium responsive psychoses. Hitzemann R, et al. **Nutr Health** 1984;3(3):153-62

Lithium perhydroantamanide complex (2:1): exposure of the peptide backbone in the analog of antamanide with antitoxic impotency. Karle IL. **Proc Natl Acad Sci USA** 1985 Nov;82(21):7155-9

Prophylaxis and the lithium ratio in bipolar patients. Yassa R, et al. **Prog Neuropsychopharmacol Biol Psychiatry** 1985;9(4):423-8

Lithium attenuates the activation-euphoria but not the psychosis induced by d-amphetamine in schizophrenia. van Kammen DP, et al. **Psychopharmacology (Berlin)** 1985;87(1):111-5

Reduction of specific arginine-vasopressin binding sites of renal medulla membranes in lithium treated rats. Mitsui T, et al. **Res Commun Chem Pathol Pharmacol** 1985 Nov;50(2):201-8

[Lithium intoxication--report of 10 cases] Wang SY, et al. **Taiwan I Hsueh Hui Tsa Chih** 1985 Aug;84(8):960-8 (Eng. Abstr.) **(Chi)**

[Prophylactic efficacy of lithium in recurrent bipolar affective disorders] Yang YY, et al. **Taiwan I Hsueh Hui Tsa Chih** 1985 Jun; 84(6):722-6 (Eng. Abstr.) **(Chi)**

[Experience with lithiotherapy in psychoses in childhood and adolescence] Kadlecová B, et al. **Cesk Psychiatr** 1985 Oct;81(5):339-44 (Eng. Abstr.) **(Cze)**

[Lithium prophylaxis, o.k., but for how long?] Slooff CJ, et al. **Ned Tijdschr Geneeskd** 1985 Sep 7;129(36):1729-33 (Eng. Abstr.) **(Dut)**

[Effect of lithium, carbamazepine, ca-valproate and diazepam on changes in social isolation-induced behavior in mice] Oehler J, et al. **Biomed Biochim Acta** 1985;44(10):1523-30 (Eng. Abstr.) **(Ger)**

[Effect of immunomodulators on the production of interleukin 2] Skotnicki AB. **Przegl Lek** 1985;42(7):573-9 (Eng. Abstr.) **(Pol)**

[Lithium in the human body] Fleishman DG, et al. **Fiziol Cheloveka** 1985 Nov-Dec;11(6):1020-5 **(Rus)**

[The renin-angiotensin-aldosterone axis in patients treated with lithium carbonate] Lucas A, et al. **Med Clin (Barc)** 1985 Nov 16; 85(16):647-9 (Eng. Abstr.) **(Spa)**

LORAZEPAM

Beta-blockers and psychic stress: a double-blind, placebo-controlled study of bopindolol vs lorazepam and butalbital in surgical patients. Chierichetti SM, et al. **Int J Clin Pharmacol Ther Toxicol** 1985 Sep; 23(9):510-4

Lorazepam use and catatonic syndrome [letter] Peterson GN. **J Clin Psychopharmacol** 1985 Dec;5(6):359-60

MANIC DISORDER

Mania, clonidine, and dopamine [letter] Shen WW. **Am J Psychiatry** 1986 Jan;143(1):127

Drug treatment of bipolar depression and mania. Cookson JC. **Br J Hosp Med** 1985 Sep;34(3):172-5 (92 ref.)

Intramuscular haloperidol decanoate for neuroleptic maintenance therapy. arap Mengech HN, et al. **East Afr Med J** 1984 Jun;61(6):435-8

Tritiated imipramine binding to platelets in manic subjects. Lewis DA, et al. **J Affective Disord** 1985 Nov;9(3):207-11

Effective management with lithium of a persistent, post-traumatic hypomania in a 10-year-old child. Joshi P, et al. **J Dev Behav Pediatr** 1985 Dec;6(6):352-4

Treatment of mania using a calcium antagonist--preliminary trial. Caillard V. **Neuropsychobiology** 1985;14(1):23-6

MATERNAL BEHAVIOR

The importance of olfactory bulb noradrenalin for maternal recognition in sheep. Pissonnier D, et al. **Physiol Behav** 1985 Sep;35(3):361-3

MEMORY

ACTH 4-9 analogue (Org 2766) in depressed elderly patients. II. Effect on memory and vigilance. Frederiksen SO, et al. **Acta Psychiatr Scand** 1985 Oct;72(4):349-57

Age-related memory deficits in rats and mice: enhancement with peripheral injections of epinephrine. Sternberg DB, et al. **Behav Neural Biol** 1985 Sep;44(2):213-20

Epinephrine facilitation of appetitive learning: attenuation with adrenergic receptor antagonists. Sternberg DB, et al. **Behav Neural Biol** 1985 Nov; 44(3):447-53

Defective responsiveness of adenylate cyclase to forskolin in the Drosophila memory mutant rutabaga. Dudai Y, et al. **J Neurogenet** 1985 Dec;2(6):365-80

On-demand platform improves accuracy of the Morris water maze procedure. Burešova O, et al. **J Neurosci Methods** 1985 Oct; 15(1):63-72

Is cholinergic activity of the caudate nucleus involved in memory? Prado-Alcala RA. **Life Sci** 1985 Dec 9;37(23):2135-42 (61 ref.)

Effects of pesticides and drugs on working memory in rats: continuous delayed response. Heise GA, et al. **Pharmacol Biochem Behav** 1985 Oct; 23(4):591-8

Effects of pesticides and drugs on working memory in rats: continuous non-match. Heise GA, et al. **Pharmacol Biochem Behav** 1985 Oct; 23(4):599-605

Chronic administration of sulbutiamine improves long term memory formation in mice: possible cholinergic mediation. Micheau J, et al. **Pharmacol Biochem Behav** 1985 Aug;23(2):195-8

Adrenalectomy fails to alter radial maze performance of rats at retention intervals of 24 hours or less. Yongue BG, et al. **Physiol Behav** 1985 Oct;35(4):651-4

Comparative effects of cholinergic drugs and lesions of nucleus basalis or fimbria-fornix on delayed matching in rats. Dunnett SB. **Psychopharmacology (Berlin)** 1985;87(3):357-63

Adrenaline, emotional arousal and memory. Christianson SA, et al. **Scand J Psychol** 1985;26(3):237–48

[Memory--4. Physiological and biochemical studies in memory and learning] Yamamoto C. **Nippon Rinsho** 1985 Jul;43(7):1332–5 **(Jpn)**

[Importance of superslow activity of brain structures to the stability of engrams and the effects of neurotropic substances] Lapina IA. **Vestn Akad Med Nauk SSSR** 1985;(9):38–40 (Eng. Abstr.) **(Rus)**

[Delayed spatial choice in the monkey with different probabilities of signal presentation] Nikitin VS. **Zh Vyssh Nerv Deiat** 1985 Sep–Oct; 35(5):968–70 **(Rus)**

MENTAL DISORDERS

Attitude change concerning right to refuse treatment: the impact of experience. Binder RL, et al. **Am J Psychiatry** 1985 Nov; 142(11):1362–5

Demographic predictors of the use of injectable versus oral antipsychotic medications in outpatients. Price N, et al. **Am J Psychiatry** 1985 Dec; 142(12):1491–2

Prevention of drug abuse by promoting mental health among school students. Gazmuri-Plaza C, et al. **Bull Narc** 1985 Apr–Sep; 37(2–3):107–12

Psychiatrists and their prescribing practices. Falk WE, et al. **Compr Psychiatry** 1985 Nov–Dec;26(6):548–53

Psychotropic medication use in chronically mentally ill females [letter] Batey SR, et al. **Drug Intell Clin Pharm** 1985 Nov;19(11):844–5

Psychological considerations in the use of psychotropic drugs with women patients. Mogul KM. **Hosp Community Psychiatry** 1985 Oct; 36(10):1080–5

Carbamazepine treatment of a patient with Klüver–Bucy syndrome. Stewart JT. **J Clin Psychiatry** 1985 Nov;46(11):496–7

Imaging of [11C]-labelled Ro 15–1788 binding to benzodiazepine receptors in the human brain by positron emission tomography. Persson A, et al. **J Psychiatr Res** 1985;19(4):609–22

The provision of diazepam to psychiatric patients [letter] Hammett E. **Milit Med** 1985 Nov;150(11):625

Longisectional interaction structure analysis (LISA) in psychopharmacology and developmental psychopathology. Lienert GA, et al. **Neuropsychobiology** 1985;14(1):27–34

Problems in the development of neuropeptides as psychotherapeutic drugs. Manberg PJ. **Prog Clin Biol Res** 1985;192:343–8

Brain ventricular size and CSF monoamine metabolites in an adolescent inpatient population. Jennings WS Jr, et al. **Psychiatry Res** 1985 Oct; 16(2):87–94

Computer-assisted review of antipsychotics on acute care units. Molnar G, et al. **QRB** 1985 Sep;11(9):271–4

[Neuroleptics in psychogeriatrics. A proposal for a more rational prescription policy] Willekens-Bogaers MA, et al. **Tijdschr Gerontol Geriatr** 1985 Oct;16(5):179–89 (Eng. Abstr.) **(Dut)**

[The use of psychoactive drugs] Huttunen MO. **Duodecim** 1985; 101(17):1698–711 (82 ref.) **(Fin)**

[The future of biological psychiatry] Linnoila M. **Duodecim** 1985; 101(17):1732–7 **(Fin)**

[Results of psychiatric treatment] Lönnqvist J. **Duodecim** 1985; 101(17):1676–85 **(Fin)**

[Driving fitness. Decrement caused by psychiatric disease and psychopharmaceuticals] Ahlheim C. **Med Monatsschr Pharm** 1985 Oct; 8(10):304–5 **(Ger)**

MENTAL PROCESSES

Control of the human functional state. Medvedev VI, et al. **Hum Physiol** 1984 Sep–Oct;10(5):353–61

MEPROBAMATE

Treatment of meprobamate overdose with repeated oral doses of activated charcoal. Hassan E. **Ann Emerg Med** 1986 Jan;15(1):73–6

Effect of tranquilizers on the total acetylcholine content and acetylcholinesterase activity in the brain tissue of Arvicanthis niloticus. Fathi MM, et al. **Comp Biochem Physiol** [C] 1985;82(2):467–74

[Effect of diazepam, meprobamate and amizyl on the emotional reactions of the rabbit to hypothalamic stimulation] Davituliani DS, et al. **Zh Vyssh Nerv Deiat** 1985 Sep–Oct;35(5):952–6 (Eng. Abstr.) **(Rus)**

METHYLPHENIDATE

Dysthymia and attention deficit disorder in adults [letter] Mattes JA. **Am J Psychiatry** 1986 Jan;143(1):114–5

Obsessive–compulsive symptoms following stimulants [letter] Koizumi HM. **Biol Psychiatry** 1985 Dec;20(12):1332–3

Effect of methylphenidate pretreatment on the behavioral and biochemical responses to amphetamine. Kolta MG, et al. **Eur J Pharmacol** 1985 Nov 5;117(2):279–82

Methylphenidate for medical in-patients. Fisch RZ. **Int J Psychiatry Med** 1985–86;15(1):75–9

A developmental dose–response analysis of the effects of methylphenidate on the peer interactions of attention deficit disordered boys. Cunningham CE, et al. **J Child Psychol Psychiatry** 1985 Nov; 26(6):955–71

Gas chromatographic–mass spectrometric analysis of methylphenidate and p–hydroxymethylphenidate using deuterated internal standards. Patrick KS, et al. **J Chromatogr** 1985 Oct 11;343(2):329–38

Methylphenidate in mild depression: a double-blind controlled trial. Mattes JA. **J Clin Psychiatry** 1985 Dec;46(12):525–7

Acute response to methylphenidate as a predictor of outcome of treatment with TCAs in the elderly. Spar JA, et al. **J Clin Psychiatry** 1985 Nov; 46(11):466–9

Psychostimulant treatment of depressive disorders secondary to medical illness. Woods SW, et al. **J Clin Psychiatry** 1986 Jan;47(1):12–5

Attention deficit disorder with hyperactivity: differential effects of methylphenidate on impulsivity. Rapport MD, et al. **Pediatrics** 1985 Dec;76(6):938–43

Neuropharmacology of methylphenidate and a neural substrate for childhood hyperactivity. Gualtieri CT, et al. **Psychiatr Clin North Am** 1985 Dec;8(4):875–92

METHYPRYLON

Pharmacokinetics of methyprylon following a single oral dose. Gwilt PR, et al. **J Pharm Sci** 1985 Sep;74(9):1001–3

METHYSERGIDE

Methysergide and spinal inhibition from electrical stimulation in the periaqueductal grey. Foong FW, et al. **Eur J Pharmacol** 1985 Oct 22; 116(3):239–48

Peripheral serotonin2 receptor blockade does not inhibit 5–hydroxytryptophan–induced aldosterone stimulation. Shenker Y, et al. **J Clin Endocrinol Metab** 1985 Dec;61(6):1201–4

MMPI

Using MMPI lithium response scales [letter] Lane JB. **Am J Psychiatry** 1985 Nov;142(11):1388–9

MOTION PERCEPTION

High thresholds for movement perception in schizophrenia may indicate abnormal extraneous noise levels of central vestibular activity. Wertheim AH, et al. **Biol Psychiatry** 1985 Nov;20(11):1197–210

MOTOR ACTIVITY

Pharmacological manipulations of the nucleus accumbens: effects on classically conditioned responses and locomotor activity in the cat. Wilson WJ, et al. **Acta Neurobiol Exp (Warsz)** 1985;45(3–4):91–105

Effect of a novel environment on locomotor hyperactivity of rats induced by apomorphine in the nucleus accumbens. Morgenstern R, et al. **Biomed Biochim Acta** 1985;44(10):1517–22

The effects of methyl beta-carboline–3–carboxylate on social interaction and locomotor activity when microinjected into the nucleus raphe dorsalis of the rat. Hindley SW, et al. **Br J Pharmacol** 1985 Nov; 86(3):753–61

Separation of the motor consequences from other actions of unilateral 6–hydroxydopamine lesions in the nigrostriatal neurones of rat brain. Hamilton MH, et al. **Brain Res** 1985 Dec 2;348(2):220–8

Contralateral circling behavior induced by intranigral microinjections of taurine and GABA in rats. Kamata K, et al. **Brain Res** 1985 Sep 23; 343(2):275–82

Rostral hypothalamic microinfusions of 5,7 dihydroxytryptamine produce anatomically and neurochemically selective depletions of hippocampal serotonin and increase the influence of estrogen and food deprivation on locomotor activity. Waldbillig RJ, et al. **Brain Res** 1985 Nov 11; 347(1):149–53

Behavioral, autonomic and motor effects of neuroleptic drugs in cats: motor impairment and aggression. Beleslin DB, et al. **Brain Res Bull** 1985 Sep;15(3):353–6

Dopamine-dependent contralateral circling induced by neurotensin applied unilaterally to the ventral tegmental area in rats. Holmes LJ, et al. **Brain Res Bull** 1985 Nov;15(5):537–8

Differential effects of chronic lead intoxication on circadian rhythm of ambulatory activity and on regional brain norepinephrine levels in rats. Shafiq-ur-Rehman, et al. **Bull Environ Contam Toxicol** 1986 Jan; 36(1):81–91

Suppression of PCP-induced behavioral arousal in the rat by yohimbine pretreatment. Byron K, et al. **Eur J Pharmacol** 1985 Nov 5; 117(2):271–3

Phospholipid liposomes potentiate the inhibitory effect of antidepressant drugs on immobility of rats in a despair test (constrained swim). Drago F, et al. **Eur J Pharmacol** 1985 Sep 24;115(2–3):179–84

SKF 38393 and apomorphine modify locomotion and exploration in rats placed on a holeboard by separate actions at dopamine D-1 and D-2 receptors. Fletcher GH, et al. **Eur J Pharmacol** 1985 Nov 19; 117(3):381–5

best copy available

MOTOR ACTIVITY

Phencyclidine binding sites in the nucleus accumbens and phencyclidine-induced hyperactivity are decreased following lesions of the mesolimbic dopamine system. French ED, et al. **Eur J Pharmacol** 1985 Oct 8;116(1-2):1-9

Prazosin: effect on psychomotor-stimulant cues and locomotor activity in mice. Snoddy AM, et al. **Eur J Pharmacol** 1985 Oct 22; 116(3):221-8

Glucocorticoids facilitate the retention of acquired immobility during forced swimming. Veldhuis HD, et al. **Eur J Pharmacol** 1985 Sep 24; 115(2-3):211-7

Quantitative differences in the pharmacological effects of (+)- and (-)-cathinone. Gugelmann R, et al. **Experientia** 1985 Dec 15; 41(12):1568-71

Carbon dioxide production by individual mice as an index of behavioral and metabolic activity. Bushnell PJ, et al. **Fundam Appl Toxicol** 1985 Oct;5(5):962-70

Analysis of the long-lasting antagonistic effect of caerulein on amphetamine hyperactivity in rats. Matsubara K, et al. **Jpn J Pharmacol** 1985 Aug;38(4):381-90

Transient responses of heart rate, arterial pressure, and head movement at the beginning of eating in awake cats. Matsukawa K, et al. **Jpn J Physiol** 1985;35(4):599-611

Biochemical and behavioral changes in rats after prolonged treatment with desipramine: interaction with p-chlorophenylalanine. Brunello N, et al. **Naunyn Schmiedebergs Arch Pharmacol** 1985 Oct;331(1):20-2

Bromocriptine potentiates the behavioural effects of directly and indirectly acting dopamine receptor agonists in mice. Jenkins OF, et al. **Naunyn Schmiedebergs Arch Pharmacol** 1985 Oct;331(1):7-11

Striatal dopamine and motor activity changes observeo shortly after lithium administration. Otero Losada ME, et al. **Naunyn Schmiedebergs Arch Pharmacol** 1985 Sep;330(3):169-74

Mesolimbic dopamine lesions produce an augmented behavioral response to enkephalin. Kalivas PW, et al. **Neuropharmacology** 1985 Oct; 24(10):931-6

Effects of drugs on neurotransmitter release: experiments in vivo and in vitro. Tapia R. **Neurosci Biobehav Rev** 1985 Fall;9(3):391-7 (64 ref.)

Kindling of dopaminergic pathways modifies the effect of substantia nigra lesions on rotational behaviour. Mintz M, et al. **Neurosci Lett** 1985 Oct 24;61(1-2):7-11

ACTH neuromodulation of the developing motor system and neonatal learning in the rat. Acker GR, et al. **Peptides (Fayetteville)** 1985; 6 Suppl 2:41-9

Behavioral investigation of the coexistence of substance P, corticotropin releasing factor, and acetylcholinesterase in lateral dorsal tegmental neurons projecting to the medial frontal cortex of the rat. Crawley JN, et al. **Peptides (Fayetteville)** 1985 Sep-Oct;6(5):891-901

Effects of corticotropin releasing factor on locomotor activity in hypophysectomized rats. Eaves M, et al. **Peptides (Fayetteville)** 1985 Sep-Oct;6(5):923-6

Different effects of apomorphine on climbing behavior and locomotor activity in three strains of mice. Cabib S, et al. **Pharmacol Biochem Behav** 1985 Oct;23(4):555-7

Operantly conditioned running: effects on brain catecholamine concentrations and receptor densities in the rat. de Castro JM, et al. **Pharmacol Biochem Behav** 1985 Oct;23(4):495-500

Locomotor effects of cocaine, cocaine congeners, and local anesthetics in mice. Reith ME, et al. **Pharmacol Biochem Behav** 1985 Nov; 23(5):831-6

The effects of thyrotropin releasing hormone on rats with lesions of the mesolimbic and nigrostriatal dopamine systems. Andrews JS, et al. **Physiol Behav** 1985 Jul;35(1):93-7

Mapping of contraversive and ipsiversive circling responses to ventral tegmental and substantia nigra electrical stimulation. Gratton A, et al. **Physiol Behav** 1985 Jul;35(1):61-5

The role of the midbrain reticular formation in the expression of two opposing nigral denervation syndromes. Vaccarino FJ, et al. **Physiol Behav** 1985 Nov;35(5):749-52

Behavioral evidence for cholecystokinin modulation of dopamine in the mesolimbic pathway. Crawley JH. **Prog Clin Biol Res** 1985; 192:131-8

Behavioral effects of cholecystokinin and its related peptides in rats. Itoh S, et al. **Prog Clin Biol Res** 1985;192:139-45

Effects of cholecystokinin and vasoactive intestinal peptide on locomotion and rearing in neofrontal decorticated rats. Katsuura G, et al. **Prog Clin Biol Res** 1985;192:147-50

Depletion of brain serotonin by 5,7-dihydroxytryptamine alters the response to amphetamine and the habituation of locomotor activity in rats. Gately PF, et al. **Psychopharmacology (Berlin)** 1985;87(4):400-5

A stimulatory effect of intraaccumbens injections of noradrenaline on the behavior of rats in the forced swim test. Plaznik A, et al. **Psychopharmacology (Berlin)** 1985;87(1):119-23

Comparison of motor activity measured by two different methods: optical and inductive systems. Diez-Noguera A, et al. **Rev Esp Fisiol** 1985 Sep;41(3):281-5

Partial insomnia, hyperactivity and hyperdipsia induced by repeated administration of toluene in rats: their relation to brain monoamine metabolism. Arito H, et al. **Toxicology** 1985 Oct;37(1-2):99-110

[Effect of hypobaric hypoxia on motor behavior in rats] Bucher U, et al. **Biomed Biochim Acta** 1985;44(7-8):1163-70 (Eng. Abstr.) **(Ger)**

[Effect of desaminoocta-pancreozymin on the locomotor activity of rats] Treptow K, et al. **Biomed Biochim Acta** 1985;44(10):1541-7 (Eng. Abstr.) **(Ger)**

[Development of reverse tolerance to the ambulation-increasing effect of ephedrine after repeated administration in mice] Hirabayashi M, et al. **Yakubutsu Seishin Kodo** 1985 Sep;5(3):231-41 (Eng. Abstr.) **(Jpn)**

MSH

GABAergic regulation of melanocyte-stimulating hormone secretion from the pars intermedia of Xenopus laevis: immunocytochemical and physiological evidence. Verburg-van Kemenade BM, et al. **Endocrinology** 1986 Jan;118(1):260-7

TRH analogue with C-terminal thioamide group. Synthesis, receptor binding, TSH-releasing activity and alpha-MSH-releasing activity. Kruszynski M, et al. **Experientia** 1985 Dec 15;41(12):1576-7

Absence of inhibitory dopaminergic control of the rabbit pituitary gland intermediate lobe. Schimchowitsch S, et al. **Neuroendocrinology** 1986; 42(1):71-4

Acetylation of alpha MSH and beta-endorphin by rat neurointermediate pituitary secretory granule-associated acetyltransferase. Gibson TR, et al. **Peptides (Fayetteville)** 1985 Jul-Aug;6(4):615-20

Regulation of biosynthesis and release of pars intermedia peptides in Rana ridibunda: dopamine affects both acetylation and release of alpha-MSH. Jenks BG, et al. **Peptides (Fayetteville)** 1985 Sep-Oct;6(5):913-21

Structure-activity studies with ACTH/alpha-MSH fragments on corticosteroid secretion of isolated zona glomerulosa and fasciculata cells. Szalay KS, et al. **Regul Pept** 1985 Jul;11(3):187-92

NEUROREGULATORS

Pharmacological manipulations of the nucleus accumbens: effects on classically conditioned responses and locomotor activity in the cat. Wilson WJ, et al. **Acta Neurobiol Exp (Warsz)** 1985;45(3-4):91-105

Neurotransmitter release by certain neuropeptides in the chicken retina. Bauer B, et al. **Acta Ophthalmol (Copenh)** 1985 Oct;63(5):581-7

Neurochemical regulation of the states of alertness. Gaillard JM. **Ann Clin Res** 1985;17(5):175-84 (59 ref.)

Development of sympathetic neurones in vivo: an investigation of the possible role of glucocorticosteroids in regulating transmitter type. Hill CE, et al. **Aust J Exp Biol Med Sci** 1985 Aug;63 (Pt 4):439-49

Polyamines appear to be second messengers in mediating Ca2+ fluxes and neurotransmitter release in potassium-depolarized synaptosomes. Iqbal Z, et al. **Biochem Biophys Res Commun** 1985 Dec 17; 133(2):563-73

Is there feedback regulation of neurotransmitter release by autoreceptors? Kalsner S. **Biochem Pharmacol** 1985 Dec 1;34(23):4085-97 (86 ref.)

Muscarinic receptors discriminated by pirenzepine are involved in the regulation of neurotransmitter release in rat nucleus accumbens. de Belleroche J, et al. **Br J Pharmacol** 1985 Oct;86(2):505-8

Neurochemical aspects of the Rett syndrome. Riederer P, et al. **Brain Dev** 1985;7(3):351-60

The role of putative excitatory amino acid neurotransmitters in the initiation of locomotion in the lamprey spinal cord. II. The effects of amino acid uptake inhibitors. Brodin L, et al. **Brain Res** 1985 Dec 23; 360(1-2):149-58

The role of putative excitatory amino acid neurotransmitters in the initiation of locomotion in the lamprey spinal cord. I. The effects of excitatory amino acid antagonists. Brodin L, et al. **Brain Res** 1985 Dec 23;360(1-2):139-48

Possible excitatory amino acid afferents to nucleus raphe dorsalis of the rat investigated with retrograde wheat germ agglutinin and D-[3H]aspartate tracing. Kalen P, et al. **Brain Res** 1985 Dec 23; 360(1-2):285-97

Estrogen effects on neuronal responsiveness to electrical and neurotransmitter stimulation: an in vitro study on the ventromedial nucleus of the hypothalamus. Kow LM, et al. **Brain Res** 1985 Nov 11;347(1):1-10

In vivo voltammetry: promise and perspective. Stamford JA. **Brain Res** 1985 Oct;357(2):119-35 (135 ref.)

Actions of feeding-relevant agents on hypothalamic glucose-responsive neurons in vitro. Kow LM, et al. **Brain Res Bull** 1985 Nov; 15(5):509-13

Neurotransmitters in the intestine of the Atlantic cod, Gadus morhua. Jensen J, et al. **Comp Biochem Physiol [C]** 1985;82(1):81-9

Transmitter expression and morphological development of embryonic medullary and mesencephalic raphe neurones after transplantation to the adult rat central nervous system. I. Grafts to the spinal cord. Foster GA, et al. **Exp Brain Res** 1985;60(3):427-44

Calcium diffusion models and transmitter release in neurons. Zucker RS. **Fed Proc** 1985 Dec;44(15):2950-2

Effects of putative neurotransmitters on release of prolactin from pituitary glands of the domestic fowl co-incubated with hypothalamic tissue. Hall TR, et al. **Gen Pharmacol** 1985;16(5):483-8

Cardiac calcium channels and their control by neurotransmitters and drugs. Trautwein W, et al. **J Am Coll Cardiol** 1985 Dec; 6(6):1409-16

Membrane retrieval by macropinocytosis in presynaptic terminals during transmitter release in cat sympathetic ganglia in situ. Kadota T, et al. **J Electron Microsc (Tokyo)** 1982;31(1):73-80

Endogenous opioids and related peptides: from molecular biology to clinical medicine. The Sir Henry Dale lecture for 1985. Imura H, et al. **J Endocrinol** 1985 Nov;107(2):147-57

A role for transglutaminase in neurotransmitter release by rat brain synaptosomes. Pastuszko A, et al. **J Neurochem** 1986 Feb; 46(2):499-508

Kainic acid differentially affects the synaptosomal release of endogenous and exogenous amino acidic neurotransmitters. Poli A, et al. **J Neurochem** 1985 Dec;45(6):1677-86

Mapping of transmitter-specific connections: simultaneous demonstration of anterograde degeneration and changes in the immunostaining pattern induced by lesions. Záborszky L, et al. **J Neurosci Methods** 1985 Sep; 14(4):255-66

Coexistence of high-affinity uptake mechanisms for putative neurotransmitter molecules in chick embryo retinal neurons in purified culture. Pessin M, et al. **J Neurosci Res** 1985;14(3):317-28

Adrenergic neurohumoral influences on FFA release from bone marrow adipose tissue. Tran MA, et al. **J Pharmacol** 1985 Apr-Jun; 16(2):171-9

Calcium entry and transmitter release at voltage-clamped nerve terminals of squid. Augustine GJ, et al. **J Physiol (Lond)** 1985 Oct;367:163-81

Neostigmine increases the size of subunits composing the quantum of transmitter release at mouse neuromuscular junction. Carlson CG, et al. **J Physiol (Lond)** 1985 Oct;367:489-502

Gonadotropin-releasing hormone as a paracrine hormone and neurotransmitter in extra-pituitary sites. Hsueh AJ, et al. **J Steroid Biochem** 1985 Nov;23(5B):757-64

Assessment of some transmitter actions in rat cerebellar slices. Flint RS, et al. **Life Sci** 1986 Jan 20;38(3):233-9

Phorbol ester, an activator of protein kinase C, enhances calcium-dependent release of sympathetic neurotransmitter. Wakade AR, et al. **Naunyn Schmiedebergs Arch Pharmacol** 1985 Oct; 331(1):122-4

Indices of neurotransmitter synthesis and release in aging sympathetic nervous system. Partanen M, et al. **Neurobiol Aging** 1985 Fall; 6(3):227-32

Properties of the uptake and release of neurotransmitter glutamate in cerebral cortical tissue of guinea pigs. Takagaki G, et al. **Neurochem Res** 1985 Aug;10(8):1059-69

Modification of the anticonvulsant activity of 2-amino-5-phosphonovalerate by agents affecting different neurotransmitter systems. Czuczwar SJ, et al. **Neuropharmacology** 1985 Oct;24(10):965-8

Basic and clinical aspects of adenosinergic neuromodulation. Marangos PJ, et al. **Neurosci Biobehav Rev** 1985 Fall;9(3):421-30 (135 ref.)

Effects of drugs on neurotransmitter release: experiments in vivo and in vitro. Tapia R. **Neurosci Biobehav Rev** 1985 Fall;9(3):391-7 (64 ref.)

Peptidergic efferents from the intercalated nuclei of the amygdala to the parabrachial nucleus in the rat. Moga MM, et al. **Neurosci Lett** 1985 Oct 24;61(1-2):13-8

Differential regulation of peptide and catecholamine characters in cultured sympathetic neurons. Kessler JA. **Neuroscience** 1985 Jul;15(3):827-39

Diffusion coefficients of neurotransmitters and their metabolites in brain extracellular fluid space. Rice ME, et al. **Neuroscience** 1985 Jul; 15(3):891-902

ACTH neuromodulation of the developing motor system and neonatal learning in the rat. Acker GR, et al. **Peptides (Fayetteville)** 1985; 6 Suppl 2:41-9

Substance K and substance P differentially modulate mesolimbic and mesocortical systems. Deutch AY, et al. **Peptides (Fayetteville)** 1985; 6 Suppl 2:113-22

Excitatory transmitter release induced by high concentrations of gamma-aminobutyric acid (GABA) in crayfish neuromuscular junctions. Finger W. **Pflugers Arch** 1985 Oct;405(3):265-73

Effects of Anemonia sulcata toxin II on presynaptic currents and evoked transmitter release at neuromuscular junctions of the mouse. Molgó J, et al. **Pflugers Arch** 1985 Dec;405(4):349-53

Studies on brain monoamine neurotransmitters in mice after prenatal exposure to barbiturate. Yanai J, et al. **Pharmacol Biochem Behav** 1985 Aug;23(2):215-9

Neurotransmitter effects on body temperature are modified with increasing age. Ferguson AV, et al. **Physiol Behav** 1985 Jun; 34(6):977-81

Effects of lipid peroxidation on neurotransmitters uptake by rat synaptosomes. Dabrowiecki Z, et al. **Pol J Pharmacol Pharm** 1985 May-Jun;37(3):325-31

Developmental neurochemistry: pharmacology and toxicology. Johnston MV. **Proc West Pharmacol Soc** 1985;28:311-3

Neurochemical relation between excitatory and inhibitory amino acids in hippocampus. Baba A, et al. **Prog Clin Biol Res** 1985;179:271-9

Pharmacological evidence for taurine as an inhibitory neurotransmitter in the cerebellum. Sakai Y, et al. **Prog Clin Biol Res** 1985; 179:313-9 (15 ref.)

Possible involvement of calmodulin in modulatory role of taurine in rat cerebral beta-adrenergic neurons. Segawa T, et al. **Prog Clin Biol Res** 1985;179:321-30

Distribution of non-opioid peptides in the mammalian CNS: relationship to monoamine neurotransmitter systems. Westlund KN. **Prog Clin Biol Res** 1985;192:395-402

Immunocytochemical and physiological identification of taurine neurons in the mammalian CNS. Wu JY, et al. **Prog Clin Biol Res** 1985; 179:261-70

Taurine on hippocampal slices: comparison to GABA and glycine, and antagonism by 4-aminopyridine. Zeise M. **Prog Clin Biol Res** 1985; 179:281-7

Neurotransmitters and their role in pulmonary physiology. Richardson J. **Recent Results Cancer Res** 1985;99:29-33

Neuromodulation of the cardiac vagus: comparison of neuropeptide Y and related peptides. Kilborn MJ, et al. **Regul Pept** 1985 Oct; 12(2):155-61

Effects of oxytocin and vasopressin in the central and in the autonomic nervous system. Interactions with other presumptive neurotransmitters. Dreifuss JJ, et al. **Regul Pept [Suppl]** 1985;4:165-71

[Circadian rhythm of central monoamine neurotransmitters in mammals] Ye WL. **Sheng Li Ko Hsueh Chin Chan** 1984 Oct;15(4):316-20 **(Chi)**

[The future of biological psychiatry] Linnoila M. **Duodecim** 1985; 101(17):1732-7 **(Fin)**

[Neuromediator mechanisms of regulating immune reactions in schizophrenics] Aliev NA. **Zh Nevropatol Psikhiatr** 1985; 85(9):1382-5 (Eng. Abstr.) **(Rus)**

[Neuromediator sensitivity of neurons of the reticular formation and orbital cortex in hungry and satiated rabbits] Borisova EV. **Zh Vyssh Nerv Deiat** 1985 Sep-Oct;35(5):907-13 (Eng. Abstr.) **(Rus)**

NEUROTENSIN

The effect of nephrectomy and ureter ligation on plasma neurotensin-like immunoreactivity levels in the conscious rat. Theodorsson-Norheim E, et al. **Acta Physiol Scand** 1985 Mar;123(3):269-72

Dexamethasone reduces fat-induced release of neurotensin in the rat. Theodorsson-Norheim E, et al. **Acta Physiol Scand** 1985 Mar; 123(3):331-3

Neurotensin-like immunoreactivity and neurotensin receptors in the rat hypothalamus and in the neurointermediate lobe of the pituitary gland. Goedert M, et al. **Brain Res** 1985 Dec 9;358(1-2):59-69

Behavioral and neurochemical effect of daily injection with neurotensin into the ventral tegmental area. Kalivas PW, et al. **Brain Res** 1985 Dec 9;358(1-2):70-6

The coexistence of two neuroactive peptides in a subpopulation of retinal amacrine cells. Li HB, et al. **Brain Res** 1985 Oct 14;345(1):176-80

Dopamine inhibition of neurotensin-induced increase in Ca2+ influx into rat pituitary cells. Memo M, et al. **Brain Res** 1985 Nov 18; 347(2):253-7

Characterization and autoradiographic distribution of neurotensin binding sites in the human brain. Sarrieau A, et al. **Brain Res** 1985 Dec 2; 348(2):375-80

Suppression of norepinephrine-elicited feeding by neurotensin: evidence for behavioral, anatomical and pharmacological specificity. Stanley BG, et al. **Brain Res** 1985 Sep 23;343(2):297-304

Dopamine-dependent contralateral circling induced by neurotensin applied unilaterally to the ventral tegmental area in rats. Holmes LJ, et al. **Brain Res Bull** 1985 Nov;15(5):537-8

The inhibitory effect of neurotensin on the motor activity of rabbit ileum: dependence on the ionic environment. Holzer P, et al. **Eur J Pharmacol** 1985 Nov 19;117(3):329-35

Neurotensin increases colonic motility. Thor K, et al. **Gastroenterology** 1986 Jan;90(1):27-31

Pupillary effects of neurotensin: structure-activity relationships. Hernandez DE, et al. **Neuropeptides** 1985 Dec;6(6):561-8

The chronotropic action of neurotensin in the guinea pig isolated heart. Bachelard H, et al. **Peptides (Fayetteville)** 1985 Sep-Oct;6(5):841-5

Organization of LHRH cells: differential apposition of neurotensin, substance P and catecholamine axons. Hoffman GE. **Peptides (Fayetteville)** 1985 May-Jun;6(3):439-61

The effects of neurotensin on gastrointestinal motility in rodents. Ayres EA, et al. **Proc West Pharmacol Soc** 1985;28:153-5

Actions and interactions of neurotensin on preoptic anterior hypothalamic neurons in vitro. Baldino F Jr, et al. **Prog Clin Biol Res** 1985; 192:409-21

Neuropeptide modulation of the behavioral effects of drugs. Barrett JE, et al. **Prog Clin Biol Res** 1985;192:37-50

Do neuropeptide systems mediate some of the effects of antipsychotic drugs? Bissette G, et al. **Prog Clin Biol Res** 1985;192:349-53

Characterization of the metabolism of substance P and neurotensin by human angiotensin I converting enzyme and 'enkephalinase'. Skidgel RA. **Prog Clin Biol Res** 1985;192:371-8

Release and degradation of neurotensin during perfusion of rat small intestine with lipid. Ferris CF, et al. **Regul Pept** 1985 Oct; 12(2):101-11

Neurotensin effect on calcium transport and dopamine release in rat striatum. Battaini F, et al. **Regul Pept [Suppl]** 1985;4:188-90

NEUROTIC DISORDERS

[Alprazolam vs. oxazepam in the treatment of anxious-neurotic patients] Pöldinger W. **Schweiz Rundsch Med Prax** 1985 Oct 29; 74(44):1199-203 (Eng. Abstr.) **(Ger)**

[Relation between the dynamics of EEG indices after a single dose of the tranquilizer phenazepam and its efficacy during a course of treatment of patients with borderline neuropsychological disorders] Uvarova LG, et al. **Zh Nevropatol Psikhiatr** 1985;85(11):1701-9 (Eng. Abstr.) **(Rus)**

NITRAZEPAM

Polarographic assay of nitrazepam formulations. Mishra AK, et al. **Analyst** 1985 Sep;110(9):1105-9

The effect of repeated doses of temazepam and nitrazepam on human psychomotor performance. Tedeschi G, et al. **Br J Clin Pharmacol** 1985 Oct;20(4):361-7

Age, sex, and nitrazepam kinetics: relation to antipyrine disposition. Greenblatt DJ, et al. **Clin Pharmacol Ther** 1985 Dec;38(6):697-703

NOMIFENSINE

Nomifensine for emotional incontinence in the elderly. Sandyk R, et al. **Clin Neuropharmacol** 1985;8(4):377-8

Nomifensine: an antidepressant with a difference? Ereshefsky L. **Clin Pharm** 1985 Nov-Dec;4(6):673-4

Trouble with nomifensine. **Drug Ther Bull** 1985 Dec 16;23(25):98-100

Dopaminergic drugs improve human visual contrast sensitivity. Domenici L, et al. **Hum Neurobiol** 1985;4(3):195-7

New nomifensine derivatives: synthesis and evaluation of central effects. Pozzo-Balbi T, et al. **Pharmazie** 1985 Aug;40(8):579-80

The responsiveness of the endogenous inhibitor of cAMP-dependent protein kinase to apomorphine in rat striatum after prolonged treatment with nomifensin. Szmigielski A, et al. **Pol J Pharmacol Pharm** 1985 May-Jun;37(3):285-93

Attenuated response to nomifensine in rats during a swim test following lesion of the habenula complex. Thornton EW, et al. **Psychopharmacology (Berlin)** 1985;87(1):81-5

NOREPINEPHRINE

Identification of an alpha-adrenoceptor binding inhibitor: possible implications in diabetes mellitus. Wider MD, et al. **Acta Diabetol Lat** 1985 Jul-Sep;22(3):263-9

Effect of rate of hemorrhage on sympathoadrenal catecholamine release in cats. Bereiter DA, et al. **Am J Physiol** 1986 Jan; 250(1 Pt 1):E69-75

Potentiation of hemorrhage-evoked catecholamine release by prior blood loss in cats. Bereiter DA, et al. **Am J Physiol** 1986 Jan; 250(1 Pt 1):E18-23

Alpha 2-noradrenergic feeding rhythm in paraventricular nucleus: relation to corticosterone. Bhakthavatsalam P, et al. **Am J Physiol** 1986 Jan; 250(1 Pt 2):R83-8

Interaction of prolactin with adrenal hormones in blood pressure regulation in rats. Mills DE, et al. **Am J Physiol** 1985 Dec; 249(6 Pt 1):E614-8

CSF noradrenaline and schizophrenia [letter] Kemali D, et al. **Am J Psychiatry** 1986 Jan;143(1):126-7

Exaggerated orthostatic responsivity of plasma norepinephrine in depression. Rudorfer MV, et al. **Arch Gen Psychiatry** 1985 Dec; 42(12):1186-92

Gabapentin decreases monoamine release without affecting acetylcholine release in the brain. Schlicker E, et al. **Arzneimittelforschung** 1985; 35(9):1347-9

Plasma norepinephrine, blood pressure and heart rate response to graded change in body position. Fiorica V, et al. **Aviat Space Environ Med** 1985 Dec;56(12):1166-71

Endocrine correlates of susceptibility to motion sickness. Kohl RL. **Aviat Space Environ Med** 1985 Dec;56(12):1158-65

Fatty acids and the control of adipocyte glycerolphosphate acyltransferase by noradrenaline [letter] Saggerson D, et al. **Biochem J** 1985 Oct 15; 231(2):495-6

Regulation of lipolysis during pregnancy and lactation in sheep. Response to noradrenaline and adenosine. Vernon RG, et al. **Biochem J** 1985 Sep 15;230(3):651-6

Accumulation of inositol phosphates and cyclic AMP in guinea-pig cerebral cortical preparations. Effects of norepinephrine, histamine, carbamylcholine and 2-chloroadenosine. Hollingsworth EB, et al. **Biochim Biophys Acta** 1985 Nov 20;847(2):207-16

Contributions of noradrenergic neurones of the locus coeruleus to the temporal damping of linear electrocortical waves. Wright JJ, et al. **Biol Cybern** 1985;52(6):351-6

The functional importance of cerebral noradrenergic processes for the activating action of nootropic drugs in the behavioural despair test in mice. Schmidt J. **Biomed Biochim Acta** 1985;44(5):755-61

Cold exposure or chronic noradrenaline treatment induces an increase in the calmodulin-like immunoreactivity of brown adipose tissue of rats. Mory G. **Biosci Rep** 1985 Aug;5(8):659-65

Mobilization of extracellularly bound Ca2+ during high K+ and norepinephrine stimulation of the rabbit aorta. Lodge NJ, et al. **Blood Vessels** 1985;22(5):234-43

Cholinesterase activity and exposure time to acetylcholine as factors influencing the muscarinic inhibition of [3H]-noradrenaline overflow from guinea-pig isolated atria. Fuder H, et al. **Br J Pharmacol** 1985 Dec;86(4):905-14

Dietary and pharmacological alterations in endogenous angiotensin II: effect on noradrenaline pressor responsiveness in the rat. Jones DR, et al. **Br J Pharmacol** 1985 Dec;86(4):889-97

Opposing alpha- and beta-adrenergic mechanisms mediate dose-dependent actions of noradrenaline on supraoptic vasopressin neurones in vivo. Day TA, et al. **Brain Res** 1985 Dec 9; 358(1-2):171-9

The action of norepinephrine in the dentate gyrus: beta-mediated facilitation of evoked potentials in vitro. Lacaille JC, et al. **Brain Res** 1985 Dec 9;358(1-2):210-20

Noradrenergic changes and memory loss in aged mice. Leslie FM, et al. **Brain Res** 1985 Dec 16;359(1-2):292-9

Clonidine and cortical plasticity: possible evidence for noradrenergic involvement. Nelson SB, et al. **Brain Res** 1985 Nov;355(1):39-50

Electrochemical stimulation of plasma LH and hypothalamic norepinephrine concentrations at short- and long-term intervals after hypothalamic knife cuts. Phelps CP, et al. **Brain Res** 1985 Nov 18; 347(2):328-35

Effect of phenytoin on [3H]norepinephrine release from synaptosomes. Pincus JH, et al. **Brain Res** 1985 Dec 2;348(2):387-90

Suppression of norepinephrine-elicited feeding by neurotensin: evidence for behavioral, anatomical and pharmacological specificity. Stanley BG, et al. **Brain Res** 1985 Sep 23;343(2):297-304

The effect of high-frequency electrical stimulation and norepinephrine on cyclic AMP levels in normal versus norepinephrine-depleted rat hippocampal slices. Stanton PK, et al. **Brain Res** 1985 Dec 9; 358(1-2):343-8

Sympathetic neurons grown in culture generate ATP by glycolysis: correlation between ATP content and [3H]norepinephrine uptake and storage. Wakade AR, et al. **Brain Res** 1985 Dec 16; 359(1-2):397-401

Effect of ventral noradrenergic bundle transection and locus coeruleus lesions on urinary 3-methoxy-4-hydroxyphenylethyleneglycol (MHPG) excretion in the rat. Weise VK, et al. **Brain Res** 1985 Dec 16;359(1-2):239-45

Efferent projections from the paraventricular nucleus mediating alpha 2-noradrenergic feeding. Weiss GF, et al. **Brain Res** 1985 Nov 18; 347(2):225-38

Tonic activity of medial preoptic norepinephrine mechanism for body temperature maintenance in sleeping and awake rats. Datta S, et al. **Brain Res Bull** 1985 Nov;15(5):447-51

Feeding behavior elicited by electrical stimulation of the lateral hypothalamic area in the rat: role of the adrenergic pathways and receptors. Homrich JG, et al. **Braz J Med Biol Res** 1985; 18(1):15-27

Differential effects of chronic lead intoxication on circadian rhythm of ambulatory activity and on regional brain norepinephrine levels in rats. Shafiq-ur-Rehman, et al. **Bull Environ Contam Toxicol** 1986 Jan; 36(1):81-91

The relationship between the thermogenic response of brown adipose tissue and age during noradrenaline infusion in the young rabbit. Harris WH, et al. **Can J Physiol Pharmacol** 1985 Oct;63(10):1215-20

Effects of (+/-)-sotalol, (+/-)-propranolol, and (-)-propranolol on norepinephrine release upon hepatic nerve stimulation in the dog liver in vivo. Yamaguchi N. **Can J Physiol Pharmacol** 1985 Nov; 63(11):1423-8

Comparative distribution of neuropeptide tyrosine-, vasoactive intestinal polypeptide-, substance P-immunoreactive, acetylcholinesterase-positive and noradrenergic nerves in the reproductive tract of the female rat. Papka RE, et al. **Cell Tissue Res** 1985;242(3):475-90

Immunohistochemical and biochemical study on the development of the noradrenaline- and adrenaline-storing cells of the adrenal medulla of the rat. Verhofstad AA, et al. **Cell Tissue Res** 1985;242(2):233-43

Correlation between refractory periods and activation-recovery intervals from electrograms: effects of rate and adrenergic interventions. Millar CK, et al. **Circulation** 1985 Dec;72(6):1372-9

Enhancement by norepinephrine of automaticity in sheep cardiac Purkinje fibers exposed to hypoxic glucose-free Tyrode's solution: a role for alpha-adrenoceptors? Mugelli A, et al. **Circulation** 1986 Jan; 73(1):180-8

Simultaneous determination of epinephrine and norepinephrine in urine by derivative synchronous fluorescence spectroscopy. Valcárcel M, et al. **Clin Chem** 1985 Nov;31(11):1790-4

Effects of exogenous catecholamines and exercise on plasma magnesium concentrations. Joborn H, et al. **Clin Endocrinol (Oxf)** 1985 Sep; 23(3):219-26

The distribution of catecholamines between platelets and plasma in normal human subjects. Smith CC, et al. **Clin Sci** 1985 Jul;69(1):1-6

Studies of contents of norepinephrine and 5-hydroxytryptamine in brain--I. Normal and cold exposure. Aly MS, et al. **Comp Biochem Physiol** [C] 1985;82(1):155-8

Epinephrine, norepinephrine and dopamine concentrations in amphibian brain. Cooney MM, et al. **Comp Biochem Physiol** [C] 1985; 82(2):395-7

The effects of adrenalectomy on the ontogenesis of brain: noradrenaline and dopamine content. Leret ML, et al. **Comp Biochem Physiol** [C] 1985;82(2):475-7

Studies of contents of norepinephrine and 5-hydroxytryptamine in brain--II. Effect of sodium barbitone and chlorpromazine. Rahman TA, et al. **Comp Biochem Physiol** [C] 1985;82(1):159-63

Release of catecholamines follows suckling or electrical stimulation of mammary nerve in lactating rats. Clapp C, et al. **Endocrinology** 1985 Dec;117(6):2498-504

Fusaric acid-induced elevation of homovanillic acid in the CSF as an index of brain noradrenaline synthesis. Elghozi JL, et al. **Eur J Pharmacol** 1985 Nov 19;117(3):363-7

Pharmacological characterization and regional distribution of alpha-noradrenergic binding sites of rat spinal cord. Giron LT Jr, et al. **Eur J Pharmacol** 1985 Sep 24;115(2-3):285-90

Dopamine but not norepinephrine or serotonin uptake inhibitors protect mice against neurotoxicity of MPTP. Melamed E, et al. **Eur J Pharmacol** 1985 Oct 8;116(1-2):179-81

Modification of behavioral response to intra-hippocampal injections of noradrenaline and adrenoceptor agonists by chronic treatment with desipramine and citalopram: functional aspects of adaptive receptor changes. Plaźnik A, et al. **Eur J Pharmacol** 1985 Nov 5; 117(2):245-52

Clonidine inhibits central noradrenergic neurons in unanesthetized cats. Reiner PB. **Eur J Pharmacol** 1985 Sep 24;115(2-3):249-57

Interaction of norepinephrine and superior cervical ganglion input in the rat pineal body. Reyes-Vazquez C, et al. **Exp Neurol** 1985 Dec; 90(3):522-8

Blockade of the pressor response to angiotensins I and II in the bullfrog, Rana catesbeiana. Harper RA, et al. **Gen Comp Endocrinol** 1985 Nov; 60(2):227-35

Interference of pentobarbital and thiopental with the vascular contraction and noradrenaline release in human cerebral arteries. Sánchez-Ferrer CF, et al. **Gen Pharmacol** 1985;16(5):469-73

Effect of aging on the response of the cerebral cortex to noradrenergic denervation. Harik SI, et al. **Gerontology** 1985;31(5):285-92

Neuropeptide Y (NPY)-like immunoreactivity in guinea pig uterus is reduced during pregnancy in parallel with noradrenergic nerves. Fried G, et al. **Histochemistry** 1985;83(5):437-42

Age-related augmentation of plasma catecholamines during dynamic exercise in healthy males. Fleg JL, et al. **J Appl Physiol** 1985 Oct; 59(4):1033-9

Effect of head-down tilt on basal plasma norepinephrine and renin activity in humans. Goldsmith SR, et al. **J Appl Physiol** 1985 Oct; 59(4):1068-71

Noradrenergic projections to the spinal cord and their role in cardiovascular control. Coote JH. **J Auton Nerv Syst** 1985 Nov; 14(3):255-62 (55 ref.)

Calcium and norepinephrine levels of rat salivary glands after terbutaline, dobutamine or isoproterenol. Schneyer CA. **J Auton Nerv Syst** 1985 Oct;14(2):191-200

Effects of chemical sympathectomy on dopamine and noradrenaline content of the dog gastrointestinal tract. Esplugues JV, et al. **J Auton Pharmacol** 1985 Sep;5(3):189-95

Irreversible inactivation of the beta-adrenoreceptor by a partial agonist. Evidence for selective loss of the agonist high affinity binding sites. Baker SP, et al. **J Biol Chem** 1985 Dec 15;260(29):15820-8

Insulin receptors and insulin modulation of norepinephrine uptake in neuronal cultures from rat brain. Boyd FT Jr, et al. **J Biol Chem** 1985 Dec 15;260(29):15880-4

Enhancement of norepinephrine biosynthesis by ascorbic acid in cultured bovine chromaffin cells. Levine M, et al. **J Biol Chem** 1985 Oct 25; 260(24):12942-7

Ascorbic acid regulation of norepinephrine biosynthesis in isolated chromaffin granules from bovine adrenal medulla. Levine M, et al. **J Biol Chem** 1985 Dec 15;260(29):15598-603

Regioselectivity of catechol O-methyltransferase. The effect of pH on the site of O-methylation of fluorinated norepinephrines. Thakker DR, et al. **J Biol Chem** 1986 Jan 5;261(1):178-84

Modification of the vasoconstrictor effects of noradrenaline and serotonin by the selective calcium antagonist PY 108-068 in the peripheral circulation of anesthetized cats. Hof RP, et al. **J Cardiovasc Pharmacol** 1985;7 Suppl 6:S53-60

Prejunctional alpha 2-adrenoceptors and norepinephrine release in the forearm of normal humans. Kiowski W, et al. **J Cardiovasc Pharmacol** 1985;7 Suppl 6:S144-8

Fluid temperature and volume dependence of the dissociated plasma epinephrine and norepinephrine response to drinking. Puddey IB, et al. **J Clin Endocrinol Metab** 1986 Feb;62(2):438-40

3-Phenyl-1-indanamines. Potential antidepressant activity and potent inhibition of dopamine, norepinephrine, and serotonin uptake. Bøgesø KP, et al. **J Med Chem** 1985 Dec;28(12):1817-28

Correlation of rates of calcium entry and release of endogenous norepinephrine in rat brain region synaptosomes. Daniell LC, et al. **J Neurochem** 1986 Jan;46(1):249-56

Neuroimmunomodulatory interactions of norepinephrine and serotonin. Walker RF, et al. **J Neuroimmunol** 1985 Nov;10(1):41-58 (91 ref.)

Noradrenergic modulation of cortical acetylcholine release is both direct and gamma-aminobutyric acid-mediated. Beani L, et al. **J Pharmacol Exp Ther** 1986 Jan;236(1):230-6

Measurement of thermodynamic parameters for norepinephrine contraction of isolated rabbit thoracic aorta. Raffa RB, et al. **J Pharmacol Exp Ther** 1985 Dec;235(3):596-600

A simplified liquid chromatography and electrochemical detection method for measurement of plasma noradrenaline. Brent PJ, et al. **J Pharmacol Methods** 1985 Nov;14(3):243-8

Noradrenaline and functional plasticity in kitten visual cortex: a re-examination. Adrien J, et al. **J Physiol (Lond)** 1985 Oct; 367:73-98

Direct observations of responses of mesenteric microcirculation of the rat to circulating noradrenaline. Hébert MT, et al. **J Physiol (Lond)** 1985 Nov;368:393-407

Presynaptic regulation by ACh of the NE mediated responses in the rat vas deferens. Miranda HF, et al. **J Recept Res** 1985;5(4):231-43

Acute increase of noradrenaline on vascular resistance in the corpus luteum of the pseudopregnant rat. Selstam G, et al. **J Reprod Fertil** 1985 Nov;75(2):351-6

Peripheral origin of plasma dopamine. Yoneda S, et al. **Jpn Circ J** 1985 Sep;49(9):1028-34

Plasma and brain catecholamines in experimental uremia: acute and chronic studies. Ali F, et al. **Life Sci** 1985 Nov 11;37(19):1757-64

Hepatic adrenoceptors involved in the glycogenolytic response to exogenous (-)-norepinephrine in the dog liver in vivo. Garceau D, et al. **Life Sci** 1985 Nov 25;37(21):1963-70

Attenuating effect of diazepam on stress-induced increases in noradrenaline turnover in specific brain regions of rats: antagonism by Ro 15-1788. Ida Y, et al. **Life Sci** 1985 Dec 30;37(26):2491-8

The calcium channel activator, Bay K 8644, enhances K+-evoked efflux of acetylcholine and noradrenaline from rat brain slices. Middlemiss DN. **Naunyn Schmiedebergs Arch Pharmacol** 1985 Oct;331(1):114-6

Depletion of noradrenaline in the hypothalamus reduces the febrile responses induced by prostaglandin E2, thyrotropin-releasing hormone and beta-endorphin in rats. Lin MT, et al. **Neuropharmacology** 1985 Nov;24(11):1039-42

The regulation of noradrenaline synthesis in central nerve terminals by autoreceptors and heteroreceptors in rat. Birch PJ, et al. **Neurosci Lett** 1985 Aug 30;59(2):197-202

Plasma norepinephrine, epinephrine and corticosterone stress responses to restraint in individual male and female rats, and their correlations. Livezey GT, et al. **Neurosci Lett** 1985 Nov 20;62(1):51-6

Norepinephrine depolarizes lateral horn cells of neonatal rat spinal cord in vitro. Ma RC, et al. **Neurosci Lett** 1985 Sep 30;60(2):163-8

Effects of noradrenaline on some potassium currents in CA1 neurones in rat hippocampal slices. Sah P, et al. **Neurosci Lett** 1985 Oct 10; 60(3):295-300

Noradrenaline mediates slow excitatory synaptic potentials in rat dorsal raphe neurons in vitro. Yoshimura M, et al. **Neurosci Lett** 1985 Nov 11;61(3):305-10

Presynaptic autoinhibition during rest and sodium-pump inhibition in isolated rat portal vein preparation. Török TL, et al. **Neuroscience** 1985 Oct;16(2):439-49

Cardiovascular effects of neuropeptide Y in the nucleus tractus solitarius of rats: relationship with noradrenaline and vasopressin. Carter DA, et al. **Peptides (Fayetteville)** 1985 May-Jun;6(3):421-5

ACTH 1-24-induced potentiation of norepinephrine contractile responses in aortic strips from spontaneously hypertensive (SH) and normotensive (WKY) rats. Vergona RA, et al. **Peptides (Fayetteville)** 1985 Jul-Aug; 6(4):581-4

Evidence of norepinephrine-mediated suppression of para-chlorophenylalanine-induced muricidal behavior. Pucilowski O, et al. **Pharmacol Res Commun** 1985 Oct;17(10):983-9

The effects of isolation, grouping and aggressive interactions on indole- and catecholamine levels and apparent turnover in the hypothalamus and midbrain of the male golden hamster. Payne AP, et al. **Physiol Behav** 1985 Jun;34(6):911-6

The importance of olfactory bulb noradrenalin for maternal recognition in sheep. Pissonnier D, et al. **Physiol Behav** 1985 Sep;35(3):361-3

Role of hypothalamic norepinephrine in control of meal patterns. Shor-Posner G, et al. **Physiol Behav** 1985 Aug;35(2):209-14

Mesolimbic noradrenaline but not dopamine is responsible for organization of rat behavior in the forced swim test and an anti-immobilizing effect of desipramine. Płaźnik A, et al. **Pol J Pharmacol Pharm** 1985 May-Jun; 37(3):347-57

Vasoactive intestinal polypeptide acts synergistically with norepinephrine to depress spontaneous discharge rate in cerebral cortical neurons. Ferron A, et al. **Proc Natl Acad Sci USA** 1985 Dec;82(24):8810-2

External Ca-independent release of norepinephrine by sympathomimetics and its role in negative feedback modulation. Vizi ES, et al. **Proc Natl Acad Sci USA** 1985 Dec;82(24):8775-9

Effects of dietary lipids on cardiovascular parameters in the conscious rat and adrenergic responses in isolated perfused organ systems. Dixon WR, et al. **Proc West Pharmacol Soc** 1985;28:19-22

Antagonism between norepinephrine and the Ca++ channel blockers nifedipine and verapamil in isolated guinea pig ventricle. Woods JP, et al. **Proc West Pharmacol Soc** 1985;28:11-4

The effects of L-threo-dihydroxyphenylserine on norepinephrine metabolism in rat brain. Semba J, et al. **Psychiatry Res** 1985 Aug; 15(4):319-26

Clinical studies of the effect of (+) and (-)-oxaprotiline upon noradrenaline uptake. Checkley SA, et al. **Psychopharmacology (Berlin)** 1985;87(1):116-8

A stimulatory effect of intraaccumbens injections of noradrenaline on the behavior of rats in the forced swim test. Płaźnik A, et al. **Psychopharmacology (Berlin)** 1985;87(1):119-23

Effects of carbamazepine on noradrenergic mechanisms in affectively ill patients. Post RM, et al. **Psychopharmacology (Berlin)** 1985; 87(1):59-63

The effect of peripheral noradrenaline depletion on responding on a schedule of differential reinforcement of low rates of response (DRL). Salmon P, et al. **Psychopharmacology (Berlin)** 1985;87(1):77-80

Psychoneuroendocrine stress responses and mood as related to the menstrual cycle. Collins A, et al. **Psychosom Med** 1985 Nov-Dec; 47(6):512-27

Galanin potentiates electrical stimulation and exogenous norepinephrine-induced contractions in the rat vas deferens. Ohhashi T, et al. **Regul Pept** 1985 Oct;12(2):163-71

Failure of branched-chain amino acids to affect synaptosomal uptake of norepinephrine and dopamine. Cobert BJ, et al. **Res Commun Chem Pathol Pharmacol** 1985 Dec;50(3):455-8

Effects of L-tyrosine on brain monoamines in rats given intravenous amphetamine. Smith DG, et al. **Subst Alcohol Actions Misuse** 1984-85; 5(6):293-8

[Adrenaline, noradrenaline and dopamine excretion and anxiety levels in surgical patients] Barham O, et al. **Arch Psychol (Frankf)** 1985; 137(4):291-5 (Eng. Abstr.) **(Ger)**

[Concentrations of external noradrenergic axonal networks in the area of type-III neuronal aggregates and dense capillary networks of the external submucosal plexus (Schabadasch's) in the pig small intestine] Stach W, et al. **Z Mikrosk Anat Forsch** 1985;99(4):617-26 (Eng. Abstr.) **(Ger)**

[Effects of colchicine on the actions of ADH, norepinephrine and forskolin on skin permeability of the frog] Svelto M, et al. **Boll Soc Ital Biol Sper** 1985 Jul 30;61(7):989-93 (Eng. Abstr.) **(Ita)**

[Excretion of catecholamines in relation to personality types A and B] Zaleska T, et al. **Pol Tyg Lek** 1985 Jul 15;40(28):781-3 (Eng. Abstr.) **(Pol)**

[Catecholamine content in the adrenals of rats developing under hypokinesia and muscle training] Abzalov RA. **Biol Nauki** 1985; (10):55-8 (Eng. Abstr.) **(Rus)**

[Analysis of the factors determining the change in cardiac output during administration of catecholamines] Osadchii LI, et al. **Biull Eksp Biol Med** 1985 Oct;100(10):387-90 (Eng. Abstr.) **(Rus)**

[Effect of prolonged interaction of mice with aggressive and submissive types of behavior on the concentration of serotonin, 5-hydroxyindoleacetic acid and noradrenalin in the brain] Kudriavtseva NN, et al. **Zh Vyssh Nerv Deiat** 1985 Sep-Oct;35(5):879-83 (Eng. Abstr.) **(Rus)**

NORMETANEPHRINE

Extractive acylation and mass spectrometric assay of 3-methoxytyramine, normetanephrine, and metanephrine in cerebrospinal fluid. Beck O, et al. **Anal Biochem** 1985 Sep;149(2):492-500

NORTRIPTYLINE

Cognitive therapy and pharmacotherapy for depression. Sustained improvement over one year. Simons AD, et al. **Arch Gen Psychiatry** 1986 Jan;43(1):43-8

CSF and plasma levels of nortriptyline and its 10-hydroxy metabolite. Nordin C, et al. **Br J Clin Pharmacol** 1985 Oct;20(4):411-3

Nortriptyline in attention deficit disorder [letter] Saul RC. **Clin Neuropharmacol** 1985;8(4):382-3

Plasma tyrosine/neutral amino acid ratio correlated with clinical response to nortriptyline in endogenously depressed patients. Møller SE, et al. **J Affective Disord** 1985 Nov;9(3):223-9

Extremely rapid hydroxylation of debrisoquine: a case report with implication for treatment with nortriptyline and other tricyclic antidepressants. Bertilsson L, et al. **Ther Drug Monit** 1985; 7(4):478-80

OBSESSIVE-COMPULSIVE DISORDER

Treatment outlines for the management of obsessive-compulsive disorders. The Quality Assurance Project. **Aust NZ J Psychiatry** 1985 Sep;19(3):240-53

Obsessive-compulsive disorder and serotonin: is there a connection? Insel TR, et al. **Biol Psychiatry** 1985 Nov;20(11):1174-88

Drug treatment of obsessive-compulsive disorder. Lelliott PT, et al. **Drugs** 1986 Jan;31(1):75-80

A comparison between the growth hormone responses to amphetamine and clonidine [letter] Siever LJ, et al. **Psychiatry Res** 1985 Sep; 16(1):79-82

OPIPRAMOL

Correlation between the rate of dissolution and absorption of opipramol from solid oral forms. Kanarkowski R, et al. **Mater Med Pol** 1985 Apr-Jun;17(2):85-7

ORGANIC MENTAL DISORDERS

Neurochemical aspects of the Rett syndrome. Riederer P, et al. **Brain Dev** 1985;7(3):351-60

Double-blind trial of suloctidil versus placebo in moderate to severe mental deterioration. Baro F, et al. **Pharmatherapeutica** 1985; 4(6):399-404

ORGANIC MENTAL DISORDERS, PSYCHOTIC

Treatment of mania using a calcium antagonist--preliminary trial. Caillard V. **Neuropsychobiology** 1985;14(1):23-6

OXAZEPAM

Severe withdrawal syndrome after substitution of a short-acting benzodiazepine for a long-acting benzodiazepine. Bond WS, et al. **Drug Intell Clin Pharm** 1985 Oct;19(10):742-4

Application of derivative-differential UV spectrophotometry for the determination of oxazepam or phenobarbitone in the presence of dipyridamole. el-Yazbi FA, et al. **J Pharm Belg** 1985 Jul-Aug; 40(4):244-8

Dose effect and preference comparison of diazepam and oxazepam. Griffiths RR, et al. **Natl Inst Drug Abuse Res Monogr Ser** 1984; 55:97-8

[Alprazolam vs. oxazepam in the treatment of anxious-neurotic patients] Pöldinger W. **Schweiz Rundsch Med Prax** 1985 Oct 29; 74(44):1199-203 (Eng. Abstr.) **(Ger)**

PARASYMPATHOMIMETICS

Myorelaxant effect of diazepam. Interactions with neuromuscular blocking agents and cholinergic drugs. Wali FA. **Acta Anaesthesiol Scand** 1985 Nov;29(8):785-9

Regulation of cerebrovascular gamma-glutamyltranspeptidase by adrenergic and cholinergic agonists. Grammas P, et al. **Biochem Pharmacol** 1985 Dec 1;34(23):4177-9

Cholinergic inhibition of follicle-stimulating hormone-induced progestin production by cultured rat granulosa cells. Kasson BG, et al. **Biol Reprod** 1985 Dec;33(5):1158-67

Cholinergic influences on the EMG oesophageal activity in the pigeon. Fileccia R, et al. **Boll Soc Ital Biol Sper** 1985 Sep 30;61(9):1357-63

The electrogenesis mechanism of hyperpolarizations induced by muscarinic agonists in hamster submandibular ganglion cells. Suzuki T, et al. **Bull Tokyo Dent Coll** 1985 Aug;26(3):153-7

A biochemical study of cholinergic-dopaminergic interactions in the central nervous system. De Souza H, et al. **Gen Pharmacol** 1985; 16(5):533-6

Characterization of cholinoreceptors in the rat urinary bladder by the use of agonists and antagonists of the cholinergic system. Adami M, et al. **J Auton Pharmacol** 1985 Sep;5(3):197-205

Distribution of central cholinergic neurons in the baboon (Papio papio). I. General morphology. Satoh K, et al. **J Comp Neurol** 1985 Jun 8; 236(2):197-214

Augmentation of cholinergic-mediated amylase release by forskolin in mouse parotid gland. Watson EL, et al. **Life Sci** 1985 Dec 30; 37(26):2531-7

Cholinergic and VIPergic effects on thyroid hormone secretion in the mouse. Ahrén B. **Peptides (Fayetteville)** 1985 Jul-Aug;6(4):585-9

The influence of neuropharmaca on the nasal glands. Preliminary report. Klaassen AB, et al. **Rhinology** 1985 Sep;23(3):191-4

[Possibilities of regulating uterine contractile function with adrenergic and cholinergic agents in an experiment] Pankratova VV, et al. **Akush Ginekol (Mosk)** 1985 Aug;(8):62-3 **(Rus)**

[Effect of M-cholinomimetics on nociceptive stimulation in the spinal cord] Nemirovskiĭ AIu. **Farmakol Toksikol** 1985 Sep-Oct;48(5):36-9 (Eng. Abstr.) **(Rus)**

PARGYLINE

Chronic clorgyline and pargyline increase apomorphine-induced stereotypy in the rat. Campbell IC, et al. **Pharmacol Biochem Behav** 1985 Dec;23(6):921-5

PENTOBARBITAL

Pentobarbital suppresses basal and reflexive pancreatic polypeptide release in dogs. Taborsky GJ Jr, et al. **Am J Physiol** 1985 Dec; 249(6 Pt 1):E577-83

The effect of pentobarbital on lidocaine toxicity and brainstem concentration. Mack RE Jr, et al. **Anesth Prog** 1985 Jul-Aug; 32(4):147-50

Interactions of gamma-aminobutyric acid (GABA), pentobarbital, and homopantothenic acid (HOPA) on internally perfused frog sensory neurons. Akaike N, et al. **Cell Mol Neurobiol** 1985 Sep;5(3):245-55

Interference of pentobarbital and thiopental with the vascular contraction and noradrenaline release in human cerebral arteries. Sánchez-Ferrer CF, et al. **Gen Pharmacol** 1985;16(5):469-73

Immediate effects of procaine and pentobarbital on placodal and non-placodal head ectoderm of the chick embryo in vitro. Rowlett KA, et al. **J Anat** 1985 Mar;140 (Pt 2):181-8

Determination of thiopental and pentobarbital in plasma using high-performance liquid chromatography. Houdret N, et al. **J Chromatogr** 1985 Oct 11;343(2):437-42

Intraseptal microinjections of substance P and analogs potentiate pentobarbital-induced narcosis and depression of hippocampal cholinergic activity. Zucker JR, et al. **J Pharmacol Exp Ther** 1985 Nov; 235(2):398-401

Influence of several bacterial and viral vaccines on hepatic drug metabolism in mice. Descotes J, et al. **Methods Find Exp Clin Pharmacol** 1985 Sep;7(9):481-3

Experimental assessment of the relative abuse liability of triazolam and pentobarbital. Roache JD, et al. **Natl Inst Drug Abuse Res Monogr Ser** 1984;55:106-10

Pentobarbital promotes bursts of gamma-aminobutyric acid-activated single channel currents in cultured mouse central neurons. Mathers DA. **Neurosci Lett** 1985 Sep 30;60(2):121-6

The prolonging effect of N,N'-diallylpentobarbital on the drug-induced sleep and motor incoordination. Yamamoto I, et al. **Res Commun Chem Pathol Pharmacol** 1985 Nov;50(2):209-19

Hemodialysis clearance of pentobarbital during continuous infusion. Wermeling D, et al. **Ther Drug Monit** 1985;7(4):485-7

PEPTIDES

Turns in peptides and proteins. Rose GD, et al. **Adv Protein Chem** 1985; 37:1-109 (383 ref.)

Actions of polypeptides at the neuromuscular junction. Wali FA. **Agents Actions** 1985 Sep;16(6):558-66

Reactions of nitrogen dioxide in aqueous model systems: oxidation of tyrosine units in peptides and proteins. Prütz WA, et al. **Arch Biochem Biophys** 1985 Nov 15;243(1):125-34

Hydrolysis of leucine enkephalin in the nasal cavity of the rat--a possible factor in the low bioavailability of nasally administered peptides. Hussain A, et al. **Biochem Biophys Res Commun** 1985 Dec 31;133(3):923-8

Progress in chronophysiology of peptide hormones with emphasis on clinical application of analogues. Angeli A, et al. **Chronobiologia** 1985 Jul-Sep;12(3):293-304

Peptide YY: metabolism and effect on pancreatic secretion in dogs. Pappas TN, et al. **Gastroenterology** 1985 Dec;89(6):1387-92

Plasma glucagon-immunoreactive components in early life in dogs. Ghiglione M, et al. **Horm Metab Res** 1985 Aug;17(8):387-90

Synthesis of peptide labelled with p-iodophenylalanine which corresponds to the first amphipathic region of apolipoprotein C-I. Harding DR, et al. **Int J Pept Protein Res** 1985 Aug;26(2):208-13

Current contributions of peptide synthesis to studies on brain-gut-skin triangle peptides. Yajima H, et al. **Int J Pept Protein Res** 1985 Oct; 26(4):337-61 (208 ref.)

The distribution of somatostatin-like immunoreactivity in the monkey hippocampal formation. Bakst I, et al. **J Comp Neurol** 1985 Jun 22; 236(4):423-42

Distribution of certain peptide-containing nerve fibres and endocrine cells in the gastrointestinal mucosa in five mammalian species. Keast JR, et al. **J Comp Neurol** 1985 Jun 15;236(3):403-22

Segmental distribution of peptide- and 5HT-like immunoreactivity in nerve terminals and fibers of the thoracolumbar sympathetic nuclei of the cat. Krukoff TL, et al. **J Comp Neurol** 1985 Oct 1; 240(1):103-16

Segmental distribution of peptide-like immunoreactivity in cell bodies of the thoracolumbar sympathetic nuclei of the cat. Krukoff TL, et al. **J Comp Neurol** 1985 Oct 1;240(1):90-102

Regeneration of peptide-containing retinofugal axons into the optic tectum with reappearance of a substance P-containing lamina. Kuljis RO, et al. **J Comp Neurol** 1985 Oct 1;240(1):1-15

Co-localization and characterization of immunoreactive peptides derived from two opioid precursors in guinea pig adrenal glands. Evans CJ, et al. **J Neurosci** 1985 Dec;5(12):3423-7

Release of pro-opiomelanocortin-derived peptides from the pars intermedia and pars distalis of the rat pituitary: effect of corticotrophin-releasing factor and somatostatin. Kraicer J, et al. **Neuroendocrinology** 1985 Nov;41(5):363-73

Aging and the blood-brain barrier: changes in the carrier-mediated transport of peptides in rats. Banks WA, et al. **Neurosci Lett** 1985 Oct 24;61(1-2):171-5

Peptidergic efferents from the intercalated nuclei of the amygdala to the parabrachial nucleus in the rat. Moga MM, et al. **Neurosci Lett** 1985 Oct 24;61(1-2):13-8

Peptides and feeding. Morley JE, et al. **Peptides (Fayetteville)** 1985; 6 Suppl 2:181-92 (183 ref.)

Further evidence that peptide histidine isoleucine (PHI) may function as a prolactin releasing factor in rats. Ohta H, et al. **Peptides (Fayetteville)** 1985 Jul-Aug;6(4):709-12

Serotonin and co-localized peptides: effects on spinal motoneuron excitability. White SR. **Peptides (Fayetteville)** 1985;6 Suppl 2:123-7

Cloning and sequence analysis of cDNA encoding urotensin I precursor. Ishida I, et al. **Proc Natl Acad Sci USA** 1986 Jan;83(2):308-12

Involvement of peptide histidine isoleucine (PHI) in prolactin secretion induced by serotonin in rats. Tojo K, et al. **Proc Soc Exp Biol Med** 1985 Dec;180(3):558-61

Peptide hormones and their possible functions in the normal and abnormal lung. Becker KL. **Recent Results Cancer Res** 1985;99:17-28

Occurrence and distribution of regulatory peptides in the respiratory tract. Polak JM, et al. **Recent Results Cancer Res** 1985;99:1-16

Effect of regulatory polypeptides on the substance P stimulated lower esophageal sphincter pressure in pigs. Aggestrup S. **Regul Pept** 1985 Sep;12(1):1-7

The subcellular distribution of peptides immunoreactive for the amino-terminal of pro-cholecystokinin in rat brain. Allard LR, et al. **Regul Pept** 1985 Sep;12(1):59-66

Galanin potentiates electrical stimulation and exogenous norepinephrine-induced contractions in the rat vas deferens. Ohhashi T, et al. **Regul Pept** 1985 Oct;12(2):163-71

Vasoactive intestinal peptide effects on GH3 pituitary tumor cells: high affinity binding, affinity labeling, and adenylate cyclase stimulation. Comparison with peptide histidine isoleucine and growth hormone-releasing factor. Wood CL, et al. **Regul Pept** 1985 Nov 7; 12(3):237-48

Peptide and amino acid electropharmacology of cultured mammalian central neurons and clonal pituitary cells. Barker JL, et al. **Regul Pept [Suppl]** 1985;4:14-22

Some ionic mechanisms of slow peptidergic neuronal excitation. Brown DA, et al. **Regul Pept [Suppl]** 1985;4:157-64

[The influence of viscosity-increasing pharmaceutic aids on the liberation of the peptide gonadotropin releasing hormone (GnRH) in solution] Lorenz D, et al. **Pharmazie** 1985 Sep;40(9):631-7 (Eng. Abstr.) **(Ger)**

[Determination of the secondary structure of proteins from circular dichroism spectra. IV. Contribution of aromatic amino acid residues into circular dichroism spectra of proteins in the peptide region] Bolotina IA, et al. **Mol Biol (Mosk)** 1985 Sep-Oct;19(5):1409-21 (Eng. Abstr.) **(Rus)**

[Regulatory mediators of the bone marrow--myelopeptides] Petrov RV, et al. **Vestn Akad Med Nauk SSSR** 1985;(8):58-62 (Eng. Abstr.) **(Rus)**

PERPHENAZINE

Perphenazine decanoate in sesame oil vs. perphenazine enanthate in sesame oil: a comparative study of pharmacokinetic properties and some clinical implications. Knudsen P, et al. **Acta Psychiatr Scand [Suppl]** 1985; 322:11-4

Perphenazine decanoate vs. perphenazine enanthate: efficacy and side effects in a 6 week double-blind, comparative study of 50 drug monitored psychotic patients. Knudsen P, et al. **Acta Psychiatr Scand [Suppl]** 1985;322:15-28

Pharmacokinetic implications of different oil vehicles used in depot neuroleptic treatment. Knudsen P, et al. **Acta Psychiatr Scand [Suppl]** 1985;322:7-10

Therapeutic advantages of monitoring plasma concentrations of perphenazine in clinical practice. Hansen LB, et al.

Psychopharmacology (Berlin) 1985;87(1):16-9

PERSONALITY DISORDERS

Treatment outlines for the management of obsessive-compulsive disorders. The Quality Assurance Project. **Aust NZ J Psychiatry** 1985 Sep;19(3):240-53

Personality diagnosis and illness diagnosis. Brown JH, et al. **Can J Psychiatry** 1985 Oct;30(6):428-33

PHENCYCLIDINE

The effect of the acetylcholine transport blocker 2-(4-phenylpiperidino) cyclohexanol (AH5183) on the subcellular storage and release of acetylcholine in mouse brain. Carroll PT. **Brain Res** 1985 Dec 9; 358(1-2):200-9

Effects of 4-(2-hydroxyethyl)-1-piperazine-ethanesulfonic acid (AH5183) on rat cortical synaptosome choline uptake, acetylcholine storage and release. Otero DH, et al. **Brain Res** 1985 Dec 16; 359(1-2):208-14

Suppression of PCP-induced behavioral arousal in the rat by yohimbine pretreatment. Byron K, et al. **Eur J Pharmacol** 1985 Nov 5; 117(2):271-3

Phencyclidine binding sites in the nucleus accumbens and phencyclidine-induced hyperactivity are decreased following lesions of the mesolimbic dopamine system. French ED, et al. **Eur J Pharmacol** 1985 Oct 8;116(1-2):1-9

Inhibition of phencyclidine percutaneous absorption by parenterally administered hypertonic saline. Bailey DN, et al. **J Anal Toxicol** 1985 Nov-Dec;9(6):267-8

Effect of phencyclidine on the metabolism of individual brain proteins. Koul O, et al. **J Neurochem** 1986 Feb;46(2):470-4

Phencyclidine and the dynamics of mouse brain histamine. Itoh Y, et al. **J Pharmacol Exp Ther** 1985 Dec;235(3):788-92

Treatment of phenylcyclohexylpyrrolidine (PHP) psychosis with haloperidol. Giannini AJ, et al. **J Toxicol Clin Toxicol** 1985; 23(2-3):185-9

The effects of the acute administration of phencyclidine hydrochloride (PCP) on the release of corticosterone, growth hormone and prolactin in the rat. Pechnick RN, et al. **Life Sci** 1986 Jan 20;38(3):291-6

Phencyclidine increases the affinity of dihydropyridine calcium channel antagonist binding in rat brain. Bolger GT, et al. **Naunyn Schmiedebergs Arch Pharmacol** 1985 Sep;330(3):227-34

Ketamine and phencyclidine cause a voltage-dependent block of responses to L-aspartic acid. Honey CR, et al. **Neurosci Lett** 1985 Oct 24; 61(1-2):135-9

Differences between calcium channel inhibitors in their effects on phencyclidine-induced behavioral stimulation in mice. Grebb JA, et al. **Pharmacol Biochem Behav** 1985 Oct;23(4):613-8

The effects of phencyclidine and ketamine on sensory thresholds and reaction times in the baboon. Lukas SE, et al. **Pharmacol Biochem Behav** 1985 Nov;23(5):743-7

Delta-9-tetrahydrocannabinol potentiates the disruptive effects of phencyclidine on repeated acquisition in monkeys. Thompson DM, et al. **Pharmacol Biochem Behav** 1985 Dec;23(6):1051-7

Cocaine potentiates the disruptive effects of phencyclidine on repeated acquisition in monkeys. Thompson DM, et al. **Pharmacol Biochem Behav** 1985 Nov;23(5):823-9

Discriminative stimulus properties and brain distribution of phencyclidine in rats following administration by injection and smoke inhalation. Wessinger WD, et al. **Pharmacol Biochem Behav** 1985 Oct; 23(4):607-12

Phencyclidine-induced dopamine-dependent behaviors in chronic haloperidol-treated rats. Yamaguchi K, et al. **Pharmacol Biochem Behav** 1985 Nov;23(5):803-9

Phencyclidine in low doses selectively blocks a presynaptic voltage-regulated potassium channel in rat brain. Bartschat DK, et al. **Proc Natl Acad Sci USA** 1986 Jan;83(1):189-92

Evidence for an endogenous peptide ligand and antagonist for PCP receptors. Contreras PC, et al. **Prog Clin Biol Res** 1985;192:495-8

Effects of cigarette smoke and 3-methylcholanthrene on the disposition of phencyclidine and its N-ethylamine analogue in the isolated perfused lung of rats. Law FC, et al. **Toxicology** 1985 Dec;37(3-4):275-84

PHENCYCLIDINE ABUSE

Management of PCP intoxication. Price WA, et al. **Am Fam Physician** 1985 Dec;32(6):115-8

Reserpine and phencyclidine-associated psychosis: three case reports. Berlant JL. **J Clin Psychiatry** 1985 Dec;46(12):542-4

PHENELZINE

Liquid chromatographic determination of inhibition of monoamine oxidase activity in platelet rich plasma of depressed patients treated with phenelzine. Gupta RN, et al. **Clin Chim Acta** 1985 Oct 31; 152(1-2):63-9

Switching monoamine oxidase inhibitors. True BL, et al. **Drug Intell Clin Pharm** 1985 Nov;19(11):825-7

Psychosis following phenelzine discontinuation [letter] **J Clin Psychopharmacol** 1985 Dec;5(6):360-1

Metabolism and pharmacokinetics of phenelzine: lack of evidence for acetylation pathway in humans. Robinson DS, et al. **J Clin Psychopharmacol** 1985 Dec;5(6):333-7

Bulimia and monoamine oxidase inhibitors: a predictor study. Hardy BW, et al. **Tex Med** 1985 Oct;81(10):39-42

PHENETHYLAMINES

Stereoselectivity and isoenzyme selectivity of monoamine oxidase inhibitors. Enantiomers of amphetamine, N-methylamphetamine and deprenyl. Robinson JB. **Biochem Pharmacol** 1985 Dec 1; 34(23):4105-8

[14C]-beta-phenethylamine, its distribution after administration by various routes to cats, and the effects of monoamine oxidase inhibitors. Garcha G, et al. **Br J Pharmacol** 1985 Dec;86(4):877-88

Prevention of dopaminergic toxicity of MPTP in mice by phenylethylamine, a specific substrate of type B monoamine oxidase. Melamed E, et al. **Br J Pharmacol** 1985 Nov;86(3):529-31

The enantiomers of SK&F 83566, a new selective D-1 dopamine antagonist, stereospecifically block stereotyped behaviour induced by apomorphine and by the selective D-2 agonist RU 24213. Molloy AG, et al. **Eur J Pharmacol** 1985 Oct 8;116(1-2):183-6

Increased life expectancy resulting from addition of L-deprenyl to Madopar treatment in Parkinson's disease: a longterm study. Birkmayer W, et al. **J Neural Transm** 1985;64(2):113-27

Effects of deuterium substitution on the catabolism of beta-phenylethylamine: an in vivo study. Dyck LE, et al. **J Neurochem** 1986 Feb;46(2):399-404

Deprenyl protects dopamine neurons from the neurotoxic effect of 1-methyl-4-phenylpyridinium ion. Mytilineou C, et al. **J Neurochem** 1985 Dec;45(6):1951-3

Effects of d-amphetamine and of beta-phenylethylamine on fixed interval responding maintained by self-regulated lateral hypothalamic stimulation in rats. Greenshaw AJ, et al. **Pharmacol Biochem Behav** 1985 Oct;23(4):519-23

Projection of an endocoid involved with schizophrenic reaction. Proctor CD, et al. **Prog Clin Biol Res** 1985;192:387-93

Effects of the putative D-1 antagonist SCH 23390 on stereotyped behaviour induced by the D-2 agonist RU24213. Pugh MT, et al. **Psychopharmacology (Berlin)** 1985;87(3):308-12

A rapid and sensitive procedure for the simultaneous analysis of beta-phenylethylamine and tranylcypromine in rat brain using trichloroacetylation and gas chromatography. Baker GB, et al. **Res Commun Chem Pathol Pharmacol** 1985 Sep;49(3):471-4

PHENOBARBITAL

Demonstration of H2O2 production in vivo during aminopyrine metabolism and phenobarbital induction. Premereur N, et al. **Arch Int Physiol Biochim** 1985 Sep;93(3):241-8

Initial rate of sodium taurocholate uptake in isolated elutriated hepatocytes from untreated and phenobarbital-treated rats. Willson RA, et al. **Biochem Pharmacol** 1985 Dec 15;34(24):4257-62

Characterization of testosterone 16 alpha-hydroxylase (I-P-450(16) alpha) induced by phenobarbital in mice. Devore K, et al. **Biochemistry** 1985 Sep 24;24(20):5632-7

Prenatal versus neonatal long-term effect of phenobarbital on mouse microsomal drug-oxidizing system. Yanai J, et al. **Biol Neonate** 1985; 48(5):269-73

Modulation of asialoglycoprotein receptor levels in rat liver by phenobarbital treatment. Evarts RP, et al. **Carcinogenesis** 1985 Dec; 6(12):1767-73

Free concentration of carbamazepine and carbamazepine-10,11-epoxide in children and adults. Influence of age and phenobarbitone co-medication. Riva R, et al. **Clin Pharmacokinet** 1985 Nov-Dec; 10(6):524-31

Neonatal population pharmacokinetics of phenobarbital derived from routine clinical data. Grasela TH Jr, et al. **Dev Pharmacol Ther** 1985; 8(6):374-83

Distribution of phenobarbital in whole blood during pregnancy and perinatally--an in vitro study. Wallin A, et al. **Eur J Clin Pharmacol** 1985;29(2):187-91

The structure of phenobarbital-inducible rat liver cytochrome P-450 isoenzyme PB-4. Production and characterization of site-specific antibodies. Frey AB, et al. **J Biol Chem** 1985 Dec 5; 260(28):15253-65

Effect of phenobarbital on adult rat liver cells treated with 3'-methyl-4-dimethylaminoazobenzene in primary culture. Miyazaki M, et al. **J Cancer Res Clin Oncol** 1985;110(3):191-5

High-performance liquid chromatographic analysis of 1-(beta-D-glucopyranosyl)phenobarbital in urine. Bhargava VO, et al. **J Chromatogr** 1985 Sep 13;343(1):219-23

Application of derivative-differential UV spectrophotometry for the determination of oxazepam or phenobarbitone in the presence of dipyridamole. el-Yazbi FA, et al. **J Pharm Belg** 1985 Jul-Aug; 40(4):244-8

Effect of phenobarbitone on the pharmacokinetics and tissue levels of amiodarone in the rat. Fruncillo RJ, et al. **J Pharm Pharmacol** 1985 Oct;37(10):729-31

Effect of phenobarbitone on the distribution and elimination of imipramine in rats. Lin TH, et al. **J Pharm Pharmacol** 1985 Oct;37(10):735-8

Cytochrome P-450 isoenzyme content and monooxygenase activities in rat liver: effect of ontogenesis and pretreatment by phenobarbital and 3-methylcholanthrene. Cresteil T, et al. **J Pharmacol Exp Ther** 1986 Jan;236(1):269-76

Barbiturates reduce human cerebral glucose metabolism. Theodore WH, et al. **Neurology** 1986 Jan;36(1):60-4

Benznidazole and nifurtimox nitroreductase activity in liver microsomes from male rats preinduced with phenobarbital or 3-methylcholanthrene. Aguilar EG, et al. **Res Commun Chem Pathol Pharmacol** 1985 Dec; 50(3):443-6

Effects of anticonvulsant drugs on brain cultures from chick embryos: a comparison with cultures from embryos treated in ovo. Sedowofia SK, et al. **Teratogenesis Carcinog Mutagen** 1985;5(3):205-17

Effect of pretreatment with cimeticine or phenobarbital on lipoperoxidation in carbon tetrachloride- and trichloroethylene-dosed rats. Cluet JL, et al. **Toxicology** 1986 Jan;38(1):91-102

[Pharmacokinetics of prednisone after oral administration in children with renal grafts. Changes induced by phenobarbital and renal insufficiency] Perignon F, et al. **Arch Fr Pediatr** 1985 Aug-Sep;42 Suppl 1:639-44 (Eng. Abstr.) **(Fre)**

[Modification of the saccharide structures of orosomuccid in rats stimulated by treatment with phenobarbital] Monnet D, et al. **C R Acad Sci [III]** 1985;301(5):151-6 (Eng. Abstr.) **(Fre)**

[Neonatal jaundice and enzyme induction therapy] Mizutani M, et al. **Nippon Rinsho** 1985 Aug;43(8):1763-71 **(Jpn)**

[Effects of phenobarbital on EEG and sensory evoked potentials in normal cat brain] Takaya M, et al. **No To Shinkei** 1985 Aug;37(8):785-90 (Eng. Abstr.) **(Jpn)**

[Induction of cytochrome P-450 forms in liver microsomes of rats in the early neonatal period after administration of phenobarbital and 3-methylcholanthrene] Guliaeva LF, et al. **Biokhimiia** 1985 Nov; 50(11):1817-24 (Eng. Abstr.) **(Rus)**

[Effect of phenobarbital and Benzonal on succinate and alpha-ketoglutarate oxidation by rat brain mitochondria] Khazanov VA, et al. **Biull Eksp Biol Med** 1985 Dec;100(12):692-4 (Eng. Abstr.) **(Rus)**

[Action of phenobarbital on bacterial luciferase of Photobacterium fischeri] Danilov VS. **Mikrobiologiia** 1985 Jul-Aug;54(4):587-91 (Eng. Abstr.) **(Rus)**

PHENOTHIAZINE TRANQUILIZERS

Radiosensitizing and radioprotective effects of phenothiazines. Maniar HS, et al. **Indian J Exp Biol** 1985 Feb;23(2):100-2

The effect of phenothiazine and dibenzazepine pretreatment on the metabolism of methamphetamine in rats. Mori M, et al. **J Pharm Pharmacol** 1985 Nov;37(11):819-20

PHENOTHIAZINES

A double blind study in out-patients with primary non-agitated depression treated with imipramine in combination with placebo, diazepam or dixyrazine. Feet PO, et al. **Acta Psychiatr Scand** 1985 Oct; 72(4):334-40

Inhibitory effect of phenothiazine derivatives on bone in vivo and osteoblastic cells in vitro. Komoda T, et al. **Biochem Pharmacol** 1985 Nov 1;34(21):3885-9

Electrophysiological effects of ethmozine in perfused rabbit hearts. Dresel PE, et al. **Can J Physiol Pharmacol** 1985 Nov;63(11):1418-22

Effects of the diethylamino analog of ethmozin (ethacizin) upon sympathetic and parasympathetic efferent activity to the canine heart. Hageman GR, et al. **J Pharmacol Exp Ther** 1986 Jan;236(1):75-9

Sensitive high performance liquid chromatographic analysis of ethmozin in plasma. Poirier JM. **Ther Drug Monit** 1985;7(4):439-41

[Comparative analysis of the action of 2 calmodulin inhibitors on the contractile function of the isolated heart] Kapel'ko VI, et al. **Fiziol Zh SSSR** 1985 Sep;71(9):1095-100 (Eng. Abstr.) **(Rus)**

PHENOXYBENZAMINE

The use of two alpha blocking agents, phenoxybenzamine and phentolamine, in ointment and injection form to improve skin flap survival in rats. Goshen J, et al. **Ann Plast Surg** 1985 Nov; 15(5):431-5

Functional involvement of vasopressin in the maintenance of systemic arterial blood pressures after phenoxybenzamine or phentolamine administration: studies in Long-Evans and Brattleboro rats. Winn MJ, et al. **J Pharmacol Exp Ther** 1985 Nov;235(2):500-5

The effect of phenoxybenzamine on histamine H1-receptor binding sites in dog frontal cortex membranes. Cook DA, et al. **Proc West Pharmacol Soc** 1985;28:213-5

PHENYLALANINE

Evolutionary implications of features of aromatic amino acid biosynthesis in the genus Acinetobacter. Byng GS, et al. **Arch Microbiol** 1985 Nov; 143(2):122-9

Synthesis of peptide labelled with p-iodophenylalanine which corresponds to the first amphipathic region of apolipoprotein C-I. Harding DR, et al. **Int J Pept Protein Res** 1985 Aug;26(2):208-13

Treatment of attention deficit disorder with DL-phenylalanine. Wood DR, et al. **Psychiatry Res** 1985 Sep;16(1):21-6

PHENYLPROPANOLAMINE

Are antihistamine-decongestants of value in the treatment of acute otitis media in children? Schnore SK, et al. **J Fam Pract** 1986 Jan; 22(1):39-43

PHENYTOIN

Phenytoin and acute mountain sickness on Mount Everest. Wohns RN, et al. **Am J Med** 1986 Jan;80(1):32-6

Effect of phenytoin on [3H]norepinephrine release from synaptosomes. Pincus JH, et al. **Brain Res** 1985 Dec 2;348(2):387-90

Frequency-dependent effects of phenytoin on frog junctional transmission: presynaptic mechanisms. Yaari Y, et al. **Brain Res** 1985 Oct 14;345(1):102-10

Enzyme immunochromatographic assay of phenytoin in capillary and venous blood compared with fluorescence polarization immunoassay of plasma from epileptic patients. Haidukewych D, et al. **Clin Chem** 1986 Jan;32(1 Pt 1):204

Free thyroxin and free triiodothyronine as measured by equilibrium dialysis and analog radioimmunoassay in serum of patients taking phenytoin and carbamazepine. Liewendahl K, et al. **Clin Chem** 1985 Dec;31(12):1993-6

On the interaction between phenytoin and digoxin. Rameis H. **Eur J Clin Pharmacol** 1985;29(1):49-53

Degeneration of granule cells following chronic phenytoin administration: an electron microscopic investigation of the mouse cerebellum. Volk B, et al. **Exp Neurol** 1986 Jan;91(1):60-70

Omeprazole inhibits oxidative drug metabolism. Studies with diazepam and phenytoin in vivo and 7-ethoxycoumarin in vitro. Gugler R, et al. **Gastroenterology** 1985 Dec;89(6):1235-41

The effect of phenytoin in vitro on normal human mononuclear cells and on human lymphoblastoid B cell lines of different Ig isotype specificities. Wangel AG, et al. **Immunobiology** 1985 Sep; 170(3):232-8

Urinary dihydrodiol metabolites of phenytoin: high-performance liquid chromatographic assay of diastereomeric composition. Maguire JH, et al. **J Chromatogr** 1985 Aug 9;342(2):323-32

Genetic variation in spontaneous and diphenylhydantoin-induced craniofacial malformations in mice. Brown KS, et al. **J Craniofac Genet Dev Biol [Suppl]** 1985;1:305-12

On the mechanism by which phenytoin blocks post-tetanic potentiation at the frog neuromuscular junction. Selzer ME, et al. **J Neurosci** 1985 Nov;5(11):2894-9

Alterations in tissue trace element and ascorbic acid metabolism in phenytoin-fed rats and mice. Dubick MA, et al. **J Nutr** 1985 Nov; 115(11):1481-7

Interaction of phenytoin and inflammation induces gingival overgrowth in rats. do Nascimento A, et al. **J Periodont Res** 1985 Jul; 20(4):386-91

Effects of phenytoin on field bursts of rat hippocampal slices in low-calcium solutions. Snow RW, et al. **Neuropharmacology** 1985 Sep; 24(9):915-7

The in vivo biosynthesis of embryonic proteins after maternal administration of phenytoin in the mouse. Hicks HE, et al. **Proc Soc Exp Biol Med** 1985 Dec;180(3):483-7

Effect of amiodarone on the pharmacokinetics of phenytoin, quinidine, and lidocaine in the rat. Fruncillo RJ, et al. **Res Commun Chem Pathol Pharmacol** 1985 Dec;50(3):451-4

Effects of anticonvulsant drugs on brain cultures from chick embryos: a comparison with cultures from embryos treated in ovo. Sedowofia SK, et al. **Teratogenesis Carcinog Mutagen** 1985;5(3):205-17

A new approach to establishing individualized maintenance doses of phenytoin. Bachmann K, et al. **Ther Drug Monit** 1985;7(4):391-400

[Unjustified exclusion of donor kidneys after phenytoin treatment? (letter)] Oldenkott P, et al. **Dtsch Med Wochenschr** 1985 Nov 22; 110(47):1834-5 **(Ger)**

[Gingival hyperplasia and diphenylhydantoin] Barone GP, et al. **Parodontol Stomatol (Nuova)** 1984 Sep-Dec;23(3 Suppl 3):149-55**(Ita)**

[Comparison of i-PiT, TDX and EMIT measurement of serum phenytoin and digoxin levels] Koizumi F, et al. **Rinsho Byori** 1985 Jul; 33(7):761-70 (29 ref.) **(Jpn)**

PHOBIC DISORDERS

Predicting treatment preferences for agoraphobia. Norton GR, et al. **Behav Res Ther** 1985;23(6):699-701

PHYSOSTIGMINE

Physostigmine: an antidote for excessive central nervous system depression or paradoxical rage reactions resulting from intravenous diazepam. Jastak JT. **Anesth Prog** 1985 May-Jun;32(3):87-92

Physostigmine as an antidote for poisoning by combination of thioridazine and trihexyphenidyl. Beilin B, et al. **Br J Clin Pract** 1985 Oct; 39(10):400-1

Acetylcholinesterase inhibition by eserine: rate constants of reaction. Part II. Brufani M, et al. **Ital J Biochem** 1985 Sep-Oct;34(5):328-40

Comparative effects of scopolamine and atropine in preventing cholinesterase inhibitor induced lethality. Janowsky DS, et al. **Milit Med** 1985 Dec;150(12):693-5

The reversible cholinesterase inhibitor physostigmine has channel-blocking and agonist effects on the acetylcholine receptor-ion channel complex. Shaw KP, et al. **Mol Pharmacol** 1985 Dec; 28(6):527-38

Bioavailability of oral physostigmine [letter] Whelpton R, et al. **N Engl J Med** 1985 Nov 14;313(20):1293-4

Effect of ambient temperature on thermoregulation in rats following preoptic/anterior hypothalamic injection of physostigmine. Fehlner KS, et al. **Neuropharmacology** 1985 Oct;24(10):993-7

Facilitation and inhibition of nicotinic transmission by eserine in the sympathetic ganglia of the rabbit. Mo N, et al. **Neuropharmacology** 1985 Nov;24(11):1093-101

Methamphetamine, physostigmine, atropine and mecamylamine: effects on force lever performance. Preston KL, et al. **Pharmacol Biochem Behav** 1985 Nov;23(5):781-8

Chin rub CRs are elicited by flavors associated with apomorphine, scopolamine, methscopolamine, physostigmine and neostigmine. Smith RJ, et al. **Pharmacol Biochem Behav** 1985 Oct;23(4):583-9

The effects of atropine, benactyzine, and physostigmine on a repeated acquisition baseline in monkeys. Penetar DM. **Psychopharmacology (Berlin)** 1985;87(1):69-76

[Physostigmine: an antidote in diazepam poisoning] Pedersen JE. **Ugeskr Laeger** 1985 Nov 4;147(45):3586-7 (Eng. Abstr.) **(Dan)**

PILOCARPINE

Effects of pilocarpine treatment and of electrical stimulation of the vagus nerve on the rat parathyroid gland, with special reference to the alteration of storage granules. Setoguti T, et al. **Acta Anat (Basel)** 1985; 124(1-2):16-25

Concentration-dependent precorneal loss of pilocarpine in rabbit eyes. Urtti A, et al. **Acta Ophthalmol (Copenh)** 1985 Oct;63(5):502-6

Pilocarpine concentrations in aqueous humor following single drop application. I. Effect of soft contact lenses. Ellis PP, et al. **Curr Eye Res** 1985 Oct;4(10):1041-7

gamma-Glutamyltranspeptidase activity of rat submandibular gland after pilocarpine stimulation. Isacsson G, et al. **Swed Dent J** 1985; 9(4):171-4

PITUITARY HORMONE RELEASING HORMONES

The role of endogenous gonadotropin-releasing hormone in the control of luteinizing hormone and testosterone secretion in the juvenile male monkey, Macaca fascicularis. Cameron JL, et al. **Biol Reprod** 1985 Aug; 33(1):147-56

Active immunization of gilts against gonadotropin-releasing hormone: effects on secretion of gonadotropins, reproductive function, and responses to agonists of gonadotropin-releasing hormone. Esbenshade KL, et al. **Biol Reprod** 1985 Oct;33(3):569-77

Does the seasonal increase in estradiol negative feedback prevent luteinizing hormone surges in anestrous ewes by suppressing hypothalamic gonadotropin-releasing hormone pulse frequency? Legan SJ, et al. **Biol Reprod** 1985 Aug;33(1):117-31

The influence of hGRF, CRF, TRH and LHRH on SRIF release from median eminence fragments. Aguila MC, et al. **Brain Res** 1985 Nov 25;348(1):180-2

Second meeting of the European Neuroendocrine Association. Hypophysiotropic peptides in basic and clinical neuroendocrinology. Milan, October 15-17, 1985. Abstracts. **J Endocrinol Invest** 1985; 8 Suppl 3:1-233

Hormonal responses to gonadotrophin releasing hormone during testicular development in male African green monkeys. Brady AG, et al. **J Med Primatol** 1985;14(6):293-304

Individual variations in FSH release after a GnRH challenge and relationship with semen output in young bulls. Abdel Malak G, et al. **J Reprod Fertil** 1985 Nov;75(2):345-50

Hormone responses to exogenous GnRH pulses in post-partum dairy cows. Peters AR, et al. **J Reprod Fertil** 1985 Nov;75(2):557-65

Influence of passive immunization against GnRH on pregnancy and parturition in the tammar wallaby, Macropus eugenii. Short RV, et al. **J Reprod Fertil** 1985 Nov;75(2):567-75

Increase in brain and pituitary radioimmunoassayable gonadotropin releasing hormone (GnRH) in the European silver eel treated with sexual steroid or human chorionic gonadotropin. Dufour S, et al. **Neuropeptides** 1985 Dec;6(6):495-502

Effects of gonadotropin-releasing hormone on the release of luteinizing hormone and follicle-stimulating hormone from bovine anterior pituitary cell cultures. Braun U, et al. **Zentralbl Veterinarmed [A]** 1985 Sep;32(8):594-605

[Hormonal response following the use of gonadotropin-releasing hormone, estradiol and gestil in sheep] Batzhargalin E. **Vet Med Nauki** 1985;22(9):60-6 (Eng. Abstr.) **(Bul)**

[Pregnancy provoked by pulsatile administration of gonadotropin-releasing hormone in 2 women with oligomenorrhea] Gandar R, et al. **Rev Fr Gynecol Obstet** 1985 Jan;80(1):39-41 (Eng. Abstr.) **(Fre)**

[The influence of viscosity-increasing pharmaceutic aids on the liberation of the peptide gonadotropin releasing hormone (GnRH) in solution] Lorenz D, et al. **Pharmazie** 1985 Sep;40(9):631-7 (Eng. Abstr.) **(Ger)**

[The pulsatile administration of releasing hormone (GnRH) for the treatment of hypothalamic amenorrhea] Urdl W, et al. **Wien Klin Wochenschr** 1985 Dec 6;97(23):883-6 (Eng. Abstr.) **(Ger)**

PITUITARY HORMONES

Melanin concentrating hormone (MCH) effects on teleost (Chrysiptera cyanea) melanophores. Oshima N, et al. **J Exp Zool** 1985 Aug; 235(2):175-80

[Dopamine, its regulation of hormone secretion and its clinical significance] Yoshimura M. **Rinsho Byori** 1985 May;33(5):509-12 **(Jpn)**

[Hypophyseal, thyroid and adrenal cortical hormone levels in the blood serum of newborn infants in the early neonatal period] Ametov AS, et al. **Pediatriia** 1985 Sep;(9):20-2 (Eng. Abstr.) **(Rus)**

PITUITARY HORMONES, ANTERIOR

Administration of low dose pulsatile gonadotropin-releasing hormone (GnRH) to GnRH-deficient men regulates free alpha-subunit secretion. Spratt DI, et al. **J Clin Endocrinol Metab** 1986 Jan;62(1):102-8

Effects of intravenous and intraventricular injection of antisera directed against corticotropin-releasing factor on the secretion of anterior pituitary hormones. Ono N, et al. **Proc Natl Acad Sci USA** 1985 Nov; 82(22):7787-90

PREDNISONE

Effects of ACTH and prednisone on mood: incidence and time of onset. Cameron OG, et al. **Int J Psychiatry Med** 1985-86;15(3):213-23

[Pharmacokinetics of prednisone after oral administration in children with renal grafts. Changes induced by phenobarbital and renal insufficiency] Perignon F, et al. **Arch Fr Pediatr** 1985 Aug-Sep;42 Suppl 1:639-44 (Eng. Abstr.) **(Fre)**

PROCHLORPERAZINE

Incompatibility of morphine sulfate and prochlorperazine edisylate in syringes [letter] Stevenson JG, et al. **Am J Hosp Pharm** 1985 Dec; 42(12):2651

Attenuation of cyclophosphamide-induced taste aversions in mice by prochlorperazine, delta 9-tetrahydrocannabinol, nabilone and levonantradol. Landauer MR, et al. **Pharmacol Biochem Behav** 1985 Aug;23(2):259-66

PROGESTERONE

Evidence for gamma-aminobutyric acid modulation of ovarian hormonal effects on luteinizing hormone secretion and hypothalamic catecholamine activity in the female rat. Adler BA, et al. **Endocrinology** 1986 Jan;118(1):91-7

In vitro study of the direct ovarian effects of gonadotropin-releasing hormone (GnRH) in the frogs, Rana pipiens and Rana catesbeiana. Hubbard GM, et al. **Gen Comp Endocrinol** 1985 Nov;60(2):154-61

The effects of estradiol and progesterone on the concentration of striatal dopamine and tyramine in ovariectomized mice. Yeung SC, et al. **Gen Pharmacol** 1985;16(5):517-9

The effects of steroid hormones and gonadotropins on in vitro placental conversion of pregnenolone to progesterone. Das NP, et al. **J Steroid Biochem** 1985 Oct;23(4):517-22

Effects of cannabinoids on progesterone release in cultures of rat luteal cells. Leung PC, et al. **Life Sci** 1985 Nov 4;37(18):1691-6

Intrahypothalamic effects of progestin agonists on estrous behavior and progestin receptor binding. Glaser JH, et al. **Physiol Behav** 1985 Jun; 34(6):871-7

[Metabolism of progesterone in fetal membranes. The effect of sex steroids and gonadotropin-releasing hormone on progesterone metabolism in fetal membranes] Hori D, et al. **Igaku Kenkyu** 1985 Jul;55(2):97-102 (Eng. Abstr.) **(Jpn)**

[Study on the direct inhibitory action of luteinizing hormone-releasing hormone on the steroidogenesis of cultured human corpus luteum cells] Okamoto S. **Nippon Sanka Fujinka Gakkai Zasshi** 1985 Oct; 37(10):2107-16 (Eng. Abstr.) **(Jpn)**

PROLACTIN

Serotonergic regulation of prolactin and growth hormone secretion in man. Lewis DA, et al. **Acta Endocrinol (Copenh)** 1985 Oct; 110(2):152-7

Interaction of prolactin with adrenal hormones in blood pressure regulation in rats. Mills DE, et al. **Am J Physiol** 1985 Dec; 249(6 Pt 1):E614-8

Prolactin involvement in regulation of testicular 5 alpha-reductase activity in the immature rat. Chase DJ, et al. **Biol Reprod** 1985 Oct; 33(3):637-43

Serotonergic influences on pituitary gland and hypothalamic induction of prolactin and luteinizing hormone release in the young turkey (Meleagris gallopavo). Fehrer SC, et al. **Biol Reprod** 1985 Dec; 33(5):1064-72

Neuroendocrine findings in a chronic cocaine abusers: a preliminary report. Gawin FH, et al. **Br J Psychiatry** 1985 Nov;147:569-73

Strain differences in pituitary prolactin content: relationship to number of hypothalamic dopamine neurons. Baker H, et al. **Brain Res** 1985 Dec 9;358(1-2):16-26

Effect of low-dose dopamine infusion on basal and stimulated TSH and prolactin concentrations in man. Connell JM, et al. **Clin Endocrinol (Oxf)** 1985 Aug;23(2):185-92

Dopamine: a prolactin-inhibiting hormone. Ben-Jonathan N. **Endocr Rev** 1985 Fall;6(4):564-89 (281 ref.)

Regulation of pituitary gonadotropin-releasing hormone (GnRH) receptors by pulsatile GnRH in female rats: effects of estradiol and prolactin. Duncan JA, et al. **Endocrinology** 1986 Jan;118(1):320-7

A complex noncoordinate regulation of alpha-lactalbumin and 25 K beta-casein by corticosterone, prolactin, and insulin in long term cultures of normal rat mammary cells. Ray DB, et al. **Endocrinology** 1986 Jan;118(1):393-407

Somatic growth in hypophysectomized pituitary-homografted rats is promoted by prolactin. Drago F, et al. **Experientia** 1985 Nov 15; 41(11):1442-4

Influence of cerebroventricular injection of dopamine on plasma prolactin and LH levels of postlaying and broody turkey hens. Hargis BM, et al. **Gen Comp Endocrinol** 1986 Jan;61(1):142-7

In vivo release of prolactin in Rana ridibunda following an intravenous injection of thyrotropin-releasing hormone. Kühn ER, et al. **Gen Comp Endocrinol** 1985 Oct;60(1):86-9

Effects of putative neurotransmitters on release of prolactin from pituitary glands of the domestic fowl co-incubated with hypothalamic tissue. Hall TR, et al. **Gen Pharmacol** 1985;16(5):483-8

Phospholipid metabolism and prolactin secretion in vitro. Canonico PL, et al. **Horm Res** 1985;22(3):164-71

Involvement of hypothalamic dopamine in the regulation of prolactin secretion. Reymond MJ, et al. **Horm Res** 1985;22(3):142-52 (76 ref.)

Prolactin and calcium metabolism in pregnant ewes. Barlet JP. **J Endocrinol** 1985 Nov;107(2):171-5

Increased dopaminergic inhibition of prolactin in the hypoprolactinaemic IPL nude rat. Cohen H, et al. **J Endocrinol** 1985 Dec;107(3):325-9

Sexual differentiation of prolactin responsiveness to thyrotropin releasing hormone (TRH) in the rat. Effects of postnatal testosterone on adenohypophyseal TRH receptor ontogenesis in male rats. Watanobe H, et al. **J Endocrinol Invest** 1985 Oct;8(5):459-64

Central effects of an antagonist and an antiserum to substance P on serum gonadotropin and prolactin secretion. Dees WL, et al. **Life Sci** 1985 Oct 28;37(17):1627-31

Inhibition of plasma prolactin in the rat by amantadine. Fayez M, et al. **Life Sci** 1985 Nov 18;37(20):1877-80

The effects of the acute administration of phencyclidine hydrochloride (PCP) on the release of corticosterone, growth hormone and prolactin in the rat. Pechnick RN, et al. **Life Sci** 1986 Jan 20;38(3):291-6

Effect of somatostatin on plasma prolactin. Lugari R, et al. **Minerva Endocrinol** 1985 Apr-Jun;10(2):79-82

Analysis by plaque assays of GH and prolactin release from individual cells in cultures of male pituitaries. Evidence for functional heterogeneity within rat mammotrope and somatotrope populations. Boockfor FR, et al. **Neuroendocrinology** 1986;42(1):64-70

Opioid kappa receptors and the secretion of prolactin (PRL) and growth hormone (GH) in the rat. II. GH and PRL release-inhibiting effects of the opioid kappa receptor agonists bremazocine and U-50,488. Krulich L, et al. **Neuroendocrinology** 1986;42(1):82-7

Dopaminergic modulation of the diethylstilbestrol-induced proliferation of the anterior pituitary gland of the Fisher 344 rat. Miyazaki K, et al. **Neuroendocrinology** 1985 Nov;41(5):405-8

Serotonergic stimulation of prolactin and corticosterone secretion is mediated by different pathways from the mediobasal hypothalamus. Van de Kar LD, et al. **Neuroendocrinology** 1985 Nov;41(5):380-4

Further evidence that peptide histidine isoleucine (PHI) may function as a prolactin releasing factor in rats. Ohta H, et al. **Peptides (Fayetteville)** 1985 Jul-Aug;6(4):709-12

Effects of in vivo pretreatment with D-Trp-6-LH-RH on prolactin and LH secretion by pituitary glands in vitro. Torres-Alemán I, et al. **Peptides (Fayetteville)** 1985 Sep-Oct;6(5):993-5

Involvement of peptide histidine isoleucine (PHI) in prolactin secretion induced by serotonin in rats. Tojo K, et al. **Proc Soc Exp Biol Med** 1985 Dec;180(3):558-61

Depot fluphenazine and plasma prolactin. Gift T, et al. **Prog Neuropsychopharmacol Biol Psychiatry** 1985;9(4):407-12

Dexamethasone increases plasma HVA but not MHPG in normal humans. Wolkowitz OM, et al. **Psychiatry Res** 1985 Oct;16(2):101-9

Cellular mechanisms for neurotensin receptor-mediated release of prolactin. Memo M, et al. **Regul Pept [Suppl]** 1985;4:200-2

PROMETHAZINE

Detachable cast pylon technique for rigid dressings on below-knee amputee patients. Bacon R, et al. **Arch Phys Med Rehabil** 1986 Jan; 67(1):56-8

PROPANEDIOLS

Formaldehyde metabolism by Escherichia coli. Carbon and solvent deuterium incorporation into glycerol, 1,2-propanediol, and 1,3-propanediol. Hunter BK, et al. **Biochemistry** 1985 Jul 16; 24(15):4148-55

Human embryo features that influence the success of cryopreservation with the use of 1,2 propanediol. Lassalle B, et al. **Fertil Steril** 1985 Nov;44(5):645-51

Interspecies variability in propylene glycol dinitrate-induced methemoglobin formation. Wyman JF, et al. **Toxicol Appl Pharmacol** 1985 Nov;81(2):203-12

PROPRANOLOL

Lack of effect of propranolol on the steady-state plasma levels of ketanserin. Trenk D, et al. **Arzneimittelforschung** 1985;35(8):1286-8

Study of propranolol binding to human alpha 1-acid glycoprotein by high-performance liquid chromatography. Soltés L, et al. **Biochem Pharmacol** 1985 Dec 15;34(24):4331-4

Contrasts between pindolol and propranolol concentration-response relationships. Carruthers SG, et al. **Br J Clin Pharmacol** 1985 Oct; 20(4):417-20

Interaction between cholinergic and adrenergic synapses of the rat subfornical organ and the thirst-inducing effect of angiotensin II. Saad WA, et al. **Braz J Med Biol Res** 1985;18(1):37-46

Effects of (+/-)-sotalol, (+/-)-propranolol, and (-)-propranolol on norepinephrine release upon hepatic nerve stimulation in the dog liver in vivo. Yamaguchi N. **Can J Physiol Pharmacol** 1985 Nov; 63(11):1423-8

Effects of betaxolol, propranolol, and atenolol on isoproterenol-induced beta-adrenoceptor responses. Riddell JG, et al. **Clin Pharmacol Ther** 1985 Nov;38(5):554-9

Biologic determinants of propranolol disposition: results from 1308 patients in the Beta-Blocker Heart Attack Trial. Walle T, et al. **Clin Pharmacol Ther** 1985 Nov;38(5):509-18

Haemodynamic effects of low and high doses of insulin during beta receptor blockade in dogs. Reikerås O, et al. **Clin Physiol** 1985 Oct; 5(5):455-67

Receptor binding of propranolol is the missing link between plasma concentration kinetics and the effect-time course in man. Wellstein A, et al. **Eur J Clin Pharmacol** 1985;29(2):131-47

Effect of ascorbic acid and adrenergic receptor blockers on adrenaline induced in vitro follicular atresia in white Leghorn hens. Moudgal RP, et al. **Indian J Exp Biol** 1985 Jun;23(6):343-4

Rapid and simultaneous extraction of propranolol, its neutral and basic metabolites from plasma and assay by high-performance liquid chromatography. Harrison PM, et al. **J Chromatogr** 1985 Oct 11; 343(2):349-58

Dose-dependent presystemic elimination of propranolol due to hepatic first-pass metabolism in rats. Iwamoto K, et al. **J Pharm Pharmacol** 1985 Nov;37(11):826-8

Attempts to use cyanide ion to trap imine intermediates in the microsomal N-dealkylation of propranolol: formation of alpha-aminonitriles as artifacts when using ether for extraction. Shetty HU, et al. **J Pharm Sci** 1985 Sep;74(9):968-71

Population study of poor debrisoquine-type metabolizers of propranolol among Japanese. Hayashi M, et al. **Jpn J Ophthalmol** 1985; 29(3):272-81

Kinetics of 1,2-dinitroglycerin following sustained release nitroglycerin: influence of propranolol and metoprolol. Ochs HR, et al. **Klin Wochenschr** 1985 Nov 15;63(22):1170-3

Once-daily propranolol [letter] Dunn JM, et al. **Lancet** 1985 Nov 23; 2(8465):1183

Ventilatory response to carbon dioxide and to isometric muscle contraction after administration of placebo, propranolol, mepindolol and salbutamol. Bosisio E, et al. **Respiration** 1985;48(2):116-21

Effect of propranolol on brain electrical activity during hyperbaric oxygenation in the rat. Torbati D. **Undersea Biomed Res** 1985 Dec; 12(4):423-9

[A population study of the poor metabolizers of the debrisoquine type in Japan] Hayashi M, et al. **Nippon Ganka Gakkai Zasshi** 1985 Aug; 89(8):983-90 (Eng. Abstr.) **(Jpn)**

PROSTAGLANDINS

Racial differences in renin, aldosterone, prostaglandin and kallikrein of normal male subjects. Lijnen P, et al. **Ann Soc Belg Med Trop** 1985 Sep;65(3):293-301

Changes in body temperature after administration of acetylcholine, histamine, morphine, prostaglandins and related agents: II. Clark WG, et al. **Neurosci Biobehav Rev** 1985 Fall;9(3):479-552 (741 ref.)

The role of prostaglandins in aldosterone and corticosterone secretion by isolated perfused rat zona glomerulosa cells. Hindawi RK, et al. **Prostaglandins Leukotrienes Med** 1985 Nov;20(2):121-8

The effect of pindolol on exercise-induced increase in plasma vasoactive prostanoids and catecholamines in healthy men. Laustiola K, et al. **Prostaglandins Leukotrienes Med** 1985 Nov;20(2):111-20

PSYCHIATRY

Attitude change concerning right to refuse treatment: the impact of experience. Binder RL, et al. **Am J Psychiatry** 1985 Nov; 142(11):1362-5

Psychiatrists and their prescribing practices. Falk WE, et al. **Compr Psychiatry** 1985 Nov-Dec;26(6):548-53

PSYCHOLOGICAL TESTS

[Correlation between serum levels of amitriptyline and the Hamilton scale of depression using high-pressure liquid chromatography] Cruz Igartúa A, et al. **Bol Asoc Med PR** 1985 Sep;77(9):375-80 **(Spa)**

PSYCHOLOGY, EXPERIMENTAL

A comparison of different methods of assessing patterns of responding in discrete trial choice procedures. Sahgal A, et al. **Psychopharmacology (Berlin)** 1985;87(3):374-7

PSYCHOMOTOR PERFORMANCE

The effect of repeated doses of temazepam and nitrazepam on human psychomotor performance. Tedeschi G, et al. **Br J Clin Pharmacol** 1985 Oct;20(4):361-7

Effects of chronic benzodiazepine administration on neuropsychological performance. Bornstein RA, et al. **Clin Neuropharmacol** 1985; 8(4):357-61

Effect of beta-blockers on psychomotor performance in normal volunteers. Betts TA, et al. **Eur J Clin Pharmacol** 1985; 28 Suppl:39-49

Beta-blockers and psychometric performance: studies in normal volunteers. McDevitt DG. **Eur J Clin Pharmacol** 1985; 28 Suppl:35-8

Central effects in man of the novel schistosomicidal benzodiazepine meclonazepam. O'Boyle C, et al. **Eur J Clin Pharmacol** 1985; 29(1):105-8

The prolonging effect of N,N'-diallylpentobarbital on the drug-induced sleep and motor incoordination. Yamamoto I, et al. **Res Commun Chem Pathol Pharmacol** 1985 Nov;50(2):209-19

PSYCHOPATHOLOGY

Longisectional interaction structure analysis (LISA) in psychopharmacology and developmental psychopathology. Lienert GA, et al. **Neuropsychobiology** 1985;14(1):27-34

PSYCHOPHARMACOLOGY

Longisectional interaction structure analysis (LISA) in psychopharmacology and developmental psychopathology. Lienert GA, et al. **Neuropsychobiology** 1985;14(1):27-34

A microcomputer-based method for physiologically interpretable measurement of the rewarding efficacy of brain stimulation. Campbell KA, et al. **Physiol Behav** 1985 Sep;35(3):395-403

A comparison of different methods of assessing patterns of responding in discrete trial choice procedures. Sahgal A, et al. **Psychopharmacology (Berlin)** 1985;87(3):374-7

PSYCHOPHYSIOLOGIC DISORDERS

[Veralipride: treatment of climacteric disorders] Stockmann R. **Rev Fr Gynecol Obstet** 1985 Jun;80(6 Pt 2):495-9 **(Fre)**

PSYCHOPHYSIOLOGY

On-demand platform improves accuracy of the Morris water maze procedure. Burešová O, et al. **J Neurosci Methods** 1985 Oct; 15(1):63-72

A microcomputer-based method for physiologically interpretable measurement of the rewarding efficacy of brain stimulation. Campbell KA, et al. **Physiol Behav** 1985 Sep;35(3):395-403

PSYCHOSES, SUBSTANCE-INDUCED

Psychoses associated with bupropion treatment. Golden RN, et al. **Am J Psychiatry** 1985 Dec;142(12):1459-62

Another case of alprazolam withdrawal syndrome [letter] Vital-Herne J, et al. **Am J Psychiatry** 1985 Dec;142(12):1515

Reserpine and phencyclidine-associated psychosis: three case reports. Berlant JL. **J Clin Psychiatry** 1985 Dec;46(12):542-4

Psychosis following phenelzine discontinuation [letter] **J Clin Psychopharmacol** 1985 Dec;5(6):360-1

Treatment of phenylcyclohexylpyrrolidine (PHP) psychosis with haloperidol. Giannini AJ, et al. **J Toxicol Clin Toxicol** 1985; 23(2-3):185-9

Lithium attenuates the activation-euphoria but not the psychosis induced by d-amphetamine in schizophrenia. van Kammen DP, et al. **Psychopharmacology (Berlin)** 1985;87(1):111-5

PSYCHOTHERAPY

Psychotherapy of schizophrenia. What happens to treatment dropouts. Katz HM, et al. **J Nerv Ment Dis** 1984 Jun;172(6):326-31

[Treatment of psychoses] Tirkkonen A. **Duodecim** 1985; 101(17):1686-97 **(Fin)**

[Psychotherapy of psychotic patients] Bender W. **Nervenarzt** 1985 Sep; 56(9):465-71 (Eng. Abstr.) **(Ger)**

PSYCHOTHERAPY, GROUP

Prolixin group. Can nursing intervention groups lower recidivism? Selander JM, et al. **J Psychosoc Nurs Ment Health Serv** 1985 Nov; 23(11):16-20

PSYCHOTIC DISORDERS

Psychotic patients' understanding of informed consent. Irwin M, et al. **Am J Psychiatry** 1985 Nov;142(11):1351-4

Cholinergic processes in blood samples from patients with major psychiatric disorders. Jope RS, et al. **Biol Psychiatry** 1985 Dec; 20(12):1258-66

Rapid tranquilization: the efficacy of oral concentrate. Dubin WR, et al. **J Clin Psychiatry** 1985 Nov;46(11):475-8

Benzodiazepines in the management of psychotic agitation [letter] Modell JG. **J Clin Psychiatry** 1985 Nov;46(11):506

Lithium carbonate and the 'cycloid spectrum' [letter] Novae A. **J Clin Psychiatry** 1985 Nov;46(11):504-5

A clinical assessment of zuclopenthixol dihydrochloride (Clopixol tablets) in the treatment of psychotic illness. Mann BS, et al. **Pharmatherapeutica** 1985;4(6):387-92

[Present status and trends in drug dependence] Jiang ZN. **Chung Hua Shen Ching Ching Shen Ko Tsa Chih** 1985 Jun; 18(3):181-4 (16 ref.) **(Chi)**

[Experience with lithiotherapy in psychoses in childhood and adolescence] Kadlecová B, et al. **Cesk Psychiatr** 1985 Oct;81(5):339-44 (Eng. Abstr.) **(Cze)**

[Lithium prophylaxis, o.k., but for how long?] Slooff CJ, et al. **Ned Tijdschr Geneeskd** 1985 Sep 7;129(36):1729-33 (Eng. Abstr.) **(Dut)**

[Treatment of psychoses] Tirkkonen A. **Duodecim** 1985; 101(17):1686-97 **(Fin)**

[Psychotherapy of psychotic patients] Bender W. **Nervenarzt** 1985 Sep; 56(9):465-71 (Eng. Abstr.) **(Ger)**

[Preventive effect of valproic acid amide in affective diseases] Kłosiewicz L. **Psychiatr Pol** 1985 Jan-Feb;19(1):23-9 (Eng. Abstr.) **(Pol)**

QUINIDINE

Influence of quinidine on the intestinal secretion of digoxin and digitoxin in guinea pigs. Schäfer SG, et al. **Chem Biol Interact** 1985 Oct; 55(1-2):203-13

Quinidine-induced nephrotic syndrome. Chisholm JC Jr. **J Natl Med Assoc** 1985 Nov;77(11):920-2

Effect of amiodarone on the pharmacokinetics of phenytoin, quinidine, and lidocaine in the rat. Funcillo RJ, et al. **Res Commun Chem Pathol Pharmacol** 1985 Dec;50(3):451-4

[The interaction of antiarrhythmic drugs with other drugs] Yamaguchi I. **Kokyu To Junkan** 1985 Aug;33(8):956-69 (151 ref.) **(Jpn)**

REACTION TIME

The effects of phencyclidine and ketamine on sensory thresholds and reaction times in the baboon. Lukas SE, et al. **Pharmacol Biochem Behav** 1985 Nov;23(5):743-7

RECEPTORS, ADRENERGIC

Adrenergic receptors in depression. Effects of electroconvulsive therapy. Cooper SJ, et al. **Br J Psychiatry** 1985 Jul;147:23-9

Octopamine receptors in the molluscan aortic bulb: effects of clozapine and chlordimeform. Dougan DF, et al. **Comp Biochem Physiol** [C] 1985; 82(1):193-7

Modification of behavioral response to intra-hippocampal injections of noradrenaline and adrenoceptor agonists by chronic treatment with desipramine and citalopram: functional aspects of adaptive receptor changes. Płaźnik A, et al. **Eur J Pharmacol** 1985 Nov 5; 117(2):245-52

Fat cell adrenoceptors: inter- and intraspecific differences and hormone regulation. Lafontan M, et al. **Int J Obes** 1985;9 Suppl 1:117-27 (58 ref.)

Peripheral adrenoceptors and serotonin receptors in depression. Changes associated with response to treatment with trazodone or amitriptyline. Healy D, et al. **J Affective Disord** 1985 Nov;9(3):285-96

[Concentrations of external noradrenergic axonal networks in the area of type-III neuronal aggregates and dense capillary networks of the external submucosal plexus (Schabadasch's) in the pig small intestine] Stach W, et al. **Z Mikrosk Anat Forsch** 1985;99(4):617-26 (Eng. Abstr.) **(Ger)**

[Receptors on the platelet membrane] Watanabe K, et al. **Rinsho Byori** 1985 Jul;33(7):726-33 (22 ref.) **(Jpn)**

RECEPTORS, ADRENERGIC, ALPHA

Identification of an alpha-adrenoceptor binding inhibitor: possible implications in diabetes mellitus. Wider MD, et al. **Acta Diabetol Lat** 1985 Jul-Sep;22(3):263-9

Enhancement by norepinephrine of automaticity in sheep cardiac Purkinje fibers exposed to hypoxic glucose-free Tyrode's solution: a role for alpha-adrenoceptors? Mugelli A, et al. **Circulation** 1986 Jan; 73(1):180-8

Pharmacological characterization and regional distribution of alpha-noradrenergic binding sites of rat spinal cord. Giron LT Jr, et al. **Eur J Pharmacol** 1985 Sep 24;115(2-3):285-90

Alpha 2-adrenoceptor coupling to adenylate cyclase in adrenaline insensitive human platelets. Swart SS, et al. **Eur J Pharmacol** 1985 Oct 8;116(1-2):113-9

Phorbol esters inhibit alpha 1-adrenergic effects and decrease the affinity of liver cell alpha 1-adrenergic receptors for (-)-epinephrine. Corvera S, et al. **J Biol Chem** 1986 Jan 15;261(2):520-6

Prejunctional alpha 2-adrenoceptors and norepinephrine release in the forearm of normal humans. Kiowski W, et al. **J Cardiovasc Pharmacol** 1985;7 Suppl 6:S144-8

Renal alpha 2-adrenoceptors, their locations and effects on sodium excretion. Pettinger WA, et al. **J Cardiovasc Pharmacol** 1985; 7 Suppl 8:S24-7

Platelet alpha 2-adrenoceptor and adenylate cyclase in patients with anorexia nervosa and bulimia. Heufelder A, et al. **J Clin Endocrinol Metab** 1985 Dec;61(6):1053-60

Studies on the role of alpha 2-adrenoceptors in the control of synaptosomal [3H]5-hydroxytryptamine release: effects of antidepressant drugs. Ellison DW, et al. **J Neurochem** 1986 Jan; 46(1):218-23

Selective alpha-2 adrenoceptor blockade by SK&F 86466: in vitro characterization of receptor selectivity. Hieble JP, et al. **J Pharmacol Exp Ther** 1986 Jan;236(1):90-6

Relationship between alpha adrenoceptor occupancy and response for the alpha-1 adrenoceptor agonist, cirazoline, and the alpha-2 adrenoceptor agonist, B-HT 933, in canine saphenous vein. Ruffolo RR Jr, et al. **J Pharmacol Exp Ther** 1985 Dec;235(3):636-43

Platelet alpha 2-adrenoceptors in major depression: relationship with urinary 4-hydroxy-3-methoxyphenylglycol and age at onset. Sacchetti E, et al. **J Psychiatr Res** 1985;19(4):579-86

Hepatic adrenoceptors involved in the glycogenolytic response to exogenous (-)-norepinephrine in the dog liver in vivo. Garceau D, et al. **Life Sci** 1985 Nov 25;37(21):1963-70

Epinephrine-stimulated maintained rubidium efflux from guinea pig hepatocytes may involve alpha 1- and alpha 2-adrenoceptors. Henley JM. **Mol Pharmacol** 1985 Nov;28(5):431-5

Prenatal exposure of rats to antidepressant drugs down-regulates beta-adrenoceptors and 5-HT2 receptors in cerebral cortex. Lack of correlation between 5-HT2 receptors and serotonin-mediated behaviour. De Ceballos ML, et al. **Neuropharmacology** 1985 Oct; 24(10):947-52

The regulation of noradrenaline synthesis in central nerve terminals by autoreceptors and heteroreceptors in rat. Birch PJ, et al. **Neurosci Lett** 1985 Aug 30;59(2):197-202

Noradrenaline mediates slow excitatory synaptic potentials in rat dorsal raphe neurons in vitro. Yoshimura M, et al. **Neurosci Lett** 1985 Nov 11;61(3):305-10

Presynaptic autoinhibition during rest and sodium-pump inhibition in isolated rat portal vein preparation. Török TL, et al. **Neuroscience** 1985 Oct;16(2):439-49

Alpha 2-adrenergic mechanisms in prefrontal cortex associated with cognitive decline in aged nonhuman primates. Arnsten AF, et al. **Science** 1985 Dec 13;230(4731):1273-6

Studies of alpha 2-adrenergic receptors of intact and functional washed human platelets by binding of 3H-dihydroergocryptine and 3H-yohimbine--correlation of 3H-yohimbine binding with the potentiation by adrenaline of ADP-induced aggregation. Lanza F, et al. **Thromb Haemost** 1985 Aug 30;54(2):402-8

Influence of alpha- and beta-adrenoceptors on thrombin-induced serotonin release in rat platelets. Koutouzov S, et al. **Thromb Res** 1985 Oct 15;40(2):147-59

RECEPTORS, ADRENERGIC, BETA

Effects of betaxolol, propranolol, and atenolol on isoproterenol-induced beta-adrenoceptor responses. Riddell JG, et al. **Clin Pharmacol Ther** 1985 Nov;38(5):554-9

Haemodynamic effects of low and high doses of insulin during beta receptor blockade in dogs. Reikerås O, et al. **Clin Physiol** 1985 Oct; 5(5):455-67

Receptor binding of propranolol is the missing link between plasma concentration kinetics and the effect-time course in man. Wellstein A, et al. **Eur J Clin Pharmacol** 1985;29(2):131-47

Irreversible inactivation of the beta-adrenoreceptor by a partial agonist. Evidence for selective loss of the agonist high affinity binding sites. Baker SP, et al. **J Biol Chem** 1985 Dec 15;260(29):15820-8

Hepatic adrenoceptors involved in the glycogenolytic response to exogenous (-)-norepinephrine in the dog liver in vivo. Garceau D, et al. **Life Sci** 1985 Nov 25;37(21):1963-70

Effects of maternal beta sympathomimetic therapy on the neonate. Armstrong C. **Neonatal Netw** 1985 Dec;4(3):6-9

Influence of alpha- and beta-adrenoceptors on thrombin-induced serotonin release in rat platelets. Koutouzov S, et al. **Thromb Res** 1985 Oct 15;40(2):147-59

RECEPTORS, CHOLINERGIC

Antigenicity of the sequence 152-167 in alpha subunits of Torpedo acetylcholine receptor [letter] Lindstrom J, et al. **Biochem J** 1985 Oct 1;231(1):247

Antigenicity of synthetic peptides 159-169 and 151-169 of Torpedo acetylcholine receptor alpha chain [letter] McCormick DJ, et al. **Biochem J** 1985 Oct 1;231(1):245-6

Allosteric effects of diprobutine on acetylcholine receptors. Chemouilli P, et al. **Eur J Pharmacol** 1985 Nov 5;117(2):205-14

Characterization of cholinoreceptors in the rat urinary bladder by the use of agonists and antagonists of the cholinergic system. Adami M, et al. **J Auton Pharmacol** 1985 Sep;5(3):197-205

Cholinergic receptor-mediated phosphorylation and activation of tyrosine hydroxylase in cultured bovine adrenal chromaffin cells. Pocotte SL, et al. **J Neurochem** 1986 Feb;46(2):610-22

The occurrence of long openings in the purified cholinergic receptor channel increases with acetylcholine concentration. Labarca P, et al. **J Neurosci** 1985 Dec;5(12):3409-13

The binding of 3H-acetylcholine to cholinergic receptors in bovine cerebral arteries. Shimohama S, et al. **Life Sci** 1985 Nov 18; 37(20):1887-93

The reversible cholinesterase inhibitor physostigmine has channel-blocking and agonist effects on the acetylcholine receptor-ion channel complex. Shaw KP, et al. **Mol Pharmacol** 1985 Dec; 28(6):527-38

Operantly conditioned running: effects on brain catecholamine concentrations and receptor densities in the rat. de Castro JM, et al. **Pharmacol Biochem Behav** 1985 Oct;23(4):495-500

[Molecular structures of preproenkephalins and nicotinic acetylcholine receptor] Noda M. **Seikagaku** 1985 Jun;57(6):447-71 (100 ref.) **(Jpn)**

RECEPTORS, DOPAMINE

Down-regulation of central dopamine receptors in schizophrenia. Zemlan FP, et al. **Am J Psychiatry** 1985 Nov;142(11):1334-7

Excitatory neuronal responses to dopamine in the cerebral cortex: involvement of D2 but not D1 dopamine receptors. Bradshaw CM, et al. **Br J Pharmacol** 1985 Oct;86(2):483-90

Ontogeny of dopamine, serotonin and spirodecanone receptors in rat forebrain--an autoradiographic study. Murrin LC, et al. **Brain Res** 1985 Nov;355(1):91-109

Presynaptic inhibition of dopamine synthesis in rat striatum: effects of chronic dopamine depletion and receptor blockade. Reches A, et al. **Brain Res** 1985 Nov 18;347(2):346-9

Analysis of dopamine D1 and D2 receptor involvement in d- and l-amphetamine-induced anorexia in rats. Gilbert DB, et al. **Brain Res Bull** 1985 Oct;15(4):385-9

Does endogenous dopamine modulate human sympathetic activity through DA2 receptors? Mannelli M, et al. **Eur J Clin Pharmacol** 1985; 29(2):159-64

Mechanism of action of apomorphine on rat gastric secretion. Costall B, et al. **Eur J Pharmacol** 1985 Oct 22;116(3):279-85

Prenatal exposure of rats to antidepressants enhances agonist affinity of brain dopamine receptors and dopamine-mediated behaviour. De Ceballos ML, et al. **Eur J Pharmacol** 1985 Oct 22;116(3):257-62

SKF 38393 and apomorphine modify locomotion and exploration in rats placed on a holeboard by separate actions at dopamine D-1 and D-2 receptors. Fletcher GH, et al. **Eur J Pharmacol** 1985 Nov 19; 117(3):381-5

Prolonged inhibition of striatal dopamine receptor sites by isofloxythepin. Lau YS, et al. **Eur J Pharmacol** 1985 Oct 8;116(1-2):25-31

In vivo quantitative imaging of dopamine receptors in human brain using positron emission tomography and [76Br]bromospiperone. Mazière B, et al. **Eur J Pharmacol** 1985 Aug 27;114(3):267-72

The enantiomers of SK&F 83566, a new selective D-1 dopamine antagonist, stereospecifically block stereotyped behaviour induced by apomorphine and by the selective D-2 agonist RU 24213. Molloy AG, et al. **Eur J Pharmacol** 1985 Oct 8;116(1-2):183-6

Structural determinants of selective affinity for brain D-1 dopamine receptors within a series of 1-phenyl-1H-3-benzazepine analogues of SK&F 38393 and SCH 23390. O'Boyle KM, et al. **Eur J Pharmacol** 1985 Sep 24;115(2-3):291-5

Stimulation of D-2 dopamine receptors in rat mesocortical areas inhibits the release of [3H]dopamine. Plantjé JF, et al. **Eur J Pharmacol** 1985 Aug 27;114(3):401-2

Chronic administration of D-amphetamine increases [3H]spiroperidol binding in cat brain. Trulson ME, et al. **Eur J Pharmacol** 1985 Nov 5;117(2):267-70

Potential neuroleptic agents. 4. Chemistry, behavioral pharmacology, and inhibition of [3H]spiperone binding of 3,5-disubstituted N-[(1-ethyl-2-pyrrolidinyl)methyl]-6-methoxysalicylamides. de Paulis T, et al. **J Med Chem** 1986 Jan;29(1):61-9

Dopamine receptor agonist activity of some 5-(2-aminoethyl)carbostyril derivatives. Kaiser C, et al. **J Med Chem** 1985 Dec;28(12):1803-10

Neuroleptic activity of chiral trans-hexahydro-gamma-carbolines. Sarges R, et al. **J Med Chem** 1986 Jan;29(1):8-19

Specific [3H]piflutixol binding to CHAPS-solubilised rat striatal preparations involves dopamine D-2 but not D-1 binding sites. Kilpatrick GJ, et al. **J Neurochem** 1986 Feb;46(2):413-21

Presynaptic dopamine autoreceptors control tyrosine hydroxylase activation in depolarized striatal dopaminergic terminals. el Mestikawy S, et al. **J Neurochem** 1986 Jan;46(1):12-22

Regulation of anterior pituitary D2 dopamine receptors by magnesium and sodium ions. Watanabe M, et al. **J Neurochem** 1985 Dec; 45(6):1842-9

The pharmacological characterization of 3,4-dihydroxyphenylimino-2-imidazolidine (DPI) as a potent mixed alpha 1/alpha 2-adrenoceptor agonist rather than as a dopamine receptor agonist. van Oene JC, et al. **J Pharm Pharmacol** 1985 Nov; 37(11):844-7

Evidence that D-1 dopamine receptors contribute to the supersensitive behavioral responses induced by L-dihydroxyphenylalanine in rats treated neonatally with 6-hydroxydopamine. Breese GR, et al. **J Pharmacol Exp Ther** 1985 Nov;235(2):287-95

Stimulation of dopamine D-1 receptors by SKF 38393 induces EEG desynchronization and behavioral arousal. Ongini E, et al. **Life Sci** 1985 Dec 16;37(24):2327-33

Neuroendocrine aspects in monitoring of dopaminergic drugs in man. Hietala J, et al. **Methods Find Exp Clin Pharmacol** 1985 Aug; 7(8):451-4

Dopamine D2 receptor binding sites for agonists. A tetrahedral model. Seeman P, et al. **Mol Pharmacol** 1985 Nov;28(5):391-9

Consequences of perinatal drug administration on brain development: striatal opiate receptors and dopamine. Moon SL. **Natl Inst Drug Abuse Res Monogr Ser** 1985;62:129-45

Methamphetamine: toxicity to dopaminergic neurons. Seiden LS. **Natl Inst Drug Abuse Res Monogr Ser** 1985;62:100-16

Is inhibition of striatal synaptosomal tyrosine hydroxylation by dopamine agonists a measure of dopamine autoreceptor function? Fowler CJ, et al. **Naunyn Schmiedebergs Arch Pharmacol** 1985 Oct;331(1):12-9

Bromocriptine potentiates the behavioural effects of directly and indirectly acting dopamine receptor agonists in mice. Jenkins OF, et al. **Naunyn Schmiedebergs Arch Pharmacol** 1985 Oct;331(1):7-11

Inhibition of gonadotropin secretion induced by cholecystokinin implants in the medial preoptic area by the dopamine receptor blocker, pimozide, in the rat. Hashimoto R, et al. **Neuroendocrinology** 1986;42(1):32-7

Dopaminergic modulation of the diethylstilbestrol-induced proliferation of the anterior pituitary gland of the Fisher 344 rat. Miyazaki K, et al. **Neuroendocrinology** 1985 Nov;41(5):405-8

Amphetamine, but not reserpine, protects mice against dopaminergic neurotoxicity of MPTP. Melamed E, et al. **Neuropharmacology** 1985 Sep;24(9):923-5

D2 dopamine receptor-mediated inhibition of forskolin-stimulated adenylate cyclase activity in rat striatum. Battaglia G, et al. **Neurosci Lett** 1985 Aug 30;59(2):177-82

Characteristics of D-1 dopamine receptors labelled by [3H]fluphenazine in homogenates of rat neostriatum. Cincotta M, et al. **Neurosci Lett** 1985 Oct 24;61(1-2):85-9

Postsynaptic D1 and D2 dopamine receptors are present in rabbit renal and mesenteric arteries. Missale C, et al. **Neurosci Lett** 1985 Oct 24; 61(1-2):207-11

Dopamine uptake blockers protect against the dopamine depleting effect of 1-methyl-4-phenyl-1,2,3,6-tetrahydropyridine (MPTP) in the mouse striatum. Ricaurte GA, et al. **Neurosci Lett** 1985 Sep 6;59(3):259-64

Inhibition of inositol phospholipid breakdown by D2 dopamine receptors in dissociated bovine anterior pituitary cells. Simmonds SH, et al. **Neurosci Lett** 1985 Oct 10;60(3):267-72

Furosemide blocks the apomorphine-elicited Cl-channel activity of rat striatal dopamine receptors functionally reconstituted into bimolecular lipid membrane. Vodyanoy V, et al. **Neurosci Lett** 1985 Nov 20; 62(1):103-6

Iron deficiency induces reversal of dopamine dependent circadian cycles: differential response to d-amphetamine and TRH. Youdim MB, et al. **Peptides (Fayetteville)** 1985 Sep-Oct;6(5):851-5

The effect of dopamine receptor agonist treatment on haloperidol-induced supersensitivity in mice. Fayle P, et al. **Pharmacol Biochem Behav** 1985 Nov;23(5):715-20

Role of dopaminergic system(s) in mediation of the behavioural effects of bombesin. Merali Z, et al. **Pharmacol Biochem Behav** 1985 Aug; 23(2):243-8

New central dopamine agonists. Borsy J. **Pol J Pharmacol Pharm** 1985 May-Jun;37(3):227-36 (29 ref.)

Dopamine receptor binding of a novel dibenzodioxazocine derivative, EGYT-2509. Gyüre K, et al. **Pol J Pharmacol Pharm** 1985 May-Jun; 37(3):253-61

Evidence for multiple dopamine receptors involved in the modulation of acetylcholine release in the striatum. Harsing LG Jr, et al. **Pol J Pharmacol Pharm** 1985 May-Jun;37(3):383-96

Lisuride and transdihydrolisuride: differences in action on central dopaminergic functions in dependence on the location and the state of receptors. Krejči I, et al. **Pol J Pharmacol Pharm** 1985 May-Jun; 37(3):263-71

Stimulation of hippocampal dopaminergic receptors: behavioral and electrophysiological effects. Smialowski A. **Pol J Pharmacol Pharm** 1985 May-Jun;37(3):333-45

Cholecystokinin-dopamine receptor interactions as studied with cholecystokinin receptor antagonists. Murphy RB. **Prog Clin Biol Res** 1985;192:105-13

The D1 dopamine agonist SKF 38393 functions as a discriminative stimulus in rats. Kamien JB, et al. **Psychopharmacology (Berlin)** 1985; 87(3):368-70

Effects of the putative D-1 antagonist SCH 23390 on stereotyped behaviour induced by the D-2 agonist RU24213. Pugh MT, et al. **Psychopharmacology (Berlin)** 1985;87(3):308-12

Apomorphine anorexia: a behavioural and neuropharmacological analysis. Willner P, et al. **Psychopharmacology (Berlin)** 1985;87(3):351-6

Quantitative analysis of D2 dopamine receptor binding in the living human brain by PET. Farde L, et al. **Science** 1986 Jan 17;231(4735):258-61

[Changes in the sensitivity of brain dopamine and serotonin receptors during the prolonged administration of carbidine] Zharkovskii AM, et al. **Biull Eksp Biol Med** 1985 Dec;100(12):719-22 (Eng. Abstr.) **(Rus)**

RECEPTORS, ENDOGENOUS SUBSTANCES

Gonadotropin releasing hormone activation is mediated by dimerization of occupied receptors. Hazum E, et al. **Biochem Biophys Res Commun** 1985 Dec 17;133(2):449-56

Comparative characterization of thyroid hormone receptors and binding proteins in rat liver nucleus, plasma membrane, and cytosol by photoaffinity labeling with L-thyroxine. Dozin B, et al. **Biochemistry** 1985 Sep 10;24(19):5203-8

Cl-/Ca2+-dependent L-glutamate binding sites do not correspond to 2-amino-4-phosphonobutanoate-sensitive excitatory amino acid receptors. Fagg GE, et al. **Br J Pharmacol** 1985 Nov;86(3):743-51

Localization and characterization of brain somatostatin receptors as studied with somatostatin-14 and somatostatin-28 receptor radioautography. Leroux P, et al. **Brain Res** 1985 Nov 11; 347(1):74-84

Ibotenic acid decreases thyrotropin-releasing hormone receptor binding in the rat amygdala. Manaker S, et al. **Brain Res** 1985 Nov 11; 347(1):144-8

Deafferentation causes a loss of presynaptic bombesin receptors and supersensitivity of substance P receptors in the dorsal horn of the cat spinal cord. Massari VJ, et al. **Brain Res** 1985 Sep 23;343(2):268-74

Evidence that cholecystokinin interacts with specific receptors and regulates insulin release in isolated rat islets of Langerhans. Verspohl EJ, et al. **Diabetes** 1986 Jan;35(1):38-43

Regulation of pituitary gonadotropin-releasing hormone (GnRH) receptors by pulsatile GnRH in female rats: effects of estradiol and prolactin. Duncan JA, et al. **Endocrinology** 1986 Jan;118(1):320-7

Induction of growth hormone (GH) receptors in adipocytes of hypophysectomized rats by GH. Gause I, et al. **Endocrinology** 1986 Jan;118(1):119-24

Structure-activity relationship of subtypes of cholecystokinin receptors in the cat lower esophageal sphincter. Rattan S, et al. **Gastroenterology** 1986 Jan;90(1):94-102

Synthesis of Z-CCK-27-32-NH2, Z-Tyr(SO-3)-Met-Gly-Trp-Met-Asp-NH2, a cholecystokinin receptor antagonist and an inhibitor of gastrin-induced acid secretion. Briet C, et al. **Int J Pept Protein Res** 1985 Sep;26(3):294-8

Characterization of a gonadotropin-releasing hormone receptor site in term placenta and chorionic villi. Iwashita M, et al. **J Clin Endocrinol Metab** 1986 Jan;62(1):127-33

Somatostatin receptors: distribution in rat central nervous system and human frontal cortex. Uhl GR, et al. **J Comp Neurol** 1985 Oct 15;240(3):288-304

Arginine-vasopressin analogues with high antidiuretic/vasopressor selectivity. Synthesis, biological activity, and receptor binding affinity of arginine-vasopressin analogues with substitutions in positions 1, 2, 4, 7, and 8. Grzonka Z, et al. **J Med Chem** 1986 Jan;29(1):96-9

Somatostatin binding sites in human and monkey brain: localization and characterization. Beal MF, et al. **J Neurochem** 1986 Feb;46(2):359-65

[3H] Boc [Nle28, 31]CCK27-33, a new highly labelled ligand for CCK receptors: binding on brain and on pancreas. Pélaprat D, et al. **Life Sci** 1985 Dec 30;37(26):2483-90

Use of GH4C1 cell variants to demonstrate a non-spare receptor model for thyrotropin-releasing hormone action. Ramsdell JS, et al. **Mol Cell Endocrinol** 1985 Dec;43(2-3):173-80

Functional corticotropin releasing factor receptors in the primate peripheral sympathetic nervous system. Udelsman R, et al. **Nature** 1986 Jan 9-15;319(6049):147-50

Autoradiographic localization of a non-reducible somatostatin analog (125I-CGP 23996) binding sites in the rat brain: comparison with membrane binding. Epelbaum J, et al. **Peptides (Fayetteville)** 1985 Jul-Aug;6(4):713-9

Cholecystokinin-dopamine receptor interactions as studied with cholecystokinin receptor antagonists. Murphy RB. **Prog Clin Biol Res** 1985;192:105-13

Analysis of the dual mechanism of ACTH release by arginine vasopressin and its analogs in conscious rats. Mormède P, et al. **Regul Pept** 1985 Nov 7;12(3):175-84

Vasoactive intestinal peptide effects on GH3 pituitary tumor cells: high affinity binding, affinity labeling, and adenylate cyclase stimulation. Comparison with peptide histidine isoleucine and growth hormone-releasing factor. Wood CL, et al. **Regul Pept** 1985 Nov 7;12(3):237-48

Reduction of specific arginine-vasopressin binding sites of renal medulla membranes in lithium treated rats. Mitsui T, et al. **Res Commun Chem Pathol Pharmacol** 1985 Nov;50(2):201-8

[Receptors on the platelet membrane] Watanabe K, et al. **Rinsho Byori** 1985 Jul;33(7):726-33 (22 ref.) **(Jpn)**

[Cytoreceptors in the molecular mechanisms of hormone action] Rozen VB. **Probl Endokrinol (Mosk)** 1985 Sep-Oct;31(5):21-6 (Eng. Abstr.) **(Rus)**

RECEPTORS, ENDORPHIN

Lithium and bulimia: the role of the dopaminergic and opiatergic systems [letter] Gillman MA, et al. **Am J Psychiatry** 1985 Dec;142(12):1522-3

Sex-dependent effects of neonatally administered morphiceptin and D-ala-D-leu-enkephalin on maze learning in rats. de Avila A, et al. **Behav Neural Biol** 1985 Nov;44(3):393-402

Delta and mu opiate receptor probes: fluorescent enkephalins with high receptor affinity and specificity. Mihara H, et al. **FEBS Lett** 1985 Nov 25;193(1):35-8

Studies on opioid receptor selectivity of beta-endorphin antagonists. Hammonds RG Jr, et al. **Int J Pept Protein Res** 1985 Aug;26(2):118-20

Selective cardiovascular and neuroendocrine effects of a kappa-opioid agonist in the nucleus tractus solitarii of rats. Carter DA, et al. **J Physiol (Lond)** 1985 Oct;367:363-75

Consequences of perinatal drug administration on brain development: striatal opiate receptors and dopamine. Moon SL. **Natl Inst Drug Abuse Res Monogr Ser** 1985;62:129-45

Has morphine a physiological function in the animal kingdom? [news] Kosterlitz HW. **Nature** 1985 Oct 24-30;317(6039):671-2

Opioid kappa receptors and the secretion of prolactin (PRL) and growth hormone (GH) in the rat. II. GH and PRL release-inhibiting effects of the opioid kappa receptor agonists bremazocine and U-50,488. Krulich L, et al. **Neuroendocrinology** 1986;42(1):82-7

Regional differences in mu 1-binding of [3H][D-Ala2,D-Leu5]-enkephalin: comparisons of thalamus and cortex in the rat. Goodman RR, et al. **Neurosci Lett** 1985 Aug 30;59(2):155-8

Opioid activity of pro-enkephalin-derived peptides in mouse vas deferens and guinea pig ileum. Sánchez-Blázquez P, et al. **Neurosci Lett** 1985 Nov 11;61(3):267-71

Recent developments in the bioassay of opioids. Kosterlitz HW, et al. **Regul Pept [Suppl]** 1985;4:1-7

RECEPTORS, GABA-BENZODIAZEPINE

Characterization of peripheral benzodiazepine binding sites in human term placenta. Fares F, et al. **Biochem Pharmacol** 1986 Jan 15;35(2):227-30

Convulsant and anti-convulsant gammabutyrolactones bind at the picrotoxinin/T-butylbicyclophosphorothionate (TBPS) receptor. Levine JA, et al. **Biochem Pharmacol** 1985 Dec 1;34(23):4187-90

Modulation of 5-hydroxytryptamine-induced head-twitch response by drugs acting at GABA and related receptors. Handley SL, et al. **Br J Pharmacol** 1985 Sep;86(1):297-303

The anorectic effect of FG 7142, a partial inverse agonist at benzodiazepine recognition sites, is reversed by CGS 8216 and clonazepam but not food deprivation. Cooper SJ. **Brain Res** 1985 Oct 28;346(1):190-4

Benzodiazepine receptors modulate circulating plasma vasopressin concentration. Wible JH Jr, et al. **Brain Res** 1985 Dec 16;359(1-2):368-70

Bidirectional control of palatable food consumption through a common benzodiazepine receptor: theory and evidence. Cooper SJ. **Brain Res Bull** 1985 Oct;15(4):397-410

Evidence for the pharmacological relevance of benzodiazepine receptors to anticonvulsant activity. Fisher TE, et al. **Can J Physiol Pharmacol** 1985 Nov;63(11):1477-9

Benzodiazepine binding sites in rat submaxillary gland: absence of markers of GABA system. Pérez C, et al. **Comp Biochem Physiol [C]** 1985;82(2):451-6

Regulation of [35S]t-butylbicyclophosphorothionate binding sites in rat brain by GABA, pyrethroid and barbiturate. Seifert J, et al. **Eur J Pharmacol** 1985 Sep 24;115(2-3):191-8

Involvement of bicuculline-insensitive receptors in the hypothermic effect of GABA and its agonists. Serrano JS, et al. **Gen Pharmacol** 1985;16(5):505-8

Benzodiazepine receptors: multiple receptors or multiple conformations? Sieghart W. **J Neural Transm** 1985;63(3-4):191-208

Postnatal development of proteins associated with different benzodiazepine receptors. Eichinger A, et al. **J Neurochem** 1986 Jan;46(1):173-80

Solubilization of peripheral benzodiazepine-binding sites from rat kidney. Gavish M, et al. **J Neurosci** 1985 Nov;5(11):2889-93

Differential diazepam-antagonist effects of the benzodiazepine receptor ligand CGS 9895 in rodents. Katzman NJ, et al. **J Pharmacol Exp Ther** 1985 Dec;235(3):589-95

Imaging of [11C]-labelled Ro 15-1788 binding to benzodiazepine receptors in the human brain by positron emission tomography. Persson A, et al. **J Psychiatr Res** 1985;19(4):609-22

GABA, depressants and chloride ions affect the rate of dissociation of 35S-t-butylbicyclophosphorothionate binding. Maksay G, et al. **Life Sci** 1985 Dec 9;37(23):2173-80

Pharmacological profile of the imidazopyridine zolpidem at benzodiazepine receptors and electrocorticogram in rats. Arbilla S, et al. **Naunyn Schmiedebergs Arch Pharmacol** 1985 Sep;330(3):248-51

The regulation of noradrenaline synthesis in central nerve terminals by autoreceptors and heteroreceptors in rat. Birch PJ, et al. **Neurosci Lett** 1985 Aug 30;59(2):197-202

Differences in the properties of bovine brain benzodiazepine receptors in the cerebellum and hippocampus revealed after reduction of disulphide bonds. Korneyev AYa, et al. **Neurosci Lett** 1985 Nov 11;61(3):279-84

Studies on the depression of gamma-aminobutyric acid potentials by phloridzin in cat dorsal root ganglion cells in vitro. Stevens DR, et al. **Neurosci Lett** 1985 Sep 30;60(2):115-9

CGS 8216 and CGS 9896, novel pyrazoloquinoline benzodiazepine ligands with benzodiazepine agonist and antagonist properties. Boast CA, et al. **Pharmacol Biochem Behav** 1985 Oct;23(4):639-44

The effects of PK 11195, a ligand for benzodiazepine binding sites, in animal tests of anxiety and stress. File SE, et al. **Pharmacol Biochem Behav** 1985 Nov;23(5):737-41

Heterogeneity of benzodiazepine binding sites: a review of recent research. Hirsch JD, et al. **Pharmacol Biochem Behav** 1985 Oct;23(4):681-5 (51 ref.)

Pyrazoloquinoline benzodiazepine receptor ligands: effects on schedule-controlled behavior in dogs. Shannon HE, et al. **Pharmacol Biochem Behav** 1985 Aug;23(2):317-23

Autoradiographic demonstration of the selectivity of two 1-N-trifluoroethyl benzodiazepines for the BZD-1 receptors in the rat brain. Wamsley JK, et al. **Pharmacol Biochem Behav** 1985 Dec;23(6):973-8

On the brain endocoid for benzodiazepine recognition sites. Guidotti A, et al. **Prog Clin Biol Res** 1985;192:477-84

Endogenous inhibitors of [3H] Ro 5-4864 binding to 'peripheral-type' binding sites for benzodiazepines are present in peripheral tissues and brain. Mantione CR, et al. **Prog Clin Biol Res** 1985;192:167-73

Tribulin: an endogenous monoamine oxidase inhibitor/benzodiazepine receptor ligand. Sandler M, et al. **Prog Clin Biol Res** 1985; 192:359-62

Are 'peripheral-type' binding sites for benzodiazepines in brain related to the convulsant actions of Ro 5-4864? Weissman BA, et al. **Prog Clin Biol Res** 1985;192:197-203

Isolation and purification of an endogenous brain ligand for benzodiazepine receptor(s). Wu JY, et al. **Prog Clin Biol Res** 1985; 192:485-93

Neuropeptide modulation of GABA receptor C1- channels. Bormann J, et al. **Regul Pept [Suppl]** 1985;4:33-8

A comparison of the relative in vitro and in vivo binding affinities of various benzodiazepines and related compounds for the benzodiazepine receptor and for the peripheral benzodiazepine binding site. Groh B, et al. **Res Commun Chem Pathol Pharmacol** 1985 Sep;49(3):463-6

[Monoacylglycerol phosphatide accumulation and the alteration of the properties of benzodiazepine receptors in the brain synaptosomes] Bogdanova ED, et al. **Biull Eksp Biol Med** 1985 Dec;100(12):684-6 (Eng. Abstr.) **(Rus)**

RECEPTORS, SEROTONIN

Serotonergic regulation of prolactin and growth hormone secretion in man. Lewis DA, et al. **Acta Endocrinol (Copenh)** 1985 Oct; 110(2):152-7

The 5-HT1 receptor agonist RU-24969 decreases 5-hydroxytryptamine (5-HT) release and metabolism in the rat frontal cortex in vitro and in vivo. Brazell MP, et al. **Br J Pharmacol** 1985 Sep;86(1):209-16

Autoradiographic identification and topographical analyses of high affinity serotonin receptor subtypes as a target for the novel putative anxiolytic TVX Q 7821. Glaser T, et al. **Brain Res** 1985 Dec 9; 358(1-2):129-36

Ontogeny of dopamine, serotonin and spirodecanone receptors in rat forebrain--an autoradiographic study. Murrin LC, et al. **Brain Res** 1985 Nov;355(1):91-109

Spiperone differentiates multiple 5-hydroxytryptamine responses in rat hippocampal slices in vitro. Beck SG, et al. **Eur J Pharmacol** 1985 Oct 8;116(1-2):195-7

Peripheral adrenoceptors and serotonin receptors in depression. Changes associated with response to treatment with trazodone or amitriptyline. Healy D, et al. **J Affective Disord** 1985 Nov;9(3):285-96

Differential effect of subchronic treatment with various neuroleptic agents on serotonin2 receptors in rat cerebral cortex. Andree TH, et al. **J Neurochem** 1986 Jan;46(1):191-7

Serotonin inhibits acetylcholine release from rat striatum slices: evidence for a presynaptic receptor-mediated effect. Gillet G, et al. **J Neurochem** 1985 Dec;45(6):1687-91

[3H]1-[2-(4-aminophenyl)ethyl]-4-(3-trifluoromethylphenyl)piperazin a selective radioligand for 5-HT1A receptors in rat brain. Ransom RW, et al. **J Neurochem** 1986 Jan;46(1):68-75

Effects of serotonin receptor agonists and antagonists on schedule-controlled behavior of squirrel monkeys. Brady LS, et al. **J Pharmacol Exp Ther** 1985 Nov;235(2):436-41

Up-regulation of serotonergic binding sites labeled by [3H]WB4101 following fimbrial transection and 5,7-dihydroxytryptamine-induced lesions. Morrow AL, et al. **Life Sci** 1985 Nov 18;37(20):1913-22

Prenatal exposure of rats to antidepressant drugs down-regulates beta-adrenoceptors and 5-HT2 receptors in cerebral cortex. Lack of correlation between 5-HT2 receptors and serotonin-mediated behaviour. De Ceballos ML, et al. **Neuropharmacology** 1985 Oct; 24(10):947-52

Clonazepam-induced up-regulation of serotonin1 binding sites in frontal cortex of rat. Wagner HR, et al. **Neuropharmacology** 1985 Oct; 24(10):953-6

Thyrotropin releasing hormone increases 5-hydroxytryptamine1 receptors in the limbic brain of the rat. Funatsu K, et al. **Peptides (Fayetteville)** 1985 May-Jun;6(3):563-6

The anorectic action of peripherally administered 5-HT is enhanced by vagotomy. Fletcher PJ, et al. **Physiol Behav** 1985 Jun;34(6):861-6

Characterization of endogenous inhibitors of [3H]-imipramine binding and [3H]-serotonin uptake from rat serum. Angel I, et al. **Prog Clin Biol Res** 1985;192:457-64

Reactivity of the bronchial artery to 5-hydroxytryptamine. El-Fawal HA, et al. **Res Commun Chem Pathol Pharmacol** 1985 Dec;50(3):325-36

[Changes in the sensitivity of brain dopamine and serotonin receptors during the prolonged administration of carbidine] Zharkovskii AM, et al. **Biull Eksp Biol Med** 1985 Dec;100(12):719-22 (Eng. Abstr.) **(Rus)**

REFLEX

No purging, no binge eating: a mechanism for imipramine's action in bulimia? [letter] Claman JM, et al. **Am J Psychiatry** 1985 Dec; 142(12):1515-6

Baroreflex sensitivity and pressor responses in a rat model of uraemia. Watson AJ, et al. **Clin Sci** 1985 Nov;69(5):637-40

Enalapril and autonomic reflexes and exercise performance. Reid JL, et al. **J Hypertension [Suppl]** 1983 Oct;1(1):129-34

Bilateral lesions of the striatum induced with 6-hydroxydopamine abolish apomorphine-induced yawning in rats. Dourish CT, et al. **Neuropharmacology** 1985 Nov;24(11):1051-5

Intrathecal somatostatin modulates spinal sensory and reflex mechanisms: behavioral and electrophysiological studies in the rat. Wiesenfeld-Hallin Z. **Neurosci Lett** 1985 Nov 20;62(1):69-74

[Effects of noxious and innocuous cutaneous stimulation on adrenal sympathetic efferent nerve activity in rats] Kurosawa M. **Hokkaido Igaku Zasshi** 1985 Jul;60(4):509-27 (Eng. Abstr.) **(Jpn)**

REINFORCEMENT (PSYCHOLOGY)

Measurement of reinforcement in depression: a pilot study. Hughes JR, et al. **J Behav Ther Exp Psychiatry** 1985 Sep;16(3):231-6

Reinforcement and rapid delivery systems: understanding adverse consequences of cocaine. Cohen S. **Natl Inst Drug Abuse Res Monogr Ser** 1985;61:151-7

Disruption of cocaine and heroin self-administration following kainic acid lesions of the nucleus accumbens. Zito KA, et al. **Pharmacol Biochem Behav** 1985 Dec;23(6):1029-36

REINFORCEMENT SCHEDULE

Individual differences in non-regulatory ingestive behavior and catecholamine systems. Mittleman G, et al. **Brain Res** 1985 Nov 25; 348(1):112-7

The effect of peripheral noradrenaline depletion on responding on a schedule of differential reinforcement of low rates of response (DRL). Salmon P, et al. **Psychopharmacology (Berlin)** 1985;87(1):77-80

RESERPINE

Tissue-specific depletion of NPY-like immunoreactivity by reserpine. Lundberg JM, et al. **Acta Physiol Scand** 1985 Mar;123(3):363-5

Effect of tranquilizers on the total acetylcholine content and acetylcholinesterase activity in the brain tissue of Arvicanthis niloticus. Fathi MM, et al. **Comp Biochem Physiol [C]** 1985;82(2):467-74

Neuropeptide Y-induced pressor responses: activation of a non-adrenergic mechanism, potentiation by reserpine and blockade by nifedipine. Mabe Y, et al. **Eur J Pharmacol** 1985 Oct 8; 116(1-2):33-9

Reserpine and phencyclidine-associated psychosis: three case reports. Berlant JL. **J Clin Psychiatry** 1985 Dec;46(12):542-4

Reserpine changes the dynamic state of enkephalin stores in rat striatum and adrenal medulla by different mechanisms. Mocchetti I, et al. **J Neurosci** 1985 Dec;5(12):3379-85

Molecular and physiological properties of tyrosine hydroxylase induced by reserpine in rat adrenal gland. Togari A, et al. **Life Sci** 1985 Oct 28;37(17):1605-11

Amphetamine, but not reserpine, protects mice against dopaminergic neurotoxicity of MPTP. Melamed E, et al. **Neuropharmacology** 1985 Sep;24(9):923-5

Reserpine-induced potentiation of the inhibitory action of neuropeptide Y on the rat vas deferens neurotransmission. Huidobro-Toro JP. **Neurosci Lett** 1985 Sep 6;59(3):247-52

Synthesis and preliminary pharmacologic assessment of the carbonates of 1-(2-thienyl)-3-dialkylamino-1-propanols. Part 4. Avramova P, et al. **Pharmazie** 1985 Aug;40(8):579

RUBIDIUM

CSF-1 stimulates Na+K+-ATPase mediated 86Rb+ uptake in mouse bone marrow-derived macrophages. Vairo G, et al. **Biochem Biophys Res Commun** 1985 Oct 15;132(1):430-7

Rubidium transport in X-irradiated human erythrocytes. Haškovec C, et al. **Int J Radiat Biol** 1985 Nov;48(5):773-83

Oxygen free-radical reduction of brain capillary rubidium uptake. Lo WD, et al. **J Neurochem** 1986 Feb;46(2):394-8

Evidence for the ordered release of rubidium ions occluded within the Na,K-ATPase of mammalian kidney. Glynn IM, et al. **J Physiol (Lond)** 1985 Nov;368:453-69

Epinephrine-stimulated maintained rubidium efflux from guinea pig hepatocytes may involve alpha 1- and alpha 2-adrenoceptors. Henley JM. **Mol Pharmacol** 1985 Nov;28(5):431-5

Subcellular flux of potassium and rubidium in amphibian oocytes. Cameron IL, et al. **Physiol Chem Phys Med NMR** 1985; 17(2):173-81

SCHIZOPHRENIA

Perphenazine decanoate in sesame oil vs. perphenazine enanthate in sesame oil: a comparative study of pharmacokinetic properties and some clinical implications. Knudsen P, et al. **Acta Psychiatr Scand [Suppl]** 1985; 322:11-4

Perphenazine decanoate vs. perphenazine enanthate: efficacy and side effects in a 6 week double-blind, comparative study of 50 drug monitored psychotic patients. Knudsen P, et al. **Acta Psychiatr Scand [Suppl]** 1985;322:15-28

Pharmacokinetic implications of different oil vehicles used in depot neuroleptic treatment. Knudsen P, et al. **Acta Psychiatr Scand [Suppl]** 1985;322:7-10

Hemodialysis in the treatment of a group of schizophrenic patients. Schulman A. **Acta Psychiatr Scand [Suppl]** 1985;321:1-127

Prodromal signs of schizophrenic relapse [letter] Herz MI, et al. **Am J Psychiatry** 1986 Jan;143(1):115-6

CSF noradrenaline and schizophrenia [letter] Kemali D, et al. **Am J Psychiatry** 1986 Jan;143(1):126-7

A high-dose, double-blind study of ceruletide in the treatment of schizophrenia. Mattes JA, et al. **Am J Psychiatry** 1985 Dec; 142(12):1482-4

Benefits of correlating neuroleptic blood level and auditory distractibility [letter] Terkelsen KG. **Am J Psychiatry** 1985 Dec;142(12):1523-4

Combination alprazolam-neuroleptic treatment of the positive and negative symptoms of schizophrenia. Wolkowitz OM, et al. **Am J Psychiatry** 1986 Jan;143(1):85-7

Down-regulation of central dopamine receptors in schizophrenia. Zemlan FP, et al. **Am J Psychiatry** 1985 Nov;142(11):1334-7

Prophylactic effects of neuroleptics in symptom-free schizophrenics: roles of dopaminergic and noradrenergic blockers. Nishikawa T, et al. **Biol Psychiatry** 1985 Nov;20(11):1161-6

High thresholds for movement perception in schizophrenia may indicate abnormal extraneous noise levels of central vestibular activity. Wertheim AH, et al. **Biol Psychiatry** 1985 Nov;20(11):1197-210

Plasma amino acids in relation to cerebrospinal fluid monoamine metabolites in schizophrenic patients and healthy controls. Bjerkenstedt L, et al. **Br J Psychiatry** 1985 Sep;147:276-82

Sulpiride and haloperidol in schizophrenia: a double-blind cross-over study of therapeutic effect, side effects and plasma concentrations. Gerlach J, et al. **Br J Psychiatry** 1985 Sep;147:283-8

Schizophrenia with good and poor outcome [letter] Quitkin F, et al. **Br J Psychiatry** 1985 Oct;147:455-6

Relapse in schizophrenia [editorial] Wing JK. **Br Med J [Clin Res]** 1985 Nov 2;291(6504):1219-20

Intramuscular haloperidol decanoate for neuroleptic maintenance therapy. arap Mengech HN, et al. **East Afr Med J** 1984 Jun;61(6):435-8

Heatstroke in a chronic schizophrenic patient treated with high-potency neuroleptics. Lazarus A. **Gen Hosp Psychiatry** 1985 Oct;7(4):361-3

L-dopa in the treatment of negative schizophrenic symptoms: a single-subject experimental study. Kay SR, et al. **Int J Psychiatry Med** 1985-86;15(3):293-8

Can clients with schizophrenia describe feelings and beliefs about taking medication? Davidhizar RE. **J Adv Nurs** 1985 Sep;10(5):469-73

Clinical significance, evaluation, and management of secondary depression in schizophrenia. Becker RE, et al. **J Clin Psychiatry** 1985 Nov; 46(11 Pt 2):26-32

Is cholecystokinin therapeutic in chronic schizophrenia? Boza RA, et al. **J Clin Psychiatry** 1985 Nov;46(11):485-6

Maintenance therapy and the natural course of schizophrenia. Davis JM. **J Clin Psychiatry** 1985 Nov;46(11 Pt 2):18-21

Plasma levels of neuroleptic in patients receiving depot fluphenazine. Cohen BM, et al. **J Clin Psychopharmacol** 1985 Dec;5(6):328-32

Neuroleptic compliance among chronic schizophrenic outpatients: an intervention outcome report. Boczkowski JA, et al. **J Consult Clin Psychol** 1985 Oct;53(5):666-71

Computerized axial tomography scans and subtypes of schizophrenia. A review of the literature. Goetz KL, et al. **J Nerv Ment Dis** 1986 Jan; 174(1):31-41 (83 ref.)

Psychotherapy of schizophrenia. What happens to treatment dropouts. Katz HM, et al. **J Nerv Ment Dis** 1984 Jun;172(6):326-31

Prolixin group. Can nursing intervention groups lower recidivism? Selander JM, et al. **J Psychosoc Nurs Ment Health Serv** 1985 Nov; 23(11):16-20

Flupenthixol decanoate (fluanxol depot) in the treatment of chronic schizophrenic patients. Haider I. **JPMA** 1985 Sep;35(9):286-9

Membranes, methylation and lithium responsive psychoses. Hitzemann R, et al. **Nutr Health** 1984;3(3):153-62

Projection of an endocoid involved with schizophrenic reaction. Proctor CD, et al. **Prog Clin Biol Res** 1985;192:387-93

Depot fluphenazine and plasma prolactin. Gift T, et al. **Prog Neuropsychopharmacol Biol Psychiatry** 1985;9(4):407-12

Specificity and nonspecificity—a major problem in biologically oriented psychopathology. Heimann H. **Psychopathology** 1985;18(2-3):82-7

Early unwanted effects of fluphenazine esters related to plasma fluphenazine concentrations in schizophrenic patients. Altamura AC, et al. **Psychopharmacology (Berlin)** 1985;87(1):30-3

Plasma levels of fluphenazine during fluphenazine decanoate treatment in schizophrenia. Chang SS, et al. **Psychopharmacology (Berlin)** 1985; 87(1):55-8

Zuclopenthixol decanoate in schizophrenia: serum levels and clinical state. Jørgensen A, et al. **Psychopharmacology (Berlin)** 1985;87(3):364-7

Lithium attenuates the activation-euphoria but not the psychosis induced by d-amphetamine in schizophrenia. van Kammen DP, et al. **Psychopharmacology (Berlin)** 1985;87(1):111-5

Plasma flupentixol concentrations and clinical response in acute schizophrenia. Balant-Gorgia AE, et al. **Ther Drug Monit** 1985; 7(4):411-4

[Determination of blood haloperidol levels by radioimmunoassay—a methodological study] Zhou DF. **Chung Hua Shen Ching Ching Shen Ko Tsa Chih** 1985 Jun; 18(3):155-7 (Eng. Abstr.) **(Chi)**

[Course and prognosis of schizophrenia in Finland] Salokangas RK. **Duodecim** 1985;101(17):1666-75 **(Fin)**

[Prediction of therapeutic success in acute neuroleptic treatment: results of an empirical study of 243 inpatient-treated schizophrenic patients] Möller HJ, et al. **Fortschr Neurol Psychiatr** 1985 Oct;53(10):370-83 (Eng. Abstr.) **(Ger)**

[Psychopathometric study of the prognostic significance of psychopathologic findings and premorbid personality for discharge of neuroleptic treated patients with schizophrenic psychoses] Möller HJ, et al. **Nervenarzt** 1985 Sep;56(9):498-505 **(Ger)**

[Possibilities in the treatment of schizophrenia based on biochemical findings] Nagashi M. **Seishin Shinkeigaku Zasshi** 1985;87(7):435-43 **(Jpn)**

[Overcoming resistance to therapy in schizophrenia] Poliachenko AB, et al. **Vrach Delo** 1985 Aug;(8):110-1 (Eng. Abstr.) **(Rus)**

[Effect of treatment with psychotropic preparations on suppressor T-lymphocytes in juvenile continuously-progressing schizophrenia] Mikheeva TV, et al. **Zh Nevropatol Psikhiatr** 1985;85(10):1550-2 (Eng. Abstr.) **(Rus)**

[B-lymphocytes of the blood in schizophrenia: effect of psychotropic therapy] Potapova VA. **Zh Nevropatol Psikhiatr** 1985;85(9):1378-81 (Eng. Abstr.) **(Rus)**

[Clinico-catamnestic study of the development of remissions in adolescents suffering recurrent schizophrenia] Simashkova NV. **Zh Nevropatol Psikhiatr** 1985;85(10):1536-40 (Eng. Abstr.) **(Rus)**

SCHIZOPHRENIA, CHILDHOOD

[Differential diagnosis and psychopharmacotherapy of endogenous schizophrenic psychoses in childhood and adolescence] Neumärker KJ. **Z Arztl Fortbild (Jena)** 1985;79(19):831-5 **(Ger)**

SCHIZOPHRENIA, PARANOID

How effective is loxapine? [letter] Tuason VB, et al. **Am J Psychiatry** 1986 Jan;143(1):116-7

Increased CSF cortisol levels after neuroleptic treatment in schizophrenia. Gattaz WF, et al. **Psychoneuroendocrinology** 1985;10(3):351-4

[Neuromediator mechanisms of regulating immune reactions in schizophrenics] Aliev NA. **Zh Nevropatol Psikhiatr** 1985; 85(9):1382-5 (Eng. Abstr.) **(Rus)**

SELF STIMULATION

Cortical and ventral tegmental systems exert opposing influences on self-stimulation from the prefrontal cortex. Spence SJ, et al. **Behav Brain Res** 1985 Sep-Oct;17(2):117-24

Evidence for a role of the preoptic area in lateral hypothalamic self-stimulation. Muñoz C, et al. **Brain Res** 1985 Dec 9; 358(1-2):85-95

Effects of quipazine and of tryptamine on self-stimulation of median raphé nucleus and of lateral hypothalamus in rats. Broadbent J, et al. **Pharmacol Biochem Behav** 1985 Dec;23(6):943-7

Relative effectiveness of pimozide, haloperidol and trifluoperazine on self-stimulation rate-intensity functions. Lynch MR, et al. **Pharmacol Biochem Behav** 1985 Nov;23(5):777-80

A microcomputer-based method for physiologically interpretable measurement of the rewarding efficacy of brain stimulation. Campbell KA, et al. **Physiol Behav** 1985 Sep;35(3):395-403

Self-stimulation of the lateral hypothalamus and ventrolateral tegmentum: excitability characteristics of the directly stimulated substrates. Macmillan CJ, et al. **Physiol Behav** 1985 Nov;35(5):711-23

SEROTONIN

Effect of a homologous series of halogenated methanes on pulmonary uptake of 5-hydroxytryptamine in isolated perfused rat lung. Hede AR, et al. **Acta Pharmacol Toxicol (Copenh)** 1985 Oct;57(4):291-6

Species differences in the velocity and stereoselectivity of platelet 5-HT uptake in rats and humans. Smith DF. **Acta Pharmacol Toxicol (Copenh)** 1985 Oct;57(4):301-3

Effects of 5-hydroxytryptamine and related agents on endothelial cell oxidative metabolism in vitro. Kjellström BT, et al. **Acta Physiol Scand** 1985 Nov;125(3):501-4

A cholecystokinin-like peptide is present in 5-hydroxytryptamine neurons in the spinal cord of the lamprey. van Dongen PA, et al. **Acta Physiol Scand** 1985 Nov;125(3):557-60

Dietary effects on brain serotonin synthesis: relationship to appetite regulation. Fernstrom JD. **Am J Clin Nutr** 1985 Nov; 42(5 Suppl):1072-82

The effects of parasympathectomy on serotonin-induced bronchoconstriction in the cat. Bai TR, et al. **Am Rev Respir Dis** 1986 Jan;133(1):110-5

Immunohistochemical demonstration of serotonin nerve fibers in the corpus striatum of the rat, cat and monkey. Mori S, et al. **Anat Embryol (Berl)** 1985;173(1):1-5

The organization of serotonin fibers in the mammalian superior colliculus. An immunohistochemical study. Ueda S, et al. **Anat Embryol (Berl)** 1985;173(1):13-21

Gabapentin decreases monoamine release without affecting acetylcholine release in the brain. Schlicker E, et al. **Arzneimittelforschung** 1985; 35(9):1347-9

Electrolytic, but not 5,7-dihydroxytryptamine, lesions of the nucleus medianus raphe impair acquisition of a radial maze task. Asin KE, et al. **Behav Neural Biol** 1985 Nov;44(3):415-24

Obsessive-compulsive disorder and serotonin: is there a connection? Insel TR, et al. **Biol Psychiatry** 1985 Nov;20(11):1174-88

Serotonergic influences on pituitary gland and hypothalamic induction of prolactin and luteinizing hormone release in the young turkey (Meleagris gallopavo). Fehrer SC, et al. **Biol Reprod** 1985 Dec; 33(5):1064-72

Effect of angiotensin II on some behavioral and neurochemical measures of the central serotonine system. Braszko JJ, et al. **Biomed Biochim Acta** 1985;44(9):1359-68

Central effects of D-Ala2-met-enkephalinamide on the blood pressure of rats after central chemical sympathectomy or serotoninectomy. Brus R, et al. **Biomed Biochim Acta** 1985;44(5):779-83

The 5-HT1 receptor agonist RU-24969 decreases 5-hydroxytryptamine (5-HT) release and metabolism in the rat frontal cortex in vitro and in vivo. Brazell MP, et al. **Br J Pharmacol** 1985 Sep;86(1):209-16

Monoaminergic involvement in the pharmacological actions of buspirone. Skolnick P, et al. **Br J Pharmacol** 1985 Nov;86(3):637-44

Topographical dopamine and serotonin distribution and turnover in rat striatum. Beal MF, et al. **Brain Res** 1985 Dec 9;358(1-2):10-5

Presence of 5-HT-positive neurons in the medial nuclei of the solitary tract. Calzà L, et al. **Brain Res** 1985 Nov 11;347(1):135-9

Growth hormone-releasing factor modifies dopaminergic but not serotonergic activity in the arcuate nucleus of hypothalamus in the rat, as recorded in vivo by differential pulse voltammetry. Crespi F, et al. **Brain Res** 1985 Dec 2;348(2):367-70

Distribution and quantification of 5-HT nerve cell bodies in the nucleus raphe dorsalis area of C57BL and BALBc mice. Relationship between anatomy and biochemistry. Daszuta A, et al. **Brain Res** 1985 Dec 23; 360(1-2):58-64

Reduced-5-hydroxytryptamine-dependent behavior in rats following chronic corticosterone treatment. Dickinson SL, et al. **Brain Res** 1985 Oct 14;345(1):10-8

The actions of substance P and serotonin on myenteric neurons in tissue culture. Hanani M, et al. **Brain Res** 1985 Dec 9;358(1-2):276-81

Changes of the release of luteinizing hormone (LH) on the day of proestrus after lesions or stimulation of the raphe nuclei in rats. Morello H, et al. **Brain Res** 1985 Dec 23;360(1-2):311-7

Dominant social status facilitates the behavioral effects of serotonergic agonists. Raleigh MJ, et al. **Brain Res** 1985 Dec 2;348(2):274-82

Multiple high affinity binding sites for 5-hydroxytryptamine: a new class of sites distinct from 5-HT1 and S2. Robaut C, et al. **Brain Res** 1985 Nov 4;346(2):250-62

Rostral hypothalamic microinfusions of 5,7 dihydroxytryptamine produce anatomically and neurochemically selective depletions of hippocampal serotonin and increase the influence of estrogen and food deprivation on locomotor activity. Waldbillig RJ, et al. **Brain Res** 1985 Nov 11; 347(1):149-53

Kainic acid-induced release of serotonin from OFF-bipolar cells in the turtle retina. Weiler R, et al. **Brain Res** 1985 Dec 23; 360(1-2):379-83

Intraocular grafts of nucleus raphe dorsalis provide cografted spinal cord with a serotonergic innervation. Henschen A, et al. **Brain Res Bull** 1985 Sep;15(3):335-42

The involvement of brain structures in the adjuvant effect of muramyl dipeptide. Mašek K, et al. **Brain Res Bull** 1985 Nov;15(5):443-6

The role of endogenous serotonin in phasic LH release. Meyer DC, et al. **Brain Res Bull** 1985 Sep;15(3):283-6

Relationship between levels and uptake of serotonin and high affinity [3H]imipramine recognition sites in the rat brain. Hrdina PD, et al. **Can J Physiol Pharmacol** 1985 Oct;63(10):1239-44

Influence of melatonin and serotonin on the number of rat pineal 'synaptic' ribbons and spherules in vitro. Vollrath L, et al. **Cell Tissue Res** 1985; 242(3):607-11

Analytical considerations for quantitative determination of serotonin and its metabolically related products in biological matrices. Mailman RB, et al. **Clin Chem** 1985 Nov;31(11):1849-54

Studies of contents of norepinephrine and 5-hydroxytryptamine in brain--I. Normal and cold exposure. Aly MS, et al. **Comp Biochem Physiol [C]** 1985;82(1):155-8

Studies of contents of norepinephrine and 5-hydroxytryptamine in brain--II. Effect of sodium barbitone and chlorpromazine. Rahman TA, et al. **Comp Biochem Physiol [C]** 1985;82(1):159-63

Biogenic amine uptake by nerve cords from the American cockroach and the influence of amidines on amine uptake and release. Scott JA, et al. **Comp Biochem Physiol [C]** 1985;82(1):43-7

Evidence for purinergic transmission in mouse bladder and for modulation of responses to electrical stimulation by 5-hydroxytryptamine. Holt SE, et al. **Eur J Pharmacol** 1985 Oct 8;116(1-2):105-11

The acute effects of methamphetamine, amphetamine and p-chloroamphetamine on the cortical serotonergic system of the rat brain: evidence for differences in the effects of methamphetamine and amphetamine. Peat MA, et al. **Eur J Pharmacol** 1985 Oct 8; 116(1-2):11-6

The biotinylation of the rabbit serotonin antibody and its application to immunohistochemical studies using the two-step ABC method. Yamada H, et al. **Histochemistry** 1985;83(4):285-9

Effects of chronically elevated intake of sweet solutions on sexual behavior of male rats. Lieblich I, et al. **Horm Behav** 1985 Sep;19(3):278-91

Oxytocic action of prostaglandin E1--role of 5-hydroxytryptamine. Acharya SB, et al. **Indian J Exp Biol** 1985 Feb;23(2):92-4

Modulation of 5-hydroxytryptamine-evoked responses of the isolated rat uterus by imidazole, a phosphodiesterase stimulator. Singh M, et al. **Indian J Physiol Pharmacol** 1985 Jan-Mar;29(1):39-42

Influence of serotonin on lymphokine secretion in vitro. Paegelow I, et al. **Int J Immunopharmacol** 1985;7(6):889-96

Calcium permeability changes and neurotransmitter release in cultured brain neurons. II. Temporal analysis of neurotransmitter release. Yarom M, et al. **J Biol Chem** 1985 Dec 25;260(30):16294-302

Effect of serotonin and its antagonist ketanserin on pial vessels. Auer LM, et al. **J Cereb Blood Flow Metab** 1985 Dec;5(4):517-22

Effect of leukotrienes, 12-HETE, histamine, bradykinin, and 5-hydroxytryptamine on in vivo rabbit cerebral arteriolar diameter. Kamitani T, et al. **J Cereb Blood Flow Metab** 1985 Dec;5(4):554-9

Immunocytochemical localization of serotonin in the rat periaqueductal gray: a quantitative light and electron microscopic study. Clements JR, et al. **J Comp Neurol** 1985 Jun 1;236(1):60-70

Segmental distribution of peptide- and 5HT-like immunoreactivity in nerve terminals and fibers of the thoracolumbar sympathetic nuclei of the cat. Krukoff TL, et al. **J Comp Neurol** 1985 Oct 1; 240(1):103-16

An immunocytochemical study of the development of central serotoninergic neurons in the chick embryo. Wallace JA. **J Comp Neurol** 1985 Jun 22;236(4):443-53

Electrical responses of cultured thyroid cells to serotonin. McGrath PA, et al. **J Endocrinol** 1985 Dec;107(3):397-401

Serotonin modulates the central pattern generator for locomotion in the isolated lamprey spinal cord. Harris-Warrick RM, et al. **J Exp Biol** 1985 May;116:27-46

3-Phenyl-1-indanamines. Potential antidepressant activity and potent inhibition of dopamine, norepinephrine, and serotonin uptake. Bøgesø KP, et al. **J Med Chem** 1985 Dec;28(12):1817-28

Central 5-HT and the respiratory response to acoustic stimulation in awake rats: effects of PCPA, 5-HTP and 8-OH-DPAT. Ahlenius S, et al. **J Neural Transm** 1985;63(3-4):285-95

Rat brain serotonin: biochemical and functional evidence for a sex difference. Carlsson M, et al. **J Neural Transm** 1985;63(3-4):297-313

The effects of manipulation of presynaptic 5-HT nerve terminals on postsynaptic 5-HT1 and 5-HT2 binding sites of the rat brain. Hall H, et al. **J Neural Transm** 1985;64(2):129-43

Studies on the role of alpha 2-adrenoceptors in the control of synaptosomal [3H]5-hydroxytryptamine release: effects of antidepressant drugs. Ellison DW, et al. **J Neurochem** 1986 Jan; 46(1):218-23

Serotonin inhibits acetylcholine release from rat striatum slices: evidence for a presynaptic receptor-mediated effect. Gillet G, et al. **J Neurochem** 1985 Dec;45(6):1687-91

Down-regulation of [3H]5-hydroxytryptamine binding sites in chick embryo brain by monoamine oxidase inhibitors or fenfluramine and potentiation by d,l-5-hydroxytryptophan. Soblosky JS, et al. **J Neurochem** 1985 Dec;45(6):1923-31

Uptake and release of tryptophan and serotonin: an HPLC method to study the flux of endogenous 5-hydroxyindoles through synaptosomes. Wolf WA, et al. **J Neurochem** 1986 Jan;46(1):61-7

Neuroimmunomodulatory interactions of norepinephrine and serotonin. Walker RF, et al. **J Neuroimmunol** 1985 Nov;10(1):41-58 (91 ref.)

Indoleacetic acid-induced hypothermia and changes in serotonin metabolism in mice. Yamada J, et al. **J Pharmacobiodyn** 1985 Jul; 8(7):564-70

Effect of an atypical barbiturate, the 2-allophanyl-2-allyl-4-valerolactone (valofan), on exploratory behaviour and brain serotonin concentrations in mice. Traversa U, et al. **J Pharmacol** 1985 Jul-Sep;16(3):279-90

[3H]5-hydroxytryptamine binding to reconstituted fraction with sulphatides, phosphatidylserine and phosphatidylinositol. Nishi A, et al. **Jpn J Pharmacol** 1985 Aug;38(4):411-7

Brain serotonin and blood pressure regulation: studies using in vivo electrochemistry and direct tissue assay. Freed CR, et al. **Life Sci** 1985 Nov 11;37(19):1783-93

Scheduled feeding versus the light-dark cycle on the rhythms of circulating tryptophan, serotonin and N-acetylserotonin in rats. Ho AK, et al. **Life Sci** 1985 Oct 28;37(17):1619-26

Up-regulation of serotonergic binding sites labeled by [3H]WB4101 following fimbrial transection and 5,7-dihydroxytryptamine-induced lesions. Morrow AL, et al. **Life Sci** 1985 Nov 18;37(20):1913-22

Age-associated alteration of serotonergic synaptic neurochemistry in rat rostral hypothalamus. Sparks DL, et al. **Neurobiol Aging** 1985 Fall; 6(3):213-7

Melatonin-induced increases in serotonin concentrations in specific regions of the chicken brain. Cassone VM, et al. **Neuroendocrinology** 1986;42(1):38-43

Serotonergic stimulation of prolactin and corticosterone secretion is mediated by different pathways from the mediobasal hypothalamus. Van de Kar LD, et al. **Neuroendocrinology** 1985 Nov;41(5):380-4

Cardio-respiratory actions of substance P, TRH and 5-HT in the nucleus tractus solitarius of rats: evidence for functional interactions of neuropeptides and amine neurotransmitters. Carter DA, et al. **Neuropeptides** 1985 Sep;6(5):425-36

(-)-Pindolol stereospecifically inhibits rat brain serotonin (5-HT) synthesis. Hjorth S, et al. **Neuropharmacology** 1985 Nov; 24(11):1143-6

Changes induced by corticosterone and adrenalectomy in synaptosomal and platelet uptake and binding of 5-HT. The relationship to [3H]imipramine binding. Lee PH, et al. **Neuropharmacology** 1985 Nov; 24(11):1043-50

Cathinone affects dopamine and 5-hydroxytryptamine neurons in vivo as measured by changes in metabolites and synthesis in four forebrain regions in the rat. Nielsen JA. **Neuropharmacology** 1985 Sep; 24(9):845-52

Serotonin modulates photoresponses in Hermissenda type-B photoreceptors. Crow T, et al. **Neurosci Lett** 1985 Sep 16;60(1):83-8

The influence of serotonergic inputs on peptide neurons in the rat suprachiasmatic nucleus: an immunocytochemical study. Kawakami F, et al. **Neurosci Lett** 1985 Nov 11;61(3):273-7

Release of endogenous 5-hydroxytryptamine from the neural and the intermediate lobe of the rat pituitary gland evoked by electrical stimulation of the pituitary stalk. Holzbauer M, et al. **Neuroscience** 1985 Jul;15(3):723-8

Immunocytochemical and electron microscopic study of serotonin neuronal organization in the dorsal raphe nucleus of the monkey. Kapadia SE, et al. **Neuroscience** 1985 Jul;15(3):729-46

Serotonin and co-localized peptides: effects on spinal motoneuron excitability. White SR. **Peptides (Fayetteville)** 1985;6 Suppl 2:123-7

The anorectic action of peripherally administered 5-HT is enhanced by vagotomy. Fletcher PJ, et al. **Physiol Behav** 1985 Jun;34(6):861-6

Histamine and serotonin independently elicit drinking in the rat. Kraly FS, et al. **Physiol Behav** 1985 Jun;34(6):963-7

Serotonin neurons on the ventral brain surface. Gorcs TJ, et al. **Proc Natl Acad Sci USA** 1985 Nov;82(21):7449-52

Formation of serotonin by rat kidneys in vivo. Stier CT Jr, et al. **Proc Soc Exp Biol Med** 1985 Dec;180(3):550-7

Involvement of peptide histidine isoleucine (PHI) in prolactin secretion induced by serotonin in rats. Tojo K, et al. **Proc Soc Exp Biol Med** 1985 Dec;180(3):558-61

Prostaglandin D2 mediated specific increase in rat brain serotonin. Bhattacharya SK, et al. **Proc West Pharmacol Soc** 1985;28:217-20

Effect of arterial endothelium on sensitivity to 5-hydroxytryptamine. Morcos NC, et al. **Proc West Pharmacol Soc** 1985;28:77-9

5-Hydroxytryptamine is an alpha agonist in rabbit blood vessels. Purdy RE, et al. **Proc West Pharmacol Soc** 1985;28:123-5

Depletion of brain serotonin by 5,7-dihydroxytryptamine alters the response to amphetamine and the habituation of locomotor activity in rats. Gately PF, et al. **Psychopharmacology (Berlin)** 1985;87(4):400-5

Reactivity of the bronchial artery to 5-hydroxytryptamine. Ei-Fawal HA, et al. **Res Commun Chem Pathol Pharmacol** 1985 Dec;50(3):325-36

Quantitative determination of serotonin released from human platelets. Marasini B, et al. **Ric Clin Lab** 1985 Jul-Sep;15(3):247-51

Influence of alpha- and beta-adrenoceptors on thrombin-induced serotonin release in rat platelets. Koutouzov S, et al. **Thromb Res** 1985 Oct 15;40(2):147-59

Studies of hepatic, brain monoamine oxidase and brain serotonin in rats. Chai KJ, et al. **Yonsei Med J** 1984;25(1):27-38

SEX BEHAVIOR, ANIMAL

Luteinizing hormone-releasing hormone facilitates the display of sexual behavior in male voles (Microtus canicaudus). Boyd SK, et al. **Horm Behav** 1985 Sep;19(3):252-64

Effects of chronically elevated intake of sweet solutions on sexual behavior of male rats. Lieblich I, et al. **Horm Behav** 1985 Sep;19(3):278-91

Serotonin type 2 antagonists inhibit lordosis behavior in the female rat: reversal with quipazine. Mendelson SD, et al. **Life Sci** 1986 Jan 6; 38(1):33-9

Luteinizing hormone releasing hormone enhances proceptivity in a primate. Kendrick KM, et al. **Neuroendocrinology** 1985 Dec; 41(6):449-53

Neuronal responsiveness to gonadotropin-releasing hormone and its correlation with sexual receptivity in the rat. Rothfeld JM, et al. **Peptides (Fayetteville)** 1985 Jul-Aug;6(4):603-8

Conditioned suppression of sexual behavior in stallions and reversal with diazepam. McDonnell SM, et al. **Physiol Behav** 1985 Jun;34(6):951-6

Effects of estrus, estrogen-progesterone priming, and vaginal stimulation on tonic immobility, dorsal immobility, and lordosis in the female rat. Smith RL, et al. **Physiol Behav** 1985 Oct;35(4):577-81

[Genetic factors in the regulation of the hypophyseo-adrenal system in aggressive and sexual interactions of male laboratory mice] Osadchuk AV, et al. **Zh Obshch Biol** 1985 Sep-Oct;46(5):711-6 (Eng. Abstr.) **(Rus)**

SLEEP

Diurnal administration of human growth hormone-releasing factor does not modify sleep and sleep-related growth hormone secretion in normal young men. Garry P, et al. **Acta Endocrinol (Copenh)** 1985 Oct; 110(2):158-63

A third view on benzodiazepines and sleep latency [letter] Rosenbaum JF. **Am J Psychiatry** 1985 Dec;142(12):1524

Neurochemical regulation of the states of alertness. Gaillard JM. **Ann Clin Res** 1985;17(5):175-84 (59 ref.)

Tonic activity of medial preoptic norepinephrine mechanism for body temperature maintenance in sleeping and awake rats. Datta S, et al. **Brain Res Bull** 1985 Nov;15(5):447-51

Signs of synchronized sleep elicited by local application of leptazol to a circumscribed area of the ventral surface of medulla oblongata in the cat. Guertzenstein PG, et al. **Braz J Med Biol Res** 1985;

18(1):87-96

Beta-blockers and sleep: a controlled trial. Betts TA, et al. **Eur J Clin Pharmacol** 1985;28 Suppl:65-8

Effect of benzodiazepine hypnotics on all-night sleep EEG spectra. Borbély AA, et al. **Hum Neurobiol** 1985;4(3):189-94

Sleep and electroencephalography: points of interest and points of controversy. Guilleminault C, et al. **J Clin Neurophysiol** 1984 Jul; 1(3):275-91 (115 ref.)

The prolonging effect of N,N'-diallylpentobarbital on the drug-induced sleep and motor incoordination. Yamamoto I, et al. **Res Commun Chem Pathol Pharmacol** 1985 Nov;50(2):209-19

Partial insomnia, hyperactivity and hyperdipsia induced by repeated administration of toluene in rats: their relation to brain monoamine metabolism. Arito H, et al. **Toxicology** 1985 Oct;37(1-2):99-110

[Sleep--2. Substances in the mechanism of sleep and wakefulness] Nagasaki H, et al. **Nippon Rinsho** 1985 Jul;43(7):1384-9 (19 ref.) **(Jpn)**

SLEEP STAGES

Diurnal administration of human growth hormone-releasing factor does not modify sleep and sleep-related growth hormone secretion in normal young men. Garry P, et al. **Acta Endocrinol (Copenh)** 1985 Oct; 110(2):158-63

SOCIAL ADJUSTMENT

Social effects of diazepam use: a longitudinal field study. Caplan RD, et al. **Soc Sci Med** 1985;21(8):887-98

[Psychopathometric study of the prognostic significance of psychopathologic findings and premorbid personality for discharge of neuroleptic treated patients with schizophrenic psychoses] Möller HJ, et al. **Nervenarzt** 1985 Sep;56(9):498-505 **(Ger)**

SODIUM

Sodium retention after adrenal enucleation. Perrone RD, et al. **Am J Physiol** 1986 Jan;250(1 Pt 1):E1-12 (86 ref.)

Renal sodium handling in normal humans subjected to low, normal, and extremely high sodium supplies. Roos JC, et al. **Am J Physiol** 1985 Dec;249(6 Pt 2):F941-7

Antisera to atrial natriuretic factor reduces urinary sodium excretion and increases plasma renin activity in rats. Naruse M, et al. **Biochem Biophys Res Commun** 1985 Nov 15;132(3):954-60

Early stimulation of ATP turnover by EGF + insulin. Relation to external pH and Na+/H+ exchange system. Talha S, et al. **Biochem Biophys Res Commun** 1985 Nov 27;133(1):265-73

Interhelical effects on the low-frequency modes and phase transitions of Li- and Na-DNA. Demarco C, et al. **Biopolymers** 1985 Nov; 24(11):2035-40

Evaluation of the electrophysiological consequences of GABA removal from the synaptic cleft by Na+ ion transport-coupled neuronal uptake. Cupello A, et al. **Brain Res** 1985 Dec 9;358(1-2):364-6

Further study of the correlation between Na-pump activity and membrane chemosensitivity. Ayrapetyan SN, et al. **Cell Mol Neurobiol** 1985 Sep; 5(3):231-43

Effects of an intravenous saline load on erythrocyte sodium transport in normal human subjects. Boero R, et al. **Clin Sci** 1985 Dec; 69(6):709-12

The sodium and bicarbonate dependence of bile secretion in the guinea-pig. Rutishauser SC. **Comp Biochem Physiol** [A] 1985; 82(2):317-22

Melittin-induced changes in Na and Cl movements across the skin and cornea (in vitro) of the toad Bufo marinus. McGahan MC, et al. **Comp Biochem Physiol** [C] 1985;82(2):291-6

DCCD-sensitive, Na+-dependent H+-influx process coupled to membrane potential formation in membrane vesicles of Halobacterium halobium. Murakami N, et al. **J Biochem (Tokyo)** 1985 Oct; 98(4):897-907

Effects of low extracellular sodium on cytosolic ionized calcium. Na+-Ca2+ exchange as a major calcium influx pathway in kidney cells. Snowdowne KW, et al. **J Biol Chem** 1985 Dec 5; 260(28):14998-507

Relationship of sodium sensitivity and the sympathetic nervous system. Dustan HP. **J Cardiovasc Pharmacol** 1985;7 Suppl 8:S56-63

Renal alpha 2-adrenoceptors, their locations and effects on sodium excretion. Pettinger WA, et al. **J Cardiovasc Pharmacol** 1985; 7 Suppl 8:S24-7

Determination of sodium, ephedrine and procaine in pharmaceuticals by capillary isotachophoresis. Fanali S, et al. **J Chromatogr** 1985 Aug 23; 330(2):436-8

Regulation of anterior pituitary D2 dopamine receptors by magnesium and sodium ions. Watanabe M, et al. **J Neurochem** 1985 Dec; 45(6):1842-9

Structure-activity relationship for substance P inhibition of carbamylcholine-stimulated 22Na+ flux in neuronal (PC12) and non-neuronal (BC3H1) cell lines. Simasko SM, et al. **J Pharmacol Exp Ther** 1985 Dec;235(3):601-5

Activation of acetylcholine synthesis in cat sympathetic ganglia: dependence on external choline and sodium-pump rate. Birks RI, et al. **J Physiol (Lond)** 1985 Oct;367:401-17

Serum factors affect Na+ pump activity and DNA synthesis in cultured cerebellar neural cells. Atterwill CK, et al. **Mol Cell Endocrinol** 1985 Nov;43(1):105-10

Decrease of potassium permeability by intracellular application of sodium ions in snail neurons. Walden J, et al. **Neurosci Lett** 1985 Sep 30; 60(2):139-43

Presynaptic autoinhibition during rest and sodium-pump inhibition in isolated rat portal vein preparation. Török TL, et al. **Neuroscience** 1985 Oct;16(2):439-49

[Dependence of ion transport across the plasma membrane on the density of the cell culture. I. Ion flows and the potassium and sodium content in 3 Chinese hamster cell lines (CHO)] Marakhova II, et al. **Tsitologiia** 1985 Sep;27(9):1011-20 (Eng. Abstr.) **(Rus)**

[Dependence of ion transport across the plasma membrane on cell culture density. II. Active and passive cation transport during the growth of L cell cultures] Marakhova II, et al. **Tsitologiia** 1985 Oct; 27(10):1156-63 (Eng. Abstr.) **(Rus)**

SOMATOSTATIN

Inhibitory action of somatostatin on meiotic maturation of cultured porcine follicular ova. Mori T, et al. **Acta Endocrinol (Copenh)** 1985 Nov;110(3):408-12

Rapid depletion of somatostatin in isolated mouse pancreatic islets after treatment with cysteamine. Petersson B, et al. **Acta Endocrinol (Copenh)** 1985 Oct;110(2):227-31

Capillary orientation of rat pancreatic D-cell processes: evidence for endocrine release of somatostatin. Aponte G, et al. **Am J Physiol** 1985 Nov;249(5 Pt 1):G599-606

Effect of exocrine pancreatic secretagogues on circulating somatostatin in dogs. Beglinger C, et al. **Am J Physiol** 1986 Jan; 250(1 Pt 1):G15-20

Somatostatin-like immunoreactivity in non-pyramidal neurons of the human isocortex. Braak E, et al. **Anat Embryol (Berl)** 1985; 173(2):237-46

Insulin, glucagon, pancreatic polypeptide hormone and somatostatin in the goat pancreas: demonstration by immunocytochemistry. Reddy S, et al. **Aust J Biol Sci** 1985;38(1):59-66

Octapeptide analogs of somatostatin exhibiting greatly enhanced in vivo and in vitro inhibition of growth hormone secretion in the rat. Murphy WA, et al. **Biochem Biophys Res Commun** 1985 Nov 15; 132(3):922-8

Negative inotropic effect of somatostatin in guinea-pig atrial fibres. Diez J, et al. **Br J Pharmacol** 1985 Nov;86(3):547-55

The influence of hGRF, CRF, TRH and LHRH on SRIF release from median eminence fragments. Aguila MC, et al. **Brain Res** 1985 Nov 25;348(1):180-2

The distribution of somatostatin-immunoreactive neurons in the visual cortex of adult rabbits and during postnatal development. Cajal-Agüeras SR, et al. **Brain Res** 1985 Dec 16;359(1-2):379-82

Localization and characterization of brain somatostatin receptors as studied with somatostatin-14 and somatostatin-28 receptor radioautography. Leroux P, et al. **Brain Res** 1985 Nov 11; 347(1):74-84

So-called interplexiform cells immunoreactive to tyrosine hydroxylase or somatostatin in rat retina. Negishi K, et al. **Brain Res** 1985 Oct 28; 346(1):136-40

The interaction of human pancreatic growth hormone releasing factor 1-44 with somatostatin in vivo in normal man. Davies RR, et al. **Clin Endocrinol (Oxf)** 1985 Sep;23(3):271-6

Somatostatin and water excretion in man: an intrarenal action. Walker BJ, et al. **Clin Endocrinol (Oxf)** 1985 Aug;23(2):169-74

On the mechanism of growth hormone autofeedback regulation: possible role of somatostatin and growth hormone-releasing factor. Conway S, et al. **Endocrinology** 1985 Dec;117(6):2284-92

Involvement of corticotropin-releasing factor and somatostatin in stress-induced inhibition of growth hormone secretion in the rat. Rivier C, et al. **Endocrinology** 1985 Dec;117(6):2478-82

Release of growth hormone (GH) from purified somatotrophs: interaction of GH-releasing factor and somatostatin and role of adenosine 3',5'-monophosphate. Sheppard MS, et al. **Endocrinology** 1985 Dec; 117(6):2364-70

Growth-hormone releasing factor does not antagonize somatostatin effects on pancreatic and gastric secretions. Chovet M, et al. **Experientia** 1985 Nov 15;41(11):1451-3

Isolation and characterization of proSS1-32, a peptide derived from the N-terminal region of porcine preprosomatostatin. Schmidt WE, et al. **FEBS Lett** 1985 Nov 11;192(1):141-6

An elasmobranchian somatostatin: primary structure and tissue distribution in Torpedo marmorata. Conlon JM, et al. **Gen Comp Endocrinol** 1985 Dec;60(3):406-13

Somatostatin stimulates ACTH release in brown trout (Salmo trutta L.). Langhorne P. **Gen Comp Endocrinol** 1986 Jan;61(1):71-5

Evidence for somatostatin-like immunoreactivity in discrete cells of the anterior pituitary of camel (Camelus dromedarius). Quéré M, et al. **Gen Comp Endocrinol** 1985 Nov;60(2):187-95

Somatostatin inhibits gastric acid secretion after gastric mucosal prostaglandin synthesis inhibition by indomethacin in man. Mogard MH, et al. **Gut** 1985 Nov;26(11):1189-91

Distribution, histochemistry and ultrastructure of somatostatin-like immunoreactive cells in the gastroenteric tract of the cartilaginous fish Scyliorhinus stellaris (L.). Tagliafierro G, et al. **Histochem J** 1985 Sep;17(9):1033-41

Pertussis toxin blocks both cyclic AMP-mediated and cyclic AMP-independent actions of somatostatin. Evidence for coupling of Ni to decreases in intracellular free calcium. Koch BD, et al. **J Biol Chem** 1985 Oct 25;260(24):13138-45

Somatostatin receptors: distribution in rat central nervous system and human frontal cortex. Uhl GR, et al. **J Comp Neurol** 1985 Oct 15;240(3):288-304

Somatostatin binding sites in human and monkey brain: localization and characterization. Beal MF, et al. **J Neurochem** 1986 Feb;46(2):359-65

Purification of somatostatin from frog brain: coisolation with retinal somatostatin-like immunoreactivity. Takami M, et al. **J Neurochem** 1985 Dec;45(6):1869-74

Somatostatin, substance P and [Lys]-vasopressin interfere with the binding of [3H][D-Ala2, Met5]enkephalinamide to rat brain membranes. Maruyama M. **Jpn J Pharmacol** 1985 Aug;38(4):445-7

Somatostatin: a metabolic regulator. Dileepan KN, et al. **Life Sci** 1985 Dec 23;37(25):2335-43 (88 ref.)

Gastrointestinal somatostatin: distribution, secretion and physiological significance. McIntosh CH. **Life Sci** 1985 Dec 2;37(22):2043-58 (203 ref.)

12-O-tetradecanoyl phorbol-13-acetate (TPA) stimulates somatostatin release from isolated perfused rat stomach. Yamatani T, et al. **Life Sci** 1985 Dec 23;37(25):2415-9

Effect of somatostatin on plasma prolactin. Lugari R, et al. **Minerva Endocrinol** 1985 Apr-Jun;10(2):79-82

Involvement of hypothalamic somatostatin in the suppression of growth hormone secretion by central corticotropin-releasing factor in conscious male rats. Katakami H, et al. **Neuroendocrinology** 1985 Nov;41(5):390-3

Release of pro-opiomelanocortin-derived peptides from the pars intermedia and pars distalis of the rat pituitary: effect of corticotrophin-releasing factor and somatostatin. Kraicer J, et al. **Neuroendocrinology** 1985 Nov;41(5):363-73

Thyroidectomy abolishes pulsatile growth hormone secretion without affecting hypothalamic somatostatin. Martin D, et al. **Neuroendocrinology** 1985 Dec;41(6):476-81

Effects of hypothalamic periventricular lesions on pulsatile growth hormone secretion. Urman S, et al. **Neuroendocrinology** 1985 Nov;41(5):357-62

Independent co-release of acetylcholine and somatostatin from cardiac vagal neurones in toad. Campbell G, et al. **Neurosci Lett** 1985 Sep 16;60(1):47-50

Acetylcholinesterase and somatostatin-immunoreactivity coexist in human neocortex. Nakamura S, et al. **Neurosci Lett** 1985 Oct 24;61(1-2):183-7

Intrathecal somatostatin modulates spinal sensory and reflex mechanisms: behavioral and electrophysiological studies in the rat. Wiesenfeld-Hallin Z. **Neurosci Lett** 1985 Nov 20;62(1):69-74

Electron microscopic immunocytochemical study of somatostatin neurons in the periventricular nucleus of the rat hypothalamus with special reference to their relationships with homologous neuronal processes. Alonso G, et al. **Neuroscience** 1985 Oct;16(2):297-306

Autoradiographic localization of a non-reducible somatostatin analog (125I-CGP 23996) binding sites in the rat brain: comparison with membrane binding. Epelbaum J, et al. **Peptides (Fayetteville)** 1985 Jul-Aug;6(4):713-9

Immunoreactive and bioactive somatostatin-like material is present in tobacco (Nicotiana tabacum). Werner H, et al. **Peptides (Fayetteville)** 1985 Sep-Oct;6(5):797-802

CSF somatostatin in affective illness and normal volunteers. Rubinow DR, et al. **Prog Neuropsychopharmacol Biol Psychiatry** 1985;9(4):393-400

The intestinal mucosa preferentially releases somatostatin-28 in pigs. Baldissera FG, et al. **Regul Pept** 1985 Jul;11(3):251-62

Caerulein and secretin induced pancreatic growth: a possible control by endogenous pancreatic somatostatin. Sarfati PD, et al. **Regul Pept** 1985 Jul;11(3):261-73

Trophic effect of some regulatory peptides on gastric exocrine and endocrine cells of the rat. Lehy T. **Scand J Gastroenterol [Suppl]** 1984;101:27-30

[The effect of antral branch on canine antral gastrin and somatostatin concentrations in gastric vagotomy] Tsutsui M. **Nippon Geka Gakkai Zasshi** 1985 Nov;86(11):1505-16 (Eng. Abstr.) **(Jpn)**

[Natural peptides and their analogs. XXXV. Synthesis and properties of [Ala5, Orn9]somatostatin] Shvachkin IuP, et al. **Bioorg Khim** 1985 Aug;11(8):1026-36 (Eng. Abstr.) **(Rus)**

SOMATOTROPIN RELEASING HORMONE

Diurnal administration of human growth hormone-releasing factor does not modify sleep and sleep-related growth hormone secretion in normal young men. Garry P, et al. **Acta Endocrinol (Copenh)** 1985 Oct;110(2):158-63

Growth hormone-releasing factor modifies dopaminergic but not serotonergic activity in the arcuate nucleus of hypothalamus in the rat, as recorded in vivo by differential pulse voltammetry. Crespi F, et al. **Brain Res** 1985 Dec 2;348(2):367-70

Effect of hypothalamic ventromedial lesions on plasma growth hormone response to growth hormone-releasing factor in rats. Wakabayashi I, et al. **Brain Res** 1985 Oct 28;346(1):70-4

Ontogenetic appearance of immunoreactive GRF-containing neurons in the rat hypothalamus. Daikoku S, et al. **Cell Tissue Res** 1985;242(3):511-8

The interaction of human pancreatic growth hormone releasing factor 1-44 with somatostatin in vivo in normal man. Davies RR, et al. **Clin Endocrinol (Oxf)** 1985 Sep;23(3):271-6

Synthetic pancreatic growth hormone-releasing factor (GRF-40) stimulates the secretion of the endocrine pancreas. Hermansen K, et al. **Diabetes** 1986 Jan;35(1):119-23

On the mechanism of growth hormone autofeedback regulation: possible role of somatostatin and growth hormone-releasing factor. Conway S, et al. **Endocrinology** 1985 Dec;117(6):2284-92

Association of 45Ca2+ mobilization with stimulation of growth hormone (GH) release by GH-releasing factor in dispersed normal male rat pituitary cells. Login IS, et al. **Endocrinology** 1986 Jan;118(1):239-43

Release of growth hormone (GH) from purified somatotrophs: interaction of GH-releasing factor and somatostatin and role of adenosine 3',5'-monophosphate. Sheppard MS, et al. **Endocrinology** 1985 Dec;117(6):2364-70

Differential responsiveness of the somatotroph to growth hormone-releasing factor during early neonatal development in the rat. Szabo M, et al. **Endocrinology** 1986 Jan;118(1):69-73

Growth-hormone releasing factor does not antagonize somatostatin effects on pancreatic and gastric secretions. Chovet M, et al. **Experientia** 1985 Nov 15;41(11):1451-3

Synthetic human growth hormone releasing factor 1-44 (GRF) stimulates glucose transport in isolated rat adipocytes. Hauner H, et al. **Horm Metab Res** 1985 Nov;17(11):620-1

Atropine blockade of growth hormone (GH)-releasing hormone-induced GH secretion in man is not exerted at pituitary level. Casanueva FF, et al. **J Clin Endocrinol Metab** 1986 Jan;62(1):186-91

Regional distribution of human growth hormone-releasing hormone in the human hypothalamus by radioimmunoassay. Leidy JW Jr, et al. **J Clin Endocrinol Metab** 1986 Feb;62(2):372-8

Impaired growth hormone (GH) response to GH-releasing hormone in thalassemia major. Pintor C, et al. **J Clin Endocrinol Metab** 1986 Feb;62(2):263-7

Sex difference in human growth hormone (GH) response to intravenous human pancreatic GH-releasing hormone administration in young adults. Smals AE, et al. **J Clin Endocrinol Metab** 1986 Feb;62(2):336-41

Growth hormone-releasing factor analogue (hGRF1-29NH2): immunoreactive-GRF plasma levels after intravenous and subcutaneous administration. Rafferty B, et al. **J Endocrinol** 1985 Dec;107(3):R5-8

Growth hormone releasing factor (GRF) increases free arachidonate levels in the pituitary: a role for lipoxygenase products. Canonico PL, et al. **Life Sci** 1986 Jan 20;38(3):267-72

Growth hormone responses to growth hormone-releasing hormone (1-29)-NH2 and a D-Ala2 analog in normal men. Barron JL, et al. **Peptides (Fayetteville)** 1985 May-Jun;6(3):575-7

Effect of hypophysectomy on immunocytochemically demonstrated growth hormone releasing factor (GHRF) in the rat brain. Merchenthaler I, et al. **Peptides (Fayetteville)** 1985 Sep-Oct;6(5):865-7

Sensitivity of rat forebrain neurons to growth hormone-releasing hormone. Twery MJ, et al. **Peptides (Fayetteville)** 1985 Jul-Aug;6(4):609-13

Vasoactive intestinal peptide effects on GH3 pituitary tumor cells: high affinity binding, affinity labeling, and adenylate cyclase stimulation. Comparison with peptide histidine isoleucine and growth hormone-releasing factor. Wood CL, et al. **Regul Pept** 1985 Nov 7;12(3):237-48

[Intervention of the calcium-calmodulin system in the release of growth hormone induced by somatocrinin] Mougin C, et al. **Ann Endocrinol (Paris)** 1985;46(1):61-3 (Eng. Abstr.) **(Fre)**

[Plasma assay of somatocrinin during growth hormone stimulation tests. Results in pediatrics] Evain-Brion D, et al **Arch Fr Pediatr** 1985 Aug-Sep;42 Suppl 1:575-8 (Eng. Abstr.) **(Fre)**

SPATIAL BEHAVIOR

[Delayed spatial choice in the monkey with different probabilities of signal presentation] Nikitin VS. **Zh Vyssh Nerv Deiat** 1985 Sep-Oct; 35(5):968-70 **(Rus)**

STARTLE REACTION

Anterior cerebellar vermal stimulation: effect on behavior and basal forebrain neurochemistry in rat. Albert TJ, et al. **Biol Psychiatry** 1985 Dec;20(12):1267-76

Central 5-HT and the respiratory response to acoustic stimulation in awake rats: effects of PCPA, 5-HTP and 8-OH-DPAT. Ahlenius S, et al. **J Neural Transm** 1985;63(3-4):285-95

Fear-enhanced acoustic startle is not attenuated by acute or chronic imipramine treatment in rats. Cassella JV, et al. **Psychopharmacology (Berlin)** 1985;87(3):278-82

Cocaine: effects on acoustic startle and startle elicited electrically from the cochlear nucleus. Harty TP, et al. **Psychopharmacology (Berlin)** 1985; 87(4):396-9

STEREOTYPED BEHAVIOR

A genetic analysis of stereotypy in the mouse: dopaminergic plasticity following chronic stress. Cabib S, et al. **Behav Neural Biol** 1985 Sep; 44(2):239-48

Neurochemical aspects of the Rett syndrome. Riederer P, et al. **Brain Dev** 1985;7(3):351-60

Contralateral circling behavior induced by intranigral microinjections of taurine and GABA in rats. Kamata K, et al. **Brain Res** 1985 Sep 23; 343(2):275-82

Effect of methylphenidate pretreatment on the behavioral and biochemical responses to amphetamine. Kolta MG, et al. **Eur J Pharmacol** 1985 Nov 5;117(2):279-82

The enantiomers of SK&F 83566, a new selective D-1 dopamine antagonist, stereospecifically block stereotyped behaviour induced by apomorphine and by the selective D-2 agonist RU 24213. Molloy AG, et al. **Eur J Pharmacol** 1985 Oct 8;116(1-2):183-6

Potential neuroleptic agents. 4. Chemistry, behavioral pharmacology, and inhibition of [3H]spiperone binding of 3,5-disubstituted N-[(1-ethyl-2-pyrrolidinyl)methyl]-6-methoxysalicylamides. de Paulis T, et al. **J Med Chem** 1986 Jan;29(1):61-9

Neuroleptic activity of chiral trans-hexahydro-gamma-carbolines. Sarges R, et al. **J Med Chem** 1986 Jan;29(1):8-19

Chronic clorgyline and pargyline increase apomorphine-induced stereotypy in the rat. Campbell IC, et al. **Pharmacol Biochem Behav** 1985 Dec;23(6):921-5

Effects of some antidepressant drugs on apomorphine concentration in the central nervous system of rats and apomorphine-induced stereotypy. Rurak A, et al. **Pol J Pharmacol Pharm** 1985 Jul-Aug;37(4):509-15

Behavioral evidence for cholecystokinin modulation of dopamine in the mesolimbic pathway. Crawley JH. **Prog Clin Biol Res** 1985; 192:131-8

Behavioral effects of cholecystokinin and its related peptides in rats. Itoh S, et al. **Prog Clin Biol Res** 1985;192:139-45

Effects of cholecystokinin and vasoactive intestinal peptide on locomotion and rearing in neofrontal decorticated rats. Katsuura G, et al. **Prog Clin Biol Res** 1985;192:147-50

Effects of the putative D-1 antagonist SCH 23390 on stereotyped behaviour induced by the D-2 agonist RU24213. Pugh MT, et al. **Psychopharmacology (Berlin)** 1985;87(3):308-12

[Stereotyped behavior and the nigro-strio-nigral system] Arushanian EB. **Zh Vyssh Nerv Deiat** 1985 Sep-Oct;35(5):819-32 (50 ref.) **(Rus)**

STRESS, PSYCHOLOGICAL

Psychogenic stress in women during fetal monitoring (hormonal profile). Shalev E, et al. **Acta Obstet Gynecol Scand** 1985;64(5):417-20

An approach to stress and anxiety in general practice. Manzie P. **Aust Fam Physician** 1985 Sep;14(9):894-5, 899-900

Dynamics of cholinergic synaptic mechanisms in rat hippocampus after stress. Finkelstein Y, et al. **Brain Res** 1985 Sep 23;343(2):314-9

Glucocorticoids facilitate the retention of acquired immobility during forced swimming. Veldhuis HD, et al. **Eur J Pharmacol** 1985 Sep 24; 115(2-3):211-7

Beta-blockers and psychic stress: a double-blind, placebo-controlled study of bopindolol vs lorazepam and butalbital in surgical patients. Chierichetti SM, et al. **Int J Clin Pharmacol Ther Toxicol** 1985 Sep; 23(9):510-4

A chronic technique for high frequency blood sampling/transfusion in the freely behaving rat which does not affect prolactin and corticosterone secretion. Wiersma J, et al. **J Endocrinol** 1985 Nov; 107(2):285-92

Effect of short-term swimming stress and diazepam on 3,4-dihydroxyphenylacetic acid (DOPAC) and 5-hydroxyindoleacetic acid (5-HIAA) levels in the caudate nucleus: an in vivo voltammetric study. Ikeda M, et al. **Naunyn Schmiedebergs Arch Pharmacol** 1985 Oct; 331(1):23-6

Stressor invoked exacerbation of amphetamine-elicited perseveration. Anisman H, et al. **Pharmacol Biochem Behav** 1985 Aug;23(2):173-83

The effects of PK 11195, a ligand for benzodiazepine binding sites, in animal tests of anxiety and stress. File SE, et al. **Pharmacol Biochem Behav** 1985 Nov;23(5):737-41

The effects of putative anxiolytic compounds (PK 8165, PK 9084 and tracazolate) on the rat corticosterone response. File SE, et al. **Physiol Behav** 1985 Oct;35(4):583-6

Psychoneuroendocrine stress responses and mood as related to the menstrual cycle. Collins A, et al. **Psychosom Med** 1985 Nov-Dec; 47(6):512-27

[Effect of enkephalins on morphologic and hormonal manifestations of the stress reaction] Lishmanov IuB, et al. **Patol Fiziol Eksp Ter** 1985 Sep-Oct;(5):14-7 (Eng. Abstr.) **(Rus)**

[Stress-induced disorders in the antitumor immunity system and their limitation by stress-limiting factors] Meerson FZ, et al. **Vestn Akad Med Nauk SSSR** 1985;(8):23-9 (Eng. Abstr.) **(Rus)**

SUBSTANCE P

Acute continuous exposure to cigarette smoke produces discrete changes in cholecystokinin and substance P levels in the hypothalamus and preoptic area of the male rat. Fuxe K, et al. **Acta Physiol Scand** 1985 Nov;125(3):437-43

The substance P innervation of the rat hippocampal region. Davies S, et al. **Anat Embryol (Berl)** 1985;173(1):45-52

Substance P immunoreactivity in the major pelvic ganglion of the rat. Dail WG, et al. **Anat Rec** 1985 May;212(1):103-9

Immunohistochemical observation on substance P in regenerating taste buds of the rat. Nishimoto T, et al. **Anat Rec** 1985 Aug; 212(4):430-6

Amidase-like activity of calpain I and calpain II on substance P and its related peptides. Hatanaka M, et al. **Arch Biochem Biophys** 1985 Nov 1;242(2):557-62

A peptide that inhibits the mitogenic stimulation of Swiss 3T3 cells by bombesin or vasopressin. Corps AN, et al. **Biochem J** 1985 Nov 1; 231(3):781-4

Proteolytic inactivation of substance P in the epithelial layer of the intestine. Nau R, et al. **Biochem Pharmacol** 1985 Nov 15; 34(22):4019-23

Relation of substance P to catecholamine metabolism and stress. Oehme P. **Biomed Biochim Acta** 1985;44(10):1401-9 (36 ref.)

Cholecystokinin and substance P concentrations in discrete areas of the rat brain: sex differences. Frankfurt M, et al. **Brain Res** 1985 Dec 9; 358(1-2):53-8

The actions of substance P and serotonin on myenteric neurons in tissue culture. Hanani M, et al. **Brain Res** 1985 Dec 9;358(1-2):276-81

Deafferentation causes a loss of presynaptic bombesin receptors and supersensitivity of substance P receptors in the dorsal horn of the cat spinal cord. Massari VJ, et al. **Brain Res** 1985 Sep 23;343(2):268-74

Regional distribution of substance P, neurokinin alpha and neurokinin beta in rat spinal cord, nerve roots and dorsal root ganglia, and the effects of dorsal root section or spinal transection. Ogawa T, et al. **Brain Res** 1985 Dec 16;359(1-2):152-7

Comparative distribution of neuropeptide tyrosine-, vasoactive intestinal polypeptide-, substance P-immunoreactive, acetylcholinesterase-positive and noradrenergic nerves in the reproductive tract of the female rat. Papka RE, et al. **Cell Tissue Res** 1985;242(3):475-90

Calcitonin gene-related peptide is a potent inhibitor of substance P degradation. Le Greves P, et al. **Eur J Pharmacol** 1985 Sep 24; 115(2-3):309-11

Opposing hemodynamic effects of substance P on pulmonary vasculature in rabbits. Worthen GS, et al. **J Appl Physiol** 1985 Oct; 59(4):1098-103

Topographic organization of substance P and monoamine cells in the ventral medulla of the cat. Marson L, et al. **J Auton Nerv Syst** 1985 Nov;14(3):271-85

A study of the substance P innervation of the intermediate zone of the thoracolumbar spinal cord. Oldfield BJ, et al. **J Comp Neurol** 1985 Jun 1;236(1):127-40

Ontogeny of substance P-like immunoreactive fibers in the taste buds and their surrounding epithelium of the circumvallate papillae of the rat. II. Electron microscopic analysis. Yamasaki H, et al. **J Comp Neurol** 1985 Nov 22;241(4):493-502

Three-dimensional distribution of substance P-like immunoreactivity in the urinary bladder of rat. Yokokawa K, et al. **J Neural Transm** 1985; 63(3-4):209-22

Effects of substance P on carbachol-stimulated 45Ca2+ uptake into cultured adrenal chromaffin cells. Boksa P. **J Neurochem** 1985 Dec; 45(6):1895-902

Structure-activity relationship for substance P inhibition of carbamylcholine-stimulated 22Na+ flux in neuronal (PC12) and non-neuronal (BC3H1) cell lines. Simasko SM, et al. **J Pharmacol Exp Ther** 1985 Dec;235(3):601-5

Intraseptal microinjections of substance P and analogs potentiate pentobarbital-induced narcosis and depression of hippocampal cholinergic activity. Zucker JR, et al. **J Pharmacol Exp Ther** 1985 Nov; 235(2):398-401

Somatostatin, substance P and [Lys]-vasopressin interfere with the binding of [3H][D-Ala2, Met5]enkephalinamide to rat brain membranes. Maruyama M. **Jpn J Pharmacol** 1985 Aug;38(4):445-7

Modification of morphine withdrawal: effect of tuftsin, [Lys4]-tuftsinyltuftsin, tetrapeptide fragment (1-4) of substance P and its amide. Aronowski J, et al. **Life Sci** 1985 Oct 28;37(17):1649-53

Central effects of an antagonist and an antiserum to substance P on serum gonadotropin and prolactin secretion. Dees WL, et al. **Life Sci** 1985 Oct 28;37(17):1627-31

Cardiovascular effects of calcitonin gene-related peptide in the pithed rat: comparison with substance P. Haass M, et al. **Life Sci** 1985 Dec 2;37(22):2085-90

Effect of age on substance P levels in the rat mesenteric artery and vein. Duckles SP. **Neurobiol Aging** 1985 Fall,6(3):237-9

Cardio-respiratory actions of substance P, TRH and 5-HT in the nucleus tractus solitarius of rats: evidence for functional interactions of neuropeptides and amine neurotransmitters. Carter DA, et al. **Neuropeptides** 1985 Sep;6(5):425-36

Substance P-immunoreactive nerves in the rat kidney. Ferguson M, et al. **Neurosci Lett** 1985 Sep 30;60(2):183-8

Evidence that large synaptic vesicles containing substance P and small synaptic vesicles have a surface antigen in common in rat. Floor E, et al. **Neurosci Lett** 1985 Sep 30;60(2):231-7

Innervation of the feline cerebral vasculature by nerve fibers containing calcitonin gene-related peptide: trigeminal origin and co-existence with substance P. Uddman R, et al. **Neurosci Lett** 1985 Nov 20; 62(1):131-6

Co-existence of glucagon- and substance P-like immunoreactivity in the chicken retina. Katayama-Kumoi Y, et al. **Neuroscience** 1985 Oct; 16(2):417-24

Behavioral investigation of the coexistence of substance P, corticotropin releasing factor, and acetylcholinesterase in lateral dorsal tegmental neurons projecting to the medial frontal cortex of the rat. Crawley JN, et al. **Peptides (Fayetteville)** 1985 Sep-Oct;6(5):891-901

Substance K and substance P differentially modulate mesolimbic and mesocortical systems. Deutch AY, et al. **Peptides (Fayetteville)** 1985; 6 Suppl 2:113-22

Organization of LHRH cells: differential apposition of neurotensin, substance P and catecholamine axons. Hoffman GE. **Peptides (Fayetteville)** 1985 May-Jun;6(3):439-61

Spantide: failure to antagonize bombesin-induced stimulation of gastrin secretion in dogs. Pappas T, et al. **Peptides (Fayetteville)** 1985 Sep-Oct; 6(5):1001-3

Calcitonin gene-related peptide coexists with substance P in capsaicin sensitive neurons and sensory ganglia of the rat. Skofitsch G, et al. **Peptides (Fayetteville)** 1985 Jul-Aug;6(4):747-54

Neuropeptide modulation of the behavioral effects of drugs. Barrett JE, et al. **Prog Clin Biol Res** 1985;192:37-50

Substance P modulation of the mesolimbic dopamine system. Kalivas P. **Prog Clin Biol Res** 1985;192:403-8

Characterization of the metabolism of substance P and neurotensin by human angiotensin I converting enzyme and 'enkephalinase'. Skidgel RA. **Prog Clin Biol Res** 1985;192:371-8

Effect of regulatory polypeptides on the substance P stimulated lower esophageal sphincter pressure in pigs. Aggestrup S. **Regul Pept** 1985 Sep;12(1):1-7

[Peptidergic transmission and late slow EPSP in sympathetic ganglion cells] Jiang ZG. **Sheng Li Ko Hsueh Chin Chan** 1984 Oct; 15(4):301-5 **(Chi)**

[Synthesis of cyclic and non-cyclic tachykinin partial sequences. 2. Synthesis of the homocyclic substance P(6-11) hexapeptide] Neubert K, et al. **Pharmazie** 1985 Aug;40(8):532-5 (Eng. Abstr.) **(Ger)**

[Substance P. New cyclic analogs] Mutulis FK, et al. **Bioorg Khim** 1985 Sep;11(9):1276-8 (Eng. Abstr.) **(Rus)**

SUBSTANCE USE DISORDERS

Clinical management of benzodiazepine dependence [letter] Marks J. **Br Med J [Clin Res]** 1985 Oct 26;291(6503):1201-2

SYMPATHOMIMETICS

A comparison of the relative toxicities of beta-sympathomimetic tocolytic agents. Hankins GD, et al. **Am J Perinatol** 1985 Oct;2(4):338-46

cAMP- and beta-adrenergic-stimulated chloride-dependent Ca2+ secretion in frog skin. Ziyadeh FN, et al. **Am J Physiol** 1985 Nov; 249(5 Pt 2):F713-22

Spectrophotometric determination of certain sympathomimetic amines. Salem FB, et al. **Analyst** 1985 Sep;110(9):1125-9

Regulation of cerebrovascular gamma-glutamyltranspeptidase by adrenergic and cholinergic agonists. Grammas P, et al. **Biochem Pharmacol** 1985 Dec 1;34(23):4177-9

Effects of adrenergic drugs on the electrical activity of pigeon oesophagus. Mulè F, et al. **Boll Soc Ital Biol Sper** 1985 Sep 30;61(9):1365-70

Hydrostatic pressure and adrenergic drugs (agonists and antagonists): effects and interactions in fish. Sebert P, et al. **Comp Biochem Physiol** [C] 1985;82(1):207-12

Modification of behavioral response to intra-hippocampal injections of noradrenaline and adrenoceptor agonists by chronic treatment with desipramine and citalopram: functional aspects of adaptive receptor changes. Plaźnik A, et al. **Eur J Pharmacol** 1985 Nov 5; 117(2):245-52

Time change of rabbit aqueous flow under influence of adrenergic drugs. Araie M. **Exp Eye Res** 1985 Sep;41(3):391-403

Influence of adrenoreceptor agonists and antagonists on ovulation in the rabbit ovary perfused in vitro. Schmidt G, et al. **J Auton Pharmacol** 1985 Sep;5(3):241-50

Microneurography: a technique for assessing central neural effects of adrenergic drugs on sympathetic outflow in humans. Mark AL, et al. **J Cardiovasc Pharmacol** 1985;7 Suppl 8:S67-9

Effects of maternal beta sympathomimetic therapy on the neonate. Armstrong C. **Neonatal Netw** 1985 Dec;4(3):6-9

[Sydnocarb as the method of choice in persistent enuresis? Findings after 2 years of administration] Simlová M, et al. **Cesk Psychiatr** 1985 Oct; 81(5):312-3 (Eng. Abstr.) **(Cze)**

[Functional synergism of beta-adrenomimetics and seduxen during action on the uterine contractile function in an experiment] Gersamiia TV, et al. **Akush Ginekol (Mosk)** 1985 Aug;(8):65-6 **(Rus)**

[Possibilities of regulating uterine contractile function with adrenergic and cholinergic agents in an experiment] Pankratova VV, et al. **Akush Ginekol (Mosk)** 1985 Aug;(8):62-3 **(Rus)**

SYNAPTIC RECEPTORS

Is there feedback regulation of neurotransmitter release by autoreceptors? Kalsner S. **Biochem Pharmacol** 1985 Dec 1;34(23):4085-97 (86 ref.)

Cl-/Ca2+-dependent L-glutamate binding sites do not correspond to 2-amino-4-phosphonobutanoate-sensitive excitatory amino acid receptors. Fagg GE, et al. **Br J Pharmacol** 1985 Nov;86(3):743-51

Neurotensin-like immunoreactivity and neurotensin receptors in the rat hypothalamus and in the neurointermediate lobe of the pituitary gland. Goedert M, et al. **Brain Res** 1985 Dec 9;358(1-2):59-69

Deafferentation causes a loss of presynaptic bombesin receptors and supersensitivity of substance P receptors in the dorsal horn of the cat spinal cord. Massari VJ, et al. **Brain Res** 1985 Sep 23;343(2):268-74

Relationship between levels and uptake of serotonin and high affinity [3H]imipramine recognition sites in the rat brain. Hrdina PD, et al. **Can J Physiol Pharmacol** 1985 Oct;63(10):1239-44

Phencyclidine binding sites in the nucleus accumbens and phencyclidine-induced hyperactivity are decreased following lesions of the mesolimbic dopamine system. French ED, et al. **Eur J Pharmacol** 1985 Oct 8;116(1-2):1-9

Tritiated imipramine binding to platelets in manic subjects. Lewis DA, et al. **J Affective Disord** 1985 Nov;9(3):207-11

Is inhibition of striatal synaptosomal tyrosine hydroxylation by dopamine agonists a measure of dopamine autoreceptor function? Fowler CJ, et al. **Naunyn Schmiedebergs Arch Pharmacol** 1985 Oct;331(1):12-9

Morphine dependence and protracted abstinence: regional alterations in CNS radioligand binding. Carlson KR, et al. **Pharmacol Biochem Behav** 1985 Dec;23(6):1059-63

Characterization of endogenous inhibitors of [3H]-imipramine binding and [3H]-serotonin uptake from rat serum. Angel I, et al. **Prog Clin Biol Res** 1985;192:457-64

Characterization of the endocoid for imipramine recognition sites. Barbaccia ML, et al. **Prog Clin Biol Res** 1985;192:431-40

Evidence for an endogenous peptide ligand and antagonist for PCP receptors. Contreras PC, et al. **Prog Clin Biol Res** 1985;192:495-8

5-methoxytryptoline and close analogs as candidates for the endogenous ligand of the 3H-imipramine recognition site. Langer SZ, et al. **Prog Clin Biol Res** 1985;192:441-55

Demonstration of an imipramine endacoid in rat brain. Rehavi M, et al. **Prog Clin Biol Res** 1985;192:465-72

Cellular mechanisms for neurotensin receptor-mediated release of prolactin. Memo M, et al. **Regul Pept [Suppl]** 1985;4:200-2

[Neuroleptics in psychogeriatrics. A proposal for a more rational prescription policy] Willekens-Bogaers MA, et al. **Tijdschr Gerontol Geriatr** 1985 Oct;16(5):179-89 (Eng. Abstr.) **(Dut)**

TESTOSTERONE

Regulation of gonadotrophin secretion in male mice from birth to adulthood. Response to LRH injection, castration and testosterone replacement therapy. Jean-Faucher C, et al. **Acta Endocrinol (Copenh)** 1985 Oct;110(2):193-9

Effects of solvent exposure on testosterone levels and butyrylcholinesterase activity in mice. Kjellstrand P, et al. **Acta Pharmacol Toxicol (Copenh)** 1985 Oct;57(4):242-9

Effects of calmodulin and lipoxygenase inhibitors on LH (lutropin)- and LHRH (luliberin)-agonist-stimulated steroidogenesis in rat Leydig cells. Sullivan MH, et al. **Biochem J** 1985 Nov 15;232(1):55-9

The role of endogenous gonadotropin-releasing hormone in the control of luteinizing hormone and testosterone secretion in the juvenile male monkey, Macaca fascicularis. Cameron JL, et al. **Biol Reprod** 1985 Aug; 33(1):147-56

Effects of intermittent pulsatile infusion of luteinizing hormone-releasing hormone on dihydrotestosterone-suppressed gonadotropin secretion in castrate rams. Schanbacher BD. **Biol Reprod** 1985 Oct;33(3):603-11

Inhibition of testosterone production with ketoconazole alone and in combination with a gonadotropin releasing hormone analogue in the rat. English HF, et al. **Cancer Res** 1986 Jan;46(1):38-42

In vitro study of the direct ovarian effects of gonadotropin-releasing hormone (GnRH) in the frogs, Rana pipiens and Rana catesbeiana. Hubbard GM, et al. **Gen Comp Endocrinol** 1985 Nov;60(2):154-61

Effect of mammalian luteinizing hormone-releasing hormone on plasma testosterone in male alligators, with observations on the nature of alligator hypothalamic gonadotropin-releasing hormone. Lance VA, et al. **Gen Comp Endocrinol** 1985 Nov;60(2):138-43

Luteinizing hormone-releasing hormone facilitates the display of sexual behavior in male voles (Microtus canicaudus). Boyd SK, et al. **Horm Behav** 1985 Sep;19(3):252-64

Evidence that estrogen regulation of testosterone secretion in adult rams is mediated by both indirect (gonadotropin dependent) and direct (gonadotropin independent) means. Sanford LM. **J Androl** 1985 Sep-Oct;6(5):306-14

Suppression of plasma gonadotropins and testosterone in adult male monkeys (Macaca fascicularis) by a potent inhibitory analog of gonadotropin-releasing hormone. Adams LA, et al. **J Clin Endocrinol Metab** 1986 Jan;62(1):58-63

Sexual differentiation of prolactin responsiveness to thyrotropin releasing hormone (TRH) in the rat. Effects of postnatal testosterone on adenohypophyseal TRH receptor ontogenesis in male rats. Watanobe H, et al. **J Endocrinol Invest** 1985 Oct;8(5):459-64

Hormonal responses to gonadotrophin releasing hormone during testicular development in male African green monkeys. Brady AG, et al. **J Med Primatol** 1985;14(6):293-304

Stimulation of hypothalamic LHRH levels and release by gonadal steroids. Kalra PS. **J Steroid Biochem** 1985 Nov;23(5B):725-31

Hormonal effects of GnRH agonist in the human male: an approach to male contraception using combined androgen and GnRH agonist treatment. Swerdloff RS, et al. **J Steroid Biochem** 1985 Nov; 23(5B):855-61

LH-RH antagonist inhibits gonadal steroid secretion in vitro. Spona J, et al. **Peptides (Fayetteville)** 1985 May-Jun;6(3):379-82

[The effects of bromocriptine on the pulsatile pattern and the circadian profile of gonadotropins and testosterone secretion in normal adult men] Aisaka K, et al. **Nippon Naibunpi Gakkai Zasshi** 1985 Jun 20; 61(6):701-9 (Eng. Abstr.) **(Jpn)**

THERAPEUTIC EQUIVALENCY

Informed consent and generic drug substitution. DeVeaugh-Geiss J. **Clin Ther** 1985;7(5):544-8

THIORIDAZINE

Prophylactic effects of neuroleptics in symptom-free schizophrenics: roles of dopaminergic and noradrenergic blockers. Nishikawa T, et al. **Biol Psychiatry** 1985 Nov;20(11):1161-6

Physostigmine as an antidote for poisoning by combination of thioridazine and trihexyphenidyl. Beilin B, et al. **Br J Clin Pract** 1985 Oct; 39(10):400-1

Critical evaluation of thioridazine bioequivalence. Barone JA, et al. **Drug Intell Clin Pharm** 1985 Nov;19(11):847-58 (43 ref.)

Thioridazine 5-sulfoxide diastereoisomers in serum and urine from rats and man after chronic thioridazine administration. Hale PW Jr, et al. **J Anal Toxicol** 1985 Sep-Oct;9(5):197-201

High-pressure liquid chromatographic determination of thioridazine and its major metabolites in biological tissues and fluids. Allender WJ. **J Chromatogr Sci** 1985 Dec;23(12):541-5

Differential effects of thioridazine, clozapine and metoclopramide on the induction of adrenomedullary enzymes by apomorphine. Ekker M, et al. **Neuropharmacology** 1985 Nov;24(11):1063-6

THIRST

Post-training brain catecholamine levels: lack of response to water-motivated training. Gold PE, et al. **Behav Neural Biol** 1985 Nov; 44(3):425-33

THYROID HORMONES

Alterations in vitamin A and thyroid hormone status in anorexia nervosa and associated disorders. Curran-Celentano J, et al. **Am J Clin Nutr** 1985 Dec;42(6):1183-91

[Hypophyseal, thyroid and adrenal cortical hormone levels in the blood serum of newborn infants in the early neonatal period] Ametov AS, et al. **Pediatriia** 1985 Sep;(9):20-2 (Eng. Abstr.) **(Rus)**

[Cytoreceptors in the molecular mechanisms of hormone action] Rozen VB. **Probl Endokrinol (Mosk)** 1985 Sep-Oct;31(5):21-6 (Eng. Abstr.) **(Rus)**

[Effect of the intravenous administration of amiodarone on the blood concentrations of thyroid hormones and thyrotropin (letter)] Rodriguez Espinosa J, et al. **Med Clin (Barc)** 1985 Oct 12;85(11):475 **(Spa)**

THYROTROPIN

Effect of low-dose dopamine infusion on basal and stimulated TSH and prolactin concentrations in man. Connell JM, et al. **Clin Endocrinol (Oxf)** 1985 Aug;23(2):185-92

TRH analogue with C-terminal thioamide group. Synthesis, receptor binding, TSH-releasing activity and alpha-MSH-releasing activity. Kruszyński M, et al. **Experientia** 1985 Dec 15;41(12):1576-7

[Effect of the intravenous administration of amiodarone on the blood concentrations of thyroid hormones and thyrotropin (letter)] Rodriguez Espinosa J, et al. **Med Clin (Barc)** 1985 Oct 12;85(11):475 **(Spa)**

THYROXINE

Comparative characterization of thyroid hormone receptors and binding proteins in rat liver nucleus, plasma membrane, and cytosol by photoaffinity labeling with L-thyroxine. Dozin B, et al. **Biochemistry** 1985 Sep 10;24(19):5203-8

Influence of hormones and undernutrition on brain development in newborn rats. Pascual-Leone AM, et al. **Biol Neonate** 1985; 48(4):228-36

Control of plasma sex steroid-binding protein (SBP) in the little brown bat: effects of thyroidectomy and treatment with L- and D-thyroxine on the induction of SBP in adult males. Damassa DA, et al. **Biol Reprod** 1985 Dec;33(5):1138-46

Proliferative response of mouse submandibular gland to androgen but not to thyroid hormone. Okamoto S, et al. **Cell Tissue Kinet** 1985 Nov; 18(6):583-8

One-step immunoassays for free (unbound) hormones: the effect of tracer binding by serum proteins. Geiseler D, et al. **Clin Chem** 1986 Jan; 32(1 Pt 1):45-9

Free thyroxin and free triiodothyronine as measured by equilibrium dialysis and analog radioimmunoassay in serum of patients taking phenytoin and carbamazepine. Liewendahl K, et al. **Clin Chem** 1985 Dec;31(12):1993-6

Thyroid hormone induces metamorphosis of flounder larvae. Inui Y, et al. **Gen Comp Endocrinol** 1985 Dec;60(3):450-4

Effect of L-thyroxine on ovarian development and gestation in the viviparous guppy, Poecilia reticulata. Lam TJ, et al. **Gen Comp Endocrinol** 1985 Nov;60(2):324-30

The relative potencies of L-T4 and L-T3 on the pituitary-thyroid axis in the Japanese quail. Parés-Herbuté N, et al. **Gen Comp Endocrinol** 1985 Nov;60(2):298-305

The effect of exposure to 40 degrees on the heat production and the serum concentrations of triiodothyronine, thyroxine, and corticosterone in immature domestic fowl. Williamson RA, et al. **Gen Comp Endocrinol** 1985 Nov;60(2):178-86

Thyroxine concentrations and secretion rates in relation to pregnancy, lactation and energy balance in goats. Riis PM, et al. **J Endocrinol** 1985 Dec;107(3):421-7

Steroid and thyroid hormone profiles following a single injection of partly purified salmon gonadotropin or GnRH analogues in male and female sea lamprey. Sower SA, et al. **J Exp Zool** 1985 Sep;235(3):403-8

Re: Salivary thyroxine as an estimate of free thyroxine [letter] Al-Ansari AA, et al. **J Nucl Med** 1984 Apr;25(4):538-9

More on free thyroxine assays [letter] **Lancet** 1985 Dec 14; 2(8468):1357-8

Internal quality control of hormone determinations by RIA. Detection of clinically significant analytical errors of serum thyroxine determination. Ruokonen A, et al. **Scand J Clin Lab Invest [Suppl]** 1984; 172:93-9

[Performance of 8 methods for evaluating the free fraction of thyroxine in chronic renal insufficiency (letter)] Schlienger JL, et al. **Presse Med** 1985 Nov 2;14(37):1931 **(Fre)**

[Familial hyperthyroxinemia] Staub JJ, et al. **Dtsch Med Wochenschr** 1985 Nov 29;110(48):1870-1 **(Ger)**

TRANQUILIZING AGENTS

Flupenthixol decanoate (fluanxol depot) in the treatment of chronic schizophrenic patients. Haider I. **JPMA** 1985 Sep;35(9):286-9

TRANQUILIZING AGENTS, MAJOR

Valproate as psychotropic agent. Interactions and adverse cerebral reactions. van Sweden B, et al. **Acta Psychiatr Scand** 1985 Sep; 72(3):315-7

Psychotic patients' understanding of informed consent. Irwin M, et al. **Am J Psychiatry** 1985 Nov;142(11):1351-4

Demographic predictors of the use of injectable versus oral antipsychotic medications in outpatients. Price N, et al. **Am J Psychiatry** 1985 Dec;

142(12):1491-2

Benefits of correlating neuroleptic blood level and auditory distractibility [letter] Terkelsen KG. **Am J Psychiatry** 1985 Dec;142(12):1523-4

Behavioral, autonomic and motor effects of neuroleptic drugs in cats: motor impairment and aggression. Beleslin DB, et al. **Brain Res Bull** 1985 Sep;15(3):353-6

Prolonged inhibition of striatal dopamine receptor sites by isofloxythepin. Lau YS, et al. **Eur J Pharmacol** 1985 Oct 8;116(1-2):25-31

Structural determinants of selective affinity for brain D-1 dopamine receptors within a series of 1-phenyl-1H-3-benzazepine analogues of SK&F 38393 and SCH 23390. O'Boyle KM, et al. **Eur J Pharmacol** 1985 Sep 24;115(2-3):291-5

Heatstroke in a chronic schizophrenic patient treated with high-potency neuroleptics. Lazarus A. **Gen Hosp Psychiatry** 1985 Oct;7(4):361-3

Lithium-carbamazepine versus lithium-neuroleptic prophylaxis in bipolar illness. Shukla S, et al. **J Affective Disord** 1985 Nov;9(3):219-22

Quantification of R-(+)-7-chloro-8-hydroxy-1-phenyl-2,3,4,5-tetrahydro-1H-3-meth benzazepine in brain and blood by use of reversed-phase high-performance liquid chromatography with electrochemical detection. Kilts CD, et al. **J Chromatogr** 1985 Aug 9;342(2):452-7

Maintenance therapy and the natural course of schizophrenia. Davis JM. **J Clin Psychiatry** 1985 Nov;46(11 Pt 2):18-21

Rapid tranquilization: the efficacy of oral concentrate. Dubin WR, et al. **J Clin Psychiatry** 1985 Nov;46(11):475-8

Neuroleptic compliance among chronic schizophrenic outpatients: an intervention outcome report. Boczkowski JA, et al. **J Consult Clin Psychol** 1985 Oct;53(5):666-71

Comparative chronic effects of buspirone or neuroleptics on rat brain dopaminergic neurotransmission. McMillen BA. **J Neural Transm** 1985; 64(1):1-12

Differential effect of subchronic treatment with various neuroleptic agents on serotonin2 receptors in rat cerebral cortex. Andree TH, et al. **J Neurochem** 1986 Jan;46(1):191-7

Flumezapine and zotepine: 5-hydroxytryptamine antagonism not involved in the lack of synergism of these antipsychotic drugs with amfonelic acid in rats. Fuller RW, et al. **J Pharm Pharmacol** 1985 Oct; 37(10):755-6

Rapid tolerance to neuroleptic-induced stimulation of dopamine release in freely moving rats. Di Chiara G, et al. **J Pharmacol Exp Ther** 1985 Nov;235(2):487-94

Effects of neuroleptics displaying antidepressant activity on behavior of rats in the forced swimming test. Górka Z, et al. **Pharmacol Biochem Behav** 1985 Aug;23(2):203-6

A clinical assessment of zuclopenthixol dihydrochloride (Clopixol tablets) in the treatment of psychotic illness. Mann BS, et al. **Pharmatherapeutica** 1985;4(6):387-92

Do neuropeptide systems mediate some of the effects of antipsychotic drugs? Bissette G, et al. **Prog Clin Biol Res** 1985;192:349-53

Increased CSF cortisol levels after neuroleptic treatment in schizophrenia. Gattaz WF, et al. **Psychoneuroendocrinology** 1985;10(3):351-4

Zuclopenthixol decanoate in schizophrenia: serum levels and clinical state. Jørgensen A, et al. **Psychopharmacology (Berlin)** 1985;87(3):364-7

Computer-assisted review of antipsychotics on acute care units. Molnar G, et al. **QRB** 1985 Sep;11(9):271-4

[Neuroleptic poisoning admitted to the Poison Treatment Center in 1980] Bjaeldager PA, et al. **Ugeskr Laeger** 1985 Sep 16;147(38):2972-5 (Eng. Abstr.) **(Dan)**

[Neuroleptics in psychogeriatrics. A proposal for a more rational prescription policy] Willekens-Bogaers MA, et al. **Tijdschr Gerontol Geriatr** 1985 Oct;16(5):179-89 (Eng. Abstr.) **(Dut)**

[Treatment of psychoses] Tirkkonen A. **Duodecim** 1985; 101(17):1686-97 **(Fin)**

[Prediction of therapeutic success in acute neuroleptic treatment: results of an empirical study of 243 inpatient-treated schizophrenic patients] Möller HJ, et al. **Fortschr Neurol Psychiatr** 1985 Oct;53(10):370-83 (Eng. Abstr.) **(Ger)**

[Psychopathometric study of the prognostic significance of psychopathologic findings and premorbid personality for discharge of neuroleptic treated patients with schizophrenic psychoses] Möller HJ, et al. **Nervenarzt** 1985 Sep;56(9):498-505 **(Ger)**

[Changes in the sensitivity of brain dopamine and serotonin receptors during the prolonged administration of carbidine] Zharkovskil AM, et al. **Biull Eksp Biol Med** 1985 Dec;100(12):719-22 (Eng. Abstr.) **(Rus)**

[B-lymphocytes of the blood in schizophrenia: effect of psychotropic therapy] Potapova VA. **Zh Nevropatol Psikhiatr** 1985;85(9):1378-81 (Eng. Abstr.) **(Rus)**

TRANQUILIZING AGENTS, MINOR

Drug therapy of anxiety disorders. Desmond P, et al. **Aust Fam Physician** 1985 Sep;14(9):876-9

Prescribing hints for the treatment of anxiety and depression. Horgan D. **Aust Fam Physician** 1985 Sep;14(9):872-5

The effects of triazolobenzodiazepines in two animal tests of anxiety and in the holeboard. File SE, et al. **Br J Pharmacol** 1985 Nov; 86(3):729-35

Autoradiographic identification and topographical analyses of high affinity serotonin receptor subtypes as a target for the novel putative anxiolytic TVX Q 7821. Glaser T, et al. **Brain Res** 1985 Dec 9; 358(1-2):129-36

Comparative chronic effects of buspirone or neuroleptics on rat brain dopaminergic neurotransmission. McMillen BA. **J Neural Transm** 1985; 64(1):1-12

Distress vocalization in rat pups. A simple screening method for anxiolytic drugs. Gardner CR. **J Pharmacol Methods** 1985 Nov;14(3):181-7

Report from the University of Chicago Drug Abuse Research Center. Johanson CE. **Natl Inst Drug Abuse Res Monogr Ser** 1984;55:76-81

Non-benzodiazepine anxiolytics: potential activity of phenylpiperazines without 3H-diazepam displacing action. Lloyd KG, et al. **Pharmacol Biochem Behav** 1985 Oct;23(4):645-52

Pharmacological and clinical effects of buspirone. Taylor DP, et al. **Pharmacol Biochem Behav** 1985 Oct;23(4):687-94 (43 ref.)

Comparison of buspirone and diazepam in generalized anxiety disorder. Jacobson AF, et al. **Pharmacotherapy** 1985 Sep-Oct;5(5):290-6

The effects of putative anxiolytic compounds (PK 8165, PK 9084 and tracazolate) on the rat corticosterone response. File SE, et al. **Physiol Behav** 1985 Oct;35(4):583-6

Disposition of the psychotropic drugs buspirone, MJ-13805 and piribedil, and of their common active metabolite 1-(2-pyrimidinyl)-piperazine in the rat. Caccia S, et al. **Xenobiotica** 1985 Oct;15(10):835-44

[Pharmaco-ethological analysis of agonistic behavior between resident and intruder mice: effects of adrenergic beta-blockers] Yoshimura H, et al. **Yakubutsu Seishin Kodo** 1985 Sep;5(3):223-9 (Eng. Abstr.) **(Jpn)**

TRANYLCYPROMINE

Hyperpyrexia following psychotropic drug overdose. Peebles-Brown AE. **Anaesthesia** 1985 Nov;40(11):1097-9

L-5HTP in depression resistant to re-uptake inhibitors An open comparative study with tranylcypromine. Nolen WA, et al. **Br J Psychiatry** 1985 Jul;147:16-22

A rapid and sensitive procedure for the simultaneous analysis of beta-phenylethylamine and tranylcypromine in rat brain using trichloroacetylation and gas chromatography. Baker GB, et al. **Res Commun Chem Pathol Pharmacol** 1985 Sep;49(3):471-4

TRIAZOLAM

Experimental assessment of the relative abuse liability of triazolam and pentobarbital. Roache JD, et al. **Natl Inst Drug Abuse Res Monogr Ser** 1984;55:106-10

TRIFLUOPERAZINE

Effect of trifluoperazine on the action of insulin in rat adipocytes. Begum N, et al. **Endocrinology** 1986 Jan;118(1):287-92

Relative effectiveness of pimozide, haloperidol and trifluoperazine on self-stimulation rate-intensity functions. Lynch MR, et al. **Pharmacol Biochem Behav** 1985 Nov;23(5):777-80

Effects of trifluoperazine and verapamil on the hydro-osmotic response to antidiuretic hormone in the urinary bladder of the toad. Kipnowski J, et al. **Res Exp Med (Berl)** 1985;185(5):367-74

[Comparative analysis of the action of 2 calmodulin inhibitors on the contractile function of the isolated heart] Kapel'ko VI, et al. **Fiziol Zh SSSR** 1985 Sep;71(9):1095-100 (Eng. Abstr.) **(Rus)**

TRYPTAMINES

Inhibitory action of exogenous melatonin, 5-methoxytryptamine, and 6-hydroxymelatonin on sexual maturation of male rats: activity of 5-methoxytryptamine might be due to its conversion to melatonin. Lang U, et al. **Biol Reprod** 1985 Oct;33(3):618-28

5-Methyltryptamine stimulates phospholipase C-mediated breakdown of exogenous phosphoinositides by blowfly salivary gland membranes. Litosch I, et al. **J Biol Chem** 1985 Dec 25;260(30):16052-5

5-Methyltryptamine decreases net accumulation of 32P into the polyphosphoinositides from [gamma-32P]ATP in a cell-free system from blowfly salivary glands. Activation of breakdown of the newly synthesized [32P]polyphosphoinositides. Litosch I, et al. **J Biol Chem** 1986 Jan 15;261(2):638-43

Analysis of cheese for histamine, tyramine, tryptamine, histidine, tyrosine, and tryptophane. Chang SF, et al. **J Dairy Sci** 1985 Nov; 68(11):2840-6

Effects of quipazine and of tryptamine on self-stimulation of median raphé nucleus and of lateral hypothalamus in rats. Broadbent J, et al. **Pharmacol Biochem Behav** 1985 Dec;23(6):943-7

[Comparative experimental study of the effect of melatonin and 5-methoxytryptamine on the thyroid gland of rats] Rom-Bugoslavskaia ES, et al. **Farmakol Toksikol** 1985 Sep-Oct;48(5):84-9 (Eng. Abstr.) **(Rus)**

BIBLIOGRAPHY

TRYPTOPHAN

Light-induced changes in plasma tryptophan and cystine. Felten RP. **Ann NY Acad Sci** 1985;453:55-64

Cloning and expression of tryptophan genes from Brevibacterium lactofermentum in Escherichia coli. del Real G, et al. **Biochem Biophys Res Commun** 1985 Dec 31;133(3):1013-9

Stopped-flow kinetic studies of metal ion dissociation or exchange in a tryptophan-containing parvalbumin. Breen PJ, et al. **Biochemistry** 1985 Sep 10;24(19):4997-5004

Spectroscopic studies of metal ion binding to a tryptophan-containing parvalbumin. Breen PJ, et al. **Biochemistry** 1985 Sep 10; 24(19):4991-7

Photoinactivation and photoaffinity labeling of tryptophan synthase alpha 2 beta 2 complex by the product analogue 6-azido-L-tryptophan. Miles EW, et al. **Biochemistry** 1985 Aug 13;24(17):4694-703

Reactivities of tyrosine, histidine, tryptophan, and methionine in radical pair formation in flavin triplet induced protein nuclear magnetic polarization. Muszkat KA, et al. **Biochemistry** 1985 Sep 24; 24(20):5416-21

The tryptophans of gramicidin are essential for the lipid structure modulating effect of the peptide. Killian JA, et al. **Biochim Biophys Acta** 1985 Oct 24;820(1):154-6

Fluorescence quenching of the buried tryptophan residue of cod parvalbumin. Eftink MR, et al. **Biophys Chem** 1985 Aug; 22(3):173-80

The pharmacokinetics of L-tryptophan following its intravenous and oral administration. Green AR, et al. **Br J Clin Pharmacol** 1985 Oct; 20(4):317-21

Stability of tryptophan during food processing and storage. 2. A comparison of methods used for the measurement of tryptophan losses in processed foods. Nielsen HK, et al. **Br J Nutr** 1985 Mar; 53(2):293-300

Stability of tryptophan during food processing and storage. 1. Comparative losses of tryptophan, lysine and methionine in different model systems. Nielsen HK, et al. **Br J Nutr** 1985 Mar;53(2):281-92

Mutagenicity of nondialyzable melanoidins prepared from carbohydrates and L-tryptophan before and after nitrite treatment. Kinae N, et al. **Chem Pharm Bull (Tokyo)** 1985 Jun;33(6):2438-44

Studies of the fluorescence from tryptophan in melittin. Tran CD, et al. **Eur Biophys J** 1985;13(1):59-64

Protective effect of tryptophan and cysteine against carbon tetrachloride-induced liver injury. Wang D, et al. **Exp Mol Pathol** 1985 Dec;43(3):364-74

Analysis of cloned DNA from Leptospira biflexa serovar patoc which complements a deletion of the Escherichia coli trpE gene. Yelton DB, et al. **J Bacteriol** 1986 Jan;165(1):41-6

Interaction of the Escherichia coli trp aporepressor with its ligand, L-tryptophan. Arvidson DN, et al. **J Biol Chem** 1986 Jan 5; 261(1):238-43

Differential inhibition of tryptophan synthase and of tryptophanase by the two diastereoisomers of 2,3-dihydro-L-tryptophan. Implications for the stereochemistry of the reaction intermediates. Phillips RS, et al. **J Biol Chem** 1985 Nov 25;260(27):14665-70

Direct chiral resolution in an aqueous two-phase system using the counter-current distribution principle. Ekberg B, et al. **J Chromatogr** 1985 Sep 27;333(1):211-4

Chromatographic determination of N-acetyl-DL-tryptophan and octanoic acid in human albumin solutions. Nelis HJ, et al. **J Chromatogr** 1985 Oct 4;333(2):381-7

Analysis of cheese for histamine, tyramine, tryptamine, histidine, tyrosine, and tryptophane. Chang SF, et al. **J Dairy Sci** 1985 Nov; 68(11):2840-6

The anti-chlamydial and anti-proliferative activities of recombinant murine interferon-gamma are not dependent on tryptophan concentrations. de la Maza LM, et al. **J Immunol** 1985 Dec; 135(6):4198-200

Nuclear magnetic resonance study of the proton exchange rate in the operator-promoter DNA sequence of the trp operon of Escherichia coli. Lefevre JF, et al. **J Mol Biol** 1985 Oct 20;185(4):689-99

Uptake and release of tryptophan and serotonin: an HPLC method to study the flux of endogenous 5-hydroxyindoles through synaptosomes. Wolf WA, et al. **J Neurochem** 1986 Jan;46(1):61-7

Suppressive effect of dietary unsaturated fatty acids on alpha-amino-beta-carboxymuconate-epsilon-semialdehyde decarboxylase, a key enzyme of tryptophan-niacin metabolism in rat liver. Sanada H. **J Nutr Sci Vitaminol (Tokyo)** 1985 Jun; 31(3):327-37

The effect of intraluminal tryptophan and phenylalanine on small intestinal motility in the conscious dog. Bull JS, et al. **J Physiol (Lond)** 1985 Oct;367:353-62

Evidence for the role of glycosylation of proteins in the tryptophan-induced stimulation of nucleocytoplasmic translocation of mRNA in rat liver. Sidransky H, et al. **Lab Invest** 1986 Jan; 54(1):93-9

Scheduled feeding versus the light-dark cycle on the rhythms of circulating tryptophan, serotonin and N-acetylserotonin in rats. Ho AK, et al. **Life Sci** 1985 Oct 28;37(17):1619-26

Effect of indolamines on beta-endorphin release by rat anterior pituitary cells. Abou Samra AB, et al. **Neuroendocrinology** 1985 Dec; 41(6):490-3

Tyrosyl fluorescence spectra of proteins lacking tryptophan: effects of intramolecular interactions. Lux B, et al. **Photochem Photobiol** 1985 Sep; 42(3):245-51

Interaction of dietary tryptophan and social isolation on territorial aggression, motor activity, and neurochemistry in mice. Lasley SM, et al. **Psychopharmacology (Berlin)** 1985;87(3):313-21

[Tryptophan of facultative methylotrophic bacteria Pseudomonas sp. M. II. Regulation of tryptophan biosynthesis] Olekhnovich IN, et al. **Genetika** 1985 Oct;21(10):1627-33 (Eng. Abstr.) **(Rus)**

[Effect of tryptophan on gluconeogenesis in the perfused liver of irradiated rats] Borovikova GV, et al. **Radiobiologiia** 1985 Sep-Oct;25(5):636-9 (Eng. Abstr.) **(Rus)**

TRYPTOPHAN HYDROXYLASE

[Interaction of genetic and environmental components in the determination of tryptophan hydroxylase activity in the mouse brain in stress] Kulikov AV, et al. **Genetika** 1985 Oct;21(10):1680-4 (Eng. Abstr.) **(Rus)**

TYROSINE

Microbial preparation of L-[15N]tyrosine and [15N]tyramine and their gas chromatographic-mass spectrometric analyses. Kahana ZE, et al. **Anal Biochem** 1985 Sep;149(2):549-54

Reactions of nitrogen dioxide in aqueous model systems: oxidation of tyrosine units in peptides and proteins. Prütz WA, et al. **Arch Biochem Biophys** 1985 Nov 15;243(1):125-34

Evolutionary implications of features of aromatic amino acid biosynthesis in the genus Acinetobacter. Byng GS, et al. **Arch Microbiol** 1985 Nov; 143(2):122-9

Fluorescence energy transfer between Tyr 69 and Cys 374 in actin. Barden JA. **Biochem Int** 1985 Oct;11(4):583-9

Nature of sulphated macromolecules in mouse Reichert's membrane. Evidence for tyrosine O-sulphate in basement-membrane proteins. Paulsson M, et al. **Biochem J** 1985 Nov 1;231(3):571-9

Reactivities of tyrosine, histidine, tryptophan, and methionine in radical pair formation in flavin triplet induced protein nuclear magnetic polarization. Muszkat KA, et al. **Biochemistry** 1985 Sep 24; 24(20):5416-21

Rabbit antibodies with specificity for tyrosine phosphate are not reactive with tyrosine sulphate. Jones JA, et al. **Biosci Rep** 1985 Aug; 5(8):707-14

Direct identification of phosphotyrosine-containing proteins in some retrovirus-transformed cells by use of anti-phosphotyrosine antibody. Seki J, et al. **Cancer Res** 1986 Feb;46(2):907-16

Comparative distribution of neuropeptide tyrosine-, vasoactive intestinal polypeptide-, substance P-immunoreactive, acetylcholinesterase-positive and noradrenergic nerves in the reproductive tract of the female rat. Papka RE, et al. **Cell Tissue Res** 1985;242(3):475-90

Plasma tyrosine/neutral amino acid ratio correlated with clinical response to nortriptyline in endogenously depressed patients. Møller SE, et al. **J Affective Disord** 1985 Nov;9(3):223-9

Tyrosine phosphorylation of a 94-kDa protein of human fibroblasts stimulated by streptococcal lipoteichoic acid. Ganguly CL, et al. **J Biol Chem** 1985 Oct 25;260(24):13342-6

In vivo and in vitro tyrosine sulfation of a membrane glycoprotein. Liu N, et al. **J Biol Chem** 1986 Jan 15;261(2):856-61

Use of fluorinated tyrosine phosphates to probe the substrate specificity of the low molecular weight phosphatase activity of calcineurin. Martin B, et al. **J Biol Chem** 1985 Dec 5;260(28):14932-7

Analysis of cheese for histamine, tyramine, tryptamine, histidine, tyrosine, and tryptophane. Chang SF, et al. **J Dairy Sci** 1985 Nov; 68(11):2840-6

Ionic requirements and subcellular localization of tubulin tyrosinolation in human polymorphonuclear leukocytes. Nath J, et al. **J Immunol** 1986 Jan;136(2):628-35

Inhibition of monoamine oxidase selectively in brain monoamine nerves using the bioprecursor (E)-beta-fluoromethylene-m-tyrosine (MDL 72394), a substrate for aromatic L-amino acid decarboxylase. Palfreyman MG, et al. **J Neurochem** 1985 Dec;45(6):1850-60

Dietary tyrosine suppresses the rise in plasma corticosterone following acute stress in rats. Reinstein DK, et al. **Life Sci** 1985 Dec 9; 37(23):2157-63

Effects of L-dopa and L-tyrosine on release of free and conjugated dopamine, homovanillic acid and dihydroxyphenylacetic acid from slices of rat striatum. Tyce GM, et al. **Life Sci** 1985 Dec 23; 37(25):2439-48

Tyrosine availability determines stimulus-evoked dopamine release from rat striatal slices. Milner JD, et al. **Neurosci Lett** 1985 Aug 30; 59(2):215-20

Tyrosine for the treatment of depression. Gelenberg AJ, et al. **Nutr Health** 1984;3(3):163-73 (44 ref.)

Tyrosyl fluorescence spectra of proteins lacking tryptophan: effects of intramolecular interactions. Lux B, et al. **Photochem Photobiol** 1985 Sep; 42(3):245-51

Evidence for a tyrosine protonation change during the primary phototransition of bacteriorhodopsin at low temperature. Rothschild KJ, et al. **Proc Natl Acad Sci USA** 1986 Jan;83(2):347-51

Effects of L-tyrosine on brain monoamines in rats given intravenous amphetamine. Smith DG, et al. **Subst Alcohol Actions Misuse** 1984-85; 5(6):293-8

Modification of a tyrosine residue in the carboxyterminal portion of human alpha2-antiplasmin. Lijnen HR, et al. **Thromb Res** 1985 Sep 1; 39(5):625-9

TYROSINE AMINOTRANSFERASE

Effects of saikosaponins on liver tyrosine aminotransferase activity induced by cortisone in adrenalectomized rats. Hashimoto M, et al. **Planta Med** 1985 Oct;(5):401-3

TYROSINE HYDROXYLASE

Transient expression of tyrosine hydroxylase immunoreactivity in some neurons of the rat neocortex during postnatal development. Berger B, et al. **Brain Res** 1985 Nov;355(1):141-4

Differential ontogeny of three putative catecholamine cell types in the postnatal rat retina. Foster GA, et al. **Brain Res** 1985 Oct; 354(2):187-96

Stimulation of retinal dopamine biosynthesis in vivo by exogenous tetrahydrobiopterin: relationship to tyrosine hydroxylase activation. Iuvone PM, et al. **Brain Res** 1985 Dec 16;359(1-2):392-6

So-called interplexiform cells immunoreactive to tyrosine hydroxylase or somatostatin in rat retina. Negishi K, et al. **Brain Res** 1985 Oct 28; 346(1):136-40

Effect of chronic cold exposure on tyrosine hydroxylase mRNA in rat adrenal gland. Stachowiak M, et al. **Brain Res** 1985 Dec 16; 359(1-2):356-9

Laminin increases both levels and activity of tyrosine hydroxylase in calf adrenal chromaffin cells. Acheson A, et al. **J Cell Biol** 1986 Jan; 102(1):151-9

Ontogeny of phenylethanolamine N-methyltransferase- and tyrosine hydroxylase-like immunoreactivity in presumptive adrenaline neurones of the foetal rat central nervous system. Foster GA, et al. **J Comp Neurol** 1985 Jun 15;236(3):348-81

Presynaptic dopamine autoreceptors control tyrosine hydroxylase activation in depolarized striatal dopaminergic terminals. el Mestikawy S, et al. **J Neurochem** 1986 Jan;46(1):12-22

Cholinergic receptor-mediated phosphorylation and activation of tyrosine hydroxylase in cultured bovine adrenal chromaffin cells. Pocotte SL, et al. **J Neurochem** 1986 Feb;46(2):610-22

Phorbol 12,13-dibutyrate increases tyrosine hydroxylase activity in the superior cervical ganglion of the rat. Wang M, et al. **J Neurochem** 1986 Feb;46(2):388-93

Molecular and physiological properties of tyrosine hydroxylase induced by reserpine in rat adrenal gland. Togari A, et al. **Life Sci** 1985 Oct 28;37(17):1605-11

Is inhibition of striatal synaptosomal tyrosine hydroxylation by dopamine agonists a measure of dopamine autoreceptor function? Fowler CJ, et al. **Naunyn Schmiedebergs Arch Pharmacol** 1985 Oct;331(1):12-9

Tyrosine hydroxylase and 28K-vitamin D-dependent calcium binding protein are localized in different subpopulations of periglomerular cells of the rat olfactory bulb. Halász N, et al. **Neurosci Lett** 1985 Oct 24; 61(1-2):103-7

Low-frequency septal stimulation increases tyrosine hydroxylase activity in the hippocampus. Graham-Jones S, et al. **Pharmacol Biochem Behav** 1985 Oct;23(4):489-93

Direct activation of tyrosine hydroxylase by calmodulin. Vulliet PR. **Proc West Pharmacol Soc** 1985;28:27-30

Genes for neurotransmitter synthesis, storage and release. Joh TH. **Prog Clin Biol Res** 1985;192:423-9

VANILMANDELIC ACID

Homovanillic acid, vanillylmandelic acid and 5-hydroxyindole-3-acetic acid are undetectable in urine of the muskrat. Yoshioka M, et al. **Chem Pharm Bull (Tokyo)** 1985 May;33(5):2145-8

VASOPRESSINS

A peptide that inhibits the mitogenic stimulation of Swiss 3T3 cells by bombesin or vasopressin. Corps AN, et al. **Biochem J** 1985 Nov 1; 231(3):781-4

Opposing alpha- and beta-adrenergic mechanisms mediate dose-dependent actions of noradrenaline on supraoptic vasopressin neurones in vivo. Day TA, et al. **Brain Res** 1985 Dec 9; 358(1-2):171-9

Stimulation of 1,2-diacylglycerol accumulation in hepatocytes by vasopressin, epinephrine, and angiotensin II. Bocckino SB, et al. **J Biol Chem** 1985 Nov 15;260(26):14201-7

Vasopressin secretion as a possible target of the gamma-aminobutyric acid-mediated component of the corticosteroid feedback effect. Acs Z, et al. **J Endocrinol** 1985 Dec;107(3):303-7

DDAVP (1-desamino-8-D-arginine vasopressin): an antagonist of the pressor action of endogenous vasopressin? Derkx FH, et al. **J Hypertension [Suppl]** 1983 Dec;1(2):58-61

Functional involvement of vasopressin in the maintenance of systemic arterial blood pressures after phenoxybenzamine or phentolamine administration: studies in Long-Evans and Brattleboro rats. Winn MJ, et al. **J Pharmacol Exp Ther** 1985 Nov;235(2):500-5

The effects and interactions of angiotensin and vasopressin on the heart of unanaesthetized sheep. Caine AC, et al. **J Physiol (Lond)** 1985 Oct; 367:1-11

Effects of oxytocin and vasopressin in the central and in the autonomic nervous system. Interactions with other presumptive neurotransmitters. Dreifuss JJ, et al. **Regul Pept [Suppl]** 1985;4:165-71

Effects of trifluoperazine and verapamil on the hydro-osmotic response to antidiuretic hormone in the urinary bladder of the toad. Kipnowski J, et al. **Res Exp Med (Berl)** 1985;185(5):367-74

[Coexpression of immunoreactivity with an anti-corticoliberin immune serum and immunoreactivity with an anti-vasopressin immune serum in human hypothalamic neurons] Clavequin MC, et al. **Ann Endocrinol (Paris)** 1985;46(1):64-6 (Eng. Abstr.) **(Fre)**

[Effects of colchicine on the actions of ADH, norepinephrine and forskolin on skin permeability of the frog] Svelto M, et al. **Boll Soc Ital Biol Sper** 1985 Jul 30;61(7):989-93 (Eng. Abstr.) **(Ita)**

VASOTOCIN

Projections of luteinizing hormone-releasing hormone and vasotocin fibers to the anterior part of the preoptic nucleus in the toad, Bufo japonicus. Jokura Y, et al. **Gen Comp Endocrinol** 1985 Dec; 60(3):390-7

WAKEFULNESS

[Sleep--2. Substances in the mechanism of sleep and wakefulness] Nagasaki H, et al. **Nippon Rinsho** 1985 Jul;43(7):1384-9 (19 ref.) **(Jpn)**

ZIMELIDINE

Selective antidepressants and cerebrospinal fluid. Lack of specificity on norepinephrine and serotonin metabolites. Potter WZ, et al. **Arch Gen Psychiatry** 1985 Dec;42(12):1171-7

Obsessive-compulsive disorder and serotonin: is there a connection? Insel TR, et al. **Biol Psychiatry** 1985 Nov;20(11):1174-88

BIBLIOGRAPHY

ACETYLCHOLINE

Dissociation of the crotoxin complex promoted by acetylcholine. Canziani GA, et al. **Acta Physiol Pharmacol Latinoam** 1985;35(2):165-80

GABA antagonists increase the release of [3H]acetylcholine from the chick retina. Agardh E. **Acta Physiol Scand** 1986 Jan;126(1):33-8

Dopamine release is enhanced while acetylcholine release is inhibited by nimodipine (Bay e 9736). Nordström O, et al. **Acta Physiol Scand** 1986 Jan;126(1):115-9

Relative activities of three calcium channel antagonists on histamine, acetylcholine and antigen-induced contractions of guinea pig ileum. Ingenito AJ. **Agents Actions** 1985 Dec;17(2):113-20

Neurotransmitters of the cochlea and cochlear nucleus: immunocytochemical evidence. Altschuler RA, et al. **Am J Otolaryngol** 1986 Mar-Apr;7(2):100-6 (59 ref.)

High-performance liquid chromatography followed by peroxyoxalate chemiluminescence detection of acetylcholine and choline utilizing immobilized enzymes. Honda K, et al. **Anal Biochem** 1986 Feb 15; 153(1):50-3

Increased agonist affinity is induced in tetranitromethane-modified muscarinic receptors. Gurwitz D, et al. **Biochemistry** 1985 Dec 31; 24(27):8086-93

The release of acetylcholine: from a cellular towards a molecular mechanism. Israël M, et al. **Biol Cell** 1985;55(1-2):1-14

The effect of cigarette smoking during pregnancy on the cholinergic system in isolated term human placental tissue. Rowell PP, et al. **Biol Reprod** 1986 Mar;34(2):344-8

The influence of enhanced K+-concentration on the uptake and acetylation of choline in hippocampus slices of rats. Rauca C, et al. **Biomed Biochim Acta** 1985;44(11-12):1621-31

Enthalpy of acetylcholine hydrolysis by acetylcholinesterase. Das YT, et al. **Biophys Chem** 1985 Nov;23(1-2):105-14

Cyclic AMP response to vasoactive intestinal peptide and beta-adrenergic or cholinergic agonists in isolated epithelial cells of rat ventral prostate. Carmena MJ, et al. **Biosci Rep** 1985 Sep;5(9):791-7

Effects of locally administered anticholinesterase agents on the secretory response of human eccrine sweat glands to acetylcholine and carbachol. Longmore J, et al. **Br J Clin Pharmacol** 1986 Feb;21(2):131-5

Frontal decortication and adaptive changes in striatal cholinergic neurons in the rat. Consolo S, et al. **Brain Res** 1986 Jan 15;363(1):128-34

Acetylcholine, aging and anatomy: differential effects in the hippocampus. Haigler HJ, et al. **Brain Res** 1986 Jan 1;362(1):157-60

The modulation of transmitter release in motor nerve endings varies with the type of muscle fiber innervated. Lev-Tov A, et al. **Brain Res** 1986 Jan 22;363(2):379-82

The effects of nerve section on the non-quantal release of ACh from the motor nerve terminal. Stanley EF, et al. **Brain Res** 1986 Feb 19; 365(2):289-92

Mechanism of the calcium-dependent stimulation of transmitter release by 4-aminopyridine in synaptosomes. Tapia R, et al. **Brain Res** 1985 Dec 30;361(1-2):373-82

Differential effects of striatal injections of dopaminergic, cholinergic and GABAergic drugs upon swimming behavior of rats. Vrijmoed-de Vries MC, et al. **Brain Res** 1986 Jan 29;364(1):77-90

Effect of acetylcholine and secretin on medullary collecting duct function in the rat. Wilson DR, et al. **Can J Physiol Pharmacol** 1986 Jan; 64(1):62-5

Effect of thiopental sodium and barbitone sodium on the total acetylcholine content and acetylcholinesterase activity in the brain tissue of Arvicanthis niloticus. Fathi MM, et al. **Comp Biochem Physiol** [C] 1986;83(1):185-90

Spontaneous release of transmitter from the growth cones of Xenopus neurons in vitro: the influence of Ca2+ and Mg2+ ions. Young SH. **Dev Biol** 1986 Feb;113(2):373-80

Generation of cortical event-related slow potentials in the rat involves nucleus basalis cholinergic innervation. Pirch JH, et al. **Electroencephalogr Clin Neurophysiol** 1986 May;63(5):464-75

Acetylcholine receptors in the gastrulating chick embryo. Laasberg T, et al. **Experientia** 1986 Apr 15;42(4):439-40

Distribution and elimination of the stereoisomers of soman and their effect on brain acetylcholine. Nordgren I, et al. **Fundam Appl Toxicol** 1985 Dec;5(6 Pt 2):S252-9

Ultraviolet spectrophotometric method for determination of cholinesterase activity with acetylcholine as a substrate. Tomita K, et al. **J Appl Biochem** 1985 Aug-Oct;7(4-5):303-10

Comparison of intraocular acetylcholine and carbachol. Yee RW, et al. **J Cataract Refract Surg** 1986 Jan;12(1):18-22

Modification of the effects of muscarinic agonists by reversible and irreversible anticholinesterase compounds in the guinea pig atrium. Freeman SE, et al. **J Mol Cell Cardiol** 1986 Mar;18(3):231-9

Stoichiometries of acetylcholine uptake, release, and drug inhibition in Torpedo synaptic vesicles: heterogeneity in acetylcholine transport and storage. Anderson DC, et al. **J Neurochem** 1986 Apr;46(4):1207-13

Acetylcholine transport and drug inhibition kinetics in Torpedo synaptic vesicles. Bahr BA, et al. **J Neurochem** 1986 Apr;46(4):1214-8

4-(1-Naphthylvinyl)pyridine decreases brain acetylcholine in vivo, but does not alter the level of acetyl-CoA. Budai D, et al. **J Neurochem** 1986 Mar;46(3):990-2

BIBLIOGRAPHY

ACETYLCHOLINE

Acetylcholine synthesis and release by a sympathetic ganglion in the presence of 2-(4-phenylpiperidino) cyclohexanol (AH5183). Collier B, et al. **J Neurochem** 1986 Mar;46(3):822-30

Effect of intrastriatal injection of diisopropylfluorophosphate on acetylcholine, dopamine, and serotonin metabolism. Robinson SE, et al. **J Neurochem** 1986 May;46(5):1632-8

Inhibition of high-affinity choline uptake and acetylcholine synthesis by quinuclidinyl and hemicholinium derivatives. Sterling GH, et al. **J Neurochem** 1986 Apr;46(4):1170-5

Serotonin enhances the excitatory acetylcholine response in the RB cell cluster of Aplysia californica. Simmons LK, et al. **J Neurosci** 1986 Mar;6(3):774-81

Acetylcholine-induced contractions in isolated rabbit pulmonary arteries: role of thromboxane A2. Altiere RJ, et al. **J Pharmacol Exp Ther** 1986 Feb;236(2):535-41

Cholinergic and GABAergic regulation of dopamine beta-hydroxylase activity in the adrenal gland of the rat. Lima L, et al. **J Pharmacol Exp Ther** 1986 Apr;237(1):265-70

Effects of d-amphetamine and dopamine synthesis inhibitors on dopamine and acetylcholine neurotransmission in the striatum. I. Release in the absence of vesicular transmitter stores. Parker EM, et al. **J Pharmacol Exp Ther** 1986 Apr;237(1):179-92

Effects of d-amphetamine and dopamine synthesis inhibitors on dopamine and acetylcholine neurotransmission in the striatum. II. Release in the presence of vesicular transmitter stores. Parker EM, et al. **J Pharmacol Exp Ther** 1986 Apr;237(1):193-203

Parasympathetic stimulation as a mechanism for platelet-activating factor-induced contractile responses in the lung. Stimler-Gerard NP. **J Pharmacol Exp Ther** 1986 Apr;237(1):209-13

Fast events in single-channel currents activated by acetylcholine and its analogues at the frog muscle end-plate. Colquhoun D, et al. **J Physiol (Lond)** 1985 Dec;369:501-57

Excitatory and differential disinhibitory actions of acetylcholine in the lateral geniculate nucleus of the cat. Eysel UT, et al. **J Physiol (Lond)** 1986 Jan;370:233-54

Effects of electrical stimulation and choline availability on the release and contents of acetylcholine and choline in superfused slices from rat striatum. Maire JC, et al. **J Physiol (Paris)** 1985;80(3):189-95

Changes of total acetylcholine content and the activity of related enzymes in SART (repeated cold)-stressed rat brain and duodenum. Kita T, et al. **Jpn J Pharmacol** 1986 Jan;40(1):174-7

Effects of bifemelane hydrochloride (MCI-2016) on acetylcholine release from cortical and hippocampal slices of rats. Saito K, et al. **Jpn J Pharmacol** 1985 Nov;39(3):410-4

Effects of bifemelane hydrochloride (MCI-2016) on acetylcholine and norepinephrine release from cortical slices of bilaterally carotid-artery-ligated Mongolian gerbils. Saito K, et al. **Jpn J Pharmacol** 1985 Nov;39(3):406-9

Elevation of acetylcholine levels in striatum of rat brain by LY163502, trans-(-)-5,5a,6,7,8,9a,10-octahydro-6-propylpyrimido less than 4,5-g greater than quinolin-2-amine dihydrochloride, a potent and stereospecific dopamine (D2) agonist. Bymaster FP, et al. **Life Sci** 1986 Jan 27;38(4):317-22

ACTH-(1-24) and alpha-MSH antagonize dopamine receptor-mediated inhibition of striatal dopamine and acetylcholine release. Versteeg DH, et al. **Life Sci** 1986 Mar 3;38(9):835-40

Quinacrine and 2-(4-phenylpiperidino)cyclohexanol (AH5183) inhibit acetylcholine release and synthesis in rat brain slices. Jope RS, et al. **Mol Pharmacol** 1986 Jan;29(1):45-51

Modulation of visual cortical plasticity by acetylcholine and noradrenaline. Bear MF, et al. **Nature** 1986 Mar 13-19;320(6058):172-6

Neuropharmacology. Acetylcholine and brain cells [news] Brown D. **Nature** 1986 Jan 30-Feb 5;319(6052):358-9

Acetylcholine induces burst firing in thalamic reticular neurones by activating a potassium conductance. McCormick DA, et al. **Nature** 1986 Jan 30-Feb 5;319(6052):402-5

Phosphatidylserine increases acetylcholine release from cortical slices in aged rats. Pedata F, et al. **Neurobiol Aging** 1985 Winter;6(4):337-9

Cerebral neocortical neurons in the aged rat: spontaneous activity, properties of pyramidal tract neurons and effect of acetylcholine and cholinergic drugs. Lamour Y, et al. **Neuroscience** 1985 Dec;16(4):835-44

Intracellular injection of acetylcholine blocks various potassium conductances in vagal motoneurons. Yarom Y, et al. **Neuroscience** 1985 Dec;16(4):739-52

Alteration of fetal heart rate caused by extrauterine environmental changes. Masuyama I, et al. **Nippon Juigaku Zasshi** 1986 Feb;48(1):61-8

Demonstration of a receptor in Torpedo synaptic vesicles for the acetylcholine storage blocker L-trans-2-(4-phenyl[3,4-3H]-piperidino) cyclohexanol. Bahr BA, et al. **Proc Natl Acad Sci USA** 1986 Apr;83(7):2267-70

On the mechanism of acetylcholine release. Dunant Y. **Prog Neurobiol** 1986;26(1):55-92 (231 ref.)

Presynaptic modulation by noradrenaline and an opioid of the substance P-induced release of [3H]acetylcholine from the myenteric plexus. Vizi ES, et al. **Regul Pept** 1985 Nov 28;12(4):317-25

The role of vagus nerve on histamine- and acetylcholine-induced bronchoconstriction (experiments on cats). Zimmermann I, et al. **Res Exp Med (Berl)** 1986;186(1):29-34

Cholinergic system of brain tissue in rats poisoned with the organophosphate, 0,0-dimethyl 0-(2,2-dichlorovinyl) phosphate. Kobayashi H, et al. **Toxicol Appl Pharmacol** 1986 Jan;82(1):32-9

Effects of insecticidal carbamates on brain acetylcholine content, acetylcholinesterase activity and behavior in mice. Kobayashi H, et al. **Toxicol Lett** 1985 Dec;29(2-3):153-9

Effects of beta-bungarotoxin and Naja naja atra snake venom phospholipase A2 on acetylcholine release and choline uptake in synaptosomes. Fletcher JE, et al. **Toxicon** 1986;24(1):91-9

Excitatory amino acid analogs evoke release of endogenous amino acids and acetyl choline from chick retina in vitro. Campochiaro P, et al. **Vision Res** 1985;25(10):1375-86

[Regulation of the synthesis of acetylcholine] Zhang X. **Sheng Li Ko Hsueh Chin Chan** 1985 Jul;16(3):244-7 (40 ref.) **(Chi)**

[Cholinergic hypothesis of depression] Leboyer M, et al. **Encephale** 1985 Nov-Dec;11(6):229-34 (53 ref.) (Eng. Abstr.) **(Fre)**

[Analysis of the reactivity of the sensorimotor neurons of the rat cerebral cortex to acetylcholine] Kotliar BI, et al. **Biol Nauki** 1985;(11):56-61 (Eng. Abstr.) **(Rus)**

[Reactivity of the cholinoceptive cortical neurons to the repeated action of acetylcholine] Kotliar BI, et al. **Biull Eksp Biol Med** 1986 Mar;101(3):259-60 (Eng. Abstr.) **(Rus)**

ACHIEVEMENT

Assessing drug effects on academic performance. Gadow KD, et al. **Psychopharmacol Bull** 1985;21(4):877-86

AFFECT

Acute effects of physostigmine and neostigmine in man. Janowsky DS, et al. **Milit Med** 1986 Jan;151(1):48-51

Hormonal and behavioral effects associated with intravenous L-tryptophan administration. Winokur A, et al. **Psychopharmacology (Berlin)** 1986;88(2):213-9

AFFECTIVE DISORDERS

Neuroendocrine effects of carbamazepine in patients with affective illness. Joffe RT, et al. **Epilepsia** 1986 Mar-Apr;27(2):156-60

Chocolate, eating disorders, and affective syndromes [letter] Zimmer B, et al. **J Clin Psychopharmacol** 1986 Feb;6(1):56-7

Investigations of melatonin secretion in man. Grof E, et al. **Prog Neuropsychopharmacol Biol Psychiatry** 1985;9(5-6):609-12

Effect of carbamazepine on mean urinary free cortisol excretion in patients with major affective illness. Rubinow DR, et al. **Psychopharmacology (Berlin)** 1986;88(1):115-8

[Course and form variations of cyclothymic phases in lithium therapy] Banzhaf M, et al. **Psychiatr Neurol Med Psychol (Leipz)** 1985 Dec;37(12):718-21 (Eng. Abstr.) **(Ger)**

AFFECTIVE DISORDERS, PSYCHOTIC

The prophylactic lithium treatment in affective disorders and the possibilities of the outcome prediction. Hanuš H, et al. **Sb Ved Pr Lek Fak Univ Karlovy** 1984;27(1):5-75

[The circulatory system in patients with depression during treatment with antidepressive drugs. I. Analysis of ECG records during the depressive phase of affective diseases] Rajewska J, et al. **Psychiatr Pol** 1985 Jul-Aug;19(4):271-7 (Eng. Abstr.) **(Pol)**

AGGRESSION

Predatory dominance and aggressive display under imipramine treatment in cats. Zagrodzka J, et al. **Acta Neurobiol Exp (Warsz)** 1985;45(5-6):137-49

Dopaminergic facilitation of recovery from amygdaloid lesions which affect hypothalamic defensive attack in cats. Maeda H, et al. **Brain Res** 1986 Jan 15;363(1):135-40

A comparison of parenteral loxapine and haloperidol in hostile and aggressive acutely schizophrenic patients. Tuason VB. **J Clin Psychiatry** 1986 Mar;47(3):126-9

The effects of marijuana on human physical aggression. Myerscough R, et al. **J Pers Soc Psychol** 1985 Dec;49(6):1541-6

Antagonism of picrotoxin against the taming effect of carbamazepine on footshock induced fighting behavior in mice. Nakao K, et al. **Jpn J Pharmacol** 1985 Oct;39(2):281-3

Therapeutic experience with lithium in childhood aggressivity. Vetró A, et al. **Neuropsychobiology** 1985;14(3):121-7

Must antidepressants be anticholinergic to inhibit muricide? Strickland JA, et al. **Pharmacol Biochem Behav** 1986 Jan;24(1):135-7

The effects of apomorphine, d-amphetamine and chlorpromazine on the aggressiveness of isolated Aequidens pulcher (Teleostei, Cichlidae).

Munro AD. **Psychopharmacology (Berlin)** 1986;88(1):124-8

Maternal aggression in rats: lack of interaction between chlordiazepoxide and fluprazine. Olivier B, et al. **Psychopharmacology (Berlin)** 1986; 88(1):40-3

AMINO ACIDS

Tryptophan to competing amino acids ratio in depressive disorder: relation to efficacy of antidepressive treatments. Møller SE. **Acta Psychiatr Scand [Suppl]** 1985;325:3-31 (146 ref.)

Inhibitory neuromodulation of release of amino acid neurotransmitters. Peris J, et al. **Alcohol Drug Res** 1985-86;6(4):253-64 (61 ref.)

Effect of intragastric amino acids on lower esophageal sphincter pressure and serum gastrin in man. McCallum RW, et al. **Am J Gastroenterol** 1986 Mar;81(3):168-71

Role of CCK in pancreatic exocrine response to amino acids and fats [letter] Singer MV. **Am J Physiol** 1986 Apr;250(4 Pt 1):G558-9

Plasma neutral amino acids and food preferences: possible implications in normals and depressives. Møller SE. **Bibl Nutr Dieta** 1986; (38):149-53

Transport of the aromatic amino acids into isolated rat liver cells. Properties of uptake by two distinct systems. Salter M, et al. **Biochem J** 1986 Jan 15;233(2):499-506

Action of excitatory amino acids and their antagonists on hippocampal neurons. Hablitz JJ. **Cell Mol Neurobiol** 1985 Dec;5(4):389-405

Modulatory effect of glucose, amino acids, and secretin on CCK-8-induced somatostatin and pancreatic polypeptide release in dogs. Schusdziarra V, et al. **Diabetes** 1986 May;35(5):523-9

Changes in gamma-aminobutyrate, glutamate, aspartate, glycine, and taurine contents in the striatum after unilateral nigrostriatal lesions in rats. Tanaka Y, et al. **Exp Neurol** 1986 Feb;91(2):259-68

Influence of medium amino acids on the ouabain sensitive and insensitive 86Rb+-fluxes in HeLa cells. Schaefer A, et al. **Experientia** 1986 Apr 15;42(4):436-7

Amino acid neurotransmitters in the CNS. Characteristics of the acidic amino acid exchange. Erecińska M, et al. **FEBS Lett** 1986 Apr 7; 199(1):95-9

Evidence for an excitatory amino acid as the transmitter of the auditory nerve in the in vitro mouse cochlear nucleus. Martin MR. **Hear Res** 1985;20(3):215-20

Rat brain concentration of administered amino acids: dependence on time of day for administration. Eriksson T, et al. **J Neural Transm** 1986; 65(1):83-91

Amino acid analysis demonstrates that increased plasma free tryptophan causes the increase of brain tryptophan during exercise in the rat. Chaouloff F, et al. **J Neurochem** 1986 May;46(5):1647-50

Effect of some centrally administered putative amino acid neurotransmitters on carrageenan-induced paw oedema in rats. Bhattacharya SK, et al. **J Pharm Pharmacol** 1986 Feb;38(2):144-6

Effect of 450191-S, a 1H-1,2,4-triazolyl benzophenone derivative, on cerebral content of neuroactive amino acids. Tomono S, et al. **Jpn J Pharmacol** 1985 Dec;39(4):558-61

Ouabain-induced changes in extracellular aspartate, glutamate and GABA levels in the rabbit olfactory bulb in vivo. Jacobson I, et al. **Neurosci Lett** 1986 Feb 28;64(2):211-5

Effects of amino acid neurotransmitter candidates on an identified insect motoneurone. Wafford KA, et al. **Neurosci Lett** 1986 Jan 16; 63(2):135-40

Plasma tryptophan and tyrosine ratios to competing amino acids in relation to antidepressant response to citalopram and maprotiline. A preliminary study. Møller SE, et al. **Psychopharmacology (Berlin)** 1986; 88(1):96-100

Excitatory amino acid analogs evoke release of endogenous amino acids and acetyl choline from chick retina in vitro. Campochiaro P, et al. **Vision Res** 1985;25(10):1375-86

[Interaction between chlorpromazine, hepatic protective agents and enzymes at the level of the liver cytoplasm and mitochondria and of the cerebral cortex in rats] Serban F, et al. **Rev Med Chir Soc Med Nat Iasi** 1985 Apr-Jun;89(2):273-7 (Eng. Abstr.) **(Rum)**

AMITRIPTYLINE

Overdose of cyclobenzaprine, the tricyclic muscle relaxant. O'Riordan W, et al. **Ann Emerg Med** 1986 May;15(5):592-3

Anorexia nervosa. Treatment efficacy of cyproheptadine and amitriptyline. Halmi KA, et al. **Arch Gen Psychiatry** 1986 Feb; 43(2):177-81

Imipramine and amitriptyline plasma concentrations and clinical response in major depression. Kocsis JH, et al. **Br J Psychiatry** 1986 Jan; 148:52-7

Bifunctional variations of the antidepressant amitriptyline theme. Asscher Y, et al. **Chem Pharm Bull (Tokyo)** 1985 Nov;33(11):4847-55

Changes of transition temperatures of phosphatidylcholine and phosphatidylglycerol in presence of amphiphilic drugs. Harder A, et al. **Chem Phys Lipids** 1986 Jan;39(1-2):65-71

Amitriptyline metabolism: association with debrisoquin hydroxylation in nonsmokers. Mellström B, et al. **Clin Pharmacol Ther** 1986 Apr; 39(4):369-71

Cimetidine interaction with amitriptyline. Curry SH, et al. **Eur J Clin Pharmacol** 1985;29(4):429-33

Moclobemide, a new reversible MAO inhibitor—interaction with tyramine and tricyclic antidepressants in healthy volunteers and depressive patients. Korn A, et al. **Psychopharmacology (Berlin)** 1986; 88(2):153-7

Inhibition of head twitch response to quipazine in rats by chronic amitriptyline but not fluvoxamine or citalopram. Pawlowski L, et al. **Psychopharmacology (Berlin)** 1986;88(3):279-84

AMPHETAMINE

Effect of amphetamine on brain catecholamines, brain beta-endorphin, serum prolactin, catechol-O-methyltransferase and monoamine oxidase of various organs in the rat. Agarwal DP, et al. **Arzneimittelforschung** 1985;35(11):1639-42

Drug effects on memory: assessment of a combined active and passive avoidance task. Sahgal A, et al. **Behav Brain Res** 1985 Oct; 17(3):251-5

Pharmaco-ontogeny of reward: enhancement of self-stimulation by D-amphetamine and cocaine in 3- and 10-day-old rats. Barr GA, et al. **Brain Res** 1986 Jan;389(1-2):193-202

Multiple amphetamine injections reduce the release of ascorbic acid in the neostriatum of the rat. Kamata K, et al. **Brain Res** 1986 Jan 8; 362(2):331-8

Locus coeruleus norepinephrine-containing neurons: effects produced by acute and subchronic treatment with antipsychotic drugs and amphetamine. Ramirez OA, et al. **Brain Res** 1986 Jan 1; 362(1):165-70

Differences in amphetamine and morphine sensitivity in lateralized and non-lateralized rats: locomotor activity and drug self-administration. Glick SD, et al. **Eur J Pharmacol** 1985 Dec 3;118(3):239-44

Study on the mechanism of the long-lasting antagonistic effect of caerulein on amphetamine-induced hyperactivity in rats. Matsubara K, et al. **Gen Pharmacol** 1986;17(1):13-7

Synthesis, identification, and acute toxicity of alpha-benzylphenethylamine and alpha-benzyl-N-methylphenethylamine. Contaminants in clandestine preparation of amphetamine and methamphetamine. Noggle FT Jr, et al. **J Assoc Off Anal Chem** 1985 Nov-Dec;68(6):1213-22

Dose response for amphetamine-induced changes in dopamine levels in push-pull perfusates of rat striatum. Kuczenski R. **J Neurochem** 1986 May;46(5):1605-11

Amphetamine-induced circling behaviour in MPTP-lesioned mice. Fung YK, et al. **J Pharm Pharmacol** 1985 Dec;37(12):922-3

Possible involvement of the central nervous system in long-term effect of caerulein on amphetamine-induced hyperactivity in rats. Matsubara K, et al. **Jpn J Pharmacol** 1985 Nov;39(3):317-21

Neuropathology and amphetamine-induced turning resulting from AF64A injections into the striatum of the rat. Stwertka SA, et al. **Life Sci** 1986 Mar 24;38(12):1105-10

Discriminative stimulus properties of amphetamine and structurally related phenalkylamines. Young R, et al. **Med Res Rev** 1986 Jan-Mar; 6(1):99-130 (74 ref.)

Amphetamine potentiation of anti-conflict action of chlordiazepoxide. Lerner T, et al. **Pharmacol Biochem Behav** 1986 Feb;24(2):241-6

Comparison of the effects of amphetamine and a fluorinated analogue on locomotion and exploratory activity in the mouse. Dubin RE, et al. **Prog Neuropsychopharmacol Biol Psychiatry** 1985;9(5-6):681-5

Brain adenylate cyclase activity in the amphetamine sensitized rat. Mamelak M, et al. **Prog Neuropsychopharmacol Biol Psychiatry** 1985; 9(5-6):721-4

Effects of amphetamine and apomorphine on locomotor activity after kainic acid lesion of the nucleus accumbens septi in the rat. Kafetzopoulos E. **Psychopharmacology (Berlin)** 1986;88(3):271-4

Amphetamine, apomorphine and investigatory behavior in the rat: analysis of the structure and pattern of responses. Kelley AE, et al. **Psychopharmacology (Berlin)** 1986;88(1):66-74

Amphetamine does not affect the partial punishment effect (PPE). Weiner I, et al. **Psychopharmacology (Berlin)** 1986;88(1):119-23

AMPHETAMINES

Serotonin receptor involvement in the avoidance learning deficit caused by p-chloroamphetamine-induced serotonin release. Ogren SO. **Acta Physiol Scand** 1986 Mar;126(3):449-62

Elimination of labetalol-induced false positives in drug analyses [letter] Wu A, et al. **Clin Chem** 1986 Feb;32(2):407

Evidence for specific methylenedioxymethamphetamine (ecstasy) binding sites in the rat brain. Gehlert DR, et al. **Eur J Pharmacol** 1985 Dec 10;119(1-2):135-6

[3H]DOB: a specific agonist radioligand for 5-HT2 serotonin receptors. Titeler M, et al. **Eur J Pharmacol** 1985 Oct 29;117(1):145-6

Fluoxetine enantiomers as antagonists of p-chloroamphetamine effects in rats. Fuller RW, et al. **Pharmacol Biochem Behav** 1986 Feb;

24(2):281–4

Comparison of the effects of amphetamine and a fluorinated analogue on locomotion and exploratory activity in the mouse. Dubin RE, et al. **Prog Neuropsychopharmacol Biol Psychiatry** 1985;9(5–6):681–5

[Rapid and simple determination of methamphetamine and amphetamine in urine and serum by gas chromatography using the flame-thermionic detector] Kotoku S, et al. **Nippon Hoigaku Zasshi** 1985 Apr; 39(2):143–8 (Eng. Abstr.) **(Jpn)**

ANOREXIA NERVOSA

The treatment of anorexia nervosa. Hsu LK. **Am J Psychiatry** 1986 May; 143(5):573–81 (97 ref.)

Anorexia nervosa. Treatment efficacy of cyproheptadine and amitriptyline. Halmi KA, et al. **Arch Gen Psychiatry** 1986 Feb; 43(2):177–81

High affinity [3H]imipramine binding and serotonin uptake to platelets of adolescent females suffering from anorexia nervosa. Weizman R, et al. **Life Sci** 1986 Mar 31;38(13):1235–42

ANTIDEPRESSIVE AGENTS

Cortical beta- and alpha 2- adrenoceptor binding, hypothalamic noradrenaline and pineal melatonin concentrations measured at different times of the day after repeated treatment of rats with imipramine, zimeldine, alaproclate and amiflamine. Ask AL, et al. **Acta Pharmacol Toxicol (Copenh)** 1986 Jan;58(1):16–24

A Belgian multicentre study of fluvoxamine in depressive outpatients. Brasseur R, et al. **Acta Psychiatr Belg** 1985 Sep–Oct;85(5):636–43

Sleep, depression and the effects of antidepressant drugs. Gaillard JM, et al. **Acta Psychiatr Belg** 1985 Sep–Oct;85(5):561–7

Tryptophan to competing amino acids ratio in depressive disorder: relation to efficacy of antidepressive treatments. Møller SE. **Acta Psychiatr Scand [Suppl]** 1985;325:3–31 (146 ref.)

Drugs and depression. Harris B. **Am J Nurs** 1986 Mar;86(3):292–3

A possible synergistic effect of alprazolam and lithium carbonate [letter] Cerra D, et al. **Am J Psychiatry** 1986 Apr;143(4):552

Patient with chronic and apparently treatment-resistant dysthymia [letter] Harris SJ, et al. **Am J Psychiatry** 1986 Feb;143(2):260–1

Lithium-antidepressant combinations in the treatment of depressed, physically ill geriatric patients. Kushnir SL. **Am J Psychiatry** 1986 Mar; 143(3):378–9

Combined psychotherapy and pharmacotherapy for depression. A systematic analysis of the evidence. Conte HR, et al. **Arch Gen Psychiatry** 1986 May;43(5):471–9

Low levels and lack of predictors of somatotherapy and psychotherapy received by depressed patients. Keller MB, et al. **Arch Gen Psychiatry** 1986 May;43(5):458–66

Effect of the antidepressant minaprine on both forms of monoamine oxidase in the rat. Kan JP, et al. **Biochem Pharmacol** 1986 Mar 15; 35(6):973–8

Plasma concentrations, information and therapy adherence during long-term treatment with antidepressants. Altamura AC, et al. **Br J Clin Pharmacol** 1985 Dec;20(6):714–6

Adverse drug reactions to first- and second-generation antidepressants: a critical evaluation of drug surveillance data. Schmidt LG, et al. **Br J Psychiatry** 1986 Jan;148:38–43

A comparison of the safety and efficacy of alprazolam and desipramine in moderately severe depression. Remick RA, et al. **Can J Psychiatry** 1985 Dec;30(8):597–601

Bifunctional variations of the antidepressant amitriptyline theme. Asscher Y, et al. **Chem Pharm Bull (Tokyo)** 1985 Nov;33(11):4847–55

Syntheses of (+/-)-2-[(inden-7-yloxy)methyl]morpholine hydrochloride (YM-08054, indeloxazine hydrochloride) and its derivatives with potential cerebral-activating and antidepressive properties. Kojima T, et al. **Chem Pharm Bull (Tokyo)** 1985 Sep;33(9):3766–74

The psychopharmacological effects of repeated doses of fluvoxamine, mianserin and placebo in healthy human subjects. Curran HV, et al. **Eur J Clin Pharmacol** 1986;29(5):601–7

Metabolism of the anti-depressant lortalamine. Elsom LF, et al. **Eur J Drug Metab Pharmacokinet** 1985 Jul–Sep;10(3):209–15

Effects of antidepressant drug combinations on cortical 5-HT2 receptors and wet-dog shakes in rats. Koshikawa F, et al. **Eur J Pharmacol** 1985 Dec 3;118(3):273–81

Antidepressant drugs given repeatedly increase binding to alpha 1-adrenoceptors in the rat cortex. Maj J, et al. **Eur J Pharmacol** 1985 Dec 10;119(1–2):113–6

Antidepressants and protein kinases: desipramine treatment affects pineal gland cAMP-dependent protein kinase activity. Moyer JA, et al. **Eur J Pharmacol** 1986 Feb 11;121(1):57–64

Typical and atypical antidepressant drug effects on locomotor activity after intra-accumbens injections in the rat. Oosterloo SK, et al. **Eur J Pharmacol** 1985 Nov 26;118(1–2):45–51

Antidepressive drugs can change the affinity of [3H]imipramine and [3H]paroxetine binding to platelet and neuronal membranes. Plenge P, et al. **Eur J Pharmacol** 1985 Dec 10;119(1–2):1–8

Antidepressants and protein kinases: inhibition of Ca2+-regulated myosin phosphorylation by fluoxetine and iprindole. Silver PJ, et al. **Eur J Pharmacol** 1986 Feb 11;121(1):65–71

Circadian rhythm stability in the depressive syndrome in patients treated with antidepressant drugs. Madjirova N. **Folia Med (Plovdiv)** 1985; 27(1):5–10

Present status of drug therapy of depression in late life. Gerner RH. **J Affective Disord** 1985;Suppl 1:S23–31 (67 ref.)

Determination of fezolamine and its desmethyl metabolite in human plasma and urine by high-performance liquid chromatography. Intravenous pharmacokinetics in the beagle hound. McCoy L, et al. **J Chromatogr** 1985 Nov 8;344:211–20

Double-blind comparison of doxepin versus bupropion in outpatients with a major depressive disorder. Feighner J, et al. **J Clin Psychopharmacol** 1986 Feb;6(1):27–32

Alprazolam treatment of postcoronary bypass anxiety and depression. Freeman AM 3d, et al. **J Clin Psychopharmacol** 1986 Feb;6(1):39–41

Down-regulation of dopamine D-2, 5-HT2 receptors and beta-adrenoceptors in rat brain after prolonged treatment with a new potential antidepressant, Lu 19-005. Nowak G, et al. **J Neural Transm** 1985;64(3–4):227–38

Chronic treatment with the potential antidepressant drug rolipram: the effect on the behavioural responses to adrenergic and dopaminergic receptor agonists with some biochemical correlates. Przegaliński E, et al. **J Neural Transm** 1985;64(3–4):211–26

Interaction between antidepressants and alpha 1-adrenergic receptor antagonists on the binding to alpha 1-acid glycoprotein. Ferry DG, et al. **J Pharm Sci** 1986 Feb;75(2):146–9

13C NMR studies of the molecular flexibility of antidepressants. Munro SL, et al. **J Pharm Sci** 1986 Feb;75(2):133–41

Effects of bifemelane hydrochloride (MCI-2016) on acetylcholine and norepinephrine release from cortical slices of bilaterally carotid-artery-ligated Mongolian gerbils. Saito K, et al. **Jpn J Pharmacol** 1985 Nov;39(3):406–9

Effects of bifemelane hydrochloride (MCI-2016) on acetylcholine release from cortical and hippocampal slices of rats. Saito K, et al. **Jpn J Pharmacol** 1985 Nov;39(3):410–4

Effects of bifemelane hydrochloride (MCI-2016) on experimental amnesia (passive avoidance failure) in rodents. Tobe A, et al. **Jpn J Pharmacol** 1985 Oct;39(2):153–61

Biochemical profile of midalcipran (F 2207), 1-phenyl-1-diethyl-aminocarbonyl-2-aminomethyl-cyclopropane (Z) hydrochloride, a potential fourth generation antidepressant drug. Moret C, et al. **Neuropharmacology** 1985 Dec;24(12):1211–9

Must antidepressants be anticholinergic to inhibit muricide? Strickland JA, et al. **Pharmacol Biochem Behav** 1986 Jan;24(1):135–7

Action of antidepressant neuroleptics, chlorprothixene and levomepromazine, on the central noradrenergic system: comparison with other antidepressants. Antkiewicz-Michaluk L. **Pol J Pharmacol Pharm** 1985 Sep–Oct;37(5):673–83

Possible relationship of the locus coeruleus--hippocampal noradrenergic neurons to depression and mode of action of antidepressant drugs. Kostowski W. **Pol J Pharmacol Pharm** 1985 Nov–Dec;37(6):727–43 (57 ref.)

Effects of antidepressants on uptake and receptor systems in the brain. Fuller RW, et al. **Prog Neuropsychopharmacol Biol Psychiatry** 1985; 9(5–6):485–90 (22 ref.)

Platelet 3H imipramine binding: a possible predictor of response to antidepressant treatment. Hrdina PD, et al. **Prog Neuropsychopharmacol Biol Psychiatry** 1985;9(5–6):619–23

Course of clinical response to antidepressants. Lapierre YD. **Prog Neuropsychopharmacol Biol Psychiatry** 1985;9(5–6):503–7

Variability of chronic antidepressant treatments on beta-adrenergic receptor sites. Suranyi-Cadotte BE, et al. **Prog Neuropsychopharmacol Biol Psychiatry** 1985;9(5–6):765–8

Effects of subchronic administration of psychoactive substances on the circadian rhythm of urinary corticosterone excretion in rats. Häusler A, et al. **Psychoneuroendocrinology** 1985;10(4):421–9

Colour associations as predictors of the effectiveness of anti-depressant pharmacotherapy in endogenous depressive patients. Demeter E, et al. **Psychopathology** 1985;18(5–6):305–9

Scales of potential use in the psychopharmacologic treatment of depressed children and adolescents. Petti TA. **Psychopharmacol Bull** 1985; 21(4):951–77

The effects of some putative antidepressant agents on the schedule-controlled behavior of the pigeon. Lamb RJ, et al. **Psychopharmacology (Berlin)** 1986;88(3):368–73

Plasma tryptophan and tyrosine ratios to competing amino acids in relation to antidepressant response to citalopram and maprotiline. A preliminary study. Møller SE, et al. **Psychopharmacology (Berlin)** 1986; 88(1):96–100

Effects of antidepressant drugs, selective noradrenaline-or 5-hydroxytryptamine uptake inhibitors, on apomorphine-induced hypothermia in mice. Pawłowski L, et al. **Psychopharmacology (Berlin)** 1986;88(2):240–6

[Novel comparative profile of the clinical activity of antidepressive agents] Ansseau M, et al. **Acta Psychiatr Belg** 1985 Sep–Oct;85(5):644–61 (Eng.

Abstr.) **(Fre)**

[Stages in the development of neuroses in the dog and effects of preparations with antidepressive and tranquilizing properties] Mekhedova AIa, et al. **Zh Vyssh Nerv Deiat** 1985 Nov–Dec; 35(6):1147–55 (Eng. Abstr.) **(Rus)**

ANXIETY

The neuropsychology of anxiety. Gray JA. **Issues Ment Health Nurs** 1985; 7(1–4):201–28

The universal enervating triad: psychopharmaceutical considerations of anxiety, schizophrenia, and depression. Miller TW, et al. **Issues Ment Health Nurs** 1984;6(3–4):275–91

Reversibility of serotonin irritation syndrome with atmospheric anions. Giannini AJ, et al. **J Clin Psychiatry** 1986 Mar;47(3):141–3

Alprazolam treatment of postcoronary bypass anxiety and depression. Freeman AM 3d, et al. **J Clin Psychopharmacol** 1986 Feb;6(1):39–41

An open clinical trial of clonazepam in the treatment of patients with recurrent panic attacks. Beaudry P, et al. **Prog Neuropsychopharmacol Biol Psychiatry** 1985;9(5–6):589–92

Buspirone: anxiolytic? Pecknold JC, et al. **Prog Neuropsychopharmacol Biol Psychiatry** 1985;9(5–6):639–42

Relaxation–induced anxiety: additional findings. McKeachie WJ. **Psychol Rep** 1985 Dec;57(3 Pt 2):1277–8

The effects of compounds related to gamma–aminobutyrate and benzodiazepine receptors on behavioural responses to anxiogenic stimuli in the rat: extinction and successive discrimination. Buckland C, et al. **Psychopharmacology (Berlin)** 1986;88(3):285–95

Differential effect of benzodiazepine sedation in high and low anxious patients in a 'real life' stress setting. O'Boyte CA, et al. **Psychopharmacology (Berlin)** 1986;88(2):226–9

Plasma catecholamines at rest and exercise in subjects with high– and low–trait anxiety. Péronnet F, et al. **Psychosom Med** 1986 Jan–Feb; 48(1–2):52–8

ANXIETY DISORDERS

Double–blind comparison of buspirone and clorazepate in anxious outpatients. Cohn JB, et al. **Am J Med** 1986 Mar 31;80(3B):10–6

Neuroendocrine effects of buspirone in patients with generalized anxiety disorder. Cohn JB, et al. **Am J Med** 1986 Mar 31;80(3B):36–40

Clonazepam in the treatment of patients with recurrent panic attacks. Beaudry P, et al. **J Clin Psychiatry** 1986 Feb;47(2):83–5

Effective short–term treatment of generalized anxiety disorder with trifluoperazine. Mendels J, et al. **J Clin Psychiatry** 1986 Apr; 47(4):170–4

One–year follow–up of anxious patients treated with diazepam. Rickels K, et al. **J Clin Psychopharmacol** 1986 Feb;6(1):32–6

The epidemiology of anxiety. Reich J. **J Nerv Ment Dis** 1986 Mar; 174(3):129–36 (85 ref.)

Forms of atypical depression and their response to antidepressant drugs. Davidson J, et al. **Psychiatry Res** 1986 Feb;17(2):87–95

What do the neurosciences tell us about anxiety disorders? A comment. Marks I, et al. **Psychol Med** 1986 Feb;16(1):9–12

[Psychiatric indications for beta–adrenergic inhibitors] Féline A, et al. **Therapie** 1985 Nov–Dec;40(6):413–6 (Eng. Abstr.) **(Fre)**

[Indicative patterns of the use of anxiolytic agents in pharmacies and the severity of symptoms] de Matos EG, et al. **AMB** 1985 Jul–Aug; 31(7–8):116–20 (Eng. Abstr.) **(Por)**

APOMORPHINE

Dopamine agonist treatment of schizophrenia with N–propylnorapomorphine. Tamminga CA, et al. **Arch Gen Psychiatry** 1986 Apr;43(4):398–402

Effect of forebrain commissurotomy on recovery from unilateral 6–OHDA lesions of the substantia nigra and circling induced by apomorphine. Steiner H, et al. **Behav Brain Res** 1985 Oct; 17(3):245–9

Mouse strain differences in apomorphine–induced behavior: an empirical and methodological study. Randall PK, et al. **Behav Neurosci** 1986 Feb; 100(1):85–92

Oscillations in apomorphine–induced stereotypies during 1 year of apomorphine administration. Csernansky JG, et al. **Biol Psychiatry** 1986 Apr;21(4):402–5

Behavior performed at onset of drug action and apomorphine stereotypy. Szechtman H. **Eur J Pharmacol** 1986 Feb 11;121(1):49–56

CCK–8 antagonizes apomorphine–induced growth hormone secretion in normal subjects. Nair NP, et al. **Horm Metab Res** 1986 Jan; 18(1):53–5

Concentration–response relations for apomorphine effects on heart rate in conscious rats. Paalzow LK, et al. **J Pharm Pharmacol** 1986 Jan; 38(1):28–34

Effect of subchronic treatment with methamphetamine on apomorphine–induced changes in locomotor activity in mice. Watanabe H, et al. **Jpn J Pharmacol** 1986 Jan;40(1):185–7

A comparative study of the locomotor activity effects of apomorphine and the 'atypical dopamine agonists' (piribedil and S3608). Offermeier J, et al. **Life Sci** 1986 Mar 10;38(10):895–903

Lateralized and compulsive exteroceptive orientation in rats treated with apomorphine. Pisa M, et al. **Neurosci Lett** 1986 Feb 14;64(1):41–6

Modulation of apomorphine–induced climbing behavior by estradiol. Fung YK, et al. **Pharmacol Biochem Behav** 1986 Jan;24(1):139–41

Different behavioural patterns induced by the dopamine agonist apomorphine analysed by multivariate statistics. Ståhle L, et al. **Pharmacol Biochem Behav** 1986 Feb;24(2):291–8

Lateralizing effects of apomorphine on taxis, postural support and rotation in rats. Pisa M, et al. **Prog Neuropsychopharmacol Biol Psychiatry** 1985; 9(5–6):525–31

Effects of amphetamine and apomorphine on locomotor activity after kainic acid lesion of the nucleus accumbens septi in the rat. Kafetzopoulos E. **Psychopharmacology (Berlin)** 1986;88(3):271–4

Amphetamine, apomorphine and investigatory behavior in the rat: analysis of the structure and pattern of responses. Kelley AE, et al. **Psychopharmacology (Berlin)** 1986;88(1):66–74

The effects of apomorphine, d–amphetamine and chlorpromazine on the aggressiveness of isolated Aequidens pulcher (Teleostei, Cichlidae). Munro AD. **Psychopharmacology (Berlin)** 1986;88(1):124–8

Effects of antidepressant drugs, selective noradrenaline–or 5–hydroxytryptamine uptake inhibitors, on apomorphine–induced hypothermia in mice. Pawłowski L, et al. **Psychopharmacology (Berlin)** 1986;88(2):240–6

Effects of central dopamine depletion on the d–amphetamine discriminative stimulus in rats. Woolverton WL, et al. **Psychopharmacology (Berlin)** 1986;88(2):196–200

[The effect of various new GABAergics on motor and oral stereotypes with apomorphine in the rat] Vamvakidès A, et al. **J Pharmacol** 1985 Oct–Dec;16(4):403–11 (Eng. Abstr.) **(Fre)**

APPETITE

Interference with central actions of angiotensin II suppresses sodium appetite. Weiss ML, et al. **Am J Physiol** 1986 Feb; 250(2 Pt 2):R250–9

Running to the taste of salt in mineralocorticoid–treated rats. Schulkin J, et al. **Horm Behav** 1985 Dec;19(4):413–25

AROMATIC AMINO ACID DECARBOXYLASES

A diphenol oxidase gene is part of a cluster of genes involved in catecholamine metabolism and sclerotization in Drosophila. II. Molecular localization of the Dox–A2 coding region. Pentz ES, et al. **Genetics** 1986 Apr;112(4):843–59

AROUSAL

The effect of phobic anxiety on plasma beta–endorphin: a single–subject experiment. Thyer BA, et al. **Behav Res Ther** 1986;24(2):237–41

Acute effects of physostigmine and neostigmine in man. Janowsky DS, et al. **Milit Med** 1986 Jan;151(1):48–51

Effect of hypoxia on ventilatory and arousal responses to CO2 during NREM sleep with and without flurazepam in young adults. Gothe B, et al. **Sleep** 1986;9(1):24-37

[Mechanisms of action of noise] Ising H. **Schriftenr Ver Wasser Boden Lufthyg** 1985;65:413-24 **(Ger)**

ASSOCIATION

Colour associations as predictors of the effectiveness of anti-depressant pharmacotherapy in endogenous depressive patients. Demeter E, et al. **Psychopathology** 1985;18(5-6):305-9

ATTENTION

6-Hydroxydopamine treatment does not affect the young rat's ability to modify its response when changing from food to water deprivation. Brenner E, et al. **Behav Brain Res** 1986 Jan;19(1):89-92

Components of attention, methylphenidate dosage, and blood levels in children with attention deficit disorder. Sebrechts MM, et al. **Pediatrics** 1986 Feb;77(2):222-8

ATTENTION DEFICIT DISORDER WITH HYPERACTIVITY

Methylphenidate treatment of cocaine abusers without attention deficit disorder: a negative report. Gawin F, et al. **Am J Drug Alcohol Abuse** 1985;11(3-4):193-7

Prediction of methylphenidate (Ritalin) responsiveness through sensory integrative testing. Kimball JG. **Am J Occup Ther** 1986 Apr; 40(4):241-8

Pemoline and urinary excretion of catecholamines and indoleamines in children with attention deficit disorder. Zametkin AJ, et al. **Am J Psychiatry** 1986 Mar;143(3):359-62

Behavioral effects of low-dose methylphenidate in childhood attention deficit disorder: implications for a mechanism of stimulant drug action. Solanto MV. **J Am Acad Child Psychiatry** 1986 Jan;25(1):96-101

Short term effects of methylphenidate on the cognitive, learning and academic performance of children with attention deficit disorder in the laboratory and the classroom. Douglas VI, et al. **J Child Psychol Psychiatry** 1986 Mar;27(2):191-211

Components of attention, methylphenidate dosage, and blood levels in children with attention deficit disorder. Sebrechts MM, et al. **Pediatrics** 1986 Feb;77(2):222-8

Clinical management of children with hyperactivity. A shift in diagnostic and therapeutic emphasis. Hesterly SO. **Postgrad Med** 1986 Apr; 79(5):299-305

AUDITORY PERCEPTION

Simulation of mechanical to neural transduction in the auditory receptor. Meddis R. **J Acoust Soc Am** 1986 Mar;79(3):702-11

AUTISM, INFANTILE

Dopamine-beta-hydroxylase (DBH) and homovanillic acid (HVA) in autistic children. Garnier C, et al. **J Autism Dev Disord** 1986 Mar; 16(1):23-9

Further speculations on possible dopamine-opioid link in autism [letter] Sandyk R. **J Autism Dev Disord** 1986 Mar;16(1):89-90

Fenfluramine and autism: careful reappraisal is in order [editorial] Gualtieri CT. **J Pediatr** 1986 Mar;108(3):417-9

Behavioral and cognitive measures used in psychopharmacological studies of infantile autism. Campbell M, et al. **Psychopharmacol Bull** 1985; 21(4):1047-53

AVOIDANCE LEARNING

Serotonin receptor involvement in the avoidance learning deficit caused by p-chloroamphetamine-induced serotonin release. Ogren SO. **Acta Physiol Scand** 1986 Mar;126(3):449-62

Evidence for a role of brain serotonergic neurotransmission in avoidance learning. Ogren SO. **Acta Physiol Scand [Suppl]** 1985;544:1-71

Place-aversion conditioned by phencyclidine in rats: development of tolerance and pharmacologic antagonism. Iwamoto ET. **Alcohol Drug Res** 1985-86;6(4):265-76

Interaction between nootropic drugs and methamphetamine on avoidance acquisition but not on locomotor activity in mice. Sansone M, et al. **Arch Int Pharmacodyn Ther** 1985 Dec;278(2):229-35

Drug effects on memory: assessment of a combined active and passive avoidance task. Sahgal A, et al. **Behav Brain Res** 1985 Oct; 17(3):251-5

Deficits in inhibitory avoidance after neurotoxic lesions of the ventral striatum are neurochemically and behaviorally selective. Schwarting R, et al. **Behav Brain Res** 1985 Dec;18(3):279-83

Disruption of neophobia, conditioned odor aversion, and conditioned taste aversion in rats with hippocampal lesions. Miller JS, et al. **Behav Neural Biol** 1986 Mar;45(2):240-53

Brief exposure to contingent reinforcement produces a sustained increment in the strength of an elicited response. Hutchinson RR, et al. **J Exp Anal Behav** 1986 Mar;45(2):189-94

Effects of bifemelane hydrochloride (MCI-2016) on experimental amnesia (passive avoidance failure) in rodents. Tobe A, et al. **Jpn J Pharmacol** 1985 Oct;39(2):153-61

Discriminative and aversive properties of beta-carboline-3-carboxylic acid ethyl ester, a benzodiazepine receptor inverse agonist, in rhesus monkeys. Takada K, et al. **Life Sci** 1986 Mar 17;38(11):1049-56

Conditioned taste aversions and changes in motor activity in lithium-treated rats. Mediating role of the area postrema. Ladowsky RL, et al. **Neuropharmacology** 1986 Jan;25(1):71-7

Shuttle-box deficits induced by inescapable shocks in rats: reversal by the beta-adrenoreceptor stimulants clenbuterol and salbutamol. Martin P, et al. **Pharmacol Biochem Behav** 1986 Feb;24(2):177-81

Effect of angiotensin II on passive avoidance performance after bilateral lesion of the nucleus accumbens septi. Winnicka MM, et al. **Pol J Pharmacol Pharm** 1985 Nov-Dec;37(6):897-901

Conditioned taste aversions induced by 1-5-hydroxytryptophan are mediated by the area postrema. Ossenkopp KP, et al. **Prog Neuropsychopharmacol Biol Psychiatry** 1985;9(5-6):745-8

Serotonin, septal lesions, and shock-escape learning in rats. Mattingly BA, et al. **Psychol Rep** 1986 Feb;58(1):3-9

Effects of lithium and rubidium on shock-induced changes in open-field activity. Hines G. **Psychopharmacology (Berlin)** 1986;88(2):209-12

Effects of propranolol on conditioned suppression, discriminated punishment and discriminated non-reward in the rat. Salmon P, et al. **Psychopharmacology (Berlin)** 1986;88(2):252-7

Effects of diazepam and pentobarbital on discrete lever-press avoidance response in mice: baseline-dependent changes. Kuribara H, et al. **Yakubutsu Seishin Kodo** 1985 Dec;5(4):343-8

AZEPINES

The effects of dilazep on reperfusion arrhythmias. Sugiyama S, et al. **Arzneimittelforschung** 1985;35(12):1802-4

Reversibility of granulocyte adhesion using polyamine-grafted nylon-6 as a new column substrate for granulocyte separation. Yui N, et al. **Biomaterials** 1985 Nov;6(6):409-15

B-HT 958 lowers blood pressure and heart rate in the rat through stimulation of dopamine receptors. Brown MJ, et al. **Br J Pharmacol** 1986 Feb;87(2):361-70

A single-dose pharmacokinetic study of the antisickling agent cetiedil. Orringer EP, et al. **Clin Pharmacol Ther** 1986 Mar;39(3):276-81

Brotizolam radioimmunoassay: development, evaluation, and application to human plasma samples. Bechtel WD, et al. **J Pharm Sci** 1985 Dec; 74(12):1265-9

Enhancing effect of absorption promoters on percutaneous absorption of a model dye (6-carboxyfluorescein) as poorly absorbable drugs. II. Study on the absorption promoting effect of azone. Ohshima T, et al. **J Pharmacobiodyn** 1985 Nov;8(11):900-5

Effects of the antiplatelet agents, dipyridamole and dilazep dihydrochloride, on in vivo platelet function and proteinuria. Inage H, et al. **Nippon Jinzo Gakkai Shi** 1985 Sep;27(9):1261-70

Effects of dilazep dihydrochloride (Dilazep) and its dose-dependent influence on rabbit acute serum sickness nephritis. Inage H, et al. **Nippon Jinzo Gakkai Shi** 1985 Sep;27(9):1253-60

BEHAVIOR

The neurochemistry of behavior. Panksepp J. **Annu Rev Psychol** 1986; 37:77-107

Behavioral changes caused by nutrients. Lieberman HR. **Bibl Nutr Dieta** 1986;(38):219-24

Perspectives in Canadian neuro-psychopharmacology. Proceedings of the eighth annual meeting of the Canadian College of Neuropsychopharmacology. May 5-8, 1985, London, Ontario. **Prog Neuropsychopharmacol Biol Psychiatry** 1985;9(5-6):463-768

Behavioral, biochemical, and blood pressure responses to alprazolam in healthy subjects: interactions with yohimbine. Charney DS, et al. **Psychopharmacology (Berlin)** 1986;88(2):133-40

The behavioral actions of diazepam and oxazepam are similar. Mewaldt SP, et al. **Psychopharmacology (Berlin)** 1986;88(2):165-71

[Phencyclidine: behavioral effects and molecular targets] Vignon J. **Biochimie** 1985 Sep;67(9):XI-XVI **(Fre)**

[Integrative relations in the structure of human behavior] Scripcaru G, et al. **Rev Med Chir Soc Med Nat Iasi** 1985 Apr-Jun;89(2):207-12 (25 ref.) (Eng. Abstr.) **(Rum)**

BEHAVIOR, ANIMAL

Evidence for a modulatory influence of centrally administered substance P on a 5-hydroxytryptamine-mediated behavioural response in the male rat. Ogren SO, et al. **Acta Physiol Scand** 1985 Dec;125(4):743-5

GABA-specificity of behaviour responses to picrotoxin injected into the colliculus superior of cats. Jaspers R, et al. **Behav Brain Res** 1985 Oct-Nov;18(1):63-9

Dopamine depletion, stimulation or blockade in the rat disrupts spatial navigation and locomotion dependent upon beacon or distal cues. Whishaw IQ, et al. **Behav Brain Res** 1985 Oct-Nov;18(1):11-29

The behavioral effects of depletions of brain serotonin induced by 5,7-dihydroxytryptamine vary with time after administration. Gately PF, et al. **Behav Neural Biol** 1986 Jan;45(1):31–42

Mouse strain differences in apomorphine-induced behavior: an empirical and methodological study. Randall PK, et al. **Behav Neurosci** 1986 Feb; 100(1):85–92

Clonidine modulates locus coeruleus metabolic hyperactivity induced by stress in behaving rats. Quintin L, et al. **Brain Res** 1986 Jan 8; 362(2):366–9

Central serotonergic responses and behavioural adaptation to repeated immobilisation: the effect of the corticosterone synthesis inhibitor metyrapone. Kennett GA, et al. **Eur J Pharmacol** 1985 Dec 17; 119(3):143–52

Subtypes of the 5-HT receptor mediating the behavioural responses to 5-methoxy-N,N-dimethyltryptamine in the rat. Tricklebank MD, et al. **Eur J Pharmacol** 1985 Oct 29;117(1):15–24

Behavioral effects of substance P in rats. Barbeau A, et al. **Int J Neurol** 1980;14(2–4):239–52

Antagonists of central and peripheral behavioral actions of cholecystokinin octapeptide. Crawley JN, et al. **J Pharmacol Exp Ther** 1986 Feb;236(2):320–30

Behavioral and receptor binding studies of phencyclidine (PCP) and lithium interaction in the rat. Mattia A, et al. **Life Sci** 1986 Mar 17; 38(11):975–84

A parametric study of the behavioral effects of phencyclidine in adult cats. Levine MS, et al. **Neuropharmacology** 1985 Dec;24(12):1181–5

Interaction of the cholinergic and catecholaminergic systems of the brain during a change in the motivational behavior of animals. Sadykhova EF, et al. **Neurosci Behav Physiol** 1985 Nov–Dec;15(6):471–6

Behavioral and neurochemical changes after intracisternal capsaicin treatment of the guinea pig. Gamse R, et al. **Neurosci Lett** 1986 Mar 14;64(3):287–92

Behavioral effects of a dimethylsulfonium analog of dopamine after injection into the nucleus accumbens and the striatum. Boldry R, et al. **Pharmacol Biochem Behav** 1986 Feb;24(2):223–8

Modulation of apomorphine-induced climbing behavior by estradiol. Fung YK, et al. **Pharmacol Biochem Behav** 1986 Jan;24(1):139–41

Interstrain correlation between behavioural effects of lithium and effects on cortical cyclic AMP. Hamburger-Bar R, et al. **Pharmacol Biochem Behav** 1986 Jan;24(1):9–13

The effects of fluoxetine and zimeldine on the behavior of olfactory bulbectomized rats. Joly D, et al. **Pharmacol Biochem Behav** 1986 Feb; 24(2):199–204

Different behavioural patterns induced by the dopamine agonist apomorphine analysed by multivariate statistics. Ståhle L, et al. **Pharmacol Biochem Behav** 1986 Feb;24(2):291–8

Dissociations between the effects of hallucinogens on behavior and raphe unit activity in behaving cats. Trulson ME. **Pharmacol Biochem Behav** 1986 Feb;24(2):351–7

The influence of chronic treatment with psychotropic drugs on behavioral changes by social isolation. Oehler J, et al. **Pol J Pharmacol Pharm** 1985 Nov–Dec;37(6):841–9

Perspectives in Canadian neuro-psychopharmacology. Proceedings of the eighth annual meeting of the Canadian College of Neuropsychopharmacology. May 5–8, 1985, London, Ontario. **Prog Neuropsychopharmacol Biol Psychiatry** 1985;9(5–6):463–768

Behavioral and neurochemical effects of (–)- and (+/–)-cathinone: dose-response and time-course. Nielsen JA, et al. **Prog Neuropsychopharmacol Biol Psychiatry** 1985;9(5–6):739–43

Developmental, behavioral, and opiate receptor changes after prenatal or postnatal beta-endorphin, CRF, or Tyr-MIF-1. Zadina JE, et al. **Psychoneuroendocrinology** 1985;10(4):367–83

Behavioural responses to diazepam of drug-naive and experienced monkeys (Macaca mulatta). Bradley CM, et al. **Psychopharmacology (Berlin)** 1986;88(1):112–4

The effects of compounds related to gamma-aminobutyrate and benzodiazepine receptors on behavioural responses to anxiogenic stimuli in the rat: extinction and successive discrimination. Buckland C, et al. **Psychopharmacology (Berlin)** 1986;88(3):285–95

Imidazole has similar behavioural effects to yohimbine. Ferrari F, et al. **Psychopharmacology (Berlin)** 1986;88(1):58–62

[Behavioral changes in rhesus monkeys induced by repeated administration of ephedrine] Kato S. **Seishin Shinkeigaku Zasshi** 1985; 87(8):583–94 (Eng. Abstr.) **(Jpn)**

[Behavioral effects of thyroliberin on animals of various species] Krylov SS, et al. **Farmakol Toksikol** 1986 Jan–Feb;49(1):30–3 (Eng. Abstr.) **(Rus)**

[Effect of acute and chronic deprivation of catecholaminergic system activity induced by 6-hydroxydopamine on the behavior of the rat] Gromova EA, et al. **Zh Vyssh Nerv Deiat** 1985 Nov–Dec; 35(6):1133–41 (Eng. Abstr.) **(Rus)**

[Concentration of monoamines in the brain of minks differing in their reaction to man] Nikulina EM, et al. **Zh Vyssh Nerv Deiat** 1985 Nov–Dec;35(6):1142–6 (Eng. Abstr.) **(Rus)**

BENACTYZINE

[Participation of the cholinergic system in central mechanisms of the cortico-limbic regulation of visceral functions] Beller NN, et al. **Fiziol Zh SSSR** 1986 Jan;72(1):61–8 **(Rus)**

BENZAZEPINES

Effects of verapamil and diltiazem on human platelet function. Addonizio VP Jr, et al. **Am J Physiol** 1986 Mar;250(3 Pt 2):H366–71

Role of the renal kinin-prostaglandin system in diltiazem-induced natriuresis. Seino M, et al. **Am J Physiol** 1986 Feb; 250(2 Pt 2):F197–202

Effect of diltiazem on hemodynamics and regional blood flows in the newborn piglet. Clozel M, et al. **Dev Pharmacol Ther** 1986; 9(1):32–43

Some atypical neuroleptics inhibit [3H]SCH 23390 binding in vivo. Andersen PH, et al. **Eur J Pharmacol** 1986 Jan 14;120(1):143–4

Dopamine D1 receptor mediation of the discriminative stimulus properties of SKF 38393. Cunningham KA, et al. **Eur J Pharmacol** 1985 Dec 10; 119(1–2):121–5

Guanine nucleotide regulation of agonist interactions at [3H]SCH23390-labeled D1 dopamine receptors in rat striatum. Hess EJ, et al. **Eur J Pharmacol** 1986 Feb 11;121(1):31–8

[3H]SCH 23390 binding sites increase after chronic blockade of D-1 dopamine receptors. Porceddu ML, et al. **Eur J Pharmacol** 1985 Dec 3;118(3):367–70

Selective antagonism of the hypotensive effects of dopamine agonists in spontaneously hypertensive rats. McCoy CE, et al. **Hypertension** 1986 Apr;8(4):298–302

Ganglionic dopamine receptors as mediators of the inhibition of neurogenic vasoconstriction produced by fenoldopam. Lokhandwala MF, et al. **J Auton Pharmacol** 1985 Dec;5(4):301–5

The renal response to diltiazem and nifedipine: comparison with nitroprusside. Blackshear JL, et al. **J Cardiovasc Pharmacol** 1986 Jan–Feb;8(1):37–43

High-performance liquid chromatographic determination of diltiazem and four of its metabolites in plasma. Application to pharmacokinetics. Goebel KJ, et al. **J Chromatogr** 1985 Dec 13;345(2):355–63

Centrally-induced vasodepressor responses to diltiazem, a calcium channel blocker, in rats. Iyoda I, et al. **J Hypertens** 1985 Dec; 3(6):639–44

Different effects of calcium-antagonists on automaticity in single pacemaker cells and in synchronized networks of cultured embryonic heart muscle cells. Koidl B, et al. **J Mol Cell Card**iol 1986 Feb; 18(2):207–17

Effects of bepridil and diltiazem on [3H]nitrendipine binding to canine cardiac sarcolemma. Potentiation of pharmacological effects of nitrendipine by bepridil. Balwierczak JL, et al. **J Pharmacol Exp Ther** 1986 Apr;237(1):40–8

The benzazepine SCH 23390 increases plasma levels of cortisol in the conscious dog. Goiny M, et al. **Naunyn Schmiedebergs Arch Pharmacol** 1986 Jan;332(1):111–2

Evidence for the site of action of glycerol trinitrate and diltiazem in inhibiting vasoconstrictor responses to norepinephrine in isolated renal arteries. Gross GJ, et al. **Pharmacology** 1986;32(1):1–10

Control of the light-regulated current in rod photoreceptors by cyclic GMP, calcium, and l-cis-diltiazem. Stern JH, et al. **Proc Natl Acad Sci USA** 1986 Feb;83(4):1163–7

Effect of DA1 receptor blockade with SCH 23390 on the renal response to electrical stimulation of the renal nerves. Bradley T, et al. **Proc Soc Exp Biol Med** 1986 Apr;181(4):492–7

[Diltiazem: a new calcium antagonist in the Netherlands] Robbens EJ, et al. **Ned Tijdschr Geneeskd** 1986 Mar 22;130(12):535–7 **(Dut)**

[New psychotropic agents. 2. Synthesis and pharmacologic activity of derivatives of 5H-pyrrolo[1,2-b][1,2,5]benzotriazepines] Stefancich G, et al. **Farmaco [Sci]** 1985 Dec;40(12):930–41 (Eng. Abstr.) **(Ita)**

[Evaluation of the effectiveness and safety in the use of cold-diltiazem-potassium cardioplegia in coronary artery bypass surgery: a first clinical trial] Kitamura S, et al. **Nippon Geka Gakkai Zasshi** 1985 Sep;86(9):1199–202 (Eng. Abstr.) **(Jpn)**

BENZODIAZEPINE TRANQUILIZERS

A comparison of the soft gelatin capsule and the tablet form of temazepam. Salonen M, et al. **Acta Pharmacol Toxicol (Copenh)** 1986 Jan; 58(1):49–54

Benzodiazepines, but not antidepressants or neuroleptics, induce dose-dependent development of tolerance to lorazepam in psychiatric patients. Aranko K, et al. **Acta Psychiatr Scand** 1985 Nov; 72(5):436–46

Double-blind comparison of buspirone and clorazepate in anxious outpatients. Cohn JB, et al. **Am J Med** 1986 Mar 31;80(3B):10–6

Preliminary evidence for the utility of carbamazepine in alprazolam withdrawal. Klein E, et al. **Am J Psychiatry** 1986 Feb;143(2):235–6

Relative bioavailability in humans for oral tablets and solutions of lormetazepam. Zecca L, et al. **Arzneimittelforschung** 1985; 35(12):1870-2

Comparative pharmacokinetics of midazolam and loprazolam in healthy subjects after oral administration. Jochemsen R, et al. **Biopharm Drug Dispos** 1986 Jan-Feb;7(1):53-61

Electron-capture gas chromatographic determination of loprazolam in plasma and a pharmacokinetic application. Levasseur FA, et al. **Biopharm Drug Dispos** 1985 Oct-Dec;6(4):381-7

Sedation in outpatient oral surgery. Comparison of temazepam by mouth and diazepam i.v. O'Boyle CA, et al. **Br J Anaesth** 1986 Apr; 58(4):378-84

Comment: Addiction liability of benzodiazepines and buspirone [letter] Nelson RC. **Drug Intell Clin Pharm** 1986 Mar;20(3):233-4

The clinical pharmacology and dental uses of benzodiazepines in the elderly. Culbertson VL. **Gerodontics** 1985 Dec;1(6):252-9

Alprazolam treatment of postcoronary bypass anxiety and depression. Freeman AM 3d, et al. **J Clin Psychopharmacol** 1986 Feb;6(1):39-41

Indirect dopaminergic effects of tofisopam, a 2,3-benzodiazepine, and their inhibition by lithium. Chopin P, et al. **J Pharm Pharmacol** 1985 Dec;37(12):917-9

Relation between time courses of pharmacological effects and of plasma levels of camazepam and its active metabolites in rats. Morino A, et al. **J Pharmacobiodyn** 1985 Aug;8(8):597-606

Prescribing and dispensing of benzodiazepines by pharmacists. Newgreen DB, et al. **Med J Aust** 1986 Mar 31;144(7):370-1

Resistance to the anti-anxiety effect of buspirone in patients with a history of benzodiazepine use [letter] Schweizer E, et al. **N Engl J Med** 1986 Mar 13;314(11):719-20

Effects of clorazepate dipotassium and placebo on psychomotor skills. Moodley P, et al. **Percept Mot Skills** 1985 Dec;61(3 Pt 2):1121-2

Benzodiazepine suppression of cortisol secretion: a measure of anxiolytic activity? Gram LF, et al. **Pharmacopsychiatry** 1986 Jan;19(1):19-22

Prescription and misuse of benzodiazepines in the Federal Republic of Germany. Müller-Oerlinghausen B. **Pharmacopsychiatry** 1986 Jan; 19(1):8-13

Opioid benzodiazepine tifluadom and drug-induced hyperactivity in mice: lack of benzodiazepine-like effects. Sansone M, et al. **Pol J Pharmacol Pharm** 1985 Sep-Oct;37(5):585-90

Differential effect of benzodiazepine sedation in high and low anxious patients in a 'real life' stress setting. O'Boyte CA, et al. **Psychopharmacology (Berlin)** 1986;88(2):226-9

Disruption of schedule-controlled behavior by Ro 15-1788 one day after acute treatment with benzodiazepines. Spealman RD. **Psychopharmacology (Berlin)** 1986;88(3):398-400

Species differences in the disposition and metabolism of camazepam. Morino A, et al. **Xenobiotica** 1985 Dec;15(12):1033-43

[Determination of diazepam and medazepam by precipitation with tetraphenylboron sodium] Garcia Madrid H, et al. **J Pharm Belg** 1985 Nov-Dec;40(6):435-8 (Eng. Abstr.) **(Fre)**

[The biological basis of drug dependence. II. The benzodiazepines] Bobon D. **Rev Med Liege** 1986 Mar 1;41(5):165-73 **(Fre)**

[The control of drug release of heavy-soluble, weak basic drugs in matrix tablets using the example of medazepam] Zessin G, et al. **Pharmazie** 1986 Jan;41(1):39-42 (Eng. Abstr.) **(Ger)**

[Indicative patterns of the use of anxiolytic agents in pharmacies and the severity of symptoms] de Matos EG, et al. **AMB** 1985 Jul-Aug; 31(7-8):116-20 (Eng. Abstr.) **(Por)**

[Correlation of the clinical pharmacological action of a single dose of fenazepam with the EEG dynamics and pharmacokinetics] Uvarova LG, et al. **Farmakol Toksikol** 1986 Jan-Feb;49(1):66-9 (Eng. Abstr.) **(Rus)**

[Correlation between the pharmacokinetic indices and the pharmacological effects of fenazepam in an experiment] Zherdev VP, et al. **Farmakol Toksikol** 1985 Nov-Dec;48(6):67-70 (Eng. Abstr.) **(Rus)**

BENZODIAZEPINONES

Clonazepam-induced up-regulation of serotonin1 and serotonin2 binding sites in rat frontal cortex. Wagner HR, et al. **Adv Neurol** 1986; 43:645-51

Structure of the anthramycin-d(ATGCAT)2 adduct from one- and two-dimensional proton NMR experiments in solution. Graves DE, et al. **Biochemistry** 1985 Dec 17;24(26):7573-81

Comparative pharmacokinetics of midazolam and loprazolam in healthy subjects after oral administration. Jochemsen R, et al. **Biopharm Drug Dispos** 1986 Jan-Feb;7(1):53-61

Electron-capture gas chromatographic determination of loprazolam in plasma and a pharmacokinetic application. Levasseur FA, et al. **Biopharm Drug Dispos** 1985 Oct-Dec;6(4):381-7

Oral pirenzepine does not affect esophageal pressures in man. Blackwell JN, et al. **Dig Dis Sci** 1986 Mar;31(3):230-5

The Ro 15-1788 cue: evidence for benzodiazepine agonist and inverse agonist properties. De Vry J, et al. **Eur J Pharmacol** 1985 Dec 17; 119(3):193-7

Long-term exposure of cortical cell cultures to clonazepam reduces benzodiazepine receptor binding. Sher PK. **Exp Neurol** 1986 May; 92(2):360-8

Muscarinic acetylcholine receptors in rat gastric mucosa. A radioautographic study using a potent muscarinic antagonist, 3H-pirenzepine. Nakamura M, et al. **Histochemistry** 1985; 83(6):479-87

Computer-controlled large scale production of high specific activity [11C]RO 15-1788 for PET studies of benzodiazepine receptors. Suzuki K, et al. **Int J Appl Radiat Isot** 1985 Dec;36(12):971-6

Clonazepam: a novel therapeutic adjunct. Freinhar JP, et al. **Int J Psychiatry Med** 1985-86;15(4):321-8

Clonazepam in the treatment of patients with recurrent panic attacks. Beaudry P, et al. **J Clin Psychiatry** 1986 Feb;47(2):83-5

Behavioral studies with anxiolytic drugs. II. Interactions of zopiclone with ethyl-beta-carboline-3-carboxylate and Ro 15-1788 in squirrel monkeys. Barrett JE, et al. **J Pharmacol Exp Ther** 1986 Feb; 236(2):313-9

Interactions of Ro 15-1788, CGS 8216 and diazepam on head-turning in rats. Goldstein JM, et al. **Life Sci** 1986 Feb 3;38(5):459-63

Antagonism of the effects of the atypical benzodiazepine, Ro 5-4864 on intracranial self-stimulation in the rat. Pellow S, et al. **Pharmacol Biochem Behav** 1986 Feb;24(2):193-7

Effects of the benzodiazepine receptor ligands midazolam, Ro 15-1788, and Ro 5-4864, alone and in combinations, on platelet serotonin uptake. Lingjaerde O. **Pharmacopsychiatry** 1986 Jan;19(1):15-8

An open clinical trial of clonazepam in the treatment of patients with recurrent panic attacks. Beaudry P, et al. **Prog Neuropsychopharmacol Biol Psychiatry** 1985;9(5-6):589-92

Effects of chlordiazepoxide training dose on the mixed agonist-antagonist properties of benzodiazepine receptor antagonist Ro 15-1788, in a drug discrimination procedure. De Vry J, et al. **Psychopharmacology (Berlin)** 1986;88(2):177-83

Effects of clonazepam and ethosuximide on the responding of pigeons under a fixed-consecutive-number schedule with and without an external discriminative stimulus. Picker M, et al. **Psychopharmacology (Berlin)** 1986;88(3):325-30

Disruption of schedule-controlled behavior by Ro 15-1788 one day after acute treatment with benzodiazepines. Spealman RD. **Psychopharmacology (Berlin)** 1986;88(3):398-400

Antimanic effects of clonazepam. Chouinard G. **Psychosomatics** 1985 Dec; 26(12 Suppl):7-12

Clonazepam for panic disorders and agitation. Fontaine R. **Psychosomatics** 1985 Dec;26(12 Suppl):13-8

Effect of selective and non-selective antimuscarinics on rectosigmoid motility and gastrointestinal transit. Jaup BH, et al. **Scand J Gastroenterol** 1985 Nov;20(9):1101-9

[Effects of blocking muscarinic receptors with pirenzepine on the functional plasma flow of the liver in man and in the rat] Avagnina P, et al. **Recenti Prog Med** 1985 Nov;76(11):553-7 (Eng. Abstr.)**(Ita)**

[Inhibitory effects of pirenzepine on cholinergic stimulation of exocrine rat pancreas in vitro] Otsuki M, et al. **Nippon Shokakibyo Gakkai Zasshi** 1985 Dec;82(12):2959-63 (Eng. Abstr.) **(Jpn)**

[Reduction of clonazepam with enteric bacteria] Kuroiwa M, et al. **Yakugaku Zasshi** 1985 Oct;105(10):960-5 (Eng. Abstr.) **(Jpn)**

[Correlation of the clinical pharmacological action of a single dose of fenazepam with the EEG dynamics and pharmacokinetics] Uvarova LG, et al. **Farmakol Toksikol** 1986 Jan-Feb;49(1):66-9 (Eng. Abstr.) **(Rus)**

[Correlation between the pharmacokinetic indices and the pharmacological effects of fenazepam in an experiment] Zherdev VP, et al. **Farmakol Toksikol** 1985 Nov-Dec;48(6):67-70 (Eng. Abstr.) **(Rus)**

BIOGENIC AMINES

Effects of meclofenoxate on the level and turnover of biogenic monoamines in the rat brain. Petkov VV, et al. **Arzneimittelforschung** 1985;35(12):1778-81

Effects of dietary vanadium exposure on levels of regional brain neurotransmitters and their metabolites. Sharma RP, et al. **Biochem Pharmacol** 1986 Feb 1;35(3):461-5

Examination of spinal monoamine receptors through which brainstem opiate-sensitive systems act in the rat. Jensen TS, et al. **Brain Res** 1986 Jan 15;363(1):114-27

Effect of hypoxia on brainstem concentration of biogenic amines in postnatal rabbits. McNamara MC, et al. **Brain Res** 1986 Mar; 390(2):253-8

Interaction of neuropeptides and biogenic amines on cyclic adenosine monophosphate accumulation in hypothalamic nuclei. Redgate ES, et al. **Brain Res** 1986 Feb 12;365(1):61-9

Stress by forced swimming in the rat: effects of mianserin and moclobemide on GABAergic-monoaminergic systems in the brain. Cicardo VH, et al. **Comp Biochem Physiol [C]** 1986;83(1):133-5

The reliability of monoamine levels in the kindled brain. Nishimura S, et al. **Folia Psychiatr Neurol Jpn** 1985;39(3):321-2

Rat brain monoamine metabolism and hypobaric hypoxia: a new approach. Trouvin JH, et al. **Gen Pharmacol** 1986;17(1):69-73

Effect of 24-hour sleep deprivation on biogenic amine turnover. Bol'shakova TD, et al. **Hum Physiol** 1985 Jul-Aug;11(4):291-5

Simultaneous analysis of twelve biogenic amine metabolites in plasma, cerebrospinal fluid and urine by capillary column gas chromatography-high-resolution mass spectrometry with selected-ion monitoring. Davis BA, et al. **J Chromatogr** 1986 Jan 24; 374(2):227-38

Determination of the biogenic amines and their major metabolites in single human brain tissue samples using a combined extraction procedure and high-performance liquid chromatography with electrochemical detection. Herregodts P, et al. **J Chromatogr** 1985 Nov 29; 345(1):33-42

Effects of chronic lithium treatment on brain monoamine metabolism and amphetamine-induced locomotor stimulation in rats. Berggren U. **J Neural Transm** 1985;64(3-4):239-50

Interhemispheric fusion. Mandell AJ. **J Psychoactive Drugs** 1985 Oct-Dec; 17(4):257-66

Studies on qingyangshen (root of cynanchum otophyllum). II. Effect of qingyangshen on metabolism of central monoamines. Kuang PG, et al. **J Tradit Chin Med** 1985 Sep;5(3):191-4

Simultaneous determination of dopamine serotonin, 3,4-dihydroxyphenyl-acetic acid, homovanillic acid, 3-methoxytyramine and 5-hydroxyindole-3-acetic acid by high performance liquid chromatography with electrochemical detection. Yokoo H, et al. **Kurume Med J** 1985;32(1):75-80

Local release of monoamines in the gastrointestinal tract: an in vivo study in rabbits. Meirieu O, et al. **Life Sci** 1986 Mar 3;38(9):827-34

Age-related alterations in monoamine release from rat striatum: an in vivo electrochemical study. Rose GM, et al. **Neurobiol Aging** 1986 Mar-Apr;7(2):77-82

Amine-mediated toxicity. The effects of dopamine, norepinephrine, 5-hydroxytryptamine, 6-hydroxydopamine, ascorbate, glutathione and peroxide on the in vitro activities of creatine and adenylate kinases in the brain of the rat. Maker HS, et al. **Neuropharmacology** 1986 Jan; 25(1):25-32

Influence of monoamines on content of luteinizing hormone-releasing hormone in different regions of the hypothalamus of male rats. Markaryan RL, et al. **Neurosci Behav Physiol** 1985 Sep-Oct; 15(5):407-10

Role of neurotransmitter in forensic medicine (Report I). A simple and sensitive analysis of biogenic amines and metabolites in tissues by high performance liquid chromatography with electrochemical detection. Endo T, et al. **Nippon Hoigaku Zasshi** 1985 Aug;39(4):260-7

Selection for growth alters the feeding response to injections of biogenic amines. Denbow DM, et al. **Pharmacol Biochem Behav** 1986 Jan; 24(1):39-42

Inhibition of rat kidney histamine-N-methyltransferase by biogenic amines. Fuhr N, et al. **Pharmacology** 1986;32(2):114-20

Effects of ECT on sleep and CSF biogenic amines in affective illness. Hoffmann G, et al. **Psychiatry Res** 1985 Nov;16(3):199-206

Developing rat brain monoamine levels following in utero exposure to a mixture of 2,4-dichlorophenoxyacetic and 2,4,5-trichlorophenoxyacetic acids. Mohammad FK, et al. **Toxicol Lett** 1985 Dec;29(2-3):215-23

[Comparison of effects of electroacupuncture stimulations of two different intensities and frequencies on monoamine neurotransmitters in rat brain regions] Wang YJ, et al. **Chen Tzu Yen Chiu** 1985;10(1):24-9 (Eng. Abstr.) **(Chi)**

[Effect of some isoquinoline alkaloids on monoamines in the rat brain] Liu GQ, et al. **Yao Hsueh Hsueh Pao** 1985 Aug;20(8):566-70 (Eng. Abstr.) **(Chi)**

[Ergot alkaloids and central monoaminergic receptors] Goldstein M. **J Pharmacol** 1985;16 Suppl 3:21-7 (Eng. Abstr.) **(Fre)**

[Organ distribution of ruthenocenyl biogenic amine derivatives--radiodiagnostic agents for the adrenals and ovaries?] Wenzel M, et al. **Strahlenther Onkol** 1986 Jan;162(1):51-6 (Eng. Abstr.) **(Ger)**

[Effect of chronic exposure to nitrogen dioxide on biogenic amine levels in the brain of guinea pigs] Felińska W, et al. **Med Pr** 1985; 36(4):236-43 (Eng. Abstr.) **(Pol)**

[Hypothalamic monoamines and nonapeptides in the regulation of thyroid function in the early ontogeny of birds] Karpezo NA, et al. **Ontogenez** 1985 Nov-Dec;16(6):589-96 (Eng. Abstr.) **(Rus)**

[Concentration of monoamines in the brain of minks differing in their reaction to man] Nikulina EM, et al. **Zh Vyssh Nerv Deiat** 1985 Nov-Dec;35(6):1142-6 (Eng. Abstr.) **(Rus)**

BIOLOGICAL PSYCHIATRY

[The new biological revolution in psychiatry: a Latin American point of view (1st part)] Alarcón R. **Acta Psiquiatr Psicol Am Lat** 1985 Jun; 31(2):131-42 (Eng. Abstr.) **(Spa)**

BIOTRANSFORMATION

Increased response of cytochrome P-450 dependent biotransformation reactions in rat liver to repeated administration of inducers. Kleeberg U, et al. **Arch Toxicol [Suppl]** 1985;8:361-5

BIPOLAR DISORDER

Drugs and depression. Harris B. **Am J Nurs** 1986 Mar;86(3):292-3

Depression. What does it mean? Minot SR. **Am J Nurs** 1986 Mar; 86(3):284-8

A possible synergistic effect of alprazolam and lithium carbonate [letter] Cerra D, et al. **Am J Psychiatry** 1986 Apr;143(4):552

Lithium ion transport by erythrocytes of randomly selected blood donors and manic-depressive patients: lack of association with affective illness. Richelson E, et al. **Am J Psychiatry** 1986 Apr;143(4):457-62

Danazol and the rapid-cycling patient [letter] Goldstein JA. **J Clin Psychiatry** 1986 Mar;47(3):153-4

Prediction of lithium dose: a mathematical alternative to the test-dose method. Zetin M, et al. **J Clin Psychiatry** 1986 Apr;47(4):175-8

Lorazepam in resistant mania [letter] Jobling M, et al. **Lancet** 1986 Mar 1;1(8479):510

Relationship between cerebrospinal fluid somatostatin and peripheral thyroid hormones with carbamazepine treatment. Joffe RT, et al. **Neuropsychobiology** 1985;14(3):115-7

Carbamazepine in treatment and prophylaxis of manic-depressive disorder. Strömgren LS, et al. **Psychiatr Dev** 1985 Winter; 3(4):349-67 (41 ref.)

Pro-opiomelanocortin-related peptides in cerebrospinal fluid: a study of manic-depressive disorder. Berrettini WH, et al. **Psychiatry Res** 1985 Dec;16(4):287-302

Effects of ECT on sleep and CSF biogenic amines in affective illness. Hoffmann G, et al. **Psychiatry Res** 1985 Nov;16(3):199-206

Colour associations as predictors of the effectiveness of anti-depressant pharmacotherapy in endogenous depressive patients. Demeter E, et al. **Psychopathology** 1985;18(5-6):305-9

Decrease in plasma levels of 3,4-dihydroxyphenylethyleneglycol in major depression. Scatton B, et al. **Psychopharmacology (Berlin)** 1986; 88(2):220-5

[Lithium and other preventive agents in affective disorders in 1984] Souček K. **Cesk Psychiatr** 1985 Dec;81(6):363-6 **(Cze)**

[GABA receptor function and manic depressive disease] Hetmar O, et al. **Nord Med** 1986;101(2):62-5 (Eng. Abstr.) **(Dan)**

[Course and form variations of cyclothymic phases in lithium therapy] Banzhaf M, et al. **Psychiatr Neurol Med Psychol (Leipz)** 1985 Dec; 37(12):718-21 (Eng. Abstr.) **(Ger)**

[Amineptine: clinical considerations on a new antidepressive] Carreca A, et al. **Clin Ter** 1985 Dec 31;115(6):449-52 (Eng. Abstr.) **(Ita)**

[Psychopathological and neurophysiological indicators in endogenous depression and the therapeutic effect of thymoleptics. II. Comparison of the effects of various thymoleptics on the psychopathological symptoms of endogenous depressive syndromes] Strzyżewski W, et al. **Psychiatr Pol** 1985 Sep-Oct;19(5):363-9 (Eng. Abstr.) **(Pol)**

[Psychopathological and neurophysiological indicators in endogenous depression and the therapeutic effect of thymoleptics. III. Analysis of the factors affecting the effectiveness of treatment with thymoleptics] Twarowska-Hauser J, et al. **Psychiatr Pol** 1985 Sep-Oct;19(5):370-5 (Eng. Abstr.) **(Pol)**

[Psychopathological and neurophysiological indicators in endogenous depression and the therapeutic effect of thymoleptics. I. Analysis of the clinical effect of antidepressive drugs with various pharmacological profiles] Twarowska-Hauser J, et al. **Psychiatr Pol** 1985 Sep-Oct; 19(5):357-62 (Eng. Abstr.) **(Pol)**

BLOOD-BRAIN BARRIER

Influence of long-term immobilization stress on regional blood-brain barrier permeability, cerebral blood flow and 5-HT level in conscious normotensive young rats. Sharma HS, et al. **J Neurol Sci** 1986 Jan; 72(1):61-76

Permeability of the blood-brain barrier to neuropeptides: the case for penetration. Banks WA, et al. **Psychoneuroendocrinology** 1985; 10(4):385-99

BOMBESIN

Effects of intrahypothalamically administered norepinephrine, serotonin and bombesin on thermoregulation in the deermouse (Peromyscus maniculatus). Lin LH, et al. **Brain Res** 1986 Feb 5;364(2):212-9

Interactions of bombesin and substance P at the feline lower esophageal sphincter. Reynolds JC, et al. **J Clin Invest** 1986 Feb;77(2):436-40

Water intake modifications induced by tachykinins, bombesins and opioid peptides. de Caro G, et al. **Peptides** 1985;6 Suppl 3:181-5

Trophic effect of bombesin on the rat pancreas: is it mediated by the release of gastrin or cholecystokinin? Lhoste E, et al. **Peptides** 1985; 6 Suppl 3:89-97

Combined effect of chronic bombesin and secretin or cholecystokinin on the rat pancreas. Lhoste E, et al. **Peptides** 1985;6 Suppl 3:83-7

BRADYKININ

Substance P, 5-hydroxytryptamine, and bradykinin stimulate abdominal visceral afferents. Lew WY, et al. **Am J Physiol** 1986 Mar; 250(3 Pt 2):R465-73

[In vivo and in vitro effects of bradykinin on the release of beta-endorphin-like immunoreactivity] Shimizu I, et al. **Nippon Naibunpi Gakkai Zasshi** 1985 Dec 20;61(12):1330-40 (Eng. Abstr.) **(Jpn)**

BUTYLAMINES

Metabolic fate of N-nitrodibutylamine in the rat. Suzuki E, et al. **Jpn J Cancer Res** 1986 Jan;77(1):39-44

[Aminooxypropylamine--an effective inhibitor of ornithine decarboxylase in vitro and in vivo] Khomutov RM, et al. **Bioorg Khim** 1985 Nov; 11(11):1574-6 (Eng. Abstr.) **(Rus)**

[Hygienic standard for tert-butylamine in water] Rudelko VA, et al. **Gig Sanit** 1985 Dec;(12):70-1 **(Rus)**

BUTYROPHENONE TRANQUILIZERS

Determination of lenperone in dog plasma by high-performance liquid chromatography. Osman MA, et al. **J Chromatogr** 1985 Dec 13; 345(2):430-5

Effect of timiperone, a new antipsychotic drug, on the sleep-wakefulness cycle in cats. Tanaka M, et al. **Jpn J Pharmacol** 1985 Nov; 39(3):391-4

BUTYROPHENONES

Pharmacokinetic and metabolic study of itanoxone in the crab Pachygrapsus marmoratus (Decapoda, Brachyura): comparative study with clofibric acid. Lautier J, et al. **Comp Biochem Physiol [C]** 1986; 83(1):143-7

Chronic proglumide increases [3H]spiperone binding in the rat brain. Bean AJ, et al. **Eur J Pharmacol** 1985 Oct 29;117(1):97-101

D-2 dopamine receptor-mediated inhibition of pro-opiomelanocortin synthesis in rat intermediate lobe. Abolition by pertussis toxin or activators of adenylate cyclase. Cote TE, et al. **J Biol Chem** 1986 Apr 5;261(10):4555-61

Determination of lenperone in dog plasma by high-performance liquid chromatography. Osman MA, et al. **J Chromatogr** 1985 Dec 13; 345(2):430-5

Effect of timiperone, a new antipsychotic drug, on the sleep-wakefulness cycle in cats. Tanaka M, et al. **Jpn J Pharmacol** 1985 Nov; 39(3):391-4

Do antipsychotic drugs and serotonin down regulate [3H]-spiroperidol binding sites in human cortex? Andorn AC. **Life Sci** 1986 Apr 7; 38(14):1251-60

Analysis of [3H]spiperone binding sites in the rat striatum and frontoparietal cortex by means of quantitative receptor autoradiography after inactivation of dopamine receptors by N-ethoxycarbonyl-2-ethoxy-1,2-dihydroquinoline in vivo: selective protection by sulpiride in the striatum. Fuxe K, et al. **Neurosci Lett** 1986 Feb 28;64(2):163-8

Synthesis of N-methyl and N-11C-methyl spiperone by phase transfer catalysis in anhydrous solvent. Omokawa H, et al. **Radioisotopes** 1985 Sep;34(9):480-5

CARBAMAZEPINE

Does carbamazepine-induced reduction of plasma haloperidol levels worsen psychotic symptoms? Arana GW, et al. **Am J Psychiatry** 1986 May;143(5):650-1

Positive effects of carbamazepine on behavioral dyscontrol in borderline personality disorder. Gardner DL, et al. **Am J Psychiatry** 1986 Apr; 143(4):519-22

Preliminary evidence for the utility of carbamazepine in alprazolam withdrawal. Klein E, et al. **Am J Psychiatry** 1986 Feb;143(2):235-6

Dopaminergic effects of carbamazepine. Relationship to clinical response in affective illness. Post RM, et al. **Arch Gen Psychiatry** 1986 Apr; 43(4):392-6

The influence of carbamazepine on the heme biosynthetic pathway. Schoenfeld N, et al. **Biochem Med** 1985 Dec;34(3):280-6

Carbamazepine and dopaminergic supersensitivity [letter] Csernansky JG, et al. **Biol Psychiatry** 1986 Feb;21(2):238-9

Antipyrine metabolite kinetics in healthy human volunteers during multiple dosing of phenytoin and carbamazepine. Shaw PN, et al. **Br J Clin Pharmacol** 1985 Dec;20(6):611-8

Improved gas-chromatographic determination of carbamazepine. Bhatia HM. **Clin Chem** 1986 Mar;32(3):563-4

The effect of storage conditions on the stability of carbamazepine and carbamazepine-10,11-epoxide in plasma. Mendez-Alvarez E, et al. **Clin Chim Acta** 1986 Feb 15;154(3):243-6

Ranitidine does not alter single-dose carbamazepine pharmacokinetics in healthy adults. Dalton MJ, et al. **Drug Intell Clin Pharm** 1985 Dec; 19(12):941-4

Neuroendocrine effects of carbamazepine in patients with affective illness. Joffe RT, et al. **Epilepsia** 1986 Mar-Apr;27(2):156-60

Gas chromatographic assay for oxcarbazepine and its main metabolites in plasma. von Unruh GE, et al. **J Chromatogr** 1985 Nov 29; 345(1):67-76

Efficacy of carbamazepine as an antidepressant in chronic resistant depressives. Prasad AJ. **J Indian Med Assoc** 1985 Jul;83(7):235-7

Carbamazepine-erythromycin interaction. Case studies and clinical significance. Wroblewski BA, et al. **JAMA** 1986 Mar 7; 255(9):1165-7

Antagonism of picrotoxin against the taming effect of carbamazepine on footshock induced fighting behavior in mice. Nakao K, et al. **Jpn J Pharmacol** 1985 Oct;39(2):281-3

Relationship between cerebrospinal fluid somatostatin and peripheral thyroid hormones with carbamazepine treatment. Joffe RT, et al. **Neuropsychobiology** 1985;14(3):115-7

Carbamazepine in treatment and prophylaxis of manic-depressive disorder. Strömgren LS, et al. **Psychiatr Dev** 1985 Winter; 3(4):349-67 (41 ref.)

Effect of carbamazepine on mean urinary free cortisol excretion in patients with major affective illness. Rubinow DR, et al. **Psychopharmacology (Berlin)** 1986;88(1):115-8

Cross-reactivity assessment of oxcarbazepine and its metabolites in the EMIT assay of carbamazepine plasma levels. Kumps A, et al. **Ther Drug Monit** 1986;8(1):95-7

[Crystallographic behavior of carbamazepine preparations under compression pressure] Kala H, et al. **Pharmazie** 1986 Jan;41(1):61-2 **(Ger)**

CARBIDOPA

Liquid chromatographic determination of levodopa, levodopa-carbidopa, and related impurities in solid dosage forms. Ting S. **J Assoc Off Anal Chem** 1986 Jan-Feb;69(1):169-73

Differential effect of carbidopa on the concentration of rat pineal and hypothalamic indoleamines. Oxenkrug GF, et al. **J Pineal Res** 1984; 1(4):349-53

[Effect of Nakom on the activity of the hypothalamo-hypophyseo-adrenal system] Slavnov VN, et al. **Farmakol Toksikol** 1986 Jan-Feb; 49(1):26-9 (Eng. Abstr.) **(Rus)**

CATECHOL ESTROGENS

A rapid, sensitive and quantitative high-performance liquid chromatographic determination of catecholestrogens in human serum. Sagara Y, et al. **Asia Oceania J Obstet Gynaecol** 1985 Dec; 11(4):597-604

Semiquinone anion radicals of catechol(amine)s, catechol estrogens, and their metal ion complexes. Kalyanaraman B, et al. **Environ Health Perspect** 1985 Dec;64:185-98

Evidence that 6-hydroxydopamine is an inhibitor of catechol-O-methyltransferase in intact tissue. Reid JJ, et al. **J Pharm Pharmacol** 1986 Jan;38(1):46-50

Effect of continuous intraventricular estrogen or catechol estrogen treatment on catecholamine turnover in various brain regions. Panek DU, et al. **J Pharmacol Exp Ther** 1986 Mar;236(3):646-52

Studies of catecholestrogen metabolism during normal pregnancy: changes of plasma catecholestrogen levels after DHA-S or E1-S injection. Sagara Y, et al. **Nippon Sanka Fujinka Gakkai Zasshi** 1986 Jan; 38(1):89-94

Estrogens with reduced catechol-forming capacity fail to induce implantation in the rat. Dey SK, et al. **Proc Soc Exp Biol Med** 1986 Feb;181(2):215-8

CATECHOLAMINES

Co-release of neuropeptide Y (NPY)-like immunoreactivity and catecholamines in newborn infants. Lundberg JM, et al. **Acta Physiol Scand** 1986 Mar;126(3):471-3

Plasma catecholamine responses to physiologic stimuli in normal human pregnancy. Barron WM, et al. **Am J Obstet Gynecol** 1986 Jan; 154(1):80-4

Refined carbohydrate increases blood pressure and catecholamine excretion in SHR and WKY. Fournier RD, et al. **Am J Physiol** 1986 Apr;250(4 Pt 1):E381-5

Explanted and implanted notochord of amphibian anuran embryos. Histofluorescence study on the ability to synthesize catecholamines. Godin I. **Anat Embryol (Berl)** 1986;173(3):393-9

Differential effects of ketamine isomers on neuronal and extraneuronal catecholamine uptake mechanisms. Lundy PM, et al. **Anesthesiology** 1986 Mar;64(3):359-63

Coupling of H+ gradients to catecholamine transport in chromaffin granules. Johnson RG, et al. **Ann NY Acad Sci** 1985;456:254-67 (32 ref.)

Effect on human platelets of catecholamines at levels achieved in the circulation. Ardlie NG, et al. **Atherosclerosis** 1985 Dec;

58(1-3):251-9

Effect of denervation and/or reserpine-induced changes on adrenomedullary catecholamines in pigeon: a fluorescence histochemical study. Mahata SK, et al. **Basic Appl Histochem** 1985;29(4):331-6

Studies on the uptake and release of propranolol and the effects of propranolol on catecholamines in cultures of bovine adrenal chromaffin cells. Boksa P. **Biochem Pharmacol** 1986 Mar 1;35(5):805-15

Acidic catecholamine metabolites: substrates for human phenolsulphotransferase M. Carter SB, et al. **Biochem Pharmacol** 1986 Apr 1;35(7):1205-6

Catecholamine synthesis: physiological coupling to precursor supply. Milner JD, et al. **Biochem Pharmacol** 1986 Mar 15;35(6):875-81

Evidence for a catecholamine-mediated slow hyperpolarizing synaptic response in parasympathetic ganglia. Akasu T, et al. **Brain Res** 1986 Feb 19;365(2):365-8

Neurotransmitter synthesis, storage, and turnover in neonatally deafferented sympathetic neurons. Smolen AJ, et al. **Brain Res** 1985 Dec;355(2):211-8

Central vasopressin in the modulation of catecholamine release in conscious rats. King KA, et al. **Can J Physiol Pharmacol** 1985 Dec; 63(12):1501-5

Cardiovascular responses and plasma catecholamines in old age. Sachs C, et al. **Clin Physiol** 1985 Dec;5(6):553-65

Influence of thyroidectomy on brain catecholamines during the postnatal period. Leret ML, et al. **Comp Biochem Physiol [C]** 1986; 83(1):117-21

Coexpression of somatostatin-like immunoreactivity and catecholaminergic properties in neural crest derivatives: comodulation of peptidergic and adrenergic differentiation in cultured neural crest. García-Arrarás JE, et al. **Dev Biol** 1986 Mar;114(1):247-57

Stress-induced elevation of testosterone concentration in high ranking baboons: role of catecholamines. Sapolsky RM. **Endocrinology** 1986 Apr; 118(4):1630-5

Semiquinone anion radicals of catechol(amine)s, catechol estrogens, and their metal ion complexes. Kalyanaraman B, et al. **Environ Health Perspect** 1985 Dec;64:185-98

Plasma renin activity, aldosterone and catecholamine levels when swimming and running. Guezennec CY, et al. **Eur J Appl Physiol** 1986; 54(6):632-7

Capillary-venous differences of free plasma catecholamines at rest and during graded exercise. Lehmann M, et al. **Eur J Appl Physiol** 1985; 54(5):502-5

Chronic clonidine treatment and its withdrawal: effects on blood pressure and catecholamine synthesizing enzymes in brain-stem nuclei. Atkinson J, et al. **Eur J Pharmacol** 1986 Feb 11;121(1):97-106

d- and l-isomers of fenfluramine differ markedly in their interaction with brain serotonin and catecholamines in the rat. Invernizzi R, et al. **Eur J Pharmacol** 1986 Jan 14;120(1):9-15

Genotypic variation in age-related changes in peripheral catecholamines. Brennan MJ, et al. **Exp Gerontol** 1985;20(5):285-90

Brain catecholamine content and turnover in aging rats. Carfagna N, et al. **Exp Gerontol** 1985;20(5):265-9

Inactivation of potassium-evoked adrenomedullary catecholamine release in the presence of calcium, strontium or BAY-K-8644. Sala F, et al. **FEBS Lett** 1986 Feb 3;196(1):34-8

A diphenol oxidase gene is part of a cluster of genes involved in catecholamine metabolism and sclerotization in Drosophila. II. Molecular localization of the Dox-A2 coding region. Pentz ES, et al. **Genetics** 1986 Apr;112(4):843-59

A diphenol oxidase gene is part of a cluster of genes involved in catecholamine metabolism and sclerotization in drosophila. I. Identification of the biochemical defect in Dox-A2 [l(2)37Bf] mutants. Pentz ES, et al. **Genetics** 1986 Apr;112(4):823-41

Differences in catecholamine excretion rates, blood pressure and lifestyle among young Western Samoan men. James GD, et al. **Hum Biol** 1985 Dec;57(4):635-47

Plasma catecholamines in chronic renal disease. Elias AN, et al. **Int J Artif Organs** 1985 Sep;8(5):243-4

Changes of sympathetic activity during tooth extraction. Papadimitriou P, et al. **Int J Oral Maxillofac Surg** 1986 Apr;15(2):148-51

Fluorescent histochemical demonstration of catecholamines in brown adipose tissue from obese (ob/ob) and lean mice acclimated at different temperatures. Ashwell M, et al. **J Auton Nerv Syst** 1985 Dec; 14(4):377-86

Uterine contractility and actions of catecholamines in longitudinal and circular uterine layers from ovariectomised guinea-pigs: the effects of ovarian steroids. Adam SP, et al. **J Auton Pharmacol** 1985 Dec; 5(4):317-24

Selectivities of some agonists acting at alpha 1- and alpha 2-adrenoreceptors in the rat vas deferens. Leedham JA, et al. **J Auton Pharmacol** 1986 Mar;6(1):39-46

Catecholamine-stimulated GTPase cycle. Multiple sites of regulation by beta-adrenergic receptor and Mg2+ studied in reconstituted receptor-Gs vesicles. Brandt DR, et al. **J Biol Chem** 1986 Feb 5; 261(4):1656-64

Catecholamine modulation of embryonic palate mesenchymal cell DNA synthesis. Pisano MM, et al. **J Cell Physiol** 1986 Jan;126(1):84-92

Simplified determination of the brain catecholamines norepinephrine, 5-hydroxyindoleacetic acid, dopamine and 5-hydroxytryptamine by high-performance liquid chromatography using electrochemical detection. Gregory VM, et al. **J Chromatogr** 1985 Nov 29; 345(1):140-4

Measurement of urinary catecholamines and their catechol metabolites and precursor by liquid chromatography with column-switching and on-line fluorimetric and electrochemical detection. Julien C, et al. **J Chromatogr** 1985 Nov 8;344:51-60

High-performance liquid chromatography of plasma catecholamines using 1,2-diphenylethylenediamine as precolumn fluorescence derivatization reagent. Mitsui A, et al. **J Chromatogr** 1985 Nov 8;344:61-70

Distribution of catecholamines between fetal and maternal compartments during human pregnancy with emphasis on L-dopa and dopamine. Peleg D, et al. **J Clin Endocrinol Metab** 1986 May;62(5):911-4

Catecholamine innervation of the caudal spinal cord in the rat. Schrøder HD, et al. **J Comp Neurol** 1985 Dec 15;242(3):358-68

Regional specialization of the rat retina: catecholamine-containing amacrine cell characterization and distribution. Versaux-Botteri C, et al. **J Comp Neurol** 1986 Jan 15;243(3):422-33

Acute effects of oral or parenteral aspartame on catecholamine metabolism in various regions of rat brain. Yokogoshi H, et al. **J Nutr** 1986 Mar; 116(3):356-64

A potentiometric study of lithium complexation with catecholamines. Sandmann BJ, et al. **J Pharm Sci** 1986 Jan;75(1):73-7

Effect of continuous intraventricular estrogen or catechol estrogen treatment on catecholamine turnover in various brain regions. Panek DU, et al. **J Pharmacol Exp Ther** 1986 Mar;236(3):646-52

Quantitative analysis of the contribution of pulmonary and hind limb circulation to the clearance of exogenous catecholamines. Sumikawa K, et al. **J Pharmacol Exp Ther** 1986 Mar;236(3):759-63

Hamster and rat pineal gland beta-adrenoceptor characterization with iodocyanopindolol and the effect of decreased catecholamine synthesis on the receptor. Craft CM, et al. **J Pineal Res** 1985;2(1):51-66

Alternating lateralization of plasma catecholamines and nasal patency in humans. Kennedy B, et al. **Life Sci** 1985 Mar 31;38(13):1203-14

Potassium ion is indispensable to the catecholamine releasing response of dog adrenals to gamma-aminobutyric acid. Kitayama S, et al. **Naunyn Schmiedebergs Arch Pharmacol** 1986 Jan;332(1):66-9

Does the carrier of chromaffin granules transport the protonated or the uncharged species of catecholamines? Kobold G, et al. **Naunyn Schmiedebergs Arch Pharmacol** 1985 Nov;331(2-3):209-19

Effects of combined administration of L-tryptophan and tricyclic antidepressants on alpha 2- and beta-adrenoceptors and monoamine levels in rat brain. Russell VA, et al. **Neurochem Res** 1985 Dec; 10(12):1661-71

Postmortem central catecholamines and antemortem cognitive impairment in elderly schizophrenics and controls. Bridge TP, et al. **Neuropsychobiology** 1985;14(2):57-61

24-hour plasma levels of prolactin, cortisol, growth hormone and catecholamines in schizophrenic patients. Kemali D, et al. **Neuropsychobiology** 1985;14(3):109-14

Interaction of the cholinergic and catecholaminergic systems of the brain during a change in the motivational behavior of animals. Sadykhova EF, et al. **Neurosci Behav Physiol** 1985 Nov-Dec;15(6):471-6

Conjugated catecholamines in rats transfused with perfluorocarbon blood substitute. Wilson JX, et al. **Neurosci Lett** 1985 Dec 18;62(3):329-33

Supersensitivity of the renal tubule to catecholamines in the chronically denervated canine kidney. Szénási G, et al. **Pflugers Arch** 1986 Jan; 406(1):57-9

Catecholamine excretion and beta-adrenergic responsiveness in estrogen-treated rats. Carlberg KA, et al. **Pharmacology** 1986; 32(3):147-56

Changes in brain catecholamine levels following DL-dopa are not potentiated by deuterium substitution. Dewar KM, et al. **Prog Neuropsychopharmacol Biol Psychiatry** 1985;9(5-6):675-80

Cerebrospinal fluid studies of monoamine metabolism in schizophrenia. van Kammen DP, et al. **Psychiatr Clin North Am** 1986 Mar; 9(1):81-97 (94 ref.)

A comparison between chlordiazepoxide and CL 218,872, a synthetic non-benzodiazepine ligand for benzodiazepine receptors, on serotonin and catecholamine turnover in brain. McElroy JF, et al. **Psychopharmacology (Berlin)** 1986;88(1):105-8

Plasma catecholamine concentrations in lambs and calves during the perinatal period. Richet E, et al. **Reprod Nutr Dev** 1985; 25(6):1007-16

Maternal plasma concentrations of catecholamines and cyclic nucleotides during labor and following delivery. Ohno H, et al. **Res Commun Chem Pathol Pharmacol** 1986 Feb;51(2):183-94

Effect of different denervation procedures on catecholamines in the gut. Graffner H, et al. **Scand J Gastroenterol** 1985 Dec;20(10):1276-80

Role of protein kinase C in the synthesis of catecholamine by isolated bovine adrenal medullary cells. Houchi H. **Tokushima J Exp Med** 1985 Jun;32(1-2):17-22

Ontogeny of catecholamine and GABA levels in rat brain: lack of effect

of perinatal lead exposure. Bailey CC, et al. **Toxicol Lett** 1986 Jan; 30(1):97–102

[Catecholamines and mental stress] Christensen NJ. **Ugeskr Laeger** 1986 Jan 27;148(5):233–7 (Eng. Abstr.) **(Dan)**

[Catecholaminergic nuclei of sheep encephalon. Immunocytochemical study. I. Myelencephalon and metencephalon] Tillet Y, et al. **C R Acad Sci [III]** 1986;302(4):125–30 (Eng. Abstr.) **(Fre)**

[Dopamine-stimulated glycosylation of rat hippocampal proteins in vitro: structure-response relationship] Pchalek V, et al. **Biomed Biochim Acta** 1985;44(11–12):1651–8 (Eng. Abstr.) **(Ger)**

[The responses of autonomic nervous system during bicycle ergometer exercise in healthy young men--special reference to parasympathetic nervous system activity] Suematsu M, et al. **Kokyu To Junkan** 1985 Nov;33(11):1317–21 **(Jpn)**

[Effects of catecholamines on the neuromuscular blocking action of a non-depolarizing muscle relaxant--Part II. Experimental studies on the anti-neuromuscular blocking actions of catecholamines and the mechanisms of these actions in the dog] Omote T, et al. **Masui** 1985 Nov;34(11):1487–98 (Eng. Abstr.) **(Jpn)**

[Effects of different salt intakes on urinary output of catecholamines and renal sympathetic nerve activity] Yamazaki H, et al. **Nippon Jinzo Gakkai Shi** 1985 Nov;27(11):1565–70 (Eng. Abstr.) **(Jpn)**

[Excretion of catecholamines and their various metabolites in children aged 10–12 years in relation to their mental development] Orgacka H, et al. **Endokrynol Pol** 1985;36(5):285–92 (Eng. Abstr.) **(Pol)**

[The role of catecholamines in vasomotor rhinitis] Blinowski JT. **Pneumonol Pol** 1985 Oct;53(10):487–91 (Eng. Abstr.) **(Pol)**

[Catecholamine and serotonin content in the lymph nodes following deafferentation] Izranov VA. **Biull Eksp Biol Med** 1986 Mar; 101(3):276–7 (Eng. Abstr.) **(Rus)**

[Characteristics of the neuromodulating effect of peripherally administered thyroliberin on the rat brain] Misin'sh IP, et al. **Biull Eksp Biol Med** 1986 Jan;101(1):50–2 (Eng. Abstr.) **(Rus)**

[Effect of changes in the catecholamine content in the brain on the chemoreactive properties of the sensorimotor cortex neurons of rats] Kruglikov RI, et al. **Izv Akad Nauk SSSR [Biol]** 1985 Nov–Dec; (6):832–40 (Eng. Abstr.) **(Rus)**

[Effect of acute and chronic deprivation of catecholaminergic system activity induced by 6-hydroxydopamine on the behavior of the rat] Gromova EA, et al. **Zh Vyssh Nerv Deiat** 1985 Nov–Dec; 35(6):1133–41 (Eng. Abstr.) **(Rus)**

CENTRAL NERVOUS SYSTEM AGENTS

A common structural model for central nervous system drugs and their receptors. Lloyd EJ, et al. **J Med Chem** 1986 Apr;29(4):453–62

Effect of various centrally acting drugs on the efflux of dopamine metabolites from the rat brain. Westerink BH, et al. **J Neurochem** 1986 Apr;46(4):1145–52

CHILD BEHAVIOR DISORDERS

Therapeutic experience with lithium in childhood aggressivity. Vetró A, et al. **Neuropsychobiology** 1985;14(3):121–7

CHILD DEVELOPMENT DISORDERS, PERVASIVE

Use of lithium and flupenthixol in a patient with pervasive developmental disorder [letter] Shafey H. **Am J Psychiatry** 1986 May;143(5):681

Use of lithium and flupenthixol in a patient with pervasive developmental disorder [letter] Shafey H. **J Am Acad Child Psychiatry** 1986 Jan; 25(1):137–8

CHILD PSYCHOLOGY

Depression in children. Epstein MH, et al. **J Sch Health** 1986 Jan; 56(1):10–2

CHLORAMINES

Inactivation of Campylobacter jejuni by chlorine and monochloramine. Blaser MJ, et al. **Appl Environ Microbiol** 1986 Feb;51(2):307–11

[Additional comments on the possibilities of using Chloramine B and Dikonit in a mixture with detergents] Kneiflová J. **Cesk Epidemiol Mikrobiol Imunol** 1986 Feb;35(1):44–9 (Eng. Abstr.) **(Cze)**

CHLORDIAZEPOXIDE

The occurrence of chlordiazepoxide degradation products in sudden deaths associated with chlordiazepoxide overdosage. Entwistle N, et al. **J Forensic Sci Soc** 1986 Jan–Feb;26(1):45–54

Tranylcypromine and chlordiazepoxide intoxication [letter] Young S, et al. **Med J Aust** 1986 Feb 3;144(3):166–7

Chlordiazepoxide directly enhances positive ingestive reactions in rats. Berridge KC, et al. **Pharmacol Biochem Behav** 1986 Feb; 24(2):217–21

Amphetamine potentiation of anti-conflict action of chlordiazepoxide. Lerner T, et al. **Pharmacol Biochem Behav** 1986 Feb;24(2):241–6

Dose-dependent impairment in the performance of a go–no go successive discrimination by chlordiazepoxide. Cole SO, et al. **Psychopharmacology (Berlin)** 1986;88(2):184–6

Effects of chlordiazepoxide training dose on the mixed agonist-antagonist properties of benzodiazepine receptor antagonist Ro 15–1788, in a drug discrimination procedure. De Vry J, et al. **Psychopharmacology (Berlin)** 1986;88(2):177–83

A comparison between chlordiazepoxide and CL 218,872, a synthetic non-benzodiazepine ligand for benzodiazepine receptors, on serotonin and catecholamine turnover in brain. McElroy JF, et al. **Psychopharmacology (Berlin)** 1986;88(1):105–8

Maternal aggression in rats: lack of interaction between chlordiazepoxide and fluprazine. Olivier B, et al. **Psychopharmacology (Berlin)** 1986; 88(1):40–3

P-CHLOROPHENYLALANINE

Altered responsiveness to substance P and 5-hydroxytryptamine in cat dorsal horn neurons after 5-HT depletion with p-chlorophenylalanine. Jeftinija S, et al. **Brain Res** 1986 Mar 12;368(1):107–15

CHLORPROMAZINE

Inhibition of fibroblast proliferation by myelotoxic drugs. Pisciotta AV, et al. **Ann NY Acad Sci** 1985;459:198–210

Functional properties of covalent beta-endorphin peptide/calmodulin complexes. Chlorpromazine binding and phosphodiesterase activation. Giedroc DP, et al. **Biochemistry** 1985 Feb 26;24(5):1203–11

Mechanism of cationic amphiphilic drug inhibition of purified lysosomal phospholipase A1. Kubo M, et al. **Biochemistry** 1985 Nov 5; 24(23):6515–20

Effects of chlorpromazine and other calmodulin antagonists on phosphatidylcholine-induced vesiculation of platelet plasma membranes. Kobayashi T, et al. **Biochim Biophys Acta** 1986 Feb 13;855(1):58–62

Partition of chlorpromazine into lipid bilayer membranes: the effect of membrane structure and composition. Luxnat M, et al. **Biochim Biophys Acta** 1986 Apr 14;856(2):274–82

Lateral diffusion of small solutes and partition of amphipaths in defect structures of lipid bilayers. Müller HJ, et al. **Biochim Biophys Acta** 1986 Apr 14;856(2):283–9

Determination of chlorpromazine and its major metabolites by gas chromatography/mass spectrometry: application to biological fluids. Gruenke LD, et al. **Biomed Mass Spectrom** 1985 Dec;12(12):707–13

Irreversible binding with biological macromolecules and effects in bacterial mutagenicity tests of the radical cation of promethazine and photoactivated promethazine. Comparison with chlorpromazine. De Mol NJ, et al. **Chem Biol Interact** 1986 Jan;57(1):73–83

Changes of transition temperatures of phosphatidylcholine and phosphatidylglycerol in presence of amphiphilic drugs. Harder A, et al. **Chem Phys Lipids** 1986 Jan;39(1–2):65–71

Chlorpromazine dissociates effects of colchicine on metabolism of triglycerides and alkaline phosphatase activity in rat liver. Selvakumar D, et al. **Indian J Biochem Biophys** 1984 Dec;21(6):400–1

Chlorpromazine inhibition of muscarinic-cholinergic responses in the rat parotid gland. Van der Ven PF, et al. **J Dent Res** 1986 Mar; 65(3):382–6

Brief exposure to contingent reinforcement produces a sustained increment in the strength of an elicited response. Hutchinson RR, et al. **J Exp Anal Behav** 1986 Mar;45(2):189–94

Effects of chlorpromazine on fixed-ratio responding: modification by fixed-interval discriminative stimuli. Witkin JM. **J Exp Anal Behav** 1986 Mar;45(2):195–205

Influence of chlorpromazine on the accumulation of 5-hydroxytryptamine by interaction with ATP. Gasco MR, et al. **J Pharm Sci** 1985 Nov; 74(11):1188–91

Influence of dietary lipids on the effect of chlorpromazine on membrane properties of rabbit red cells. Housley G, et al. **Proc R Soc Lond [Biol]** 1986 Feb 22;227(1246):43–51

Chlorpromazine and pimozide alter reinforcement efficacy and motor performance. Heyman GM, et al. **Psychopharmacology (Berlin)** 1986; 88(3):346–53

The effects of apomorphine, d-amphetamine and chlorpromazine on the aggressiveness of isolated Aequidens pulcher (Teleostei, Cichlidae). Munro AD. **Psychopharmacology (Berlin)** 1986;88(1):124–8

Therapeutic monitoring of chlorpromazine. III: Minimal interconversion between chlorpromazine and metabolites in human blood. Hawes EM, et al. **Ther Drug Monit** 1986;8(1):37–41

Plasma nor1-chlorpromazine concentrations: effects of age, race, and sex. Young RC. **Ther Drug Monit** 1986;8(1):23–6

Diazepam and chlorpromazine stimulate feeding in dwarf goats. Anika SM. **Vet Res Commun** 1985 Sep;9(4):309–12

[Interaction between chlorpromazine, hepatic protective agents and enzymes at the level of the liver cytoplasm and 'mitochondria and of the cerebral cortex in rats] Serban F, et al.

Rev Med Chir Soc Med Nat Iasi 1985 Apr-Jun;89(2):273-7 (Eng. Abstr.) **(Rum)**

[Effect of chlorpromazine on the graft versus host reaction] Grin J, et al. **Acta Physiol Pharmacol Latinoam** 1985;35(3):337-47 (Eng. Abstr.) **(Spa)**

CHLORPROTHIXENE

Action of antidepressant neuroleptics, chlorprothixene and levomepromazine, on the central noradrenergic system: comparison with other antidepressants. Antkiewicz-Michaluk L. **Pol J Pharmacol Pharm** 1985 Sep-Oct;37(5):673-83

[Comparison of the effects of chlorprothixene and haloperidol on hypothalamic function in patients with paranoid schizophrenia] Horodnicki JM, et al. **Psychiatr Pol** 1985 May-Jun;19(3):181-7 (Eng. Abstr.) **(Pol)**

COCAINE

Medical and psychiatric complications of cocaine abuse with possible points of pharmacological treatment. Estroff TW, et al. **Adv Alcohol Subst Abuse** 1985 Fall-1986 Winter;5(1-2):61-76

Methylphenidate treatment of cocaine abusers without attention deficit disorder: a negative report. Gawin F, et al. **Am J Drug Alcohol Abuse** 1985;11(3-4):193-7

Interpersonal psychotherapy adapted for ambulatory cocaine abusers. Rounsaville BJ, et al. **Am J Drug Alcohol Abuse** 1985; 11(3-4):171-91

Comparison of 4% lidocaine/0.5% phenylephrine with 5% cocaine: which dilates the nasal passage better? Sessler CN, et al. **Anesthesiology** 1986 Feb;64(2):274-7

Abstinence symptomatology and psychiatric diagnosis in cocaine abusers. Clinical observations. Gawin FH, et al. **Arch Gen Psychiatry** 1986 Feb; 43(2):107-13

Structural requirements for cocaine congeners to interact with dopamine and serotonin uptake sites in mouse brain and to induce stereotyped behavior. Reith ME, et al. **Biochem Pharmacol** 1986 Apr 1; 35(7):1123-9

Pharmaco-ontogeny of reward: enhancement of self-stimulation by D-amphetamine and cocaine in 3- and 10-day-old rats. Barr GA, et al. **Brain Res** 1986 Jan;389(1-2):193-202

More treatment centres responding to growing cocaine use. Korcok M. **Can Med Assoc J** 1986 Feb 15;134(4):415-8

Cocaine infants: a new arrival at hospitals' step? Newald J. **Hospitals** 1986 Apr 5;60(7):96

Cocaine increases natural killer cell activity. Van Dyke C, et al. **J Clin Invest** 1986 Apr;77(4):1387-90

Treatment of depression in chronic cocaine and phencyclidine abuse with desipramine. Giannini AJ, et al. **J Clin Pharmacol** 1986 Mar; 26(3):211-4

Intranasal topical cocaine: Moffett's method or topical cocaine paste? Quiney RE. **J Laryngol Otol** 1986 Mar;100(3):279-83

Characteristics of tolerance, recovery from tolerance and cross-tolerance for cocaine used as a discriminative stimulus. Wood DM, et al. **J Pharmacol Exp Ther** 1986 Apr;237(1):120-5

Pharmacological approaches to cocaine addiction. Dackis CA, et al. **J Subst Abuse Treat** 1985;2(3):139-45 (46 ref.)

Cocaine abuse and eating disorders [letter] Jonas JM, et al. **Lancet** 1986 Feb 15;1(8477):390-1

Pimozide blocks establishment but not expression of cocaine-produced environment-specific conditioning. Beninger RJ, et al. **Life Sci** 1986 Apr 14;38(15):1425-31

Effects of cocaine on the electrical activity of single noradrenergic neurons from locus coeruleus. Pitts DK, et al. **Life Sci** 1986 Mar 31; 38(13):1229-34

Pneumomediastinum and cervical emphysema from the inhalation of 'free based' cocaine: report of three cases. Aroesty DJ, et al. **Otolaryngol Head Neck Surg** 1986 Mar;94(3):372-4

Maternal cocaine abuse and effect on the newborn. Madden JD, et al. **Pediatrics** 1986 Feb;77(2):209-11

Comparative discriminative stimulus properties of dl-cathinone, d-amphetamine, and cocaine in rats. Huang D, et al. **Pharmacol Biochem Behav** 1986 Feb;24(2):205-10

Locomotor depression in mice by norcocaine does not involve central alpha 2-adrenergic or presynaptic dopamine receptors. Reith ME, et al. **Pharmacol Biochem Behav** 1986 Feb;24(2):305-7

6-Hydroxydopamine lesions of the medial prefrontal cortex fail to influence intravenous self-administration of cocaine. Martin-Iverson MT, et al. **Psychopharmacology (Berlin)** 1986;88(3):310-4

Effects of central dopamine depletion on the d-amphetamine discriminative stimulus in rats. Woolverton WL, et al. **Psychopharmacology (Berlin)** 1986;88(2):196-200

Cocaine: it costs too much [editorial] Macdonald DI. **Public Health Rep** 1986 Mar-Apr;101(2):121-2

[Repair of cocaine-induced perforations of the nasal septum (or the glider-wing mucosal flap)] Chalaye JC, et al. **Ann Chir Plast Esthet** 1985;30(3):229-35 (Eng. Abstr.) **(Fre)**

[Modifications of the hepatotoxicity of cocaine on Swiss mice by various inhibitors] Cornette C, et al. **C R Soc Biol (Paris)** 1985;179(3):320-6 (Eng. Abstr.) **(Fre)**

COGNITION

Effortful and automatic cognitive processes in depression. Roy-Byrne PP, et al. **Arch Gen Psychiatry** 1986 Mar;43(3):265-7

Short term effects of methylphenidate on the cognitive, learning and academic performance of children with attention deficit disorder in the laboratory and the classroom. Douglas VI, et al. **J Child Psychol Psychiatry** 1986 Mar;27(2):191-211

Cognitive-behavioural treatment for benzodiazepine dependence [letter] Sanchez-Craig M, et al. **Lancet** 1986 Feb 15;1(8477):388

Measures of cognitive functioning appropriate for use in pediatric psychopharmacological research studies. Swanson JM. **Psychopharmacol Bull** 1985;21(4):887-90

COGNITION DISORDERS

Cognitive symptoms in late-life depression and their treatment. Siegfried K. **J Affective Disord** 1985;Suppl 1:S33-40

COLOR PERCEPTION

[Drug-induced functional disorders of cone function and cone interaction] Zrenner E, et al. **Fortschr Ophthalmol** 1985;82(6):589-94 (Eng. Abstr.) **(Ger)**

COMPULSIVE BEHAVIOR

The Leyton Obsessional Inventory-Child Version. Berg CJ, et al. **J Am Acad Child Psychiatry** 1986 Jan;25(1):84-91

CONDITIONING (PSYCHOLOGY)

Pimozide blocks establishment but not expression of cocaine-produced environment-specific conditioning. Beninger RJ, et al. **Life Sci** 1986 Apr 14;38(15):1425-31

CONDITIONING, CLASSICAL

Conditioned rotational behavior in rats with unilateral 6-hydroxydopamine lesions of the substantia nigra. Carey RJ. **Brain Res** 1986 Feb 19;365(2):379-82

Destruction of intrinsic neurons in the lateral hypothalamus disrupts the classical conditioning of autonomic but not behavioral emotional responses in the rat. Iwata J, et al. **Brain Res** 1986 Mar 12; 368(1):161-6

CONDITIONING, OPERANT

Conditionability of caudate dopamine activity in the caudate nucleus of cats demonstrated by in vivo electrochemistry. Brozoski TJ, et al. **Brain Res** 1986 Feb 5;364(2):275-83

Comparison of drug effects on fixed-ratio performance and chain performance maintained under a second-order fixed-ratio schedule. Winsauer PJ, et al. **J Exp Anal Behav** 1985 Nov;44(3):367-76

Effects of chlorpromazine on fixed-ratio responding: modification by fixed-interval discriminative stimuli. Witkin JM. **J Exp Anal Behav** 1986 Mar;45(2):195-205

Effects of cholinergic drugs on aversive operant behavior induced by dorsal central gray stimulation in rats. Moriyama M, et al. **Jpn J Pharmacol** 1985 Nov;39(3):339-47

Discriminative properties of the psychostimulant dl-cathinone in a two lever operant task. Lack of evidence for dopaminergic mediation. Goudie AJ, et al. **Neuropharmacology** 1986 Jan;25(1):85-94

Effects of MK-212 (6-chloro-2[1-piperazinyl]pyrazine) on schedule-controlled behavior and their reversal by 5-HT antagonists in the pigeon. Mansbach RS, et al. **Neuropharmacology** 1986 Jan; 25(1):13-9

Visceral cortex lesions block conditioned taste aversions induced by morphine. Mackey WB, et al. **Pharmacol Biochem Behav** 1986 Jan; 24(1):71-8

Chronic haloperidol treatment: effects on operant responding and inter-response time. Heath GF, et al. **Prog Neuropsychopharmacol Biol Psychiatry** 1985;9(5-6):697-701

Conditioned taste aversions induced by 1-5-hydroxytryptophan are mediated by the area postrema. Ossenkopp KP, et al. **Prog Neuropsychopharmacol Biol Psychiatry** 1985;9(5-6):745-8

Chlorpromazine and pimozide alter reinforcement efficacy and motor performance. Heyman GM, et al. **Psychopharmacology (Berlin)** 1986; 88(3):346-53

The effects of some putative antidepressant agents on the schedule-controlled behavior of the pigeon. Lamb RJ, et al. **Psychopharmacology (Berlin)** 1986;88(3):368-73

Different effects of haloperidol and extinction on instrumental behaviours. Salamone JD. **Psychopharmacology (Berlin)** 1986;88(1):18-23

Effects of propranolol on conditioned suppression, discriminated punishment and discriminated non-reward in the rat. Salmon P, et al. **Psychopharmacology (Berlin)** 1986;88(2):252-7

Disruption of schedule-controlled behavior by Ro 15-1788 one day after acute treatment with benzodiazepines. Spealman RD. **Psychopharmacology (Berlin)** 1986;88(3):398-400

Amphetamine does not affect the partial punishment effect (PPE). Weiner I, et al. **Psychopharmacology (Berlin)** 1986;88(1):119-23

Effects of diazepam and pentobarbital on discrete lever-press avoidance response in mice: baseline-dependent changes. Kuribara H, et al. **Yakubutsu Seishin Kodo** 1985 Dec;5(4):343-8

CONFLICT (PSYCHOLOGY)

Amphetamine potentiation of anti-conflict action of chlordiazepoxide. Lerner T, et al. **Pharmacol Biochem Behav** 1986 Feb;24(2):241-6

CONVULSIVE THERAPY

[Catamnestic evaluation of the treatment of schizophrenia using insulin coma] Pavlovský P, et al. **Cesk Psychiatr** 1985 Dec;81(6):391-6 (Eng. Abstr.) **(Cze)**

CORTICOSTERONE

Inhibition of corticosteroidogenesis by etomidate. Goverde HJ, et al. **Acta Anaesthesiol Belg** 1985 Dec;36(4):375-80

The role of thyroid and adrenal cortical hormones in the modulation of the gonadal function in birds. Péczely P. **Acta Biol Hung** 1985; 36(1):45-70

Effects of prolactin administration on the zona glomerulosa of the rat adrenal cortex: stereology and plasma hormone concentrations. Mazzocchi G, et al. **Acta Endocrinol (Copenh)** 1986 Jan;111(1):101-5

LPS-caused secretion of corticosterone is mediated by histamine through histidine decarboxylase. Suzuki S, et al. **Am J Physiol** 1986 Mar; 250(3 Pt 1):E243-7

Pituitary-dependent and -independent secretion of CS caused by bacterial endotoxin in rats. Suzuki S, et al. **Am J Physiol** 1986 Apr; 250(4 Pt 1):E470-4

Replacement therapy against increased hydroxyurea toxicity in pituitary or adrenal ablated rats. Vacca M, et al. **Arch Toxicol [Suppl]** 1985; 8:385-9

Effect of stress-related hormones on short term memory. Gibbs ME, et al. **Behav Brain Res** 1986 Jan;19(1):1-6

In vitro interactions between Sertoli cells and steroidogenic cells. Perrard-Sapori MH, et al. **Biochem Biophys Res Commun** 1986 Jan 29; 134(2):957-62

Glucocorticoid regulation of hepatic cytosolic glucocorticoid receptors in vivo and its relationship to induction of tyrosine aminotransferase. Shirwany TA, et al. **Biochim Biophys Acta** 1986 Apr 8;886(1):162-8

Short- and long-term effects of ACTH on the adrenal zona glomerulosa of the rat. A coupled stereological and enzymological study. Mazzocchi G, et al. **Cell Tissue Res** 1986;243(2):303-10

Are endogenous glucocorticoids involved in short-term regulation of hepatic glycogen metabolism? Viskupič E, et al. **Endocrinol Exp (Bratisl)** 1985 Dec;19(4):283-9

Endogenous corticoids and lung development in the fetal rabbit. Hümmelink R, et al. **Endocrinology** 1986 Apr;118(4):1622-9

Effects of extrahypothalamic structures on the hypothalamic cell nuclear binding of corticosterone. Weidenfeld J, et al. **Exp Brain Res** 1985; 61(1):91-3

Basal plasma corticosterone level after bilateral selective lesions of the olfactory pathways in the rat. Cattarelli M, et al. **Experientia** 1986 Feb 15;42(2):169-71

Flight stimulates adrenocortical activity in pigeons (Columba livia). Haase E, et al. **Gen Comp Endocrinol** 1986 Mar;61(3):424-7

Serum inflammatory responses of transcortin binding activities and of total and free corticosterone and progesterone levels in developing rats: a kinetic approach. Savu L, et al. **Int J Tissue React** 1985;7(6):443-8

Effects of pinealectomy and aging on the serum corticosterone circadian rhythm in rats. Oxenkrug GF, et al. **J Pineal Res** 1984;1(2):181-5

Diurnal rhythm of alpha 2-noradrenergic receptors in the paraventricular nucleus and other brain areas: relation to circulating corticosterone and feeding behavior. Jhanwar-Uniyal M, et al. **Life Sci** 1986 Feb 3; 38(5):473-82

Plasma corticosterone responses to electrical stimulation of the amygdaloid complex: cytoarchitectural specificity. Dunn JD, et al. **Neuroendocrinology** 1986;42(3):211-7

Interaction between corticosterone and alpha-2-noradrenergic system of the paraventricular nucleus in relation to feeding behavior. Roland CR, et al. **Neuroendocrinology** 1986;42(4):296-305

Effects of stimulation of the preoptic area on hypothalamic paraventricular nucleus unit activity and corticosterone secretion in freely moving rats. Saphier D, et al. **Neuroendocrinology** 1986;42(2):167-73

Norepinephrine depletion in the paraventricular nucleus inhibits the adrenocortical responses to neural stimuli. Feldman S, et al. **Neurosci Lett** 1986 Feb 28;64(2):191-5

Effects of polyunsaturated fatty acids and hormones on synaptogenesis in serum-free medium cultures of mouse fetal hypothalamic cells. Tixier-Vidal A, et al. **Neuroscience** 1986;17(1):115-32

Endocrine response to acute cold exposure by lactating and non-lactating Norway rats. Adels LE, et al. **Physiol Behav** 1986 Jan;36(1):179-81

Selective breeding of chickens for corticosterone response to social stress. Gross WB, et al. **Poult Sci** 1985 Dec;64(12):2230-3

Corticosterone sampling of laying hens in different management systems. Koelkebeck KW, et al. **Poult Sci** 1986 Jan;65(1):183-5

Daily variation of corticosterone and thyroid hormones in broiler cockerels. Smoak KD, et al. **Poult Sci** 1986 Jan;65(1):197-8

In vivo responsiveness of the broilers' adrenocortical system. Smoak KD, et al. **Poult Sci** 1986 Jan;65(1):194-6

The mechanism of the effect of K+ on the steroidogenesis of rat zona glomerulosa cells of the adrenal cortex: role of cyclic AMP. Hyatt PJ, et al. **Proc R Soc Lond [Biol]** 1986 Feb 22;227(1246):21-42

Lithium and twenty-four hour rhythms of serum corticosterone, prolactin and growth hormone in pigmented eye rats. Seggie J, et al. **Prog Neuropsychopharmacol Biol Psychiatry** 1985;9(5-6):755-8

Role of prostacyclin on steroidogenesis by frog interrenal gland in vitro. Delarue C, et al. **Prostaglandins** 1986 Jan;31(1):5-17

Effects of subchronic administration of psychoactive substances on the circadian rhythm of urinary corticosterone excretion in rats. Häusler A, et al. **Psychoneuroendocrinology** 1985;10(4):421-9

Enhanced elevation of corticosterone following arecoline administration to rats selectively bred for increased cholinergic function. Overstreet DH, et al. **Psychopharmacology (Berlin)** 1986;88(1):129-30

Identification of 19-nor-corticosterone in rat urine. Dale SL, et al. **Steroids** 1985 Jan;45(1):91-8

[Evaluation of the inhibitory effect of circulating corticosteroids on circadian stimulated and stress induced secretion of ACTH in rats] Ixart G, et al. **C R Soc Biol (Paris)** 1985;179(3):346-51 (Eng. Abstr.) **(Fre)**

[Effect of muscimol (GABA-agonist) on thalamo-hypothalamic regulation by corticotropic efferents (thalamic model)] Ramade F, et al. **C R Soc Biol (Paris)** 1985;179(3):383-8 (Eng. Abstr.) **(Fre)**

[Studies on preferential binding to glucocorticoid of rat liver anionic glutathione S-transferase] Maruyama H, et al. **Nippon Naibunpi Gakkai Zasshi** 1985 Sep 20;61(9):893-911 (Eng. Abstr.) **(Jpn)**

[Effect of RL-175 on testosterone and corticosterone levels in the plasma of male albino rats] Lokhov RE, et al. **Vopr Med Khim** 1985 Nov-Dec; 31(6):86-8 (Eng. Abstr.) **(Rus)**

[The effect of sex factors on the interaction of progesterone and glucocorticoids during increased tyrosine aminotransferase and tryptophane pyrrolase activity in the liver in rats] Németh S. **Bratisl Lek Listy** 1986 Jan;85(1):19-23 (Eng. Abstr.) **(Slo)**

[Effect of clorgyline and of alpha-methyl-p-tyrosine on the plasma levels of corticosterone in the rat] Pinilla J, et al. **Rev Esp Fisiol** 1985 Dec; 41(4):411-6 (Eng. Abstr.) **(Spa)**

CORTICOTROPIN

Plasma adrenocorticotrophin, cortisol and aldosterone responses to ovine corticotrophin-releasing factor and vasopressin in sheep. Pradier P, et al. **Acta Endocrinol (Copenh)** 1986 Jan;111(1):93-100

ACTH and prolactin deficiency. Puig ML, et al. **Acta Endocrinol (Copenh)** 1986 Mar;111(3):296-9

Antler cycle and thermolabile and thermostable alkaline phosphatase in white-tailed deer; circannual and circadian rhythms and variation after thyroxine, dexamethasone and ACTH administration. Sempéré AJ, et al. **Acta Endocrinol (Copenh)** 1986 Jan;111(1):133-9

By 95 days of gestation CRF increases plasma ACTH and cortisol in ovine fetuses. Hargrave BY, et al. **Am J Physiol** 1986 Apr; 250(4 Pt 1):E422-7

Interaction between CRF and angiotensin II in control of ACTH and adrenal steroids. Keller-Wood M, et al. **Am J Physiol** 1986 Mar; 250(3 Pt 2):R396-402

Long-term effects of hypothalamic paraventricular lesion on CRF content and stimulated ACTH secretion. Makara GB, et al. **Am J Physiol** 1986 Mar;250(3 Pt 1):E319-24

Renin, ACTH, and adrenocortical function during hypoxia and hemorrhage in conscious rats. Raff H, et al. **Am J Physiol** 1986 Feb; 250(2 Pt 2):R240-4

The relationship of beta-endorphin and ACTH in the cerebrospinal fluid and plasma of adult surgical patients. Scheller MS, et al. **Ann Clin Res** 1985;17(6):323-6

Dual activation of the inositol-triphosphate-calcium and cyclic nucleotide intracellular signaling systems by adrenocorticotropin in rat adrenal cells. Farese RV, et al. **Biochem Biophys Res Commun** 1986 Mar 28; 135(3):742-8

Discordant changes between immunoreactive ACTH and beta-endorphin in rat brain and pituitary during early development. Kapcala LP. **Brain Res** 1986 Feb 5;364(2):350-9

Short- and long-term effects of ACTH on the adrenal zona glomerulosa of the rat. A coupled stereological and enzymological study. Mazzocchi G, et al. **Cell Tissue Res** 1986;243(2):303-10

The regulation of the corticomelanotropic cell activity in Aves--II. Effect of various peptides on the release of ACTH from dispersed, perfused duck pituitary cells. Castro MG, et al. **Comp Biochem Physiol [A]** 1986; 83(1):71-5

Are endogenous glucocorticoids involved in short-term regulation of hepatic glycogen metabolism? Viskupič E, et al. **Endocrinol Exp (Bratisl)** 1985 Dec;19(4):283-9

Responses of plasma adrenocorticotropin and cortisol to intravenous injection of synthetic ovine corticotropin releasing factor in the morning and early evening in normal human subjects. Watabe T, et al. **Endocrinol Jpn** 1985 Oct;32(5):771-9

Stimulation of adenosine 3',5'-monophosphate production in rat Sertoli cells by alpha-melanotropin-stimulating hormone (alpha MSH) and des-acetyl alpha MSH. Boitani C, et al. **Endocrinology** 1986 Apr; 118(4):1513-8

In vitro stimulation and inhibition of adrenocorticotropin release by pituitary cells from ovine fetuses and lambs. Durand P, et al. **Endocrinology** 1986 Apr;118(4):1387-94

Long term culture of primary rat pituitary adrenocorticotropin/endorphin-producing cells in serum-free medium. May V, et al. **Endocrinology** 1986 Apr;118(4):1284-95

Spontaneous and stimulated adrenocorticotropin and vasopressin pulsatile secretion in the pituitary venous effluent of the horse. Redekopp C, et al. **Endocrinology** 1986 Apr;118(4):1410-6

Dopaminergic modulation of ACTH-induced grooming. Spruijt BM, et al. **Eur J Pharmacol** 1986 Jan 29;120(3):249-56

The possible potassium involvement in the modulation of the long-term trophic action of ACTH on the rat adrenal zona fasciculata. Robba C, et al. **Exp Clin Endocrinol** 1985 Dec;86(3):371-4

Lack of glycosilation of pro-opiomelanocortin might account for the periodic acid-Schiff-negative reaction in ACTH cells of teleost fishes. Iturriza FC, et al. **Gen Comp Endocrinol** 1986 Feb;61(2):229-36

In vitro study of frog (Rana ridibunda Pallas) interrenal function by use of a simplified perifusion system. VIII. Structure-activity relationship of synthetic ACTH fragments and gamma-MSH. Leboulenger F, et al. **Gen Comp Endocrinol** 1986 Feb;61(2):187-96

Comparative effects of corticotropin-releasing factor, arginine vasopressin, and related neuropeptides on the secretion of ACTH and alpha-MSH by frog anterior pituitary cells and neurointermediate lobes in vitro. Tonon MC, et al. **Gen Comp Endocrinol** 1986 Mar; 61(3):438-45

Rise in plasma beta-endorphin and ACTH in response to hyperthermia in sauna. Ježová D, et al. **Horm Metab Res** 1985 Dec;17(12):693-4

Inhibition of spontaneous ACTH release and improved response to CRF in sheep premedicated with the enkephalin analogue DAMME. Redekopp CA, et al. **Horm Metab Res** 1985 Dec;17(12):646-9

Beta-endorphin attenuates the serum cortisol response to exogenous adrenocorticotropin. Beyer HS, et al. **J Clin Endocrinol Metab** 1986 May;62(5):808-11

Effect of ketoconazole on adrenocorticotrophic hormone secretion in vitro and in vivo. Burrin JM, et al. **J Endocrinol** 1986 Jan; 108(1):37-41

Cholecystokinin-8 stimulates adrenocorticotropin release from anterior pituitary cells. Reisine T, et al. **J Pharmacol Exp Ther** 1986 Mar; 236(3):621-6

Effect of etomidate on hypercortisolism due to ectopic ACTH production [letter] Gärtner R, et al. **Lancet** 1986 Feb 1;1(8475):275

ACTH increases adrenal medullary PNMT activity in neonatal rats. Banerji TK, et al. **Life Sci** 1986 Jan 27;38(4):343-9

Intra-cerebroventricular captopril reduces plasma ACTH and vasopressin responses to hemorrhagic stress. Cameron VA, et al. **Life Sci** 1986 Feb 10;38(6):553-9

ACTH-(1-24) and alpha-MSH antagonize dopamine receptor-mediated inhibition of striatal dopamine and acetylcholine release. Versteeg DH, et al. **Life Sci** 1986 Mar 3;38(9):835-40

Vanadium inhibits ACTH-mediated but not cyclic AMP-dependent adrenal steroidogenesis. Hayashi Y, et al. **Mol Cell Endocrinol** 1986 Jan; 44(1):17-24

Atrial natriuretic factor does not affect basal, forskolin- and CRF-stimulated adenylate cyclase activity, cAMP formation or ACTH secretion, but does stimulate cGMP synthesis in anterior pituitary. Heisler S, et al. **Mol Cell Endocrinol** 1986 Feb;44(2):125-31

Centrally administered inhibitors of the generation and action of angiotensin II do not attenuate the increase in ACTH secretion produced by ether stress in rats. Buckner FS, et al. **Neuroendocrinology** 1986;42(2):97-101

Glutamate decarboxylase activity in the pituitary in the presence of a change in the corticotropin level in the rat organism. Mishunina TM, et al. **Neurosci Behav Physiol** 1985 Sep-Oct;15(5):439-42

Atrial natriuretic peptide inhibits the stimulation of aldosterone secretion by ACTH in vitro and in vivo. Chartier L, et al. **Proc Soc Exp Biol Med** 1986 May;182(1):132-6

Implication of the serotoninergic system in the decreased ACTH response to stress after lesion of the amygdaloid central nucleus. Beaulieu S, et al. **Prog Neuropsychopharmacol Biol Psychiatry** 1985;9(5-6):665-9

[Passive immunization with an anti-oCRF41 immune serum inhibits the circadian increase of plasma ACTH in rats] Ixart G, et al. **C R Acad Sci [III]** 1985;301(14):659-64 (Eng. Abstr.) **(Fre)**

[Evaluation of the inhibitory effect of circulating corticosteroids on circadian stimulated and stress induced secretion of ACTH in rats] Ixart G, et al. **C R Soc Biol (Paris)** 1985;179(3):346-51 (Eng. Abstr.) **(Fre)**

[Responses of plasma cortisol and ACTH to stimulation by the synthetic ovine ACTH-releasing factor in normal man (letter)] Dewailly D, et al. **Presse Med** 1985 Dec 7;14(42):2148 (Fre)

CORTICOTROPIN RELEASING HORMONE

Plasma adrenocorticotrophin, cortisol and aldosterone responses to ovine corticotrophin-releasing factor and vasopressin in sheep. Pradier P, et al. **Acta Endocrinol (Copenh)** 1986 Jan;111(1):93-100

Application of avidin-biotinized peroxidase (ABC) method for immunocytochemical localization of corticotropin-releasing factor (CRF) in rat hypothalamus. Miśkowiak B, et al. **Acta Histochem (Jena)** 1985;77(2):127-31

Effects of morphine on hypothalamic corticotropin-releasing factor (CRF), norepinephrine and dopamine in non-stressed and stressed rats. Suemaru S, et al. **Acta Med Okayama** 1985 Dec;39(6):463-70

Corticotropin-releasing factor can stimulate gonadotropin secretion by human fetal pituitaries in superfusion. Blumenfeld Z, et al. **Am J Obstet Gynecol** 1986 Mar;154(3):606-12

By 95 days of gestation CRF increases plasma ACTH and cortisol in ovine fetuses. Hargrave BY, et al. **Am** J **Physiol** 1986 Apr; 250(4 Pt 1):E422-7

Interaction between CRF and angiotensin II in control of ACTH and adrenal steroids. Keller-Wood M, et al. **Am J Physiol** 1986 Mar; 250(3 Pt 2):R396-402

Long-term effects of hypothalamic paraventricular lesion on CRF content and stimulated ACTH secretion. Makara GB, et al. **Am J Physiol** 1986 Mar;250(3 Pt 1):E319-24

Demonstration that corticotropin-releasing factor binding to rat peripheral tissues is modulated by glucocorticoid treatment in vivo and in vitro. Dave JR, et al. **Biochem Biophys Res Commun** 1986 Jan 14; 134(1):255-60

Corticotropin-releasing factor and intraocular pressure. Liu JH. **Curr Eye Res** 1985 Dec;4(12):1247-52

Brain corticotropin-releasing factor (CRF) and catecholamine responses in acutely stressed rats. Suemaru S, et al. **Endocrinol Jpn** 1985 Oct; 32(5):709-18

Responses of plasma adrenocorticotropin and cortisol to intravenous injection of synthetic ovine corticotropin releasing factor in the morning and early evening in normal human subjects. Watabe T, et al. **Endocrinol Jpn** 1985 Oct;32(5):771-9

hpGRF-44-NH2, lot no. 92-81-5G-41-47, is (human) growth hormone-releasing factor containing no trace of (ovine) corticotropin-releasing factor. Ling N, et al. **Endocrinology** 1986 Mar; 118(3):1249-51

Corticotropin-releasing factor binding to the anterior pituitary receptor is modulated by divalent cations and guanyl nucleotides. Perrin MH, et al. **Endocrinology** 1986 Mar;118(3):1171-9

Identification of a putative GH-releasing factor (GRF) batch as predominantly ovine CRF with a small quantity of human GRF. Tannenbaum GS, et al. **Endocrinology** 1986 Mar;118(3):1246-8

Immunoreactivity of hypothalamo-neurohypophysial neurons which secrete corticotropin-releasing hormone (CRH) and vasopressin (Vp): immunocytochemical evidence for a correlation with their functional state in colchicine-treated rats. Alonso G, et al. **Exp Brain Res** 1986; 61(3):497-505

Inhibition of spontaneous ACTH release and improved response to CRF in sheep premedicated with the enkephalin analogue DAMME. Redekopp CA, et al. **Horm Metab Res** 1985 Dec;17(12):646-9

Corticotrophin-releasing factor-like immunoreactivity and bioactivity of human fetal and adult hypothalami. Ackland JF, et al. **J Endocrinol** 1986 Feb;108(2):171-80

The physiological significance of arginine vasopressin in potentiating the response to corticotrophin-releasing factor in sheep. Redekopp C, et al. **J Endocrinol** 1986 Feb;108(2):309-12

Stimulation and inhibition of food intake in sheep by centrally-administered hypothalamic releasing factors. Ruckebusch Y, et al. **Life Sci** 1986 Mar 10;38(10):929-34

Atrial natriuretic factor does not affect basal, forskolin- and CRF-stimulated adenylate cyclase activity, cAMP formation or ACTH secretion, but does stimulate cGMP synthesis in anterior pituitary. Heisler S, et al. **Mol Cell Endocrinol** 1986 Feb;44(2):125-31

Corticotropin-releasing factor and forskolin increase proopiomelanocortin messenger RNA levels in rat anterior and intermediate cells in vitro. Loeffler JP, et al. **Neurosci Lett** 1985 Dec 18;62(3):383-7

The coexistence of oxytocin and corticotropin-releasing factor in the hypothalamus: an immunocytochemical study in the rat, sheep and hedgehog. Papadopoulos GC, et al. **Neurosci Lett** 1985 Dec 4; 62(2):213-8

Effects of sauvagine, urotensin I and CRF on food intake in rats. Negri L, et al. **Peptides** 1985;6 Suppl 3:53-7

Developmental, behavioral, and opiate receptor changes after prenatal or postnatal beta-endorphin, CRF, or Tyr-MIF-1. Zadina JE, et al.

Psychoneuroendocrinology 1985;10(4):367-83

Stress-induced inhibition of reproductive functions: role of endogenous corticotropin-releasing factor. Rivier C, et al. **Science** 1986 Feb 7; 231(4738):607-9

[Passive immunization with an anti-oCRF41 immune serum inhibits the circadian increase of plasma ACTH in rats] Ixart G, et al. **C R Acad Sci [III]** 1985;301(14):659-64 (Eng. Abstr.) **(Fre)**

[Responses of plasma cortisol and ACTH to stimulation by the synthetic ovine ACTH-releasing factor in normal man (letter)] Dewailly D, et al. **Presse Med** 1985 Dec 7;14(42):2148 **(Fre)**

[Hypothalamic factors: current findings] Sizonenko PC. **Schweiz Med Wochenschr** 1986 Mar 1;116(9):271-4 (Eng. Abstr.) **(Fre)**

CROSS-CULTURAL COMPARISON

Pharmacotherapy of chronic hospitalized schizophrenics: prescription practices. Wilson WH, et al. **Neuropsychobiology** 1985;14(2):75-82

DELUSIONS

Two cases of 'pure' or 'primary' erotomania successfully treated with pimozide. Munro A, et al. **Can J Psychiatry** 1985 Dec;30(8):619-22

Monosymptomatic hypochondriacal psychosis manifesting as delusions of infestation: case studies of treatment with haloperidol. Andrews E, et al. **J Clin Psychiatry** 1986 Apr;47(4):188-90

DEMENTIA

The concept of subcortical and cortical dementia: another look. Whitehouse PJ. **Ann Neurol** 1986 Jan;19(1):1-6 (84 ref.)

Postmortem central catecholamines and antemortem cognitive impairment in elderly schizophrenics and controls. Bridge TP, et al. **Neuropsychobiology** 1985;14(2):57-61

DEPRESSION

Plasma neutral amino acids and food preferences: possible implications in normals and depressives. Møller SE. **Bibl Nutr Dieta** 1986;(38):149-53

Circadian rhythm stability in the depressive syndrome in patients treated with antidepressant drugs. Madjirova N. **Folia Med (Plovdiv)** 1985; 27(1):5-10

Present status of drug therapy of depression in late life. Gerner RH. **J Affective Disord** 1985;Suppl 1:S23-31 (67 ref.)

General management of depression in late life. Murphy E. **J Affective Disord** 1985;Suppl 1:S7-10

Antidepressant-resistant depression in the elderly [editorial] Borson S, et al. **J Am Geriatr Soc** 1986 Mar;34(3):245-7

Treatment of depression in chronic cocaine and phencyclidine abuse with desipramine. Giannini AJ, et al. **J Clin Pharmacol** 1986 Mar; 26(3):211-4

Alprazolam treatment of postcoronary bypass anxiety and depression. Freeman AM 3d, et al. **J Clin Psychopharmacol** 1986 Feb;6(1):39-41

Depression in children. Epstein MH, et al. **J Sch Health** 1986 Jan; 56(1):10-2

A double-blind comparison of once-daily flupenthixol and mianserin in depressed hospital out-patients. Majid I. **Pharmatherapeutica** 1986; 4(7):405-10

Evidence for the locus coeruleus involvement in desipramine action in animal models of depression. Danysz W, et al. **Pol J Pharmacol Pharm** 1985 Nov-Dec;37(6):855-64

[Value of amineptin in the treatment of different depressive states. Apropos of 112 cases treated as part of a national multi-centric study] Marie-Cardine M, et al. **Encephale** 1985 Jul-Aug;11(4):175-7 (Eng. Abstr.) **(Fre)**

[The circulatory system in patients with depression during treatment with antidepressive drugs. I. Analysis of ECG records during the depressive phase of affective diseases] Rajewska J, et al. **Psychiatr Pol** 1985 Jul-Aug;19(4):271-7 (Eng. Abstr.) **(Pol)**

DEPRESSION, INVOLUTIONAL

[Vital disorders of the mouth (glossodynia) in depressive involutional psychoses] Maier C. **Nervenarzt** 1986 Feb;57(2):113-5 (Eng. Abstr.) **(Ger)**

DEPRESSIVE DISORDER

A Belgian multicentre study of fluvoxamine in depressive outpatients. Brasseur R, et al. **Acta Psychiatr Belg** 1985 Sep-Oct;85(5):636-43

Tryptophan to competing amino acids ratio in depressive disorder: relation to efficacy of antidepressive treatments. Møller SE. **Acta Psychiatr Scand [Suppl]** 1985;325:3-31 (146 ref.)

Depression. Acute care in the hospital. Campbell L. **Am J Nurs** 1986 Mar;86(3):288-91

Drugs and depression. Harris B. **Am J Nurs** 1986 Mar;86(3):292-3

Depression. What does it mean? Minot SR. **Am J Nurs** 1986 Mar; 86(3):284-8

An association between norepinephrine-to-epinephrine ratio and suicidal ideation in depression [letter] **Am J Psychiatry** 1986 May; 143(5):683-4

Change in serum antidepressant level at a constant dose of medication [letter] Chisholm DD. **Am J Psychiatry** 1986 Mar;143(3):388

Antidepressant effect of a tryptophan hydroxylase activation inhibitor, AGN 2979 [letter] Clerc G, et al. **Am J Psychiatry** 1986 Feb; 143(2):264-5

Patient with chronic and apparently treatment-resistant dysthymia [letter] Harris SJ, et al. **Am J Psychiatry** 1986 Feb;143(2):260-1

Lithium-antidepressant combinations in the treatment of depressed, physically ill geriatric patients. Kushnir SL. **Am J Psychiatry** 1986 Mar; 143(3):378-9

Lithium augmentation in psychotic depression refractory to combined drug treatment. Nelson JC, et al. **Am J Psychiatry** 1986 Mar; 143(3):363-6

Tricyclic nonresponders: phenomenology and treatment. Roose SP, et al. **Am J Psychiatry** 1986 Mar;143(3):345-8

Combined psychotherapy and pharmacotherapy for depression. A systematic analysis of the evidence. Conte HR, et al. **Arch Gen Psychiatry** 1986 May;43(5):471-9

Low levels and lack of predictors of somatotherapy and psychotherapy received by depressed patients. Keller MB, et al. **Arch Gen Psychiatry** 1986 May;43(5):458-66

Treatment for depression. 'Standard' clinical practice as an unexamined topic. Kupfer DJ, et al. **Arch Gen Psychiatry** 1986 May; 43(5):509-11

Dopaminergic effects of carbamazepine. Relationship to clinical response in affective illness. Post RM, et al. **Arch Gen Psychiatry** 1986 Apr; 43(4):392-6

Effortful and automatic cognitive processes in depression. Roy-Byrne PP, et al. **Arch Gen Psychiatry** 1986 Mar;43(3):265-7

Social skills training: an effective treatment for unipolar non-psychotic depression? Jackson HJ, et al. **Aust NZ J Psychiatry** 1985 Dec; 19(4):342-53 (52 ref.)

Seasonal variation of platelet serotonin uptake and 3H-imipramine binding in normal and depressed subjects. Egrise D, et al. **Biol Psychiatry** 1986 Mar;21(3):283-92

Urinary excretion of free tyramine and of norepinephrine and its metabolites in unipolar depressed patients. Roy A, et al. **Biol Psychiatry** 1986 Feb;21(2):221-4

Desmethylimipramine treatment increases melatonin production in humans. Sack RL, et al. **Biol Psychiatry** 1986 Apr;21(4):406-10

Plasma concentrations, information and therapy adherence during long-term treatment with antidepressants. Altamura AC, et al. **Br J Clin Pharmacol** 1985 Dec;20(6):714-6

Should plasma or urinary MHPG be measured in psychiatric research? A critical comment. Filser JG, et al. **Br J Psychiatry** 1986 Jan; 148:95-7

Cerebrospinal fluid vasopressin--changes in depression. Gjerris A, et al. **Br J Psychiatry** 1985 Dec;147:696-701

Imipramine and amitriptyline plasma concentrations and clinical response in major depression. Kocsis JH, et al. **Br J Psychiatry** 1986 Jan; 148:52-7

Management of depression in general practice [editorial] Brandon S. **Br Med J [Clin Res]** 1986 Feb 1;292(6516):287-9

A comparison of the safety and efficacy of alprazolam and desipramine in moderately severe depression. Remick RA, et al. **Can J Psychiatry** 1985 Dec;30(8):597-601

Abstinence from night sleep as a treatment for endogenous depressions. The earliest observations in a Danish mental hospital (1954) and an analysis of the causal mechanism. Ostenfeld I. **Dan Med Bull** 1986 Feb; 33(1):45-9

Growth hormone release after desipramine in depressive illness. Meesters P, et al. **Eur Arch Psychiatry Neurol Sci** 1985;235(3):140-2

Hypothalamic releasing factor in primary and situational depression. Dekeyser YF. **Int J Neurol** 1980;14(2-4):269-72

The universal enervating triad: psychopharmaceutical considerations of anxiety, schizophrenia, and depression. Miller TW, et al. **Issues Ment Health Nurs** 1984;6(3-4):275-91

Cognitive symptoms in late-life depression and their treatment. Siegfried K. **J Affective Disord** 1985;Suppl 1:S33-40

Therapeutic effects of serotonin uptake inhibitors in depression. Asberg M, et al. **J Clin Psychiatry** 1986 Apr;47 Suppl:23-35 (199 ref.)

Atypical depression and seasonal energy syndrome [letter] Pies R. **J Clin Psychiatry** 1986 Feb;47(2):98

Clinical studies on the phenylethylamine hypothesis of affective disorder: urine and blood phenylacetic acid and phenylalanine dietary supplements. Sabelli HC, et al. **J Clin Psychiatry** 1986 Feb; 47(2):66-70

Stability of the postpsychotic depression syndrome. Siris SG, et al. **J Clin Psychiatry** 1986 Feb;47(2):86-8

Double-blind comparison of doxepin versus bupropion in outpatients with a major depressive disorder. Feighner J, et al. **J Clin Psychopharmacol** 1986 Feb;6(1):27-32

Efficacy of carbamazepine as an antidepressant in chronic resistant depressives. Prasad AJ. **J Indian Med Assoc** 1985 Jul;83(7):235-7

Biological markers in depression. Monoamine metabolites in urine of depressed patients and normal subjects. Vandel S, et al. **Pharmacopsychiatry** 1985 Nov;18(6):347-50

Neurotransmitter metabolites and endocrine responses in depression. Hasey GM, et al. **Prog Neuropsychopharmacol Biol Psychiatry** 1985; 9(5-6):613-7

Platelet 3H imipramine binding: a possible predictor of response to antidepressant treatment. Hrdina PD, et al. **Prog Neuropsychopharmacol Biol Psychiatry** 1985;9(5-6):619-23

Course of clinical response to antidepressants. Lapierre YD. **Prog Neuropsychopharmacol Biol Psychiatry** 1985;9(5-6):503-7

Forms of atypical depression and their response to antidepressant drugs. Davidson J, et al. **Psychiatry Res** 1986 Feb;17(2):87-95

Effects of ECT on sleep and CSF biogenic amines in affective illness. Hoffmann G, et al. **Psychiatry Res** 1985 Nov;16(3):199-206

Human plasma melatonin is elevated during treatment with the monoamine oxidase inhibitors clorgyline and tranylcypromine but not deprenyl. Murphy DL, et al. **Psychiatry Res** 1986 Feb;17(2):119-27

Visual flicker in depression: response criteria, confidence ratings and response times. Herskovic JE, et al. **Psychol Med** 1986 Feb; 16(1):187-97

Colour associations as predictors of the effectiveness of anti-depressant pharmacotherapy in endogenous depressive patients. Demeter E, et al. **Psychopathology** 1985;18(5-6):305-9

Scales of potential use in the psychopharmacologic treatment of depressed children and adolescents. Petti TA. **Psychopharmacol Bull** 1985; 21(4):951-77

Moclobemide, a new reversible MAO inhibitor--interaction with tyramine and tricyclic antidepressants in healthy volunteers and depressive patients. Korn A, et al. **Psychopharmacology (Berlin)** 1986; 88(2):153-7

Plasma tryptophan and tyrosine ratios to competing amino acids in relation to antidepressant response to citalopram and maprotiline. A preliminary study. Møller SE, et al. **Psychopharmacology (Berlin)** 1986; 88(1):96-100

Decrease in plasma levels of 3,4-dihydroxyphenylethyleneglycol in major depression. Scatton B, et al. **Psychopharmacology (Berlin)** 1986; 88(2):220-5

Depression in primary care: evolving concepts and approach to therapy. Rucker L, et al. **South Med J** 1986 Feb;79(2):215-22 (94 ref.)

[Novel comparative profile of the clinical activity of antidepressive agents] Ansseau M, et al. **Acta Psychiatr Belg** 1985 Sep-Oct;85(5):644-61 (Eng. Abstr.) **(Fre)**

[Resistant depressions in chronicity phase. Clinical and pharmacological aspects. Apropos of 25 cases] Houillon P, et al. **Ann Med Psychol (Paris)** 1985 Jul;143(7):628-33 **(Fre)**

[Cholinergic hypothesis of depression] Leboyer M, et al. **Encephale** 1985 Nov-Dec;11(6):229-34 (53 ref.) (Eng. Abstr.) **(Fre)**

[Value of amineptin in the treatment of different depressive states. Apropos of 112 cases treated as part of a national multi-centric study] Marie-Cardine M, et al. **Encephale** 1985 Jul-Aug;11(4):175-7 (Eng. Abstr.) **(Fre)**

[Circadian rhythms of the central temperature and blood cortisol in endogenous depression] Souetre E, et al. **Encephale** 1985 Sep-Oct; 11(5):185-98 (Eng. Abstr.) **(Fre)**

[Possibilities and limitations of treating depressive disorders in practice] Gastpar M. **Ther Umsch** 1986 Jan;43(1):50-5 (Eng. Abstr.) **(Ger)**

[Amineptine: clinical considerations on a new antidepressive] Carreca A, et al. **Clin Ter** 1985 Dec 31;115(6):449-52 (Eng. Abstr.) **(Ita)**

[The circulatory system in patients with depression during treatment with antidepressive drugs. II. Effect of therapeutic doses of thymoleptics on ECG records in patients with endogenous depression] Rajewska J. **Psychiatr Pol** 1985 Jul-Aug;19(4):278-84 (Eng. Abstr.) **(Pol)**

[Psychopathological and neurophysiological indicators in endogenous depression and the therapeutic effect of thymoleptics. II. Comparison of the effects of various thymoleptics on the psychopathological symptoms of endogenous depressive syndromes] Strzyżewski W, et al. **Psychiatr Pol** 1985 Sep-Oct;19(5):363-9 (Eng. Abstr.) **(Pol)**

[Psychopathological and neurophysiological indicators in endogenous depression and the therapeutic effect of thymoleptics. I. Analysis of the clinical effect of antidepressive drugs with various pharmacological profiles] Twarowska-Hauser J, et al. **Psychiatr Pol** 1985 Sep-Oct; 19(5):357-62 (Eng. Abstr.) **(Pol)**

[Psychopathological and neurophysiological indicators in endogenous depression and the therapeutic effect of thymoleptics. III. Analysis of the factors affecting the effectiveness of treatment with thymoleptics] Twarowska-Hauser J, et al. **Psychiatr Pol** 1985 Sep-Oct;19(5):370-5 (Eng. Abstr.) **(Pol)**

DESIPRAMINE

Sleep, depression and the effects of antidepressant drugs. Gaillard JM, et al. **Acta Psychiatr Belg** 1985 Sep-Oct;85(5):561-7

Treating bulimia with desipramine. A double-blind, placebo-controlled study. Hughes PL, et al. **Arch Gen Psychiatry** 1986 Feb;43(2):182-6

Desmethylimipramine treatment increases melatonin production in humans. Sack RL, et al. **Biol Psychiatry** 1986 Apr;21(4):406-10

A comparison of the safety and efficacy of alprazolam and desipramine in moderately severe depression. Remick RA, et al. **Can J Psychiatry** 1985 Dec;30(8):597-601

Treatment of childhood hyperactivity with desipramine: plasma drug concentration, cardiovascular effects, plasma and urinary catecholamine levels, and clinical response. Donnelly M, et al. **Clin Pharmacol Ther** 1986 Jan;39(1):72-81

Growth hormone release after desipramine in depressive illness. Meesters P, et al. **Eur Arch Psychiatry Neurol Sci** 1985;235(3):140-2

Antidepressants and protein kinases: desipramine treatment affects pineal gland cAMP-dependent protein kinase activity. Moyer JA, et al. **Eur J Pharmacol** 1986 Feb 11;121(1):57-64

Liquid chromatographic determination of identity, content, and content uniformity of desipramine, fluphenazine, and promazine. Beaulieu N, et al. **J Assoc Off Anal Chem** 1986 Jan-Feb;69(1):178-9

A sensitive colorimetric method for the determination of imipramine hydrochloride and desipramine hydrochloride. el-Yazbi FA, et al. **J Clin Hosp Pharm** 1985 Dec;10(4):373-7

Treatment of depression in chronic cocaine and phencyclidine abuse with desipramine. Giannini AJ, et al. **J Clin Pharmacol** 1986 Mar; 26(3):211-4

Tricyclic antidepressants in vivo methylation: response to Lydiard and co-workers [letter] Narasimhachari N. **J Clin Psychopharmacol** 1986 Feb;6(1):61-2

Agonist interactions with beta-adrenergic receptors following chronic administration of desipramine or the atypical antidepressants, iprindole and mianserin. Hancock AA, et al. **J Recept Res** 1985;5(5-6):311-34

Antagonism by dopamine, but not noradrenaline receptor blockers of the anti-immobility activity of desipramine after different treatment schedules in the rat. Pulvirenti L, et al. **Pharmacol Res Commun** 1986 Jan;18(1):73-80

Evidence for the locus coeruleus involvement in desipramine action in animal models of depression. Danysz W, et al. **Pol J Pharmacol Pharm** 1985 Nov-Dec;37(6):855-64

DESOXYCORTICOSTERONE

Body sodium in rats: response to DOCA, adrenalectomy, changes in salt intake, and a salt load. Simpson FO, et al. **Am J Physiol** 1986 Mar; 250(3 Pt 2):F551-8

Deoxycorticosterone biosynthesis in kidney tissue of experimental animals. Characterization of steroid 21-hydroxylase activity in guinea pig kidney. Casey ML, et al. **Ann NY Acad Sci** 1985;458:232-7

Replacement therapy against increased hydroxyurea toxicity in pituitary or adrenal ablated rats. Vacca M, et al. **Arch Toxicol [Suppl]** 1985; 8:385-9

Mineralocorticoid escape during kallikrein inhibition. Overlack A, et al. **Clin Sci** 1986 Jan;70(1):13-7

Running to the taste of salt in mineralocorticoid-treated rats. Schulkin J, et al. **Horm Behav** 1985 Dec;19(4):413-25

Sodium transport by rat cortical collecting tubule. Effects of vasopressin and desoxycorticosterone. Reif MC, et al. **J Clin Invest** 1986 Apr; 77(4):1291-8

Mineralocorticoid effect on K+ permeability of the rabbit cortical collecting tubule. Stokes JB. **Kidney Int** 1985 Oct;28(4):640-5

DEXTROAMPHETAMINE

Relationship of limbic dopamine levels to amphetamine- and anticholinergic-induced hyperactivity in the rat. Carey RJ. **Biol Psychiatry** 1986 Mar;21(3):317-21

Comparison of drug effects on fixed-ratio performance and chain performance maintained under a second-order fixed-ratio schedule. Winsauer PJ, et al. **J Exp Anal Behav** 1985 Nov;44(3):367-76

Effects of chronic lithium treatment on brain monoamine metabolism and amphetamine-induced locomotor stimulation in rats. Berggren U. **J Neural Transm** 1985;64(3-4):239-50

Effects of d-amphetamine and dopamine synthesis inhibitors on dopamine and acetylcholine neurotransmission in the striatum. I. Release in the absence of vesicular transmitter stores. Parker EM, et al. **J Pharmacol Exp Ther** 1986 Apr;237(1):179-92

Effects of d-amphetamine and dopamine synthesis inhibitors on dopamine and acetylcholine neurotransmission in the striatum. II. Release in the presence of vesicular transmitter stores. Parker EM, et al. **J Pharmacol Exp Ther** 1986 Apr;237(1):193-203

Central noradrenaline depletion attenuates amphetamine-induced locomotor behavior. Mohammed AK, et al. **Neurosci Lett** 1986 Feb 28;64(2):139-44

Unilateral dopamine depletions attenuate the response of striatal neurons to systemic amphetamine in both hemispheres. Basse-Tomusk AE, et al. **Neuroscience** 1985 Dec;16(4):845-50

Comparative discriminative stimulus properties of dl-cathinone, d-amphetamine, and cocaine in rats. Huang D, et al. **Pharmacol Biochem Behav** 1986 Feb;24(2):205-10

Central noradrenaline depletion antagonizes aspects of d-amphetamine-induced hyperactivity in the rat. Archer T, et al. **Psychopharmacology (Berlin)** 1986;88(2):141-6

The effects of apomorphine, d-amphetamine and chlorpromazine on the aggressiveness of isolated Aequidens pulcher (Teleostei, Cichlidae). Munro AD. **Psychopharmacology (Berlin)** 1986;88(1):124-8

Effects of central dopamine depletion on the d-amphetamine discriminative stimulus in rats. Woolverton WL, et al. **Psychopharmacology (Berlin)** 1986;88(2):196-200

DIAZEPAM

Cardiovascular changes in dogs given diazepam and diazepam-ketamine. Haskins SC, et al. **Am J Vet Res** 1986 Apr;47(4):795-8

Diazepam and free plasma bupivacaine concentration [letter] Burke D. **Anesth Analg** 1986 Mar;65(3):314

Variability of the respiratory response to diazepam. Bailey PL, et al. **Anesthesiology** 1986 Apr;64(4):460-5

Preliminary study of the pharmacokinetics of desmethyldiazepam administered as drops or tablets. Yeates RA, et al. **Arzneimittelforschung** 1986;36(1):138-40

Diazepam inhibits potassium-induced aldosterone secretion in adrenal glomerulosa cell. Shibata H, et al. **Biochem Biophys Res Commun** 1986 Mar 28;135(3):994-9

Influence of benzodiazepine (diazepam) by single and repeated treatment on the growth of Tetrahymena. Darvas Z, et al. **Biomed Biochim Acta** 1985;44(11-12):1725-8

Diazepam and midazolam for sedation during bronchoscopy [letter] Dundee JW, et al. **Br J Anaesth** 1986 Apr;58(4):466-7

Sedation in outpatient oral surgery. Comparison of temazepam by mouth and diazepam i.v. O'Boyle CA, et al. **Br J Anaesth** 1986 Apr; 58(4):378-84

Lamotrigine (BW430C), a potential anticonvulsant. Effects on the central nervous system in comparison with phenytoin and diazepam. Cohen AF, et al. **Br J Clin Pharmacol** 1985 Dec;20(6):619-29

One-year follow-up of anxious patients treated with diazepam. Rickels K, et al. **J Clin Psychopharmacol** 1986 Feb;6(1):32-6

Diazepam in blood of Danish drivers: occurrence as shown by gas-liquid chromatographic assay following radioreceptor screening. Worm K, et al. **J Forensic Sci Soc** 1985 Nov-Dec;25(6):407-12

Estimation of the blood-plasma concentration ratio of diazepam in the rat. Klotz U. **J Pharmacokinet Biopharm** 1985 Jun;13(3):347-8

Plasma concentrations of diazepam and N-desmethyldiazepam in Asian children after an intravenous or rectal dose of diazepam. Quak SH, et al. **J Singapore Paediatr Soc** 1985;27(3-4):200-3

Developmental alterations in maturing rats caused by chronic prenatal and postnatal diazepam treatments. Shibuya T, et al. **Jpn J Pharmacol** 1986 Jan;40(1):21-9

Cognitive-behavioural treatment for benzodiazepine dependence [letter] Sanchez-Craig M, et al. **Lancet** 1986 Feb 15;1(8477):388

Interactions of Ro 15-1788, CGS 8216 and diazepam on head-turning in rats. Goldstein JM, et al. **Life Sci** 1986 Feb 3;38(5):459-63

Supraspinal depressant action of diazepam on the crossed extensor reflex. Kawasaki K, et al. **Neurosci Lett** 1986 Jan 16;63(2):175-9

Stressor-provoked response patterns in a swim task: modification by diazepam. Prince CR, et al. **Pharmacol Biochem Behav** 1986 Feb; 24(2):323-8

Behavioural responses to diazepam of drug-naive and experienced monkeys (Macaca mulatta). Bradley CM, et al. **Psychopharmacology (Berlin)** 1986;88(1):112-4

The pharmacokinetics of diazepam and desmethyldiazepam in rat brain and plasma. Friedman H, et al. **Psychopharmacology (Berlin)** 1986; 88(3):267-70

The behavioral actions of diazepam and oxazepam are similar. Mewaldt SP, et al. **Psychopharmacology (Berlin)** 1986;88(2):165-71

Differential effect of benzodiazepine sedation in high and low anxious patients in a 'real life' stress setting. O'Boyte CA, et al. **Psychopharmacology (Berlin)** 1986;88(2):226-9

Diazepam and chlorpromazine stimulate feeding in dwarf goats. Anika SM. **Vet Res Commun** 1985 Sep;9(4):309-12

Effects of diazepam and pentobarbital on discrete lever-press avoidance response in mice: baseline-dependent changes. Kuribara H, et al. **Yakubutsu Seishin Kodo** 1985 Dec;5(4):343-8

[Determination of diazepam and medazepam by precipitation with tetraphenylboron sodium] Garcia Madrid H, et al. **J Pharm Belg** 1985 Nov-Dec;40(6):435-8 (Eng. Abstr.) **(Fre)**

[The effect of diazepam on neonatal neurobehavioral response] Kojima S, et al. **Nippon Sanka Fujinka Gakkai Zasshi** 1985 Dec; 37(12):2784-90 (Eng. Abstr.) **(Jpn)**

[Effect of anticonvulsants on serum protein binding of 14C-diazepam] Mimaki T, et al. **No To Hattatsu** 1985 Nov;17(6):485-90 (Eng. Abstr.) **(Jpn)**

[Stages in the development of neuroses in the dog and effects of preparations with antidepressive and tranquilizing properties] Mekhedova AIa, et al. **Zh Vyssh Nerv Deiat** 1985 Nov-Dec; 35(6):1147-55 (Eng. Abstr.) **(Rus)**

[The effect of premedication with diazepam on patient cooperation during dental treatment] Jakšić M. **Vojnosanit Pregl** 1985 Sep-Oct; 42(5):357-9 (Eng. Abstr.) **(Ser)**

[Simple-blind clinical study with sublingual lorazepam vs. injectable diazepam as premedication in colonoscopies] Costas CD, et al. **Acta Gastroenterol Latinoam** 1985;15(1):43-8 (Eng. Abstr.) **(Spa)**

DIBENZAZEPINES

Inhibition of fibroblast proliferation by myelotoxic drugs. Pisciotta AV, et al. **Ann NY Acad Sci** 1985;459:198-210

Locus coeruleus norepinephrine-containing neurons: effects produced by acute and subchronic treatment with antipsychotic drugs and amphetamine. Ramirez OA, et al. **Brain Res** 1986 Jan 1; 362(1):165-70

Stress by forced swimming in the rat: effects of mianserin and moclobemide on GABAergic-monoaminergic systems in the brain. Cicardo VH, et al. **Comp Biochem Physiol** [C] 1986;83(1):133-5

The psychopharmacological effects of repeated doses of fluvoxamine, mianserin and placebo in healthy human subjects. Curran HV, et al. **Eur J Clin Pharmacol** 1986;29(5):601-7

Absolute bioavailability of mianserin tablets and solution in healthy humans. Timmer CJ, et al. **Eur J Drug Metab Pharmacokinet** 1985 Oct-Dec;10(4):315-23

Synchronizing EEG effect of mianserin. Bo P, et al. **Farmaco [Sci]** 1985 Dec;40(12):909-20

Simultaneous determination of metapramine and its demethylated metabolites in plasma by gas chromatography-mass spectrometry. Bougerolle AM, et al. **J Chromatogr** 1985 Nov 29;345(1):59-66

Alpha-adrenolytic properties of apogalanthamine and azapetine analogs. Ishida Y, et al. **J Pharmacobiodyn** 1985 Nov;8(11):917-23

Agonist interactions with beta-adrenergic receptors following chronic administration of desipramine or the atypical antidepressants, iprindole and mianserin. Hancock AA, et al. **J Recept Res** 1985;5(5-6):311-34

Mianserin and agranulocytosis [letter] Morgan CA, et al. **Med J Aust** 1986 Feb 3;144(3):165

Classification of sulpiride, clozapine and haloperidol by toposelective recording from different brain structures in the immobilized rat (stereo-EEG). Dimpfel W, et al. **Neuropsychobiology** 1985; 14(3):157-64

A double-blind comparison of once-daily flupenthixol and mianserin in depressed hospital out-patients. Majid I. **Pharmatherapeutica** 1986; 4(7):405-10

Electrophysiological effects of a new antiarrhythmic substance Bonnecor (AWD 19-166, GS 015) on mammalian myocardium. Nilius B, et al. **Pharmazie** 1985 Dec;40(12):847-51

Electrical effects of the new antiarrhythmic compound Bonnecor (AWD 19-166, GS 015) under arrhythmogenic conditions. Nilius B. **Pharmazie** 1985 Dec;40(12):855-6

Inotropic effects of the antiarrhythmic compound Bonnecor (AWD 19-166, GS 015). Nilius B, et al. **Pharmazie** 1985 Dec;40(12):854

[Pharmacokinetics and pharmacodynamics of 3-carbethoxyamino-5-dimethylamino-acetyl-iminodibenzyl hydrochloride (Bonnecor, AWD 19-166, GS 015) in the cat] Kaverina NV, et al. **Pharmazie** 1985 Dec;40(12):868-9 (Eng. Abstr.) **(Ger)**

[Characteristics of the anti-arrhythmic action of 3-carbethoxyamino-5-dimethylaminoacetyl-imino-dibenzyl hydrochloride (Bonnecor, AWD 19-166, GS 015)] Kaverina NV, et al. **Pharmazie** 1985 Dec;40(12):840-4 (Eng. Abstr.) **(Ger)**

[Antiarrhythmic effectiveness of 3-carbalkoxyamino-5-(omega-aminoacyl)-10,11-dihydro-5H-dibenz-[azepines] Kaverina NV, et al. **Pharmazie** 1985 Dec;40(12):830-2 (Eng. Abstr.) **(Ger)**

[Pharmacokinetics and metabolism of 3-carbethoxyamino-5-dimethylamino-acetyl-iminodibenzyl hydrochloride (Bonnecor, AWD 19-166, GS 015) in the rat] Klemm W, et al. **Pharmazie** 1985 Dec;40(12):864-7 (Eng. Abstr.) **(Ger)**

[Pharmaceutical characterization and spectroscopy of Bonnecor (AWD 19-166, GS 015)] Mayer W, et al. **Pharmazie** 1985 Dec;40(12):832-5 (Eng. Abstr.) **(Ger)**

[Summarized presentation of studies on the toxicology of 3-carbethoxyamino-5-dimethylamino-acetyl-10,11-dihydrobenz[b,f]azepine hydrochloride (Bonnecor, GS 015, AWD 19-166)] Nürnberger H, et al. **Pharmazie** 1985 Dec;40(12):871-3 (Eng. Abstr.) **(Ger)**

[New derivatives of 10,11-dihydro-5H-dibenz[b,f]azepine with antiarrhythmic action] Wunderlich H, et al. **Pharmazie** 1985 Dec; 40(12):827-30 (Eng. Abstr.) **(Ger)**

[Synthesis of 3-carbethoxyamino-5-dimethylamino-[1-14C]-acetyl-10,11-dihydro-5h-dibenz[b,f]azepine hydrochloride (Bonnecor, AWD 19-166, GS 015)] Zerjatke W. **Pharmazie** 1985 Dec;40(12):874 (Eng. Abstr.) **(Ger)**

[EEG changes with leponex medication] Kursawe HK, et al. **Psychiatr Neurol Med Psychol (Leipz)** 1985 Dec;37(12):705-12 (Eng. Abstr.) **(Ger)**

[Detection of Leponex (clozapine) in biological material] Kozlova IS, et al. **Sud Med Ekspert** 1986 Jan-Mar;29(1):43-4 (Eng. Abstr.) **(Rus)**

DIBENZOTHIEPINS

Prolongation of cardiac allograft survival with the PAF antagonist BN-52021 and the thromboxane receptor antagonists L640035 and L636499. Foegh ML, et al. **Adv Prostaglandin Thromboxane Leukotriene Res** 1985;15:381-4

In vivo voltammetry in the suprachiasmatic nucleus of the rat: effects of RU24969, methiothepin and ketanserin. Martin KF, et al. **Eur J Pharmacol** 1986 Feb 11;121(1):135-9

Stereoselective blockade at the 5-HT autoreceptor and inhibition of radioligand binding to central 5-HT recognition sites by the optical isomers of methiothepin. Hibert M, et al. **Neuropharmacology** 1986 Jan; 25(1):1-4

DIBENZOXAZEPINES

Amoxapine-associated agranulocytosis with thrombocytosis occurring early during recovery. Sedlacek SM, et al. **Am J Med** 1986 Mar; 80(3):533-6

Side effects of the new antidepressants [letter] Mattes JA. **Am J Psychiatry** 1986 Feb;143(2):261

A comparison of parenteral loxapine and haloperidol in hostile and aggressive acutely schizophrenic patients. Tuason VB. **J Clin Psychiatry** 1986 Mar;47(3):126-9

Determination of amoxapine and its metabolites in human serum by high-performance liquid chromatography. Kobayashi A, et al. **Neuropharmacology** 1985 Dec;24(12):1253-6

DIBENZOXEPINS

Increase in the cardiotonic action and in the therapeutic margin of digoxin by the adrenergic beta-stimulant doxaminol in cats. Sponer G, et al. **Arzneimittelforschung** 1985;35(11):1663-7

Inhibition of prostaglandin generation in the rabbit brain in-vivo by AD-1590, a non-steroidal anti-inflammatory agent with potent antipyretic activity. Nakamura H, et al. **J Pharm Pharmacol** 1985 Dec; 37(12):894-8

DIETHYLAMINES

A solid sorbent air sampling and analytical procedure for methyl-, dimethyl-, ethyl-, and diethylamine. Elskamp CJ, et al. **Am Ind Hyg Assoc J** 1986 Jan;47(1):41-9

DIIODOTYROSINE

Ultrastructural changes elicited in the Tetrahymena by primary exposure (imprinting) and reexposure to hormone. Csaba G, et al. **Z Mikrosk Anat Forsch** 1985;99(6):884-90

DISCRIMINATION (PSYCHOLOGY)

Discriminative stimulus properties of amphetamine and structurally related phenalkylamines. Young R, et al. **Med Res Rev** 1986 Jan-Mar; 6(1):99-130 (74 ref.)

A comparison of the discriminative stimulus properties of phencyclidine, given intraperitoneally or intraventricularly in rats. Slifer BL, et al. **Neuropharmacology** 1985 Dec;24(12):1175-9

Comparative discriminative stimulus properties of dl-cathinone, d-amphetamine, and cocaine in rats. Huang D, et al. **Pharmacol Biochem Behav** 1986 Feb;24(2):205-10

Dose-dependent impairment in the performance of a go-no go successive discrimination by chlordiazepoxide. Cole SO, et al. **Psychopharmacology (Berlin)** 1986;88(2):184-6

Effects of clonazepam and ethosuximide on the responding of pigeons under a fixed-consecutive-number schedule with and without an external discriminative stimulus. Picker M, et al. **Psychopharmacology (Berlin)** 1986;88(3):325-30

Effects of central dopamine depletion on the d-amphetamine discriminative stimulus in rats. Woolverton WL, et al. **Psychopharmacology (Berlin)** 1986;88(2):196-200

DISCRIMINATION LEARNING

Dopamine D1 receptor mediation of the discriminative stimulus properties of SKF 38393. Cunningham KA, et al. **Eur J Pharmacol** 1985 Dec 10; 119(1-2):121-5

Visual discrimination learning and interhemispheric transfer in the cat, as affected by 6-hydroxydopamine. Sprague JM, et al. **Exp Brain Res** 1985;61(1):43-53

Brief exposure to contingent reinforcement produces a sustained increment in the strength of an elicited response. Hutchinson RR, et al. **J Exp Anal Behav** 1986 Mar;45(2):189-94

Effects of chlorpromazine on fixed-ratio responding: modification by fixed-interval discriminative stimuli. Witkin JM. **J Exp Anal Behav** 1986 Mar;45(2):195-205

Discriminative and aversive properties of beta-carboline-3-carboxylic acid ethyl ester, a benzodiazepine receptor inverse agonist, in rhesus monkeys. Takada K, et al. **Life Sci** 1986 Mar 17;38(11):1049-56

Discriminative stimulus properties of amphetamine and structurally related phenalkylamines. Young R, et al. **Med Res Rev** 1986 Jan-Mar; 6(1):99-130 (74 ref.)

Discriminative properties of the psychostimulant dl-cathinone in a two lever operant task. Lack of evidence for dopaminergic mediation. Goudie AJ, et al. **Neuropharmacology** 1986 Jan;25(1):85-94

Effects of chlordiazepoxide training dose on the mixed agonist-antagonist properties of benzodiazepine receptor antagonist Ro 15-1788, in a drug discrimination procedure. De Vry J, et al. **Psychopharmacology (Berlin)** 1986;88(2):177-83

[Drug discrimination: methodology and current problems] Watanabe S. **Yakubutsu Seishin Kodo** 1985 Dec;5(4):289-302 (68 ref.) (Eng. Abstr.) **(Jpn)**

DOPA

Interaction of several mono- and dihydroxybenzene derivatives of various depigmenting potencies with L-3,4-dihydroxyphenylalanine-melanin. Menter JM, et al. **Arch Biochem Biophys** 1986 Feb 1;244(2):846-56

Sub-chronic administration of (-)-3-PPP and central dopamine receptor sensitivity changes. Hjorth S, et al. **J Neural Transm** 1985; 64(3-4):187-98

Changes in brain catecholamine levels following DL-dopa are not potentiated by deuterium substitution. Dewar KM, et al. **Prog Neuropsychopharmacol Biol Psychiatry** 1985;9(5-6):675-80

DOPAMINE

Effects of morphine on hypothalamic corticotropin-releasing factor (CRF), norepinephrine and dopamine in non-stressed and stressed rats. Suemaru S, et al. **Acta Med Okayama** 1985 Dec;39(6):463-70

Modification of reserpine induced rigidity by dopaminergic and alpha-adrenergic drugs. Anderson RJ. **Acta Neurol Scand** 1985 Dec; 72(6):584-9

Evidence against a functional role for dopamine-4-sulphate in the kidney. Bradley T, et al. **Acta Physiol Scand** 1985 Dec;125(4):739-41

Dopamine release is enhanced while acetylcholine release is inhibited by nimodipine (Bay e 9736). Nordström O, et al. **Acta Physiol Scand** 1986 Jan;126(1):115-9

Dissociation between renal prostaglandin E2 and renin release. Effects of glucagon, dopamine and cyclic AMP in dogs. Vikse A, et al. **Acta Physiol Scand** 1985 Dec;125(4):619-26

Effect of long-term application of Oxyphenon on biogenic amine levels in female rat brain. Hrbek J, et al. **Acta Univ Palacki Olomuc Fac Med** 1985;112:295-301

Effect of Oxyphenon on norepinephrine and dopamine levels in male rat brain. Hrbek J, et al. **Acta Univ Palacki Olomuc Fac Med** 1985; 112:303-8

Comparison of the effect of single and repeated administration of Oxyphenon on norepinephrine and dopamine levels in female rat brains. Hrbek J, et al. **Acta Univ Palacki Olomuc Fac Med** 1985;112:309-12

Effect of intravenous infusion of low-dose dopamine on renal function in normal individuals and in patients with renal disease. ter Wee PM, et al. **Am J Nephrol** 1986;6(1):42-6

Modulation of luteinizing hormone immunoreactivity and bioactivity by dopamine but not norepinephrine in women. Barnes RB, et al. **Am J Obstet Gynecol** 1986 Feb;154(2):445-50

Variability and selectivity of anterior pituitary response to dopamine agonists throughout the normal menstrual cycle. Kletzky OA, et al. **Am J Obstet Gynecol** 1986 Feb;154(2):362-7

Neurotransmitters of the cochlea and cochlear nucleus: immunocytochemical evidence. Altschuler RA, et al. **Am J Otolaryngol** 1986 Mar-Apr;7(2):100-6 (59 ref.)

Neural not tubular dopamine increases glomerular filtration rate in perfused rat kidneys. Baines AD, et al. **Am J Physiol** 1986 Apr; 250(4 Pt 2):F674-9

Pulmonary inactivation of vasopressors following cardiac operations. Hochberg MS, et al. **Ann Thorac Surg** 1986 Feb;41(2):200-3

Dopaminergic effects of carbamazepine. Relationship to clinical response in affective illness. Post RM, et al. **Arch Gen Psychiatry** 1986 Apr; 43(4):392-6

3H-dopamine uptake and 3H-haloperidol binding in striatum after administration of methyl mercury to rats. Komulainen H, et al. **Arch Toxicol** 1985 Sep;57(4):268-71

Catecholaminergic and serotoninergic brain structures in European green frogs: an autoradiographical study. Diederen JH, et al. **Basic Appl Histochem** 1985;29(4):297-308

The influence of estrogen on nigrostriatal dopamine activity: behavioral and neurochemical evidence for both pre- and postsynaptic components. Becker JB, et al. **Behav Brain Res** 1986 Jan;19(1):27-33

Lateralized decrease in self-stimulation induced by haloperidol in rats with unilateral 6-hydroxydopamine lesions. Carey RJ. **Behav Brain Res** 1985 Dec;18(3):215-22

Deficits in spatial-memory tasks following lesions of septal dopaminergic terminals in the rat. Simon H, et al. **Behav Brain Res** 1986 Jan; 19(1):7-16

BIBLIOGRAPHY

Dopamine depletion, stimulation or blockade in the rat disrupts spatial navigation and locomotion dependent upon beacon or distal cues. Whishaw IQ, et al. **Behav Brain Res** 1985 Oct–Nov;18(1):11–29

Disturbances in exploratory behavior and functional recovery in the Y and radial mazes following dopamine depletion of the lateral septum. Taghzouti K, et al. **Behav Neural Biol** 1986 Jan;45(1):48–56

Influences of amino acids on the circadian rhythms of brain neurotransmitters. Angelova C, et al. **Bibl Nutr Dieta** 1986;(38):72–81

Structural requirements for cocaine congeners to interact with dopamine and serotonin uptake sites in mouse brain and to induce stereotyped behavior. Reith ME, et al. **Biochem Pharmacol** 1986 Apr 1;35(7):1123–9

Relationship of limbic dopamine levels to amphetamine- and anticholinergic–induced hyperactivity in the rat. Carey RJ. **Biol Psychiatry** 1986 Mar;21(3):317–21

The use of capillary gas chromatography/mass spectrometry for the determination of acidic dopamine metabolites in human brain. Michotte Y, et al. **Biomed Mass Spectrom** 1985 Dec;12(12):704–6

Conditionability of caudate dopamine activity in the caudate nucleus of cats demonstrated by in vivo electrochemistry. Brozoski TJ, et al. **Brain Res** 1986 Feb 5;364(2):275–83

Intrastriatal grafting of dopamine–containing neuronal cell suspensions: effects of mixing with target or non–target cells. Brundin P, et al. **Brain Res** 1986 Jan;389(1–2):77–84

The mechanism of action of MPTP and MPP+ on endogenous dopamine release from the rat corpus striatum superfused in vitro. Chang GD, et al. **Brain Res** 1986 Mar 12;368(1):134–40

Selective activation of mesolimbic and mesocortical dopamine metabolism in rat brain by infusion of a stable substance P analogue into the ventral tegmental area. Elliott PJ, et al. **Brain Res** 1986 Jan 15;363(1):145–7

Synaptic connections between serotoninergic axon terminals and tyrosine hydroxylase–immunoreactive neurons in the arcuate nucleus of the rat hypothalamus. A combination of electron microscopic autoradiography and immunocytochemistry. Kiss J, et al. **Brain Res** 1986 Feb 5;364(2):284–94

Effects of ventro–medial mesencephalic tegmentum (VMT) stimulation on the spontaneous activity of nucleus accumbens neurones: influence of the dopamine system. Le Douarin C, et al. **Brain Res** 1986 Jan 22;363(2):290–8

Dopaminergic facilitation of recovery from amygdaloid lesions which affect hypothalamic defensive attack in cats. Maeda H, et al. **Brain Res** 1986 Jan 15;363(1):135–40

Two simian virus 40 (SV40)–transformed cell lines from the mouse striatum and mesencephalon presenting astrocytic characters. II. Interactions with mesencephalic neurons. Mallat M, et al. **Brain Res** 1986 Apr;391(1):23–31

KCl–induced calcium–independent release of endogenous dopamine from rat brain slices. Okuma Y, et al. **Brain Res** 1986 Jan 15;363(1):47–52

Does triiodothyronine influence the morphogenesis of fetal mouse mesencephalic dopaminergic neurons cultured in chemically defined medium? Puymirat J, et al. **Brain Res** 1985 Dec;355(2):315–7

Differential effects of striatal injections of dopaminergic, cholinergic and GABAergic drugs upon swimming behavior of rats. Vrijmoed–de Vries MC, et al. **Brain Res** 1986 Jan 29;364(1):77–90

In vivo measurement of spontaneous release and metabolism of dopamine from intrastriatal nigral grafts using intracerebral dialysis. Zetterström T, et al. **Brain Res** 1986 Jan 8;362(2):344–9

Effects of dopamine and norepinephrine on neuronal activity of the olfactory tubercle. Guevara–Aguilar R, et al. **Brain Res Bull** 1985 Dec;15(6):665–8

Activation of striatal dopaminergic grafts by haloperidol. Herman JP, et al. **Brain Res Bull** 1985 Dec;15(6):543–6

Brain dopamine activity following intranigral or intrathalamic drug injections in the rat. Kilpatrick IC, et al. **Brain Res Bull** 1985 Dec;15(6):553–61

Antidromic discharge property of meso–accumbens dopaminergic VTA neurons in rats. Shinba T, et al. **Brain Res Bull** 1985 Dec;15(6):579–86

Activation of specific central dopamine pathways: locomotion and footshock. Speciale SG, et al. **Brain Res Bull** 1986 Jan;16(1):33–8

Effects of chronic methamphetamine on the nigral–striatal dopamine system in rat brain: tyrosine hydroxylase immunochemistry and quantitative light microscopic studies. Trulson ME, et al. **Brain Res Bull** 1985 Dec;15(6):569–77

Right ventricular function and pulmonary hemodynamics during dopamine infusion in burned patients. Martyn J, et al. **Chest** 1986 Mar;89(3):357–60

Effects of dopamine on renal function in the rat isolated perfused kidney. McGrath B, et al. **Clin Exp Pharmacol Physiol** 1985 Jul–Aug;12(4):343–52

Dopamine in rat kidney slices—its production and its histofluorescent localization. Hagege J, et al. **Contrib Nephrol** 1985;49:140–4

Impaired effect of dopamine on cardiac output during octopamine infusion. Tajimi K, et al. **Crit Care Med** 1986 Mar;14(3):192–4

Dopamine–induced migrating myoelectrical complex–like activity in human duodenum. Marzio L, et al. **Dig Dis Sci** 1986 Apr;31(4):349–54

D–2 dopaminergic agonists and adenosine 3',5'–monophosphate directly regulate the synthesis of alpha–melanocyte–stimulating hormone–like peptides by cultured rat melanotrophs. Beaulieu M, et al. **Endocrinology** 1986 Mar;118(3):1032–9

Dopamine and L–dopa: inhibition of thyrotropin–stimulated thyroidal thyroxine release. Maayan ML, et al. **Endocrinology** 1986 Feb;118(2):632–6

Striatal and mesolimbic dopaminergic contribution to 3,4–dihydroxyphenylacetic acid sulfate in rat plasma. Boudet C, et al. **Eur J Pharmacol** 1986 Feb 11;121(1):113–8

Evidence for the release of 1–methyl–4–phenylpyridinium (MPP+) from rat striatal neurons in vitro. Keller HH, et al. **Eur J Pharmacol** 1985 Dec 17;119(3):247–50

1–Methyl–4–phenyl–1,2,3,6–tetrahydropyridine (MPTP) administration to C57–black mice leads to parallel decrements in neostriatal dopamine content and tyrosine hydroxylase activity. Mayer RA, et al. **Eur J Pharmacol** 1986 Jan 29;120(3):375–7

GM1 monosialoganglioside inner ester induces early recovery of striatal dopamine uptake in rats with unilateral nigrostriatal lesion. Raiteri M, et al. **Eur J Pharmacol** 1985 Dec 3;118(3):347–50

Visual discrimination learning and interhemispheric transfer in the cat, as affected by 6–hydroxydopamine. Sprague JM, et al. **Exp Brain Res** 1985;61(1):43–53

Effect of thyrotropin–releasing hormone and dopamine on the in vitro secretion of prolactin by the bullfrog pituitary gland. Seki T, et al. **Gen Comp Endocrinol** 1986 Feb;61(2):197–202

Effect of low–dose dopamine infusion on insulin and glucagon release in fasting normal man. Connell JM, et al. **Horm Metab Res** 1986 Jan;18(1):67–8

Parathyroid hormone and calcitonin secretion in man: effect of dopamine agonists and antagonists. Williams GA, et al. **Horm Metab Res** 1986 Jan;18(1):64–6

Selective antagonism of the hypotensive effects of dopamine agonists in spontaneously hypertensive rats. McCoy CE, et al. **Hypertension** 1986 Apr;8(4):298–302

Dopamine influences the light peak in the perfused mammalian eye. Dawis SM, et al. **Invest Ophthalmol Vis Sci** 1986 Mar;27(3):330–5

Influences of endogenous dopamine on carotid body discharge and ventilation. Chow CM, et al. **J Appl Physiol** 1986 Feb;60(2):370–5

Further speculations on possible dopamine–opioid link in autism [letter] Sandyk R. **J Autism Dev Disord** 1986 Mar;16(1):89–90

A study of the relationship between dopamine and noradrenaline content and transmural pressure in the mesenteric arteries of the dog. Azevedo I, et al. **J Auton Pharmacol** 1986 Mar;6(1):33–7

Angiotensin II and dopamine modulate both cAMP and inositol phosphate productions in anterior pituitary cells. Involvement in prolactin secretion. Enjalbert A, et al. **J Biol Chem** 1986 Mar 25;261(9):4071–5

Automated method to estimate catecholamine and indoleamine content and turnover rates. Freeman GB, et al. **J Chromatogr** 1986 Jan 24;374(2):239–49

Increased dopaminergic activity inhibits basal and metoclopramide–stimulated prolactin and thyrotropin secretion. Agner T, et al. **J Clin Endocrinol Metab** 1986 Apr;62(4):778–82

Endogenous dopaminergic dysfunction: a novel form of human growth hormone deficiency and short stature. Huseman CA, et al. **J Clin Endocrinol Metab** 1986 Mar;62(3):484–90

Distribution of catecholamines between fetal and maternal compartments during human pregnancy with emphasis on L–dopa and dopamine. Peleg D, et al. **J Clin Endocrinol Metab** 1986 May;62(5):911–4

Gonadotropin–releasing hormone neurosecretion in the human hypothalamus: in vitro regulation by dopamine. Rasmussen DD, et al. **J Clin Endocrinol Metab** 1986 Mar;62(3):479–83

Periventricular dopaminergic neurons terminating in the neuro–intermediate lobe of the cat hypophysis. Luppi PH, et al. **J Comp Neurol** 1986 Feb 8;244(2):204–12

Age–dependent changes in the mechanisms regulating dopamine uptake in the central nervous system. Missale C, et al. **J Gerontol** 1986 Mar;41(2):136–9

Synthesis and toxicity toward nigrostriatal dopamine neurons of 1–methyl–4–phenyl–1,2,3,6–tetrahydropyridine (MPTP) analogues. Fries DS, et al. **J Med Chem** 1986 Mar;29(3):424–7

Evaluation of hypothalamic dopaminergic function by neuropharmacologic means in aged women. Cocchi D, et al. **J Neural Transm** 1985;64(3–4):199–210

Dopaminergic regulation of cone retinomotor movement in isolated teleost retinas: II. Modulation by gamma–aminobutyric acid and serotonin. Dearry A, et al. **J Neurochem** 1986 Apr;46(4):1022–31

Dopaminergic regulation of cone retinomotor movement in isolated teleost retinas: I. Induction of cone contraction is mediated by D2 receptors. Dearry A, et al. **J Neurochem** 1986 Apr;46(4):1006–21

Monoamine neurotransmitter metabolism and locomotor activity during chemical hypoxia. Freeman GB, et al. **J Neurochem** 1986 Mar;46(3):733–8

Characterization of sodium-dependent [3H]GBR-12935 binding in brain: a radioligand for selective labelling of the dopamine transport complex. Janowsky A, et al. **J Neurochem** 1986 Apr;46(4):1272-6

Brain dialysis: in vivo metabolism of dopamine and serotonin by monoamine oxidase A but not B in the striatum of unrestrained rats. Kato T, et al. **J Neurochem** 1986 Apr;46(4):1277-82

Dose response for amphetamine-induced changes in dopamine levels in push-pull perfusates of rat striatum. Kuczenski R. **J Neurochem** 1986 May;46(5):1605-11

Release of endogenous 3,4-dihydroxyphenylethylamine and its metabolites from the isolated neurointermediate lobe of the rat pituitary gland. Effects of electrical stimulation and of inhibition of monoamine oxidase and reuptake. Racké K, et al. **J Neurochem** 1986 Mar; 46(3):745-52

Effect of intrastriatal injection of diisopropylfluorophosphate on acetylcholine, dopamine, and serotonin metabolism. Robinson SE, et al. **J Neurochem** 1986 May;46(5):1632-8

Dopamine action in the nucleus accumbens. DeFrance JF, et al. **J Neurophysiol** 1985 Dec;54(6):1568-77

Stimulation of the lateral habenula inhibits dopamine-containing neurons in the substantia nigra and ventral tegmental area of the rat. Christoph GR, et al. **J Neurosci** 1986 Mar;6(3):613-9

Investigation of the failure of parenterally administered haloperidol to antagonize dopamine released from micropipettes in the caudate. Johnson SW, et al. **J Neurosci** 1986 Feb;6(2):572-80

Endogenous dopamine can modulate inhibition of substantia nigra pars reticulata neurons elicited by GABA iontophoresis or striatal stimulation. Waszczak BL, et al. **J Neurosci** 1986 Jan;6(1):120-6

Indirect dopaminergic effects of tofisopam, a 2,3-benzodiazepine, and their inhibition by lithium. Chopin P, et al. **J Pharm Pharmacol** 1985 Dec;37(12):917-9

Re-evaluation of the L-dopa loading effect on dopamine metabolism in rat striatum. el Gemayel G, et al. **J Pharm Pharmacol** 1986 Feb; 38(2):134-6

Evidence for dopamine release and metabolism beyond the control of nerve impulses and dopamine receptors in rat substantia nigra. Nissbrandt H, et al. **J Pharm Pharmacol** 1985 Dec;37(12):884-9

Effect of nialamide on the metabolism of dopamine injected into the nucleus accumbens of old rats. Cousin KM, et al. **J Pharmacol Exp Ther** 1986 Apr;237(1):25-30

Regulation of dopamine synthesis in the medial prefrontal cortex is mediated by release modulating autoreceptors: studies in vivo. Galloway MP, et al. **J Pharmacol Exp Ther** 1986 Mar;236(3):689-98

Effects of d-amphetamine and dopamine synthesis inhibitors on dopamine and acetylcholine neurotransmission in the striatum. II. Release in the presence of vesicular transmitter stores. Parker EM, et al. **J Pharmacol Exp Ther** 1986 Apr;237(1):193-203

Effects of d-amphetamine and dopamine synthesis inhibitors on dopamine and acetylcholine neurotransmission in the striatum. I. Release in the absence of vesicular transmitter stores. Parker EM, et al. **J Pharmacol Exp Ther** 1986 Apr;237(1):179-92

Cholecystokinin octapeptides alter the release of endogenous dopamine from the rat nucleus accumbens in vitro. Voigt M, et al. **J Pharmacol Exp Ther** 1986 Apr;237(1):147-53

Regulation of dopamine synthesis in the medial prefrontal cortex: studies in brain slices. Wolf ME, et al. **J Pharmacol Exp Ther** 1986 Mar; 236(3):699-707

The hypothalamo-hypophyseal rat explant in vitro: endocrinological studies of the pars intermedia dopaminergic neural input. Davis MD. **J Physiol (Lond)** 1986 Jan;370:381-93

Effects of neurotransmitters or drugs on the in vivo release of dopamine and its metabolites. Kito S, et al. **Jpn J Pharmacol** 1986 Jan; 40(1):57-67

Effects of neuroleptics on dopamine release from striatal slices. Yamada S, et al. **Kurume Med J** 1985;32(2):127-30

ACTH-(1-24) and alpha-MSH antagonize dopamine receptor-mediated inhibition of striatal dopamine and acetylcholine release. Versteeg DH, et al. **Life Sci** 1986 Mar 3;38(9):835-40

Inhibition of prolactin release and blockade of adenohypophyseal cell cyclic AMP accumulation are two dissociable effects of dopaminergic and non-dopaminergic drugs. Lafond J, et al. **Mol Cell Endocrinol** 1986 Mar;44(3):219-25

Dopamine, acting through D-2 receptors, inhibits rat striatal adenylate cyclase by a GTP-dependent process. Cooper DM, et al. **Mol Pharmacol** 1986 Feb;29(2):113-9

Sex differences in [3H]-estradiol binding in brain and pituitary after acute dopaminergic treatment. In vivo studies in the rat. Gietzen DW, et al. **Neuroendocrinology** 1986;42(4):334-43

Serotonin and dopamine independently regulate pituitary beta-endorphin release in vivo. Sapun-Malcolm D, et al. **Neuroendocrinology** 1986; 42(3):191-6

Biochemical correlates of motor changes caused by the manipulation of dopamine function in the substantia nigra of the mouse. Bradbury AJ, et al. **Neuropharmacology** 1985 Dec;24(12):1155-61

Laterality of dopamine function and neuroleptic action in the amygdala in the rat. Bradbury AJ, et al. **Neuropharmacology** 1985 Dec; 24(12):1163-70

Effects of avermectin B1a and picrotoxin on striatal release of dopamine with reference to replacement of extracellular chloride with nitrate. Ishiko J, et al. **Neuropharmacology** 1985 Dec;24(12):1147-54

Ascorbic acid reduces the dopamine depletion induced by MPTP. Wagner GC, et al. **Neuropharmacology** 1985 Dec;24(12):1261-2

Dopaminergic toxicity of rotenone and the 1-methyl-4-phenylpyridinium ion after their stereotaxic administration to rats: implication for the mechanism of 1-methyl-4-phenyl-1,2,3,6-tetrahydropyridine toxicity. Heikkila RE, et al. **Neurosci Lett** 1985 Dec 18;62(3):389-94

Novel synaptic responses mediated by dopamine and gamma-aminobutyric acid in neuroendocrine cells of the intermediate pituitary. MacVicar BA, et al. **Neurosci Lett** 1986 Feb 14; 64(1):35-40

Prolonged changes in dopaminergic terminal excitability and short changes in dopaminergic neuron discharge rate after short peripheral stimulation in monkey. Romo R, et al. **Neurosci Lett** 1985 Dec 18; 62(3):335-40

The norepinephrine and dopamine content of the cat carotid body in vivo under normoxic and hypoxic conditions. Starlinger H, et al. **Neurosci Lett** 1986 Feb 14;64(1):65-8

Different developmental schedules of dopaminergic and noradrenergic neurons in dissociation culture of fetal rat midbrain and hindbrain. Ahnert-Hilger G, et al. **Neuroscience** 1986;17(1):157-65

Unilateral dopamine depletions attenuate the response of striatal neurons to systemic amphetamine in both hemispheres. Basse-Tomusk AE, et al. **Neuroscience** 1985 Dec;16(4):845-50

Release and metabolism of [3H]dopamine in the neurointermediate lobe of the rat pituitary gland. Racké K, et al. **Neuroscience** 1985 Nov; 16(3):501-10

Treat shock with dopamine. Gever LN. **Nursing** 1986 Mar;16(3):93

Effects of dopamine and noradrenaline on Ca channels of cultured sensory and sympathetic neurons of chick. Marchetti C, et al. **Pflugers Arch** 1986 Feb;406(2):104-11

Striatally-mediated response of some structurally rigid analogues of dopamine. Antonian L, et al. **Pharmacol Biochem Behav** 1986 Feb; 24(2):253-8

Behavioral effects of a dimethylsulfonium analog of dopamine after injection into the nucleus accumbens and the striatum. Boldry R, et al. **Pharmacol Biochem Behav** 1986 Feb;24(2):223-8

Alteration of the turnover of dopamine and 5-hydroxytryptamine in rat brain associated with hypothermia. Okuda C, et al. **Pharmacol Biochem Behav** 1986 Jan;24(1):79-83

Antagonism by dopamine, but not noradrenaline receptor blockers of the anti-immobility activity of desipramine after different treatment schedules in the rat. Pulvirenti L, et al. **Pharmacol Res Commun** 1986 Jan;18(1):73-80

Submaximal plasma prolactin response to TRH and dopamine activity in man. Spoov J. **Pharmacopsychiatry** 1985 Nov;18(6):330-2

Further evidence that central neurotensin inhibits pituitary prolactin secretion by stimulating dopamine release from the hypothalamus. Tojo K, et al. **Proc Soc Exp Biol Med** 1986 Apr;181(4):517-22

Some factors affecting striatal 3-methoxytyramine concentrations in the mouse and rat. McQuade PS, et al. **Prog Neuropsychopharmacol Biol Psychiatry** 1985;9(5-6):725-9

Cholecystokinin peptides, dopamine and schizophrenia--a review. Nair NP, et al. **Prog Neuropsychopharmacol Biol Psychiatry** 1985; 9(5-6):515-24 (60 ref.)

CSF dopamine turnover and positive schizophrenic symptoms after withdrawal of long-term neuroleptic treatment. Frecska E, et al. **Psychiatry Res** 1985 Nov;16(3):221-6

Effects of central dopamine depletion on the d-amphetamine discriminative stimulus in rats. Woolverton WL, et al. **Psychopharmacology (Berlin)** 1986;88(2):196-200

Formation of dopamine sulfate from L-dopa by perfusion of dog kidney. Tsunematsu T. **Tokushima J Exp Med** 1985 Jun;32(1-2):23-9

Neurobiochemical alterations induced by the artificial sweetener aspartame (NutraSweet). Coulombe RA Jr, et al. **Toxicol Appl Pharmacol** 1986 Mar 30;83(1):79-85

[Comparison of the dopaminergic activity of the new Czechoslovak ergoline derivate transdihydrolisuride (Tergurid Spofa) with lisuride] Schreiber V, et al. **Bratisl Lek Listy** 1986 Jan;85(1):14-8 (Eng. Abstr.) **(Cze)**

[Dopamine-stimulated glycosylation of rat hippocampal proteins in vitro: structure-response relationship] Pchalek V, et al. **Biomed Biochim Acta** 1985;44(11-12):1651-8 (Eng. Abstr.) **(Ger)**

[The role of dopamine in the dyspeptic symptom complex] Kurtz W. **Fortschr Med** 1986 Jan 23;104(4):93-6 (Eng. Abstr.) **(Ger)**

[Role of the pituitary in modulating the effect of the dopaminergic and serotoninergic systems on the immune response] Al'perina EL, et al. **Fiziol Zh SSSR** 1985 Nov;71(11):1428-32 (Eng. Abstr.) **(Rus)**

[The hypothalamo-hypophyseal dopaminergic system in rats] Alexandrová M. **Cesk Fysiol** 1986;35(1):17-28 (76 ref.) **(Slo)**

DOPAMINE BETA-HYDROXYLASE

Light and electron microscopic immunohistochemistry on the localization of cytochrome P-450 of the side chain cleavage system and of cytochrome P-450 of 11 beta-hydroxylase in the bovine adrenal cortical cells. Ishimura K, et al. **Arch Histol Jpn** 1985 Dec;48(5):541-6

Olefin oxygenation and N-dealkylation by dopamine beta-monooxygenase: catalysis and mechanism-based inhibition. Padgette SR, et al. **Biochemistry** 1985 Oct 8;24(21):5826-39

Postnatal development of dopamine-beta-hydroxylase-immunoreactive fibers of the spinal cord of the rat. Aramant RB, et al. **Brain Res** 1986 Mar;390(2):161-71

Dopamine-beta-hydroxylase (DBH) and homovanillic acid (HVA) in autistic children. Garnier C, et al. **J Autism Dev Disord** 1986 Mar; 16(1):23-9

The mechanism of inactivation of dopamine beta-hydroxylase by hydrazines. Fitzpatrick PF, et al. **J Biol Chem** 1986 Apr 5; 261(10):4510-8

Studies on the binding of copper to dopamine beta-monooxygenase and other proteins using the Cu2+ ion-selective electrode. Syvertsen C, et al. **J Inorg Biochem** 1986 Jan;26(1):63-76

Cholinergic and GABAergic regulation of dopamine beta-hydroxylase activity in the adrenal gland of the rat. Lima L, et al. **J Pharmacol Exp Ther** 1986 Apr;237(1):265-70

Determination of dopamine-beta-hydroxylase in cerebrospinal fluid by high-performance liquid chromatography with electrochemical detection. Dillen L, et al. **J Pharmacol Methods** 1986 Feb; 15(1):51-63

Reserpine and the monoaminergic regulation of adrenal dopamine beta-hydroxylase activity. Lima L, et al. **Neuroscience** 1986; 17(1):235-45

DOXAPRAM

Sensitive nitrogen-phosphorus capillary gas chromatographic assay for doxapram in premature infants. Torok-Both GA, et al. **J Chromatogr** 1985 Nov 8;344:372-7

DOXEPIN

Doxepin-cimetidine interaction: increased doxepin bioavailability during cimetidine treatment. Abernethy DR, et al. **J Clin Psychopharmacol** 1986 Feb;6(1):8-12

Double-blind comparison of doxepin versus bupropion in outpatients with a major depressive disorder. Feighner J, et al. **J Clin Psychopharmacol** 1986 Feb;6(1):27-32

DRUG EVALUATION

Measurement of compliance. Sleator EK. **Psychopharmacol Bull** 1985; 21(4):1089-93

DRUG SCREENING

[Behavioral and pharmacological studies of methamphetamine-induced stereotypy of mice by the open field method] Nakamura K, et al. **Yakugaku Zasshi** 1985 Aug;105(8):775-83 (Eng. Abstr.) **(Jpn)**

DRUG TOLERANCE

Characteristics of tolerance, recovery from tolerance and cross-tolerance for cocaine used as a discriminative stimulus. Wood DM, et al. **J Pharmacol Exp Ther** 1986 Apr;237(1):120-5

ELECTROCONVULSIVE THERAPY

Low levels and lack of predictors of somatotherapy and psychotherapy received by depressed patients. Keller MB, et al. **Arch Gen Psychiatry** 1986 May;43(5):458-66

Effects of ECT on sleep and CSF biogenic amines in affective illness. Hoffmann G, et al. **Psychiatry Res** 1985 Nov;16(3):199-206

ELECTROENCEPHALOGRAPHY

Synchronizing EEG effect of mianserin. Bo P, et al. **Farmaco [Sci]** 1985 Dec;40(12):909-20

Classification of sulpiride, clozapine and haloperidol by toposelective recording from different brain structures in the immobilized rat (stereo-EEG). Dimpfel W, et al. **Neuropsychobiology** 1985; 14(3):157-64

The physiology and pharmacology of hippocampal formation theta rhythms. Bland BH. **Prog Neurobiol** 1986;26(1):1-54 (279 ref.)

[EEG changes with leponex medication] Kursawe HK, et al. **Psychiatr Neurol Med Psychol (Leipz)** 1985 Dec;37(12):705-12 (Eng. Abstr.) **(Ger)**

[Correlation of the clinical pharmacological action of a single dose of fenazepam with the EEG dynamics and pharmacokinetics] Uvarova LG, et al. **Farmakol Toksikol** 1986 Jan-Feb;49(1):66-9 (Eng. Abstr.) **(Rus)**

ELECTROLYTES

Effect of luminally administered serotonin and substance P on jejunal handling of water and electrolytes. McFadden D, et al. **Am J Surg** 1986 Jan;151(1):81-6

Water and electrolyte absorption from a human Thiry-Vella ileal loop. Responses to systemic administration of gastrin, glucagon, secretin, and cholecystokinin. Lai EC, et al. **Ann Surg** 1986 Apr;203(4):434-8

Investigations of nerve populations influencing ion transport that can be stimulated electrically, by serotonin and by a nicotinic agonist. Keast JR, et al. **Naunyn Schmiedebergs Arch Pharmacol** 1985 Nov; 331(2-3):260-6

[Changes in serum electrolytes and cardiovascular function: a possible cause of shock during nasal operation using local anesthetics] Okamoto K, et al. **Nippon Jibiinkoka Gakkai Kaiho** 1985 Sep;88(9):1146-52 (Eng. Abstr.) **(Jpn)**

ELECTROSHOCK

Brain histamine turnover enhanced by footshock. Yoshitomi I, et al. **Brain Res** 1986 Jan 1;362(1):195-8

Activation of specific central dopamine pathways: locomotion and footshock. Speciale SG, et al. **Brain Res Bull** 1986 Jan;16(1):33-8

Electroconvulsive shock: effect on pineal and hypothalamic indoles. McIntyre IM, et al. **J Pineal Res** 1984;1(3):273-9

EMOTIONS

Increase of circulating beta-endorphin-like immunoreactivity correlates with the change in feeling of pleasantness after running. Wildmann J, et al. **Life Sci** 1986 Mar 17;38(11):997-1003

[Neurochemical aspects of the emotional reactivity and motor activity of rats in new circumstances] Kulagin DA, et al. **Usp Fiziol Nauk** 1986 Jan-Mar;17(1):92-109 (99 ref.) **(Rus)**

[Disorders of positive emotions in schizophrenics: survey of research, (problems, hypotheses)] Poliakov IuF, et al. **Zh Nevropatol Psikhiatr** 1985;85(12):1857-62 (45 ref.) **(Rus)**

ENDORPHINS

Proceedings of the International Narcotics Research Conference. North Falmouth, Massachusetts, June 23-28, 1985. **Alcohol Drug Res** 1985-86; 6(2-3):63-252

Peptide biosynthesis. Cox BM. **Alcohol Drug Res** 1985-86;6(2-3):85-6

Molecular biological approaches. Schwartz J. **Alcohol Drug Res** 1985-86; 6(2-3):81-3

Evaluation on the treatment of morphine addiction by acupuncture Chinese herbs and opioid peptides. Yang MM, et al. **Am J Chin Med** 1986;14(1-2):46-50

Apgar scores and cerebrospinal fluid beta-endorphinlike immunoreactivity [letter] Todd D. **Am J Dis Child** 1986 Feb; 140(2):91-2

Plasma immunoreactive beta-endorphin in exercise-associated amenorrhea. Laatikainen T, et al. **Am J Obstet Gynecol** 1986 Jan; 154(1):94-7

The relationship of beta-endorphin and ACTH in the cerebrospinal fluid and plasma of adult surgical patients. Scheller MS, et al. **Ann Clin Res** 1985;17(6):323-6

The effect of phobic anxiety on plasma beta-endorphin: a single-subject experiment. Thyer BA, et al. **Behav Res Ther** 1986;24(2):237-41

Beta-endorphin is present in active and inactive forms in rat gastric antrum. Rosenquist GL, et al. **Biochem Biophys Res Commun** 1986 Jan 14;134(1):14-20

Breakdown of small enkephalin derivatives and adrenal peptide E by human plasma. Boarder MR, et al. **Biochem Pharmacol** 1986 Mar 15; 35(6):1043-7

Tertiary structure in deletion analogues of human beta-endorphin: resistance to leucine aminopeptidase action. Bewley TA, et al. **Biochemistry** 1985 Nov 5;24(23):6568-71

Functional properties of covalent beta-endorphin peptide/calmodulin complexes. Chlorpromazine binding and phosphodiesterase activation. Giedroc DP, et al. **Biochemistry** 1985 Feb 26;24(5):1203-11

Identification of distinct binding site subunits of mu and delta opioid receptors. Howard AD, et al. **Biochemistry** 1986 Jan 28;25(2):357-60

Discordant changes between immunoreactive ACTH and beta-endorphin in rat brain and pituitary during early development. Kapcala LP. **Brain Res** 1986 Feb 5;364(2):350-9

Hypothalamic opioids and the acute-phase glycoprotein response in guinea pigs. Ahokas RA, et al. **Brain Res Bull** 1985 Dec; 15(6):603-8

Opioid antagonists in circulatory shock [editorial] Groeger JS. **Crit Care Med** 1986 Feb;14(2):170-1

Central regulation of intestinal basal and stimulated water and ion transport by endogenous opiates in dogs. Primi MP, et al. **Dig Dis Sci** 1986 Feb;31(2):172-6

Secretion into the culture medium of a foreign gene product from Escherichia coli: use of the ompF gene for secretion of human

beta-endorphin. Nagahari K, et al. **EMBO J** 1985 Dec 16; 4(13A):3589-92
Modulation of luteinizing hormone(LH) release by clonidine and opioid peptides in castrated male rats. Koh T, et al. **Endocrinol Jpn** 1985 Oct; 32(5):653-9
Long term culture of primary rat pituitary adrenocorticotropin/endorphin-producing cells in serum-free medium. May V, et al. **Endocrinology** 1986 Apr;118(4):1284-95
A diurnal rhythm in proopiomelanocortin messenger ribonucleic acid that varies concomitantly with the content and secretion of beta-endorphin in the intermediate lobe of the rat pituitary. Millington WR, et al. **Endocrinology** 1986 Feb;118(2):829-34
The effect of training on responses of beta-endorphin and other pituitary hormones to insulin-induced hypoglycemia. Mikines KJ, et al. **Eur J Appl Physiol** 1985;54(5):476-9
Opioid peptides. Conformational studies of dermorphin and its constitutive fragments by circular dichroism. IX. Scatturin A, et al. **Farmaco [Sci]** 1985 Oct;40(10):709-16
Chemical characterization and opioid activity of an exorphin isolated from in vivo digests of casein. Meisel H. **FEBS Lett** 1986 Feb 17; 196(2):223-7
Immunoreactive beta-endorphin in human ovaries. Aleem FA, et al. **Fertil Steril** 1986 Apr;45(4):507-11
Plasma beta-endorphin levels in anovulatory states: changes after treatments for the induction of ovulation. Petraglia F, et al. **Fertil Steril** 1986 Feb;45(2):185-90
Rise in plasma beta-endorphin and ACTH in response to hyperthermia in sauna. Ježová D, et al. **Horm Metab Res** 1985 Dec;17(12):693-4
Effect of third ventricular injection of beta-endorphin on the electrophysiological responses of some regions of endocrine hypothalamus. Tandon OP, et al. **Indian J Physiol Pharmacol** 1985 Apr-Jun;29(2):75-82
Further speculations on possible dopamine-opioid link in autism [letter] Sandyk R. **J Autism Dev Disord** 1986 Mar;16(1):89-90
The size of enzymes acetylating alpha-melanocyte-stimulating hormone and beta-endorphin. Chappell MC, et al. **J Biol Chem** 1986 Jan 25; 261(3):1088-91
Competitive binding of dynorphin-(1-13) and beta-endorphin to cerebroside sulfate in solution. Wu CS, et al. **J Biol Chem** 1986 Mar 15;261(8):3687-91
Separation and detection of closely related endorphins by liquid chromatography-electrochemistry. Fleming LH, et al. **J Chromatogr** 1986 Feb 14;375(1):65-73
Beta-endorphin attenuates the serum cortisol response to exogenous adrenocorticotropin. Beyer HS, et al. **J Clin Endocrinol Metab** 1986 May;62(5):808-11
No evidence for the presence of beta-casomorphins in human plasma after ingestion of cows' milk or milk products. Teschemacher H, et al. **J Dairy Res** 1986 Feb;53(1):135-8
Immunoreactive dynorphin B in sacral primary afferent fibers of the cat. Basbaum AI, et al. **J Neurosci** 1986 Jan;6(1):127-33
Spinal release of immunoreactive Met-enkephalin by intraventricular beta-endorphin and its analogs in anesthetized rats. Tseng LF, et al. **J Pharmacol Exp Ther** 1986 Apr;237(1):65-74
Effect of short photoperiod on hypothalamic methionine-enkephalin and LHRH content and serum beta-endorphin-like immunoreactivity (beta-end LI) levels in golden hamsters. Kumar MS, et al. **J Pineal Res** 1984;1(2):197-205
Food deprivation-induced changes in the level of opioid peptides in the pituitary and brain of rat. Vaswani KK, et al. **Life Sci** 1986 Jan 13; 38(2):197-201
Increase of circulating beta-endorphin-like immunoreactivity correlates with the change in feeling of pleasantness after running. Wildmann J, et al. **Life Sci** 1986 Mar 17;38(11):997-1003
Pharmacology of opioids. Part 1. Basic aspects. Mather LE. **Med J Aust** 1986 Apr 14;144(8):424-7
Opioid peptides decrease noradrenaline release and blood pressure in the rabbit at peripheral receptors. Szabo B, et al. **Naunyn Schmiedebergs Arch Pharmacol** 1986 Jan;332(1):50-6
Serotonin and dopamine independently regulate pituitary beta-endorphin release in vivo. Sapun-Malcolm D, et al. **Neuroendocrinology** 1986; 42(3):191-6
Modulation by Leu-enkephalin of peptide release from perifused neurointermediate pituitary. II. Inhibition of calcium-mediated secretion of alpha-MSH and beta-endorphin. Al Zein M, et al. **Neuroendocrinology** 1986;42(3):248-54
Distribution of immunoreactive alpha-neo-endorphin in the rat brain. Smiałowska M, et al. **Neurosci Lett** 1985 Dec 18;62(3):359-64
Water intake modifications induced by tachykinins, bombesins and opioid peptides. de Caro G, et al. **Peptides** 1985;6 Suppl 3:181-5
Native opioid-like peptides in Squilla mantis ganglia. Marino G, et al. **Peptides** 1985;6 Suppl 3:403-6
Changes in the activity of rat cortical and hippocampal neurones after the iontophoretic administration of beta-endorphin, glutamate and GABA. Strejčková A, et al. **Physiol Bohemoslov** 1985;34(6):567-73
Serotonergic regulation of the brain and gut beta-endorphin and dynorphin content in the rat. Majeed NH, et al. **Pol J Pharmacol Pharm** 1985 Nov-Dec;37(6):909-18
Isolation and structure of a C-terminally amidated nonopioid peptide, amidorphin-(8-26), from bovine striatum: a major product of proenkephalin in brain but not in adrenal medulla. Liebisch DC, et al. **Proc Natl Acad Sci USA** 1986 Mar;83(6):1936-40
Gamma-type endorphins: neurolepticum-like and antipsychotic action. Van Ree JM, et al. **Prog Neuropsychopharmacol Biol Psychiatry** 1985; 9(5-6):561-7
Plasma immunoreactive beta-endorphin in bulimics. Fullerton DT, et al. **Psychol Med** 1986 Feb;16(1):59-63
Developmental, behavioral, and opiate receptor changes after prenatal or postnatal beta-endorphin, CRF, or Tyr-MIF-1. Zadina JE, et al. **Psychoneuroendocrinology** 1985;10(4):367-83
Circadian rhythms of beta-endorphin in the aged. Casale G, et al. **Z Gerontol** 1985 Nov-Dec;18(6):340-2
[Neurochemical characteristics of opioid peptides] Vion-Dury J, et al. **Presse Med** 1986 Mar 8;15(10):475-9 (21 ref.) (Eng. Abstr.) **(Fre)**

ENKEPHALIN, LEUCINE

Leu-enkephalin impairs memory of an appetitive maze response in mice. Linden D, et al. **Behav Neurosci** 1986 Feb;100(1):33-8
Structure-activity relationships of enkephalins containing serially replaced thiomethylene amide bond surrogates. Spatola AF, et al. **Life Sci** 1986 Apr 7;38(14):1243-9
Proposals for the mu-active conformation of the enkephalin analog Tyr-cyclol(-N gamma-D-A2-bu-Gly-Phe-Leu-). Maigret B, et al. **Mol Pharmacol** 1986 Mar;29(3):314-20
Modulation by Leu-enkephalin of peptide release from perifused neurointermediate pituitary. II. Inhibition of calcium-mediated secretion of alpha-MSH and beta-endorphin. Al Zein M, et al. **Neuroendocrinology** 1986;42(3):248-54
[Conformation of the enkephalin cycloanalog Lys-Tyr-Gly-Gly-Phe-Leu-] Balodis IuIu, et al. **Bioorg Khim** 1985 Nov;11(11):1468-75 (Eng. Abstr.) **(Rus)**
[Changes in the met- and leu-enkephalin levels in the rat brain during burn shock] Zaets TL, et al. **Biull Eksp Biol Med** 1986 Jan; 101(1):10-1 (Eng. Abstr.) **(Rus)**
[Effect of enkephalins on the function of the calcium-regulating endocrine glands in shock] Zoloev GK, et al. **Biull Eksp Biol Med** 1986 Mar; 101(3):284-7 (Eng. Abstr.) **(Rus)**
[Effect of enkephalins on metabolic indices in acute experimental blood loss in rats] Zoloev GK. **Patol Fiziol Eksp Ter** 1985 Nov-Dec; (6):25-8 (Eng. Abstr.) **(Rus)**

ENKEPHALIN, METHIONINE

Enkephalin analogue in schizophrenia. Double blind cross-over trial. Joergensen A, et al. **Acta Psychiatr Scand** 1986 Jan;73(1):45-8
Crystal structure of methionine-enkephalin. Mastropaolo D, et al. **Biochem Biophys Res Commun** 1986 Jan 29;134(2):698-703
Chronic treatment with five different neuroleptics elicits behavioral supersensitivity to opiate infusion into the nucleus accumbens. Stinus L, et al. **Biol Psychiatry** 1986 Jan;21(1):34-48
Local and remote effects of intra-caudate administration of GABA-related drugs on Met-enkephalin release in the basal ganglia. Bourgoin S, et al. **Brain Res** 1985 Dec 30;361(1-2):361-72
Ultrastructural localization of enkephalin immunoreactivity in the substantia nigra of the monkey. Inagaki S, et al. **Brain Res** 1986 Jan 1;362(1):171-4
Distribution of immunoreactive metorphamide (adrenorphin) in discrete regions of the rat brain: comparison with Met-enkephalin-Arg6-Gly7-Leu8. Zamir N, et al. **Brain Res** 1985 Dec 30;361(1-2):193-9
Central regulation of intestinal basal and stimulated water and ion transport by endogenous opiates in dogs. Primi MP, et al. **Dig Dis Sci** 1986 Feb;31(2):172-6

Modulation of luteinizing hormone(LH) release by clonidine and opioid peptides in castrated male rats. Koh T, et al. **Endocrinol Jpn** 1985 Oct; 32(5):653-9

Metorphamide levels in chromaffin cells increase after treatment with reserpine. Eiden LE, et al. **J Neurochem** 1986 May;46(5):1651-4

Spinal release of immunoreactive Met-enkephalin by intraventricular beta-endorphin and its analogs in anesthetized rats. Tseng LF, et al. **J Pharmacol Exp Ther** 1986 Apr;237(1):65-74

Effect of short photoperiod on hypothalamic methionine-enkephalin and LHRH content and serum beta-endorphin-like immunoreactivity (beta-end LI) levels in golden hamsters. Kumar MS, et al. **J Pineal Res** 1984;1(2):197-205

Characterization of aminopeptidases responsible for inactivating endogenous (Met5)enkephalin in brain slices using peptidase inhibitors and anti-aminopeptidase M antibodies. Giros B, et al. **Mol Pharmacol** 1986 Mar;29(3):281-7

Presynaptic modulation by noradrenaline and an opioid of the substance P-induced release of [3H]acetylcholine from the myenteric plexus. Vizi ES, et al. **Regul Pept** 1985 Nov 28;12(4):317-25

Methionine-enkephalin does not alter human platelet aggregatory response. Given MB, et al. **Thromb Res** 1985 Dec 1;40(5):711-4

[Changes in the met- and leu-enkephalin levels in the rat brain during burn shock] Zaets TL, et al. **Biull Eksp Biol Med** 1986 Jan; 101(1):10-1 (Eng. Abstr.) **(Rus)**

ENKEPHALINS

Neurotransmitters of the cochlea and cochlear nucleus: immunocytochemical evidence. Altschuler RA, et al. **Am J Otolaryngol** 1986 Mar-Apr;7(2):100-6 (59 ref.)

Reptilian enkephalins: implications for the evolution of proenkephalin. Lindberg I, et al. **Arch Biochem Biophys** 1986 Feb 15;245(1):1-7

Localization of substance P- and enkephalin-like immunoreactivity in the human paravertebral sympathetic ganglia. Del Fiacco M, et al. **Basic Appl Histochem** 1985;29(4):309-20

Breakdown of small enkephalin derivatives and adrenal peptide E by human plasma. Boarder MR, et al. **Biochem Pharmacol** 1986 Mar 15; 35(6):1043-7

Glutamic acid decarboxylase and enkephalin immunoreactive axon terminals in the rat neostriatum synapse with striatonigral neurons. Aronin N, et al. **Brain Res** 1986 Feb 12;365(1):151-8

Distribution of enkephalin-immunoreactive cell bodies in relation to serotonin-containing neurons in the raphe nuclei of the cat: immunohistochemical evidence for the coexistence of enkephalins and serotonin in certain cells. Léger L, et al. **Brain Res** 1986 Jan 1; 362(1):63-73

Properties of antidromically identified neurons in the enkephalinergic magnocellular dorsal nucleus of the guinea pig hypothalamus. Poulain P. **Brain Res** 1986 Jan 1;362(1):74-82

Addiction, nutrition and health. Russell CA. **Dent Health (London)** 1985 Nov-Dec;24(5):7, 9-11

Identification of a 27-kDa enkephalin-containing protein associated with bovine adrenal medullary chromaffin granule membranes by immunoblotting. Birch NP, et al. **FEBS Lett** 1986 Mar 3; 197(1-2):173-8

NOE data at 500 MHz reveal the proximity of phenyl and tyrosine rings in enkephalin. Gupta G, et al. **FEBS Lett** 1986 Mar 31; 198(2):245-50

The prohormone processing activity is enriched in a low-density subpopulation of chromaffin granules. Maret GE, et al. **FEBS Lett** 1986 Jan 20;195(1-2):258-60

Cloning and expression in Escherichia coli of the synthetic proenkephalin analogue gene. Hostomský Z, et al. **Gene** 1985;39(2-3):269-74

'Enkephalinase', a newly characterised dipeptidyl carboxypeptidase: properties and possible role in enkephalinergic transmission. Schwartz JC, et al. **Int J Neurol** 1980;14(2-4):195-204 (45 ref.)

The ultrastructure of enkephalin-immunoreactive neurons in the interpeduncular nucleus of the rat. Mahalik TJ, et al. **J Comp Neurol** 1986 Feb 15;244(3):360-8

Geometrical correspondence between phenazocine and the enkephalins. Froimowitz M, et al. **J Med Chem** 1986 Apr;29(4):573-8

Dynorphin- and enkephalin-like immunoreactivity is altered in limbic-basal ganglia regions of rat brain after repeated electroconvulsive shock. Kanamatsu T, et al. **J Neurosci** 1986 Mar;6(3):644-9

GABAergic regulation of enkephalin in rat striatum: alterations in Met5-enkephalin level, precursor content and preproenkephalin messenger RNA abundance. Sivam SP, et al. **J Pharmacol Exp Ther** 1986 Apr;237(1):326-31

The stimulation of food intake by selective agonists of mu, kappa and delta opioid receptors. Gosnell BA, et al. **Life Sci** 1986 Mar 24; 38(12):1081-8

Nomenclature for enkephalin degrading peptidases. Hersh LB. **Life Sci** 1986 Mar 31;38(13):1151-3 (17 ref.)

Effect of various enkephalin analogs and dipeptides on the enzymatic activity of enkephalinase B isolated from calf-brain striatum. van Amsterdam JG, et al. **Life Sci** 1986 Mar 24;38(12):1111-8

Detection of the mRNA coding for enkephalin precursor in the rat brain and adrenal by using an 'in situ' hybridization procedure. Bloch B, et al. **Neurosci Lett** 1986 Feb 14;64(1):29-34

Inputs to motoneurones in the hypoglossal nucleus of the rat: light and electron microscopic immunocytochemistry for choline acetyltransferase, substance P and enkephalins using monoclonal antibodies. Connaughton M, et al. **Neuroscience** 1986;17(1):205-24

Isolation and structure of a C-terminally amidated nonopioid peptide, amidorphin-(8-26), from bovine striatum: a major product of proenkephalin in brain but not in adrenal medulla. Liebisch DC, et al. **Proc Natl Acad Sci USA** 1986 Mar;83(6):1936-40

Permissive effect of dexamethasone on the increase of proenkephalin mRNA induced by depolarization of chromaffin cells. Naranjo JR, et al. **Proc Natl Acad Sci USA** 1986 Mar;83(5):1513-7

Activation of mouse T-helper cells induces abundant preproenkephalin mRNA synthesis. Zurawski G, et al. **Science** 1986 May 9; 232(4751):772-5

[Enkephalins] Grzeszczak W, et al. **Przegl Lek** 1985;42(10):714-8 **(Pol)**

[Effect of vasopressin and enkephalin analogs on the chemoreactive properties of the sensorimotor cortex neurons in rats] Kruglikov RI, et al. **Biol Nauki** 1985;(11):61-6 (Eng. Abstr.) **(Rus)**

ENURESIS

Childhood enuresis: prevalence, perceived impact, and prescribed treatments. Foxman B, et al. **Pediatrics** 1986 Apr;77(4):482-7

EPHEDRINE

Use of orthogonal polynomials for unequal intervals to eliminate interference in spectrophotometric analysis. Simultaneous determination of ephedrine hydrochloride and diphenhydramine hydrochloride in two-component mixtures. Korany MA, et al. **Analyst** 1986 Jan; 111(1):41-4

Possible involvement of beta 2-adrenoceptors in hyperthermic effect of l-ephedrine in rats. Yamahara J, et al. **J Pharmacobiodyn** 1985 Aug; 8(8):591-6

The effect of chronic ephedrine treatment on substrate utilization, the sympathoadrenal activity, and energy expenditure during glucose-induced thermogenesis in man. Astrup A, et al. **Metabolism** 1986 Mar;35(3):260-5

No promethazine in Nyquil [letter] Lewis ET. **N Engl J Med** 1986 Apr 3;314(14):927

[Gas chromatographic analysis of ephedrine] Pham C, et al. **Acta Pharm Hung** 1986 Jan;56(1):16-25 (Eng. Abstr.) **(Hun)**

[Behavioral changes in rhesus monkeys induced by repeated administration of ephedrine] Kato S. **Seishin Shinkeigaku Zasshi** 1985; 87(8):583-94 (Eng. Abstr.) **(Jpn)**

EPINEPHRINE

Comparative study of mechanical responses of hepatic arteries strips to adrenalin in presence of pyridoxine and pyridoxal-5'-phosphate. Bettini V, et al. **Acta Vitaminol Enzymol** 1985;7(3-4):155-66

Glucoregulatory role of cortisol and epinephrine interactions studied in adrenalectomized dogs. Gauthier C, et al. **Am J Physiol** 1986 Apr; 250(4 Pt 1):E393-401

Ontogeny of epinephrine-induced anorexia in rats. Rodriguez-Zendejas AM, et al. **Am J Physiol** 1986 Feb;250(2 Pt 2):R313-7

An association between norepinephrine-to-epinephrine ratio and suicidal ideation in depression [letter] **Am J Psychiatry** 1986 May; 143(5):683-4

The metabolic and ventilatory response to the infusion of stress hormones. Weissman C, et al. **Ann Surg** 1986 Apr;203(4):408-12

Epinephrine. Use, adverse effects, and dosage calculation. Kochansky SW. **AORN J** 1986 Apr;43(4):852-5

Responses of adrenal catecholamine secretion to lateral hypothalamic stimulation and lesion in rats. Katafuchi T, et al. **Brain Res** 1986 Jan 15;363(1):141-4

Modulating effects of posttraining epinephrine on memory: involvement of the amygdala noradrenergic system. Liang KC, et al. **Brain Res** 1986 Mar 12;368(1):125-33

Paradoxical effects of epinephrine on cAMP synthesis and degradation in rat adipocytes. Fatemi SH. **Cell Mol Biol** 1985;31(5):349-56

Parenteral adrenergic bronchodilators and potassium. Küng M. **Chest** 1986 Mar;89(3):322-3

Adrenergic coronary tone during submaximal exercise in the dog is produced by circulating catecholamines. Evidence for adrenergic denervation supersensitivity in the myocardium but not in coronary vessels. Chilian WM, et al. **Circ Res** 1986 Jan;58(1):68-82

Effect of epinephrine on cerebral and myocardial perfusion in an infant animal preparation of cardiopulmonary resuscitation. Schleien CL, et al. **Circulation** 1986 Apr;73(4):809-17

Selective alpha 2 receptor blockade facilitates the insulin response to adrenaline but not to glucose in man. Struthers AD, et al. **Clin Endocrinol (Oxf)** 1985 Nov;23(5):539-46

Cardiovascular and metabolic responses to low dose adrenaline infusion: an invasive study in humans. Freyschuss U, et al. **Clin Sci** 1986 Feb;

70(2):199-206

Plasma adrenaline measurements [letter] McCulloch R, et al. **Clin Sci** 1986 Feb;70(2):211-2

Catecholamine-mediated injury to endothelium in rabbit perfused aorta: a quantitative analysis by scanning electron microscopy. Makhmudov RM, et al. **Cor Vasa** 1985;27(6):456-63

Human aqueous humor catecholamines. Autzen T, et al. **Curr Eye Res** 1985 Dec;4(12):1269-71

Further studies on the effect of retrobulbar epinephrine injection on ocular and optic nerve blood flow. Jay WM, et al. **Curr Eye Res** 1986 Jan; 5(1):63-7

Acute influence of cigarette smoke in platelets, catecholamines and neurophysins in the normal conditions of daily life. de Lorgeril M, et al. **Eur Heart J** 1985 Dec;6(12):1063-8

Reproducibility of plasma catecholamine concentrations at rest and during exercise in man. Péronnet F, et al. **Eur J Appl Physiol** 1986; 54(6):555-8

Evidence that epinephrine acts preferentially as an antilipolytic agent in abdominal human subcutaneous fat cells: assessment by analysis of beta and alpha 2 adrenoceptor properties. Berlan M, et al. **Eur J Clin Invest** 1985 Dec;15(6):341-8

Plasma catecholamines and glucose during moderate exercise in the trout: comparison with bursts of violent activity. Ristori MT, et al. **Exp Biol** 1985;44(4):247-53

Cardiac function and plasma catecholamines during upright exercise in healthy young subjects. Kelbaek H, et al. **Int J Cardiol** 1986 Mar; 10(3):223-35

Free plasma catecholamines, heart rates, lactate levels, and oxygen uptake in competition weight lifters, cyclists, and untrained control subjects. Lehmann M, et al. **Int J Sports Med** 1986 Feb;7(1):18-21

Plasma norepinephrine concentration reflects pharmacological alteration of sympathetic activity in the conscious cat. Hubbard JW, et al. **J Auton Nerv Syst** 1986 Jan;15(1):93-100

Insulin antagonizes epinephrine activation of the membrane transport of fatty acids. Potential site for hormonal suppression of lipid mobilization. Abumrad NA, et al. **J Biol Chem** 1986 Mar 5;261(7):2999-3001

Hormone-stimulated polyphosphoinositide breakdown in rat liver plasma membranes. Roles of guanine nucleotides and calcium. Uhing RJ, et al. **J Biol Chem** 1986 Feb 15;261(5):2140-6

Epinephrine infusion decreases magnesium plasma concentration in humans [letter] Belz GG, et al. **J Cardiovasc Pharmacol** 1985 Nov-Dec; 7(6):1205-6

Pharmacologic support of the myocardium following aortocoronary bypass surgery: a comparative study. Balderman SC, et al. **J Clin Pharmacol** 1986 Mar;26(3):175-83

Unusual responses of cultured Fundulus heteroclitus melanophores to epinephrine and ions, paradox of K+ versus Na+. Clark CR, et al. **J Exp Zool** 1985 Dec;236(3):361-4

In vivo hyperglycemic effect of (-)- and (+)-epinephrine in dogs. Kowarski CR, et al. **J Pharm Sci** 1986 Jan;75(1):78-9

Microvascular reactivity of in vitro blood perfused juxtameduliary nephrons from rats. Casellas D, et al. **Kidney Int** 1985 Nov; 28(5):752-9

Infiltration of adrenaline before thyroidectomy [letter] Mair IM. **Lancet** 1971 Dec 11;2(7737):1324

Epinephrine and norepinephrine stimulation of adenylate cyclase in bovine retina homogenate: evidence for interaction with the dopamine D1 receptor. Vanderheyden P, et al. **Life Sci** 1986 Mar 31; 38(13):1221-7

In vitro effects of betamethasone, adrenaline and noradrenaline on normal human T-lymphocyte rosettes. Kumar R, et al. **Mater Med Pol** 1985 Jul-Sep;17(3):170-1

Desensitization of epinephrine-initiated platelet aggregation does not alter binding to the alpha 2-adrenergic receptor or receptor coupling to adenylate cyclase. Motulsky HJ, et al. **Mol Pharmacol** 1986 Jan; 29(1):1-6

Regulation of thyrotropin secretion by the central epinephrine system. Studies in the chronically cannulated rat. Terry LC. **Neuroendocrinology** 1986;42(2):102-8

Action of isoproterenol and epinephrine on the guinea pig taenia coli studied by intracellular microelectrodes. Tomita T, et al. **Nippon Heikatsukin Gakkai Zasshi** 1985 Jul;21 Suppl:55-9

Plasma catecholamines at rest and exercise in subjects with high- and low-trait anxiety. Péronnet F, et al. **Psychosom Med** 1986 Jan-Feb; 48(1-2):52-8

Potentiation of adrenaline-induced platelet aggregation by angiotensin II. Ding YA, et al. **Thromb Haemost** 1985 Oct 30;54(3):717-20

Synergism between thrombin and epinephrine in human platelets: different dose-response relationships for aggregation and dense granule secretion. Steen VM, et al. **Thromb Haemost** 1985 Oct 30;54(3):680-3

Leukotrienes potentiate the effects of epinephrine and thrombin on human platelet aggregation. Mehta P, et al. **Thromb Res** 1986 Mar 1; 41(5):731-8

[The effect of adrenaline, pilocarpine and timolol on axoplasmic transport in the optic nerve. I. Findings in normotensive eyes] Brožek B, et al. **Cesk Oftalmol** 1985 Feb;41(1):13-6 (Eng. Abstr.) **(Cze)**

ESTRADIOL

Short-term effects of oestradiol and 4-hydroxyoestradiol on gonadotrophin-releasing hormone induced luteinizing hormone secretion by rat pituitary cells in culture. Emons G, et al. **Acta Endocrinol (Copenh)** 1986 Mar;111(3):312-20

The effect of oestrogen and relaxin on uterine and cervical enzymes: collagenase, proteoglycanase and beta-glycuronidase. Too CK, et al. **Acta Endocrinol (Copenh)** 1986 Mar;111(3):394-403

Effects of oestradiol-17 beta and LRH upon the two fractions of pituitary follicle-stimulating hormone separated by concanavalin-A chromatography. Ulloa-Aguirre A, et al. **Acta Endocrinol (Copenh)** 1985 Dec;110(4):475-82

Effects of estradiol and some antiestrogens (clomiphene, tamoxifen, and hydroxytamoxifen) on luteinizing hormone secretion by rat pituitary cells in culture. Emons G, et al. **Arch Gynecol** 1986;237(4):199-211

Effect of single or repeated estrogen administration on tuberoinfundibular GABA neurons and anterior pituitary GABA receptors: biochemical and functional studies. Apud JA, et al. **Brain Res** 1985 Dec 30; 361(1-2):146-53

The sialagogue response of striatal dopamine receptors to L-dopa is not influenced by castration or chronic estrogen treatment. Pazo JH, et al. **Brain Res Bull** 1986 Jan;16(1):1-4

Plasma noradrenaline and its relationship to plasma oestradiol in normal women during the menstrual cycle. Davidson L, et al. **Clin Exp Pharmacol Physiol** 1985 Sep-Oct;12(5):489-93

Biphasic stimulatory effects of estrogen on gonadotropin surges induced by continuous administration of gonadotropin-releasing hormone in women. Araki S, et al. **Endocrinol Jpn** 1985 Oct;32(5):595-605

Effect of ovariectomy and estrogen on [3H]imipramine binding to different regions of rat brain. Stockert M, et al. **Eur J Pharmacol** 1985 Dec 17; 119(3):255-7

Bromocriptine and sulpiride competitively inhibit estrogen binding to its receptor in the adrenal gland. Lüthy IA, et al. **Experientia** 1986 Feb 15;42(2):136-8

Inhibition of estradiol-induced gonadotropin release in ovariectomized rhesus macaques by a gonadotropin-releasing hormone antagonist. Norman RL, et al. **Fertil Steril** 1986 Feb;45(2):288-91

Sex differences in [3H]-estradiol binding in brain and pituitary after acute dopaminergic treatment. In vivo studies in the rat. Gietzen DW, et al. **Neuroendocrinology** 1986;42(4):334-43

Effect of ovarian steroids to stimulate region-specific hypothalamic 5-hydroxytryptamine synthesis in ovariectomized rats. King TS, et al. **Neuroendocrinology** 1986;42(4):344-50

Androgenic and estrogenic control of the self-priming effect of LHRH in the castrated male rat. Nazian SJ. **Neuroendocrinology** 1986; 42(2):112-9

Influence of neonatal injection of estradiol and testosterone on hypothalamo-hypophyseal-gonadal interrelationships and fertility in male rats. Baranov VG, et al. **Neurosci Behav Physiol** 1985 Sep-Oct; 15(5):404-7

Modulation of apomorphine-induced climbing behavior by estradiol.

Fung YK, et al. **Pharmacol Biochem Behav** 1986 Jan;24(1):139-41

Increased clearance rate of plasma thyroxine accompanies estradiol-induced vitellogenesis in male Japanese quail. Robinson GA, et al. **Poult Sci** 1985 Dec;64(12):2397-9

[Study on the central action of catecholestrogen: effect of 2-hydroxyestrogens on the preovulatory LH surge] Okatani Y. **Nippon Sanka Fujinka Gakkai Zasshi** 1986 Feb;38(2):151-60 (Eng. Abstr.) **(Jpn)**

EXPLORATORY BEHAVIOR

Disturbances in exploratory behavior and functional recovery in the Y and radial mazes following dopamine depletion of the lateral septum. Taghzouti K, et al. **Behav Neural Biol** 1986 Jan;45(1):48-56

The effects of yohimbine on exploratory and locomotor behaviour are attributable to its effects at noradrenaline and not at benzodiazepine receptors. Chopin P, et al. **Neuropharmacology** 1986 Jan;25(1):53-7

Comparison of the effects of amphetamine and a fluorinated analogue on locomotion and exploratory activity in the mouse. Dubin RE, et al. **Prog Neuropsychopharmacol Biol Psychiatry** 1985;9(5-6):681-5

Amphetamine, apomorphine and investigatory behavior in the rat: analysis of the structure and pattern of responses. Kelley AE, et al. **Psychopharmacology (Berlin)** 1986;88(1):66-74

EXTINCTION (PSYCHOLOGY)

Different effects of haloperidol and extinction on instrumental behaviours. Salamone JD. **Psychopharmacology (Berlin)** 1986;88(1):18-23

FEAR

Effect of a selective serotonin uptake inhibitor in agoraphobia with panic attacks. A double-blind comparison of zimeldine, imipramine and placebo. Evans L, et al. **Acta Psychiatr Scand** 1986 Jan;73(1):49-53

CO2 inhalation in the treatment of panic attacks. Griez E, et al. **Behav Res Ther** 1986;24(2):145-50

Destruction of intrinsic neurons in the lateral hypothalamus disrupts the classical conditioning of autonomic but not behavioral emotional responses in the rat. Iwata J, et al. **Brain Res** 1986 Mar 12; 368(1):161-6

Clonazepam in the treatment of patients with recurrent panic attacks. Beaudry P, et al. **J Clin Psychiatry** 1986 Feb;47(2):83-5

Urinary norepinephrine excretion in panic and phobic disorders. Dajas F, et al. **J Neural Transm** 1986;65(1):75-81

An open clinical trial of clonazepam in the treatment of patients with recurrent panic attacks. Beaudry P, et al. **Prog Neuropsychopharmacol Biol Psychiatry** 1985;9(5-6):589-92

Clonazepam for panic disorders and agitation. Fontaine R. **Psychosomatics** 1985 Dec;26(12 Suppl):13-8

FENFLURAMINE

Food deprivation fails to potentiate intravenous self-administration of fenfluramine in naive rats. Papasava M, et al. **Appetite** 1986 Mar; 7(1):55-61

d- and l-isomers of fenfluramine differ markedly in their interaction with brain serotonin and catecholamines in the rat. Invernizzi R, et al. **Eur J Pharmacol** 1986 Jan 14;120(1):9-15

Fenfluramine and autism: careful reappraisal is in order [editorial] Gualtieri CT. **J Pediatr** 1986 Mar;108(3):417-9

Effects of serotonin antagonists on the performance of a simple food acquisition task in rats treated with fenfluramine isomers. Thurlby PL, et al. **Pharmacol Res Commun** 1985 Dec;17(12):1129-39

FK 33-824

Inhibition of spontaneous ACTH release and improved response to CRF in sheep premedicated with the enkephalin analogue DAMME. Redekopp CA, et al. **Horm Metab Res** 1985 Dec;17(12):646-9

Effect of adrenergic antagonism on the growth hormone, prolactin and cortisol response to a synthetic opioid agonist in man. Bouloux PM, et al. **Horm Res** 1986;23(2):83-90

FLICKER FUSION

Visual flicker in depression: response criteria, confidence ratings and response times. Herskovic JE, et al. **Psychol Med** 1986 Feb; 16(1):187-97

FLUPHENAZINE

Effect of prolonged dopamine receptor blockade on lactotroph activity in the rat pituitary gland. Prysor-Jones RA, et al. **Acta Endocrinol (Copenh)** 1985 Dec;110(4):469-74

Liquid chromatographic determination of identity, content, and content uniformity of desipramine, fluphenazine, and promazine. Beaulieu N, et al. **J Assoc Off Anal Chem** 1986 Jan-Feb;69(1):178-9

[3H]Fluphenazine binding to brain membranes: simultaneous measurement of D-1 and D-2 receptor sites. Morgan DG, et al. **J Neurochem** 1986 May;46(5):1623-31

FLURAZEPAM

Simple thin-layer chromatographic method for the investigation of six related compounds in flurazepam hydrochloride and its capsules. Klein CM, et al. **J Chromatogr** 1985 Dec 20;350(1):273-8

Effect of CGS-8216 on high-dose flurazepam convulsive threshold. Bourn WM, et al. **Pharmacology** 1986;32(3):131-3

Effect of hypoxia on ventilatory and arousal responses to CO2 during NREM sleep with and without flurazepam in young adults. Gothe B, et al. **Sleep** 1986;9(1):24-37

FOOD DEPRIVATION

Food deprivation fails to potentiate intravenous self-administration of fenfluramine in naive rats. Papasava M, et al. **Appetite** 1986 Mar; 7(1):55-61

Food deprivation-induced changes in the level of opioid peptides in the pituitary and brain of rat. Vaswani KK, et al. **Life Sci** 1986 Jan 13; 38(2):197-201

FSH

Acute effects of GnRF-induced gonadotrophin secretion upon ovarian steroid secretion in the ferret. Matson C, et al **Acta Endocrinol (Copenh)** 1986 Mar;111(3):373-7

Effects of oestradiol-17 beta and LRH upon the two fractions of pituitary follicle-stimulating hormone separated by concanavalin-A chromatography. Ulloa-Aguirre A, et al. **Acta Endocrinol (Copenh)** 1985 Dec;110(4):475-82

Estrogen inhibition of LH and FSH secretion: effects of a GnRH antagonist. Charlesworth MC, et al. **Am J Physiol** 1986 Apr; 250(4 Pt 1):E341-5

Androgen and progesterone effects on follicle-stimulating hormone and luteinizing hormone secretion in anestrous mares. Thompson DL Jr, et al. **Biol Reprod** 1986 Feb;34(1):51-7

Induction of ovulation in primate models. Kenigsberg D, et al. **Endocr Rev** 1986 Feb;7(1):34-43 (45 ref.)

Biphasic stimulatory effects of estrogen on gonadotropin surges induced by continuous administration of gonadotropin-releasing hormone in women. Araki S, et al. **Endocrinol Jpn** 1985 Oct;32(5):595-605

Evidence that pulsatile follicle-stimulating hormone secretion is independent of endogenous luteinizing hormone-releasing hormone. Culler MD, et al. **Endocrinology** 1986 Feb;118(2):609-12

Prolactin (PRL), follicle-stimulating hormone, and luteinizing hormone are regulators of testicular PRL receptors in golden hamsters. Klemcke HG, et al. **Endocrinology** 1986 Feb;118(2):773-82

Increased frequency of pulsatile luteinizing hormone-releasing hormone administration selectively decreases follicle-stimulating hormone levels in men with idiopathic azoospermia. Gross KM, et al. **Fertil Steril** 1986 Mar;45(3):392-6

Temporal relationship between the onset of daily gonadotrophin surges and of puberty in female golden hamsters. Donham RS, et al. **J Endocrinol** 1986 Feb;108(2):219-24

Testosterone maintains pituitary and serum FSH and spermatogenesis in gonadotrophin-releasing hormone antagonist-suppressed rats. Rea MA, et al. **J Endocrinol** 1986 Jan;108(1):101-7

Stimulation of gonadotropin release by a non-GnRH peptide sequence of the GnRH precursor. Millar RP, et al. **Science** 1986 Apr 4; 232(4746):68-70

GABA

Comparative studies of fresh and postmortem isolated rat cortical synaptosomes: uptake and potassium-evoked release of gamma-aminobutyric acid. Kálmán M, et al. **Acta Biol Hung** 1985; 36(1):87-91

GABA antagonists increase the release of [3H]acetylcholine from the chick retina. Agardh E. **Acta Physiol Scand** 1986 Jan;126(1):33-8

Neurotransmitters of the cochlea and cochlear nucleus: immunocytochemical evidence. Altschuler RA, et al. **Am J Otolaryngol** 1986 Mar-Apr;7(2):100-6 (59 ref.)

Ion-coupled neurotransmitter transport across the synaptic plasma membrane. Kanner BI, et al. **Ann NY Acad Sci** 1985;456:153-61 (40 ref.)

Cardiovascular effects of L-glutamate and gamma-aminobutyric acid injected into the rostral ventrolateral medulla in normotensive and spontaneously hypertensive rats. Kubo T, et al. **Arch Int Pharmacodyn Ther** 1986 Jan;279(1):150-61

GABA-specificity of behaviour responses to picrotoxin injected into the colliculus superior of cats. Jaspers R, et al. **Behav Brain Res** 1985 Oct-Nov;18(1):63-9

Distribution of GABA binding site subtypes in rat pituitary gland. Anderson RA, et al. **Brain Res** 1986 Feb 12;365(1):78-84

Effect of single or repeated estrogen administration on tuberoinfundibular

GABA neurons and anterior pituitary GABA receptors: biochemical and functional studies. Apud JA, et al. **Brain Res** 1985 Dec 30; 361(1-2):146-53

Local and remote effects of intra-caudate administration of GABA-related drugs on Met-enkephalin release in the basal ganglia. Bourgoin S, et al. **Brain Res** 1985 Dec 30;361(1-2):361-72

The action of oxygen and oxygen at high pressure on inhibitory transmission. Colton CA, et al. **Brain Res** 1986 Jan 29;364(1):151-8

Gamma-aminobutyric acid-immunoreactivity in the rat hippocampus. A light and electron microscopic study with anti-GABA antibodies. Gamrani H, et al. **Brain Res** 1986 Jan 29;364(1):30-8

Release of gamma-aminobutyric acid from the visual cortex of young kittens. Hicks TP, et al. **Brain Res** 1986 Jan;389(1-2):299-304

GABAergic neurons in rat hippocampal culture. Hoch DB, et al. **Brain Res** 1986 Feb;390(1):53-64

Subpopulations of rat cerebellar astrocytes in primary culture: morphology, cell surface antigens and [3H]GABA transport. Johnstone SR, et al. **Brain Res** 1986 Jan;389(1-2):63-75

Ontogeny of GABAergic neurons in chick brain: studies in vivo and in vitro. Jong YJ, et al. **Brain Res** 1986 Feb;390(1):83-90

Further behavioral analysis of GABA-mediated inhibition in the early chick embryo. Maderdrut JL, et al. **Brain Res** 1986 Feb; 390(1):157-60

Cogeneration of retrogradely labeled corticocortical projection and GABA-immunoreactive local circuit neurons in cerebral cortex. Miller MW. **Brain Res** 1985 Dec;355(2):187-92

Influence of a benzodiazepine, midazolam, and gamma-aminobutyric acid (GABA) on basal somatostatin secretion from cerebral and diencephalic neurons in dispersed cell culture. Stryker TD, et al. **Brain Res** 1986 Jan 8;362(2):339-43

Effect of clonidine and gamma-aminobutyric acid on the discharges of medullo-spinal sympathoexcitatory neurons in the rat. Sun MK, et al. **Brain Res** 1986 Mar 12;368(1):1-17

Mechanism of the calcium-dependent stimulation of transmitter release by 4-aminopyridine in synaptosomes. Tapia R, et al. **Brain Res** 1985 Dec 30;361(1-2):373-82

Differential effects of striatal injections of dopaminergic, cholinergic and GABAergic drugs upon swimming behavior of rats. Vrijmoed-de Vries MC, et al. **Brain Res** 1986 Jan 29;364(1):77-90

Effects of gamma-aminobutyric acid on cones and bipolar cells of the tiger salamander retina. Wu SM. **Brain Res** 1986 Feb 12;365(1):70-7

Studies of angiotensin I converting enzyme: effects of kinins, bacitracin, gamma-aminobutyric and epsilon-aminocaproic acids, and related compounds on substrate binding and catalysis in vitro. Odya CE, et al. **Can J Physiol Pharmacol** 1986 Jan;64(1):50-4

Role of uptake in gamma-aminobutyric acid (GABA)-mediated responses in guinea pig hippocampal neurons. Hablitz JJ, et al. **Cell Mol Neurobiol** 1985 Dec;5(4):353-71

GABA neurones in retinas of different species and their postnatal development in situ and in culture in the rabbit retina. Osborne NN, et al. **Cell Tissue Res** 1986;243(1):117-23

Stress by forced swimming in the rat: effects of mianserin and moclobemide on GABAergic-monoaminergic systems in the brain. Cicardo VH, et al. **Comp Biochem Physiol** [C] 1986;83(1):133-5

On GABAergic mechanisms in the optokinetic nystagmus of the frog: effects of bicuculline, allylglycine and SR 95103, a new GABA antagonist. Bonaventure N, et al. **Eur J Pharmacol** 1985 Nov 26; 118(1-2):61-8

Enhancement of GABA binding by the benzodiazepine partial agonist CGS9896. Meiners BA, et al. **Eur J Pharmacol** 1985 Dec 10; 119(1-2):61-5

Autoradiographic localization of GABA-regulated chloride ionophore binding sites using [3H]t-butylbicycloorthobenzoate. O'Connor LH, et al. **Eur J Pharmacol** 1986 Jan 14;120(1):141-2

GABAB receptors in the rabbit uterus may mediate contractile responses. Riesz M, et al. **Eur J Pharmacol** 1985 Dec 17;119(3):199-204

Quantitative distribution of GABA-immunoreactive neurons in the visual cortex (area 17) of the cat. Gabbott PL, et al. **Exp Brain Res** 1986; 61(2):323-31

GABA-immunoreactive neurons in the dorsal lateral geniculate nucleus of the rat: characterisation by combined Golgi-impregnation and immunocytochemistry. Gabbott PL, et al. **Exp Brain Res** 1986; 61(2):311-22

The relationship between GABA immunoreactivity and labelling by local uptake of [3H]GABA in the striate cortex of monkey. Kisvárday ZF, et al. **Exp Brain Res** 1986;62(1):89-98

The proportion and size of GABA-immunoreactive neurons in the magnocellular and parvocellular layers of the lateral geniculate nucleus of the rhesus monkey. Montero VM, et al. **Exp Brain Res** 1986; 62(1):215-23

Binocular interactions in the lateral geniculate nucleus of the cat: GABAergic inhibition reduced by dominant afferent activity. Pape HC, et al. **Exp Brain Res** 1986;61(2):265-71

Afferent fibers from the septum terminate on gamma-aminobutyric acid (GABA-) interneurons and granule cells in the area dentata of the rat. Schwerdtfeger WK. **Experientia** 1986 Apr 15;42(4):392-4

Effect of amygdala kindling on GABA neurons: histochemical and biochemical detection of GABA-T activity. Itagaki S, et al. **Folia Psychiatr Neurol Jpn** 1985;39(3):297-300

Changes in GABAergic system parameters after chronic administration of bicuculline. Pérez C, et al. **Gen Pharmacol** 1985;16(6):629-32

Presence of gamma-aminobutyric acid and its specific receptor binding sites in the human term placenta. Erdö SL, et al. **Gynecol Obstet Invest** 1985;20(4):199-203

The postganglionic excitatory innervation of the mouse urinary bladder and its modulation by prejunctional GABAB receptors. Santicioli P, et al. **J Auton Pharmacol** 1986 Mar;6(1):53-66

Determination of progabide and its acid metabolite in biological fluids by high-performance liquid chromatography on silica column with ultraviolet detection. Ascalone V, et al. **J Chromatogr** 1985 Nov 8; 344:231-9

Postnatal development of 3H-GABA-accumulating cells in rabbit retina. Redburn DA, et al. **J Comp Neurol** 1986 Jan 1;243(1):41-57

Comparative distribution of 3H-GABA uptake and GAD immunoreactivity in goldfish retinal amacrine cells: a double-label analysis. Yazulla S, et al. **J Comp Neurol** 1986 Feb 8;244(2):149-62

GABA-noradrenergic interaction: evidence for differential sites of action for GABA-A and GABA-B receptors. Suzdak PD, et al. **J Neural Transm** 1985;64(3-4):163-72

Dopaminergic regulation of cone retinomotor movement in isolated teleost retinas: II. Modulation by gamma-aminobutyric acid and serotonin. Dearry A, et al. **J Neurochem** 1986 Apr;46(4):1022-31

A search for receptors modulating the release of gamma-[3H]aminobutyric acid in rabbit caudate nucleus slices. Limberger N, et al. **J Neurochem** 1986 Apr;46(4):1109-17

Release of previously incorporated gamma-[3H]aminobutyric acid in rabbit caudate nucleus slices. Limberger N, et al. **J Neurochem** 1986 Apr;46(4):1102-8

Gamma-aminobutyric acid affects the developmental expression of neuron-associated proteins in cerebellar granule cell cultures. Meier E, et al. **J Neurochem** 1986 Apr;46(4):1256-62

Is GABA-stimulated [3H]flunitrazepam binding modulated by benzodiazepine receptor ligands? [letter] Mennini T. **J Neurochem** 1986 Apr;46(4):1326-7

Maitotoxin-induced release of gamma-[3H]aminobutyric acid from cultures of striatal neurons. Shalaby IA, et al. **J Neurochem** 1986 Apr; 46(4):1161-5

Interaction of t-butylbicyclophosphorothionate with gamma-aminobutyric acid-gated chloride channels in cultured cerebral neurons. Tehrani MH, et al. **J Neurochem** 1986 May;46(5):1542-8

Uptake of gamma-aminobutyric acid by brain tissue preparations: a reevaluation. Wood JD, et al. **J Neurochem** 1986 Mar;46(3):739-44

Endogenous dopamine can modulate inhibition of substantia nigra pars reticulata neurons elicited by GABA iontophoresis or striatal stimulation. Waszczak BL, et al. **J Neurosci** 1986 Jan;6(1):120-6

Cholinergic and GABAergic regulation of dopamine beta-hydroxylase activity in the adrenal gland of the rat. Lima L, et al. **J Pharmacol Exp Ther** 1986 Apr;237(1):265-70

GABAergic regulation of enkephalin in rat striatum: alterations in Met5-enkephalin level, precursor content and preproenkephalin messenger RNA abundance. Sivam SP, et al. **J Pharmacol Exp Ther** 1986 Apr;237(1):326-31

Ranitidine potentiates ileum contractions caused by GABA and electrical stimulation. Trzeciakowski JP, et al. **Life Sci** 1986 Jan 13; 38(2):173-82

Further evidence for, and nature of, the facilitatory GABAergic influence on central noradrenergic transmission. Dennis T, et al. **Naunyn Schmiedebergs Arch Pharmacol** 1985 Nov;331(2-3):225-34

Potassium ion is indispensable to the catecholamine releasing response of dog adrenals to gamma-aminobutyric acid. Kitayama S, et al. **Naunyn Schmiedebergs Arch Pharmacol** 1986 Jan;332(1):66-9

A comparison of methods for removal of endogenous GABA from brain membranes prepared for binding assays. Fisher TE, et al. **Neurochem Res** 1986 Jan;11(1):1-8

GABA uptake in embryonic palate mesenchymal cells of two mouse strains. Wee EL, et al. **Neurochem Res** 1985 Dec;10(12):1673-88

Uptake and autoreceptor-controlled release of [3H]-GABA by the hypothalamic median eminence and pituitary neurointermediate lobe. Anderson R, et al. **Neuroendocrinology** 1986;42(4):277-84

Prolongation of gamma-aminobutyric acid-mediated inhibitory postsynaptic potentials by 4,5,6,7-tetrahydroisoxazolo[4,5-c]pyridin-3-ol (THPO). Korn SJ, et al. **Neurosci Lett** 1986 Feb 14;64(1):47-52

Neurogenesis of GABAergic neurons in the rat dentate gyrus: a combined autoradiographic and immunocytochemical study. Lübbers K, et al. **Neurosci Lett** 1985 Dec 18;62(3):317-22

Novel synaptic responses mediated by dopamine and gamma-aminobutyric acid in neuroendocrine cells of the intermediate pituitary. MacVicar BA, et al. **Neurosci Lett** 1986 Feb 14; 64(1):35-40

Ultrastructural immunocytochemistry of gamma-aminobutyrate in the cerebral and cerebellar cortex of the rat. Seguela P, et al.

Neuroscience 1985 Dec;16(4):865-74

The role of GABAergic inhibition in the response properties of neurones in cat visual area 18. Vidyasagar TR, et al. **Neuroscience** 1986; 17(1):49-55

Benzodiazepine binding sites in mice forebrain and kidneys: evidence for similar regulation by GABA agonists. Rägo LK, et al. **Pharmacol Biochem Behav** 1986 Jan;24(1):1-3

Effect of bicuculline on sexual activity in castrated male rats. Fernandez-Guasti A, et al. **Physiol Behav** 1986;36(2):235-7

Changes in the activity of rat cortical and hippocampal neurones after the iontophoretic administration of beta-endorphin, glutamate and GABA. Strejčková A, et al. **Physiol Bohemoslov** 1985;34(6):567-73

Involvement of noradrenaline in potentiation of the head-twitch response by GABA-related drugs. Singh L, et al. **Psychopharmacology (Berlin)** 1986;88(3):315-9

Parvalbumin in most gamma-aminobutyric acid-containing neurons of the rat cerebral cortex. Celio MR. **Science** 1986 Feb 28; 231(4741):995-7

The action of inhibitory neurotransmitters, gamma-aminobutyric acid and glycine may distinguish between the area centralis and the peripheral retina in cats. Priest TD, et al. **Vision Res** 1985;25(12):1761-70

[The effect of various new GABAergics on motor and oral stereotypes with apomorphine in the rat] Vamvakidès A, et al. **J Pharmacol** 1985 Oct-Dec;16(4):403-11 (Eng. Abstr.) **(Fre)**

[Effect of thyrotropin releasing hormone (TRH) on GABA (gamma aminobutyric acid) metabolism in mouse and rat brains: as to the activities of GAD (glutamic acid decarboxylase), GABA-T (GABA-transaminase) and GABA re-uptake] Kurahashi K, et al. **No To Shinkei** 1985 Dec;37(12):1211-6 (Eng. Abstr.) **(Jpn)**

[Gamma-aminobutyric acid (GABA) activates three types of receptor-ionophore complex] Akaike N. **Yakugaku Zasshi** 1985 Oct; 105(10):926-36 (Eng. Abstr.) **(Jpn)**

[Gamma-aminobutyric acid and bulbar mechanisms of regulating hemodynamics] Gurevich MI, et al. **Fiziol Zh** 1986 Jan-Feb; 32(1):107-14 (73 ref.) **(Rus)**

[Effect of gamma-aminobutyric acid on neurons of the spinal lymphatic center] Serbeniuk TsV, et al. **Fiziol Zh SSSR** 1985 Nov; 71(11):1386-92 (Eng. Abstr.) **(Rus)**

[Sensitivity to GABA of the soma and dendrites of pyramidal cells in isolated sections of hippocampus in the rat] Artemenko DP, et al. **Neirofiziologiia** 1985;17(6):737-47 (Eng. Abstr.) **(Rus)**

[Comparative sensitivity of the somas and dendrites of pyramidal neurons of the hippocampus to glutamate, aspartate and GABA in isolated sections of rat brain] Artemenko DP, et al. **Neirofiziologiia** 1985; 17(6):837-40 (Eng. Abstr.) **(Rus)**

GALVANIC SKIN RESPONSE

The pharmacodynamic response of the basal skin potential to quinidine gluconate. Ando HY, et al. **Life Sci** 1986 Feb 3;38(5):417-24

GENERALIZATION, STIMULUS

TFMPP may produce its stimulus effects via a 5-HT1B mechanism. McKenney JD, et al. **Pharmacol Biochem Behav** 1986 Jan;24(1):43-7

GENETICS, BEHAVIORAL

[Genetical aspects of hormonal modification of the stress reactivity. II. Modification in early ontogenesis of the stress reactivity of adult gray rats selected for behavior toward man] Dygalo NN, et al. **Genetika** 1986 Mar;22(3):500-6 (Eng. Abstr.) **(Rus)**

GLUCURONIDASE

The effect of oestrogen and relaxin on uterine and cervical enzymes: collagenase, proteoglycanase and beta-glycuronidase. Too CK, et al. **Acta Endocrinol (Copenh)** 1986 Mar;111(3):394-403

Intrauterine position affects sex-accessory biochemistry in adult female mice. Wechman R Jr, et al. **Biol Reprod** 1985 Nov;33(4):803-7

Furosemide 1-O-acyl glucuronide. In vitro biosynthesis and pH-dependent isomerization to beta-glucuronidase-resistant forms. Rachmel A, et al. **Drug Metab Dispos** 1985 Nov-Dec;13(6):705-10

Beta-glucuronidase mutants of the nematode Caenorhabditis elegans. Sebastiano M, et al. **Genetics** 1986 Mar;112(3):459-68

Effect of sodium thiomalate on immune complex-induced release of lysosomal enzymes from human polymorphonuclear leucocytes. Carević O. **Immunopharmacology** 1986 Feb;11(1):7-11

The distribution of N-acetyl-beta-glucosaminidase, beta-glucuronidase, acid alpha-naphthyl acetate esterase and alpha-naphthyl acetate esterase in subpopulations of thymocytes, bone marrow cells and other lymphoid organs in mice. Rodriguez-Segade S, et al. **Int J Biochem** 1986; 18(2):149-53

The influence of the host on expression of intestinal microbial enzyme activities involved in metabolism of foreign compounds. Cole CB, et al. **J Appl Bacteriol** 1985 Dec;59(6):549-53

beta-Glucuronidase and hyperbilirubinaemia in breast-fed and formula-fed babies. Gourley GR, et al. **Lancet** 1986 Mar 22; 1(8482):644-6

Two roles for guanine nucleotides in the stimulus-secretion sequence of neutrophils. Barrowman MM, et al. **Nature** 1986 Feb 6-12; 319(6053):504-7

GONADOTROPINS, PITUITARY

Inhibition of estradiol-induced gonadotropin release in ovariectomized rhesus macaques by a gonadotropin-releasing hormone antagonist. Norman RL, et al. **Fertil Steril** 1986 Feb;45(2):288-91

Relationship between pituitary GnRH-binding sites and pituitary release of gonadotrophins in post-partum beef cows. Leung K, et al. **J Reprod Fertil** 1986 Jan;76(1):53-63

The antiprogesterone steroid RU-486 does not impair gonadotropin-stimulated luteal adenylyl cyclase activity or gonadotropin release by pituitary cells. Rojas FJ, et al. **J Steroid Biochem** 1985 Dec;23(6A):1053-8

Pre-menstrual syndrome--are gonadotropins the cause of the condition? Coulson CJ. **Med Hypotheses** 1986 Mar;19(3):243-55 (83 ref.)

HABITUATION (PSYCHOPHYSIOLOGY)

Synaptic plasticity in vitro: cell culture of identified Aplysia neurons mediating short-term habituation and sensitization. Rayport SG, et al. **J Neurosci** 1986 Mar;6(3):759-63

HALOPERIDOL

Does carbamazepine-induced reduction of plasma haloperidol levels worsen psychotic symptoms? Arana GW, et al. **Am J Psychiatry** 1986 May;143(5):650-1

3H-dopamine uptake and 3H-haloperidol binding in striatum after administration of methyl mercury to rats. Komulainen H, et al. **Arch Toxicol** 1985 Sep;57(4):268-71

Effect of dithiocarbamate fungicides and thiurams on 3H-haloperidol binding in rat brain. Komulainen H, et al. **Arch Toxicol [Suppl]** 1985; 8:77-9

Lateralized decrease in self-stimulation induced by haloperidol in rats with unilateral 6-hydroxydopamine lesions. Carey RJ. **Behav Brain Res** 1985 Dec;18(3):215-22

Prefrontal cortex: possible site of antipsychotic action of haloperidol. Chang WH, et al. **Biol Psychiatry** 1986 Apr;21(4):422-4

Acute and chronic effects of haloperidol on plasma and brain homovanillic acid in the rat. Chang WH, et al. **Biol Psychiatry** 1986 Apr; 21(4):374-81

Locus coeruleus norepinephrine-containing neurons: effects produced by acute and subchronic treatment with antipsychotic drugs and amphetamine. Ramirez OA, et al. **Brain Res** 1986 Jan 1; 362(1):165-70

Activation of striatal dopaminergic grafts by haloperidol. Herman JP, et al. **Brain Res Bull** 1985 Dec;15(6):543-6

Simultaneous microdetermination of biperiden, haloperidol, and trihexyphenidyl in plasma and its application to pharmacokinetic analysis after concomitant intravenous administration of the drugs to rabbits. Yokogawa K, et al. **Chem Pharm Bull (Tokyo)** 1985 Oct; 33(10):4581-6

The effect of antimuscarinic agents on haloperidol induced behavioral hypersensitivity. Carvey PM, et al. **Eur J Pharmacol** 1986 Jan 21; 120(2):193-9

A novel long-lasting dopamine receptor blocker: haloperidol-bovine serum albumin conjugate. Garrigues AM, et al. **Eur J Pharmacol** 1985 Dec 3;118(3):313-9

Norepinephrine with its precursors and their antagonists haloperidol and phentolamine interact with dye free radicals in opposite ways. Marinov BS. **FEBS Lett** 1986 Mar 17;198(1):130-4

Measurement of haloperidol and reduced haloperidol in human plasma using reversed-phase high-performance liquid chromatography. Miller RL, et al. **J Chromatogr** 1986 Jan 24;374(2):405-8

Monosymptomatic hypochondriacal psychosis manifesting as delusions of infestation: case studies of treatment with haloperidol. Andrews E, et al. **J Clin Psychiatry** 1986 Apr;47(4):188-90

A comparison of parenteral loxapine and haloperidol in hostile and aggressive acutely schizophrenic patients. Tuason VB. **J Clin Psychiatry** 1986 Mar;47(3):126-9

Dosage strategies with long-acting injectable neuroleptics, including haloperidol decanoate. Kane JM. **J Clin Psychopharmacol** 1986 Feb; 6(1 Suppl):20S-23S

Variable dose studies provide misleading therapeutic windows [letter] Van Putten T, et al. **J Clin Psychopharmacol** 1986 Feb;6(1):55-6

A clinical trial comparing intramuscular haloperidol decanoate and oral haloperidol in chronic schizophrenic patients: efficacy, safety, and dosage equivalence. Vasavan Nair NP, et al. **J Clin Psychopharmacol** 1986 Feb;6(1 Suppl):30S-37S

In vivo displacement by 3-PPP enantiomers of N,N-dipropyl-5,6-ADTN from dopamine receptor-binding sites in rat striatum. Carlsson A, et al. **J Neural Transm** 1985;64(3-4):173-85

Investigation of the failure of parenterally administered haloperidol to antagonize dopamine released from micropipettes in the caudate. Johnson SW, et al. **J Neurosci** 1986 Feb;6(2):572-80

Ultrasonic vocalization in rat pups: effects of early postnatal exposure to haloperidol. Cagiano R, et al. **Life Sci** 1986 Apr 14; 38(15):1417-23

Classification of sulpiride, clozapine and haloperidol by toposelective recording from different brain structures in the immobilized rat (stereo-EEG). Dimpfel W, et al. **Neuropsychobiology** 1985; 14(3):157-64

Submaximal plasma prolactin response to TRH and dopamine activity in man. Spoov J. **Pharmacopsychiatry** 1985 Nov;18(6):330-2

Chronic haloperidol treatment: effects on operant responding and inter-response time. Heath GF, et al. **Prog Neuropsychopharmacol Biol Psychiatry** 1985;9(5-6):697-701

Effects of haloperidol on somatostatin-like immunoreactivity in the CSF of Schizophrenic patients. Gattaz WF, et al. **Psychiatry Res** 1986 Jan; 17(1):1-6

Different effects of haloperidol and extinction on instrumental behaviours. Salamone JD. **Psychopharmacology (Berlin)** 1986;88(1):18-23

Benzodiazepines combined with neuroleptics for management of severe disruptive behavior. Salzman C, et al. **Psychosomatics** 1986 Jan; 27(1 Suppl):17-22

[Plasma assay of haloperidol by high performance liquid chromatography] Hequet D, et al. **Ann Biol Clin (Paris)** 1985;43(5):739-42 (Eng. Abstr.) **(Fre)**

[Comparison of the effects of chlorprothixene and haloperidol on hypothalamic function in patients with paranoid schizophrenia] Horodnicki JM, et al. **Psychiatr Pol** 1985 May-Jun;19(3):181-7 (Eng. Abstr.) **(Pol)**

[Chronic treatment of schizophrenia with injectable bromperidol decanoate] Suárez Richards M. **Acta Psiquiatr Psicol Am Lat** 1985 Sep; 31(3).222-8 (Eng. Abstr.) **(Spa)**

HEXOBARBITAL

Prostaglandin D2-induced potentiation of hexobarbitone hypnosis in rats: role of 5-hydroxytryptamine. Bhattacharya SK, et al. **J Pharm Pharmacol** 1985 Dec;37(12):915-6

[Effect of noise on xenobiotic detoxication in the liver] Nikiforov B, et al. **Gig Sanit** 1985 Nov;(11):58-9 **(Rus)**

HISTAMINE

Histamine receptor activation by unsaturated (allyl and propargyl) homologs of histamine. Banning JW, et al. **Agents Actions** 1985 Dec; 17(2):138-44

Relative activities of three calcium channel antagonists on histamine, acetylcholine and antigen-induced contractions of guinea pig ileum. Ingenito AJ. **Agents Actions** 1985 Dec;17(2):113-20

LPS-caused secretion of corticosterone is mediated by histamine through histidine decarboxylase. Suzuki S, et al. **Am J Physiol** 1986 Mar; 250(3 Pt 1):E243-7

Simultaneous determination of histamine and N tau-methylhistamine with high-performance liquid chromatography using electrochemical detection. Mine K, et al. **Anal Biochem** 1986 Jan;152(1):127-35

The effect of short-term immunotherapy with Pollinex on anti-IgE and antigen-induced histamine release from sensitive human basophils. Chyrek-Borowska S, et al. **Arch Immunol Ther Exp (Warsz)** 1985; 33(6):777-82

A study of the H2-receptor for histamine stimulating adenylate cyclase in homogenates of guinea-pig lung parenchyma. Foreman JC, et al. **Br J Pharmacol** 1986 Jan;87(1):37-44

Brain histamine turnover enhanced by footshock. Yoshitomi I, et al. **Brain Res** 1986 Jan 1;362(1):195-8

Effects of histamine and related compounds on thyrotropin secretion in rats. Mitsuma T, et al. **Horm Res** 1986;23(2):99-105

Biochemical and morphological correlates of transmitter type in C2, an identified histaminergic neuron in Aplysia. Schwartz JH, et al. **J Comp Neurol** 1986 Mar 15;245(3):401-21

Presynaptic inhibition produced by an identified presynaptic inhibitory neuron. II. Presynaptic conductance changes caused by histamine. Kretz R, et al. **J Neurophysiol** 1986 Jan;55(1):131-46

Lack of direct splanchnic nerve inhibitory effects on histamine-induced gastric acid secretion in rats. Yokotani K, et al. **J Pharmacol Exp Ther** 1986 Mar;236(3):770-5

Histaminergic mechanisms in the vertebrate visual system. Nowak JZ. **Pol J Pharmacol Pharm** 1985 Nov-Dec;37(6):783-819 (138 ref.)

The role of vagus nerve on histamine- and acetylcholine-induced bronchoconstriction (experiments on cats). Zimmermann I, et al. **Res Exp Med (Berl)** 1986;186(1):29-34

[The effect of catecholamines and histamine on liver circulation] Antal J, et al. **Bratisl Lek Listy** 1986 Mar;85(3):249-57 (Eng. Abstr.) **(Slo)**

HOMOVANILLIC ACID

Dopaminergic effects of carbamazepine. Relationship to clinical response in affective illness. Post RM, et al. **Arch Gen Psychiatry** 1986 Apr; 43(4):392-6

Prefrontal cortex: possible site of antipsychotic action of haloperidol. Chang WH, et al. **Biol Psychiatry** 1986 Apr;21(4):422-4

Acute and chronic effects of haloperidol on plasma and brain homovanillic acid in the rat. Chang WH, et al. **Biol Psychiatry** 1986 Apr; 21(4):374-81

Homovanillic acid (HVA) urinary excretion and day/night rhythm of chronic schizophrenic patients. Preliminary observations. Mathieu P, et al. **Encephale** 1985 Sep-Oct;11(5):199-202

Dopamine-beta-hydroxylase (DBH) and homovanillic acid (HVA) in autistic children. Garnier C, et al. **J Autism Dev Disord** 1986 Mar; 16(1):23-9

Sensitive determination of tyrosine metabolites, p-hydroxyphenylacetic acid, 4-hydroxy-3-methoxyphenyl-acetic acid and 4-hydroxy-3-methoxymandelic acid, by gas chromatography-negative-ion chemical-ionization mass spectrometry. Application to a stable isotope-labelled tracer experiment to investigate their metabolism in man. Shimamura M, et al. **J Chromatogr** 1986 Jan 10;374(1):17-26

Motor activity increases tryptophan, 5-hydroxyindoleacetic acid, and homovanillic acid in ventricular cerebrospinal fluid of the conscious rat. Chaouloff F, et al. **J Neurochem** 1986 Apr;46(4):1313-6

Effect of various centrally acting drugs on the efflux of dopamine metabolites from the rat brain. Westerink BH, et al. **J Neurochem** 1986 Apr;46(4):1145-52

Relationship between dominance hierarchy, cerebrospinal fluid levels of amine transmitter metabolites (5-hydroxyindole acetic acid and homovanillic acid) and plasma cortisol in monkeys. Yodyingyuad U, et al. **Neuroscience** 1985 Dec;16(4):851-8

Biological markers in depression. Monoamine metabolites in urine of depressed patients and normal subjects. Vandel S, et al. **Pharmacopsychiatry** 1985 Nov;18(6):347-50

Menstrual cycle affects plasma HVA [letter] Petty F, et al. **Psychiatry Res** 1986 Feb;17(2):169-71

Homovanillic acid in caudate and pre-frontal cortex following acute and chronic neuroleptic administration. Bowers MB Jr, et al. **Psychopharmacology (Berlin)** 1986;88(1):63-5

[Monoamine metabolite levels in cerebrospinal fluid of schizophrenic patients] Imazu Y, et al. **Seishin Shinkeigaku Zasshi** 1985; 87(9):634-42 **(Jpn)**

HOSTILITY

A comparison of parenteral loxapine and haloperidol in hostile and aggressive acutely schizophrenic patients. Tuason VB **J Clin Psychiatry** 1986 Mar;47(3):126-9

HYDANTOINS

A modified system for thiazolinone conversion to thiohydantoin derivatives and their separation by high-pressure liquid chromatography. Bhown AS, et al. **Anal Biochem** 1985 Nov 1; 150(2):457-62

Assay of mephenytoin metabolism in human liver microsomes by high-performance liquid chromatography. Meier UT, et al. **Anal Biochem** 1985 Dec;151(2):286-91

Mephenytoin hydroxylase activity in human liver: inhibition by steroids. Jurima M, et al. **Drug Metab Dispos** 1985 Nov-Dec;13(6):746-9

Effect of prostacyclin (PGI2) and a prostaglandin analogue BW 245C on galactosamine-induced hepatic necrosis. Noda Y, et al. **J Hepatol** 1986;2(1):53-64

HYDRAZINES

Fluorescent hydrazides for the high-performance liquid chromatographic determination of biological carbonyls. Anderson JM. **Anal Biochem** 1986 Jan;152(1):146-53

Structure-activity relationship studies of antiviral N-quinolin-4-yl-N'-benzylidenehydrazine derivatives by discriminant analysis. Gombar VK. **Arzneimittelforschung** 1985;35(11):1633-6

Inactivation of myoglobin by ortho-substituted arylhydrazines. Formation of prosthetic heme aryl-iron but not N-aryl adducts. Ortiz de Montellano PR, et al. **Biochemistry** 1985 Feb 26;24(5):1147-52

The role of formaldehyde in hydrazine-induced methylation of liver DNA guanine. Bosan WS, et al. **Carcinogenesis** 1986 Mar;7(3):413-8

Tetraformyltrisazine and hydrazine-induced methylation of liver DNA guanine. Lambert CE, et al. **Carcinogenesis** 1986 Mar;7(3):419-22

Effect of benserazid and 6-hydroxydopamine on the development of the last larval instar of the house cricket, Acheta domestica L. Rózsa KS, et al. **Comp Biochem Physiol** [C] 1986;83(1):83-8

Free radical-mediated activation of hydrazine derivatives. Kalyanaraman B, et al. **Environ Health Perspect** 1985 Dec;64:179-84

The mechanism of inactivation of dopamine beta-hydroxylase by hydrazines. Fitzpatrick PF, et al. **J Biol Chem** 1986 Apr 5; 261(10):4510-8

Determination of the activity of 16 hydrazine derivatives in the

BIBLIOGRAPHY

bioluminescence test for genotoxic agents. Levi BZ, et al. **Mutat Res** 1986 Apr;173(4):233-7

Generation of anaphylatoxin activity related to C3a, by treatment of human serum with the nitrogen nucleophile N2H4 or the chaotrope KSCN. von Zabern I, et al. **Scand J Immunol** 1985 Dec; 22(6):639-51

Antiaggregatory effects of thromboxane receptor antagonists in vivo. Darius H, et al. **Thromb Res** 1985 Dec 1;40(5):663-75

[The effects of new (dialkoxy-2,3-phenyl) methylhydrazides and their N-benzyl derivatives on rats and mice subjected to a variety of tests in relation to antidepressive effect] Papadaki-Valiraki A, et al. **Ann Pharm Fr** 1985;43(2):155-60 (Eng. Abstr.) **(Fre)**

[DMNH—a new competent indicator for measuring the chemiluminescence of neutrophilic granulocytes and monocytes] Eschenbach C, et al. **Klin Wochenschr** 1985 Dec 2;63(23):1218-25 (Eng. Abstr.) **(Ger)**

HYDRAZONES

Effects of derivatives of hydroxypyruvaldehyde phenylosazone on the Ca2+-adenosine triphosphatase activity of porcine erythrocyte membrane. Nakabayashi T, et al. **Chem Pharm Bull (Tokyo)** 1985 Aug; 33(8):3510-3

Properties of S-adenosylmethionine decarboxylase from rabbit liver: effects of some hydrazone compounds on its activity. Balaña-Fouce R, et al. **Comp Biochem Physiol [B]** 1986;83(1):221-5

HYDROXYBUTYRATES

Pulmonary surfactant lipid synthesis from ketone bodies, lactate and glucose in newborn rats. Sheehan PM, et al. **Lipids** 1985 Dec; 20(12):835-41

[Effect of lithium oxybutyrate on the serotonin and 5-hydroxyindoleacetic acid content in the brain of rabbits] Saratikov AS, et al. **Biull Eksp Biol Med** 1986 Mar;101(3):312-5 (Eng. Abstr.) **(Rus)**

[Toxicity and narcotic effect of sodium oxybutyrate and ketalar at different periods of combined radiation lesion, burn injury and irradiation exposure] Il'iuchenok TIu, et al. **Farmakol Toksikol** 1985 Nov-Dec; 48(6):87-9 (Eng. Abstr.) **(Rus)**

HYDROXYDOPAMINES

The effect of 6-hydroxydopamine infused into the third cerebral ventricle on the plasma cortisol concentration in sheep subjected to repeated and prolonged stress stimuli. Domański E, et al. **Acta Endocrinol (Copenh)** 1985 Dec;110(4):546-52

Studies of neurotensin-dopamine receptor interactions in striatal membranes of the male rat. The influence of 6-hydroxydopamine-induced dopamine receptor supersensitivity. Fuxe K, et al. **Acta Physiol Scand** 1986 Jan;126(1):147-9

6-Hydroxydopamine treatment does not affect the young rat's ability to modify its response when changing from food to water deprivation. Brenner E, et al. **Behav Brain Res** 1986 Jan;19(1):89-92

Lateralized decrease in self-stimulation induced by haloperidol in rats with unilateral 6-hydroxydopamine lesions. Carey RJ. **Behav Brain Res** 1985 Dec;18(3):215-22

Effect of forebrain commissurotomy on recovery from unilateral 6-OHDA lesions of the substantia nigra and circling induced by apomorphine. Steiner H, et al. **Behav Brain Res** 1985 Oct; 17(3):245-9

Conditioned rotational behavior in rats with unilateral 6-hydroxydopamine lesions of the substantia nigra. Carey RJ. **Brain Res** 1986 Feb 19;365(2):379-82

Disruption of corticospinal plasticity by 6-hydroxydopamine as measured by intracortical microstimulation in rats. Castro AJ, et al. **Brain Res** 1986 Jan;389(1-2):295-8

Visual behavior of monocularly deprived kittens treated with 6-hydroxydopamine. Gordon B, et al. **Brain Res** 1986 Jan; 389(1-2):21-9

Comparative effects of the neurotoxins N-chloroethyl-N-ethyl-2-bromobenzylamine hydrochloride (DSP4) and 6-hydroxydopamine on hypothalamic noradrenergic, dopaminergic and 5-hydroxytryptaminergic neurons in the male rat. Lookingland KJ, et al. **Brain Res** 1986 Feb 19;365(2):228-34

Effect of benserazid and 6-hydroxydopamine on the development of the last larval instar of the house cricket, Acheta domestica L. Rózsa KS, et al. **Comp Biochem Physiol [C]** 1986;83(1):83-8

Visual discrimination learning and interhemispheric transfer in the cat, as affected by 6-hydroxydopamine. Sprague JM, et al. **Exp Brain Res** 1985;61(1):43-53

Neuroimmunomodulation: impairment of humoral immune responsiveness by 6-hydroxydopamine treatment. Cross RJ, et al. **Immunology** 1986 Jan;57(1):145-52

Doses of 6-hydroxydopamine sufficient to deplete norepinephrine are not sufficient to decrease plasticity in the visual cortex. Trombley P, et al. **J Neurosci** 1986 Jan;6(1):266-73

Evidence that 6-hydroxydopamine is an inhibitor of catechol-O-methyltransferase in intact tissue. Reid JJ, et al. **J Pharm Pharmacol** 1986 Jan;38(1):46-50

6-Hydroxydopamine lesions of the medial prefrontal cortex fail to influence intravenous self-administration of cocaine. Martin-Iverson MT, et al. **Psychopharmacology (Berlin)** 1986;88(3):310-4

[Fluorohistochemical changes of serotonin in the APUD cells after injection of 6-hydroxydopamine intraperitoneally] Peng JY, et al. **Chen Tzu Yen Chiu** 1985;10(4):298-303 (Eng. Abstr.) **(Chi)**

[Effect of 6-hydroxydopamine on the ultrastructure of non-catecholaminergic elements of the dorsal hippocampus] Semenov SP. **Arkh Anat Gistol Embriol** 1986 Jan;90(1):23-7 (Eng. Abstr.) **(Rus)**

[Effect of acute and chronic deprivation of catecholaminergic system activity induced by 6-hydroxydopamine on the behavior of the rat] Gromova EA, et al. **Zh Vyssh Nerv Deiat** 1985 Nov-Dec; 35(6):1133-41 (Eng. Abstr.) **(Rus)**

HYDROXYINDOLEACETIC ACID

Pemoline and urinary excretion of catecholamines and indoleamines in children with attention deficit disorder. Zametkin AJ, et al. **Am J Psychiatry** 1986 Mar;143(3):359-62

Recent advances in high-performance liquid chromatographic analysis of small molecules. Application of high-performance liquid chromatography with electrochemical detection to the study of neurotransmitters in vivo. Routledge C, et al. **Biochem Soc Trans** 1985 Dec;13(6):1058-61

Effects of prenatal exposure to lithium on indoleamines in maturing mouse brain. Hoff KM, et al. **Gen Pharmacol** 1986;17(1):101-3

Motor activity increases tryptophan, 5-hydroxyindoleacetic acid, and homovanillic acid in ventricular cerebrospinal fluid of the conscious rat. Chaouloff F, et al. **J Neurochem** 1986 Apr;46(4):1313-6

An investigation of demethylation in the metabolism of methoxytryptamine and methoxytryptophol. Leone RM, et al. **J Pineal Res** 1985;2(1):87-94

Differential effect of carbidopa on the concentration of rat pineal and hypothalamic indoleamines. Oxenkrug GF, et al. **J Pineal Res** 1984; 1(4):349-53

Relationship between dominance hierarchy, cerebrospinal fluid levels of amine transmitter metabolites (5-hydroxyindole acetic acid and homovanillic acid) and plasma cortisol in monkeys. Yodyingyuad U, et al. **Neuroscience** 1985 Dec;16(4):851-8

Biological markers in depression. Monoamine metabolites in urine of depressed patients and normal subjects. Vandel S, et al. **Pharmacopsychiatry** 1985 Nov;18(6):347-50

[Monoamine metabolite levels in cerebrospinal fluid of schizophrenic patients] Imazu Y, et al. **Seishin Shinkeigaku Zasshi** 1985; 87(9):634-42 **(Jpn)**

[Effect of lithium oxybutyrate on the serotonin and 5-hydroxyindoleacetic acid content in the brain of rabbits] Saratikov AS, et al. **Biull Eksp Biol Med** 1986 Mar;101(3):312-5 (Eng. Abstr.) **(Rus)**

HYDROXYTRYPTOPHAN

Influence of sequential doses of 5-hydroxytryptophan on prolactin release. Sueldo CE, et al. **Am J Obstet Gynecol** 1986 Feb;154(2):424-7

Prolactin release after 5-hydroxytryptophan treatment requires an intact neurointermediate pituitary lobe. Johnston CA, et al. **Endocrinology** 1986 Feb;118(2):805-10

Therapeutic effects of serotonin uptake inhibitors in depression. Asberg M, et al. **J Clin Psychiatry** 1986 Apr;47 Suppl:23-35 (199 ref.)

Stimulation of the serotonin autoreceptor prevents the calcium-calmodulin-dependent increase of serotonin biosynthesis in rat raphe slices. Sawada M, et al. **J Neurochem** 1986 Mar;46(3):963-7

Differential effect of carbidopa on the concentration of rat pineal and hypothalamic indoleamines. Oxenkrug GF, et al. **J Pineal Res** 1984; 1(4):349-53

Conditioned taste aversions induced by 1-5-hydroxytryptophan are mediated by the area postrema. Ossenkopp KP, et al. **Prog Neuropsychopharmacol Biol Psychiatry** 1985;9(5-6):745-8

HYDROXYZINE

Comparison of the suppressive effect of astemizole, terfenadine, and hydroxyzine on histamine-induced wheals and flares in humans. Gendreau-Reid L, et al. **J Allergy Clin Immunol** 1986 Feb; 77(2):335-40

HYPERKINESIS

Treatment of childhood hyperactivity with desipramine: plasma drug concentration, cardiovascular effects, plasma and urinary catecholamine levels, and clinical response. Donnelly M, et al. **Clin Pharmacol Ther** 1986 Jan;39(1):72-81

HYPOCHONDRIASIS

Monosymptomatic hypochondriacal psychosis manifesting as delusions of infestation: case studies of treatment with haloperidol. Andrews E, et al. **J Clin Psychiatry** 1986 Apr;47(4):188-90

IMIPRAMINE

Predatory dominance and aggressive display under imipramine treatment in cats. Zagrodzka J, et al. **Acta Neurobiol Exp (Warsz)** 1985; 45(5-6):137-49

High-affinity imipramine binding and serotonin uptake in platelets of eight adolescent and ten adult obsessive-compulsive patients. Weizman A, et al. **Am J Psychiatry** 1986 Mar;143(3):335-9

Seasonal variation of platelet serotonin uptake and 3H-imipramine binding in normal and depressed subjects. Egrise D, et al. **Biol Psychiatry** 1986 Mar;21(3):283-92

Imipramine and amitriptyline plasma concentrations and clinical response in major depression. Kocsis JH, et al. **Br J Psychiatry** 1986 Jan; 148:52-7

Changes of transition temperatures of phosphatidylcholine and phosphatidylglycerol in presence of amphiphilic drugs. Harder A, et al. **Chem Phys Lipids** 1986 Jan;39(1-2):65-71

Veratrine- and glutamate-stimulated cGMP production in cultured rat neurons is differentially inhibited by imipramine. Novelli A, et al. **Eur J Pharmacol** 1985 Nov 26;118(1-2):189-90

Antidepressive drugs can change the affinity of [3H]imipramine and [3H]paroxetine binding to platelet and neuronal membranes. Plenge P, et al. **Eur J Pharmacol** 1985 Dec 10;119(1-2):1-8

Effect of ovariectomy and estrogen on [3H]imipramine binding to different regions of rat brain. Stockert M, et al. **Eur J Pharmacol** 1985 Dec 17; 119(3):255-7

Extractional-spectrophotometric determination of microquantities of the antidepressant imipramine with picric acid. Baltova E, et al. **Folia Med (Plovdiv)** 1984;26(2):53-8

A sensitive colorimetric method for the determination of imipramine hydrochloride and desipramine hydrochloride. el-Yazbi FA, et al. **J Clin Hosp Pharm** 1985 Dec;10(4):373-7

Agoraphobia: relative and combined effectiveness of therapist-assisted in vivo exposure and imipramine. Mavissakalian M, et al. **J Clin Psychiatry** 1986 Mar;47(3):117-22

Binding of [3H]imipramine to mouse cerebrocortical membranes and to glass fiber filters. Reith ME. **J Neurochem** 1986 Mar;46(3):760-6

Subcellular site of action of imipramine in rodent brain. Wood MD, et al. **J Neurochem** 1986 Apr;46(4):999-1005

Modulation of peripheral beta-1 and alpha-2 receptor sensitivities by the administration of the tricyclic antidepressant, imipramine, alone and in combination with alpha-2 antagonists to rats. Keith RA, et al. **J Pharmacol Exp Ther** 1986 Feb;236(2):356-63

High affinity [3H]imipramine binding and serotonin uptake to platelets of adolescent females suffering from anorexia nervosa. Weizman R, et al. **Life Sci** 1986 Mar 31;38(13):1235-42

Pharmacokinetics of imipramine are affected by age and sex in rats. Wilson MA, et al. **Life Sci** 1986 Feb 24;38(8):711-8

Platelet 3H imipramine binding: a possible predictor of response to antidepressant treatment. Hrdina PD, et al. **Prog Neuropsychopharmacol Biol Psychiatry** 1985;9(5-6):619-23

Platelet 3H-imipramine binding and steroid hormones serum concentrations during the menstrual cycle. Poirier MF, et al. **Psychopharmacology (Berlin)** 1986;88(1):86-9

Disabling fear of AIDS responsive to imipramine. Jenike MA, et al. **Psychosomatics** 1986 Feb;27(2):143-4

[The circulatory system in patients with depression during treatment with antidepressive drugs. II. Effect of therapeutic doses of thymoleptics on ECG records in patients with endogenous depression] Rajewska J. **Psychiatr Pol** 1985 Jul-Aug;19(4):278-84 (Eng. Abstr.) **(Pol)**

[Interaction of piracetam with 3H-imipramine binding sites and the GAMA-benzodiazepine receptor complex of brain membranes] Rozhanets VV, et al. **Biull Eksp Biol Med** 1986 Jan;101(1):40-2 (Eng. Abstr.) **(Rus)**

[Problems of drug recognition. Imipramine receptors] Shimanovskii NL, et al. **Farmakol Toksikol** 1986 Jan-Feb;49(1):103-7 (36 ref.) **(Rus)**

IMPRINTING (PSYCHOLOGY)

Androgens and imprinting: differential effects of testosterone on filial preference in the domestic chick. Bolhuis JJ, et al. **Behav Neurosci** 1986 Feb;100(1):51-6

Ultrastructural changes elicited in the Tetrahymena by primary exposure (imprinting) and reexposure to hormone. Csaba G, et al. **Z Mikrosk Anat Forsch** 1985;99(6):884-90

ISOCARBOXAZID

Case report of successful treatment of bulimia with isocarboxazid [letter] Kronig MH. **Am J Psychiatry** 1986 Apr;143(4):551-2

LACTATES

Free plasma catecholamines, heart rates, lactate levels, and oxygen uptake in competition weight lifters, cyclists, and untrained control subjects. Lehmann M, et al. **Int J Sports Med** 1986 Feb;7(1):18-21

Determination of alpha-naphthoxylactic acid, a major metabolite of propranolol, in plasma by high-performance liquid chromatography [letter] Harrison PM, et al. **J Chromatogr** 1986 Jan 10;374(1):223-5

Pulmonary surfactant lipid synthesis from ketone bodies, lactate and glucose in newborn rats. Sheehan PM, et al. **Lipids** 1985 Dec; 20(12):835-41

LEARNING

Effortful and automatic cognitive processes in depression. Roy-Byrne PP, et al. **Arch Gen Psychiatry** 1986 Mar;43(3):265-7

Pesticide-drug interaction in rats. Fenyvesi G, et al. **Arch Toxicol [Suppl]** 1985;8:269-71

Short term effects of methylphenidate on the cognitive, learning and academic performance of children with attention deficit disorder in the laboratory and the classroom. Douglas VI, et al. **J Child Psychol Psychiatry** 1986 Mar;27(2):191-211

Difference in learning and retention by Albino-Swiss mice. Part 2. Effect of some anxiolytic drugs. Valzelli L, et al. **Methods Find Exp Clin Pharmacol** 1985 Nov;7(11):569-72

Assessing drug effects on academic performance. Gadow KD, et al. **Psychopharmacol Bull** 1985;21(4):877-86

Lessons from snails and other models [news] Barnes DM. **Science** 1986 Mar 14;231(4743):1246-9

LEVODOPA

The sialagogue response of striatal dopamine receptors to L-dopa is not influenced by castration or chronic estrogen treatment. Pazo JH, et al. **Brain Res Bull** 1986 Jan;16(1):1-4

Dopamine and L-dopa: inhibition of thyrotropin-stimulated thyroidal thyroxine release. Maayan ML, et al. **Endocrinology** 1986 Feb; 118(2):632-6

The time-dependent inactivation of human brain dihydropteridine reductase by the oxidation products of L-dopa. Waring P. **Eur J Biochem** 1986 Mar 3;155(2):305-10

Liquid chromatographic determination of levodopa, levodopa-carbidopa, and related impurities in solid dosage forms. Ting S. **J Assoc Off Anal Chem** 1986 Jan-Feb;69(1):169-73

Distribution of catecholamines between fetal and maternal compartments during human pregnancy with emphasis on L-dopa and dopamine. Peleg D, et al. **J Clin Endocrinol Metab** 1986 May;62(5):911-4

Re-evaluation of the L-dopa loading effect on dopamine metabolism in rat striatum. el Gemayel G, et al. **J Pharm Pharmacol** 1986 Feb; 38(2):134-6

L-dopa reverses the effects of MPP+ toxicity. Wagner GC, et al. **Psychopharmacology (Berlin)** 1986;88(3):401-2

Formation of dopamine sulfate from L-dopa by perfusion of dog kidney. Tsunematsu T. **Tokushima J Exp Med** 1985 Jun;32(1-2):23-9

[Activation of glomerular guanylate cyclase by L-dopa and expansion of the extracellular volume] Sraer JD. **Nephrologie** 1985;6(5):248-9 **(Fre)**

[Effect of Nakom on the activity of the hypothalamo-hypophyseo-adrenal system] Slavnov VN, et al. **Farmakol Toksikol** 1986 Jan-Feb; 49(1):26-9 (Eng. Abstr.) **(Rus)**

[Use of L-DOPA and a traveling pulse magnetic field to treat patients with neurocirculatory dystonia] Chogovadze VA. **Klin Med (Mosk)** 1986 Jan;64(1):63-6 **(Rus)**

LH

Short-term effects of oestradiol and 4-hydroxyoestradiol on gonadotrophin-releasing hormone induced luteinizing hormone secretion by rat pituitary cells in culture. Emons G, et al. **Acta Endocrinol (Copenh)** 1986 Mar;111(3):312-20

Acute effects of GnRF-induced gonadotrophin secretion upon ovarian steroid secretion in the ferret. Matson C, et al. **Acta Endocrinol (Copenh)** 1986 Mar;111(3):373-7

Modulation of luteinizing hormone immunoreactivity and bioactivity by dopamine but not norepinephrine in women. Barnes RB, et al. **Am J Obstet Gynecol** 1986 Feb;154(2):445-50

Norepinephrine inhibition of pulsatile LH release: receptor specificity. Bergen H, et al. **Am J Physiol** 1986 Feb;250(2 Pt 1):E205-11

Interpulse interval sequence of LH in normal men essentially constitutes a renewal process. Butler JP, et al. **Am J Physiol** 1986 Mar; 250(3 Pt 1):E338-40

Estrogen inhibition of LH and FSH secretion: effects of a GnRH antagonist. Charlesworth MC, et al. **Am J Physiol** 1986 Apr; 250(4 Pt 1):E341-5

Functional changes in luteinizing hormone-secreting cells from pre- and postpartum ewes. Wise ME, et al. **Am J Physiol** 1986 Mar; 250(3 Pt 1):E282-7

Effects of estradiol and some antiestrogens (clomiphene, tamoxifen, and hydroxytamoxifen) on luteinizing hormone secretion by rat pituitary cells in culture. Emons G, et al. **Arch Gynecol** 1986;237(4):199-211

Coordinate actions of arachidonic acid and protein kinase C in gonadotropin-releasing hormone-stimulated secretion of luteinizing hormone. Chang JP, et al. **Biochem Biophys Res Commun** 1986 Jan 14:134(1):134-9

Recovery of pulsatile luteinizing hormone secretion following permanent disruption of the ascending noradrenergic fiber tract in the ovariectomized rat. Clifton DK, et al. **Biol Reprod** 1985 Nov; 33(4):808-14

Androgen and progesterone effects on follicle-stimulating hormone and luteinizing hormone secretion in anestrous mares. Thompson DL Jr, et al. **Biol Reprod** 1986 Feb;34(1):51-7

Ontogenesis of [3H]serotonin binding sites in the hypothalamus of the female rat: relation to serotonin-induced LH release in moxestrol-pretreated rats. Becú-Villalobos D, et al. **Brain Res** 1986 Feb;390(1):111-6

Sex differences in pituitary LH storage and release in LHRH-stimulated pubertal rats. A correlative immunohistochemical and radioimmunoassay study. Watanabe YG. **Cell Tissue Res** 1986; 243(3):509-15

Seasonal variation in plasma testosterone, luteinizing hormone concentrations and LH-RH responsiveness in mature, male rusa deer (Cervus rusa timorensis). van Mourik S, et al. **Comp Biochem Physiol** [A] 1986;83(2):347-51

Induction of ovulation in primate models. Kenigsberg D, et al. **Endocr Rev** 1986 Feb;7(1):34-43 (45 ref.)

Biphasic stimulatory effects of estrogen on gonadotropin surges induced by continuous administration of gonadotropin-releasing hormone in women. Araki S, et al. **Endocrinol Jpn** 1985 Oct;32(5):595-605

Modulation of luteinizing hormone(LH) release by clonidine and opioid peptides in castrated male rats. Koh T, et al. **Endocrinol Jpn** 1985 Oct; 32(5):653-9

Qualitative and quantitative differences in hLH species in the first and second LH release induced by continuous stimulation with synthetic LHRH in normal menstrual cycle as assessed by isoelectrofocusing. Suginami H, et al. **Endocrinol Jpn** 1985 Oct;32(5):583-93

Evidence that pulsatile follicle-stimulating hormone secretion is independent of endogenous luteinizing hormone-releasing hormone. Culler MD, et al. **Endocrinology** 1986 Feb;118(2):609-12

Prolactin (PRL), follicle-stimulating hormone, and luteinizing hormone are regulators of testicular PRL receptors in golden hamsters. Klemcke HG, et al. **Endocrinology** 1986 Feb;118(2):773-82

Comparison of the time courses of luteinizing hormone (LH) secretion rates during continuous stimulation by LH-releasing hormone (LH-RH) in vivo and in vitro. de Koning J, et al. **Experientia** 1986 Jan 15; 42(1):60-2

Activity of gonadotropin-releasing hormone neurons during the preovulatory luteinizing hormone surge. Steele PA, et al. **Fertil Steril** 1986 Feb;45(2):179-84

Relationship between release of LH and incorporation of tritiated thymidine in the anterior pituitary gland of the castrated male rat: effect of LHRH and its highly active analogue buserelin. Romano MI, et al. **Horm Metab Res** 1986 Jan;18(1):31-3

Temporal relationship between the onset of daily gonadotrophin surges and of puberty in female golden hamsters. Donham RS, et al. **J Endocrinol** 1986 Feb;108(2):219-24

Effect of LHRH immunoneutralization on follicular development, the LH surge and luteal function in the stumptailed macaque monkey (Macaca arctoides). Fraser HM, et al. **J Reprod Fertil** 1986 Jan; 76(1):299-309

Effects and interactions of LH and LHRH agonist on testicular morphology and function in hypophysectomized rats. Kerr JB, et al. **J Reprod Fertil** 1986 Jan;76(1):175-92

Sulfated LH subunits and a tyrosine-sulfated secretory protein (secretogranin II) in female rat adenohypophyses: changes with age and stimulation of release by LHRH. Cozzi MG, et al. **Mol Cell Endocrinol** 1986 Jan;44(1):47-54

Morphological characterization of LH secretory granule response to LHRH and calmodulin inhibitor. Nakamura F, et al. **Mol Cell Endocrinol** 1986 Jan;44(1):11-5

Androgenic and estrogenic control of the self-priming effect of LHRH in the castrated male rat. Nazian SJ. **Neuroendocrinology** 1986; 42(2):112-9

Evaluation of the OvuSTICK urinary luteinizing hormone kit in normal and stimulated menstrual cycles. Elkind-Hirsch K, et al. **Obstet Gynecol** 1986 Mar;67(3):450-3

Stimulation of gonadotropin release by a non-GnRH peptide sequence of the GnRH precursor. Millar RP, et al. **Science** 1986 Apr 4; 232(4746):68-70

[Dose-effect study of Berlin-Chemie's GnRHvet in castrated heifers by luteinizing hormone detection] Schneider F, et al. **Arch Exp Veterinarmed** 1985 Nov;39(6):894-900 (Eng. Abstr.) **(Ger)**

[Study on the central action of catecholestrogen: effect of 2-hydroxyestrogens on the preovulatory LH surge] Okatani Y. **Nippon Sanka Fujinka Gakkai Zasshi** 1986 Feb;38(2):151-60 (Eng. Abstr.) **(Jpn)**

[Episode secretion of LH releasing hormone and LH in peripheral plasma of women with and without ovulatory disturbances] Okuda K, et al. **Nippon Sanka Fujinka Gakkai Zasshi** 1985 Dec;37(12):2799-805 (Eng. Abstr.) **(Jpn)**

LH-FSH RELEASING HORMONE

Effects of oestradiol-17 beta and LRH upon the two fractions of pituitary follicle-stimulating hormone separated by concanavalin-A chromatography. Ulloa-Aguirre A, et al. **Acta Endocrinol (Copenh)** 1985 Dec;110(4):475-82

Estrogen inhibition of LH and FSH secretion: effects of a GnRH antagonist. Charlesworth MC, et al. **Am J Physiol** 1986 Apr; 250(4 Pt 1):E341-5

Testicular steroid response to continuous and pulsatile intravenous luteinizing hormone-releasing hormone administration in normal men. Fauser BC, et al. **Andrologia** 1986 Jan-Feb;18(1):89-96

Luteinizing hormone-releasing hormone [letter] Glass AR. **Arch Intern Med** 1986 Mar;146(3):603, 607

Coordinate actions of arachidonic acid and protein kinase C in gonadotropin-releasing hormone-stimulated secretion of luteinizing hormone. Chang JP, et al. **Biochem Biophys Res Commun** 1986 Jan 14;134(1):134-9

Gonadotropin releasing hormone enhances polyphosphoinositide hydrolysis in rat pituitary cells. Kiesel L, et al. **Biochem Biophys Res Commun** 1986 Jan 29,134(2):861-7

Gonadotropin-releasing hormone release by superfused hypothalami in response to norepinephrine. Nowak FV, et al. **Biol Reprod** 1985 Nov; 33(4):790-6

Gonadotropin-releasing hormone effects on placental hormones during gestation: II. Progesterone, estrone, estradiol and estriol. Siler-Khodr TM, et al. **Biol Reprod** 1986 Mar;34(2):255-64

Gonadotropin-releasing hormone effects on placental hormones during gestation: I. Alpha-human chorionic gonadotropin, human chorionic gonadotropin and human chorionic somatomammotropin. Siler-Khodr TM, et al. **Biol Reprod** 1986 Mar;34(2):245-54

Diacylglycerol and phorbol esters enhance LHRH and prostaglandin E2 secretion from median eminence nerve terminals in vitro. Valenca MM, et al. **Brain Res Bull** 1985 Dec;15(6):657-9

Sex differences in pituitary LH storage and release in LHRH-stimulated pubertal rats. A correlative immunohistochemical and radioimmunoassay study. Watanabe YG. **Cell Tissue Res** 1986; 243(3):509-15

Enzyme immunoassay for the determination of des-Gly10-NH2-LH-RH-ethylamide (fertirelin) in bovine plasma. Okada J, et al. **Chem Pharm Bull (Tokyo)** 1985 Oct;33(10):4464-70

Seasonal variation in plasma testosterone, luteinizing hormone concentrations and LH-RH responsiveness in mature, male rusa deer (Cervus rusa timorensis). van Mourik S, et al. **Comp Biochem Physiol** [A] 1986;83(2):347-51

Ovulation inhibition with nafarelin acetate nasal administration for six months. Brenner PF, et al. **Contraception** 1985 Dec;32(6):531-51

Pharmacokinetics of gonadotropin-releasing hormone and its analogs. Handelsman DJ, et al. **Endocr Rev** 1986 Feb;7(1):95-105 (106 ref.)

Biphasic stimulatory effects of estrogen on gonadotropin surges induced by continuous administration of gonadotropin-releasing hormone in women. Araki S, et al. **Endocrinol Jpn** 1985 Oct;32(5):595-605

The time interval effect on two consecutive LHRH-TRH tests on adult female baboons. Su JH, et al. **Endocrinol Jpn** 1985 Aug;32(4):455-62

Qualitative and quantitative differences in hLH species in the first and second LH release induced by continuous stimulation with synthetic LHRH in normal menstrual cycle as assessed by isoelectrofocusing. Suginami H, et al. **Endocrinol Jpn** 1985 Oct;32(5):583-93

Gonadotropin-releasing hormone stimulates mass changes in phosphoinositides and diacylglycerol accumulation in purified gonadotrope cell cultures. Andrews WV, et al. **Endocrinology** 1986 Mar; 118(3):1148-58

Ovarian gonadotropin-releasing hormone-like protein(s): demonstration and characterization. Aten RF, et al. **Endocrinology** 1986 Mar; 118(3):961-7

Evidence that pulsatile follicle-stimulating hormone secretion is independent of endogenous luteinizing hormone-releasing hormone. Culler MD, et al. **Endocrinology** 1986 Feb;118(2):609-12

Transient changes in the in vitro activity of the luteinizing hormone-releasing hormone pulse generator after ovariectomy in rats. Dluzen DE, et al. **Endocrinology** 1986 Mar;118(3):1110-3

Localization of cells containing LHRH-like mRNA in rat forebrain using in situ hybridization. Shivers BD, et al. **Endocrinology** 1986 Feb; 118(2):883-5

Leukotriene C4 is a potent stimulator of LHRH secretion. Gerozissis K, et al. **Eur J Pharmacol** 1986 Feb 11;121(1):159-60

Studies on the prolactin-releasing capacity of luteinizing hormone releasing hormone in male subjects. Gooren LJ, et al. **Exp Clin Endocrinol** 1985 Dec;86(3):300-4

Comparison of the time courses of luteinizing hormone (LH) secretion rates during continuous stimulation by LH-releasing hormone (LH-RH) in vivo and in vitro. de Koning J, et al. **Experientia** 1986 Jan 15; 42(1):60-2

Studies on the modulation of the desensitization of the pituitary gland by luteinizing hormone-releasing hormone in the ovariectomized rat. Koiter TR, et al. **Experientia** 1986 Mar 15;42(3):304-7

Increased frequency of pulsatile luteinizing hormone-releasing hormone administration selectively decreases follicle-stimulating hormone levels in men with idiopathic azoospermia. Gross KM, et al. **Fertil Steril** 1986 Mar;45(3):392-6

Inhibition of estradiol-induced gonadotropin release in ovariectomized rhesus macaques by a gonadotropin-releasing hormone antagonist. Norman RL, et al. **Fertil Steril** 1986 Feb;45(2):288-91

The economics of inducing ovulation with human menopausal gonadotropins versus pulsatile subcutaneous gonadotropin-releasing hormone. Sueldo CE, et al. **Fertil Steril** 1986 Jan;45(1):128-9

Ontogeny of neuropeptidergic systems: luteinizing hormone releasing hormone (LHRH); somatostatin (SRIF) and neurophysin (NF) in the hypothalamus of the domestic pig by immunocytochemistry. Polkowska J, et al. **Folia Histochem Cytobiol** 1985;23(4):193-200

Multiple forms of gonadotropin-releasing hormone in amphibian brains. Sherwood NM, et al. **Gen Comp Endocrinol** 1986 Feb;61(2):313-22

Relationship between release of LH and incorporation of tritiated thymidine in the anterior pituitary gland of the castrated male rat: effect of LHRH and its highly active analogue buserelin. Romano MI, et al. **Horm Metab Res** 1986 Jan;18(1):31-3

Antagonistic analogs of luteinizing hormone-releasing hormone are mast cell secretagogues. Morgan JE, et al. **Int Arch Allergy Appl Immunol** 1986;80(1):70-5

Hypothalamic releasing factor in primary and situational depression. Dekeyser YF. **Int J Neurol** 1980;14(2-4):269-72

Elevation of serum testosterone during chronic LHRH agonist treatment in the bull. Melson BE, et al. **J Anim Sci** 1986 Jan;62(1):199-207

Ovulation inhibition by administration of weekly gonadotropin-releasing hormone antagonist. Kenigsberg D, et al. **J Clin Endocrinol Metab** 1986 Apr;62(4):734-8

Gonadotropin-releasing hormone neurosecretion in the human hypothalamus: in vitro regulation by dopamine. Rasmussen DD, et al. **J Clin Endocrinol Metab** 1986 Mar;62(3):479-83

Follicular stimulation versus ovulation induction in juvenile primates: importance of gonadotropin-releasing hormone dose. Sopelak VM, et al. **J Clin Endocrinol Metab** 1986 Mar;62(3):557-62

Immunocytochemical localization of luteinizing hormone-releasing hormone (LHRH) pathways in the sheep brain during anestrus and the mid-luteal phase of the estrous cycle. Lehman MN, et al. **J Comp Neurol** 1986 Feb 1;244(1):19-35

Testosterone maintains pituitary and serum FSH and spermatogenesis in gonadotrophin-releasing hormone antagonist-suppressed rats. Rea MA, et al. **J Endocrinol** 1986 Jan;108(1):101-7

Luteinizing hormone releasing hormone (LHRH): II. A new contraceptive agent. Rojanasakul A, et al. **J Med Assoc Thai** 1986 Jan;69(1):16-21

LHRH therapy for cryptorchidism [letter] de Vries JD. **J Pediatr** 1986 Jan;108(1):162

Single-dose pharmacokinetics of leuprolide in humans following intravenous and subcutaneous administration. Sennello LT, et al. **J Pharm Sci** 1986 Feb;75(2):158-60

Effect of short photoperiod on hypothalamic methionine-enkephalin and LHRH content and serum beta-endorphin-like immunoreactivity (beta-end LI) levels in golden hamsters. Kumar MS, et al. **J Pineal Res** 1984;1(2):197-205

Effect of LHRH immunoneutralization on follicular development, the LH surge and luteal function in the stumptailed macaque monkey (Macaca arctoides). Fraser HM, et al. **J Reprod Fertil** 1986 Jan;76(1):299-309

Suppression of follicular development after chronic LHRH immunoneutralization in the ewe. McNeilly AS, et al. **J Reprod Fertil** 1986 Jan;76(1):481-90

Double-blind, placebo-controlled study of luteinising-hormone-releasing-hormone nasal spray in treatment of undescended testes. deMuinck Keizer-Schrama SM, et al. **Lancet** 1986 Apr 19;1(8486):876-80

Characterization of luteinizing hormone-releasing hormone receptor binding in rat pituitary cell monolayer cultures; influence of intercellular communication. Andries M, et al **Mol Cell Endocrinol** 1986 Feb;44(2):147-58

Morphological characterization of LH secretory granule response to LHRH and calmodulin inhibitor. Nakamura F, et al. **Mol Cell Endocrinol** 1986 Jan;44(1):11-5

LHRH stimulates plasminogen activator and inhibits steroid production by granulosa cells of adult rat Graafian follicles. Wang C, et al. **Mol Cell Endocrinol** 1986 Jan;44(1):61-8

LHRH neurons in the female C57BL/6J mouse brain during reproductive aging: no loss up to middle age. Hoffman GE, et al. **Neurobiol Aging** 1986 Jan-Feb;7(1):45-8

Hypothalamic LHRH in aging rats: effects of ovariectomy and steroid replacement. Rubin BS, et al. **Neurobiol Aging** 1985 Winter;6(4):309-15

On the short-loop feedback regulation of the hypothalamic luteinizing hormone releasing hormone 'pulse generator' in the rhesus monkey. Kesner JS, et al. **Neuroendocrinology** 1986;42(2):109-11

Androgenic and estrogenic control of the self-priming effect of LHRH in the castrated male rat. Nazian SJ. **Neuroendocrinology** 1986;42(2):112-9

Influence of monoamines on content of luteinizing hormone-releasing hormone in different regions of the hypothalamus of male rats. Markaryan RL, et al. **Neurosci Behav Physiol** 1985 Sep-Oct;15(5):407-10

Axovascular relationships in developing median eminence of perinatal rats with special reference to luteinizing hormone-releasing hormone projections. Ugrumov MV, et al. **Neuroscience** 1985 Dec;16(4):897-906

Chronic gonadotropin-releasing hormone agonist treatment suppresses ovulation and sexual behavior in group-living female rhesus monkeys. Wallen K, et al. **Physiol Behav** 1986;36(2):369-75

Decapeptides as effective agonists from L-amino acids biologically equivalent to the luteinizing hormone-releasing hormone. Folkers K, et al. **Proc Natl Acad Sci USA** 1986 Feb;83(4):1070-4

Structure-activity studies on gonadotropin-releasing hormone in teleosts, amphibians, reptiles and mammals. Peter RE. **Prog Clin Biol Res** 1986;205:75-93 (66 ref.)

Hormonal treatment of undescended testis. Toublanc JE. **Prog Clin Biol Res** 1985;203:207-11

Stimulation of gonadotropin release by a non-GnRH peptide sequence of the GnRH precursor. Millar RP, et al. **Science** 1986 Apr 4;232(4746):68-70

Human luteinizing hormone-releasing hormone gene (LHRH) is located on short arm of chromosome 8 (region 8p11.2----p21). Yang-Feng TL, et al. **Somatic Cell Mol Genet** 1986 Jan;12(1):95-100

[Stimulatory effect of a traditional herbal medicine, Unkeito on LH-RH release] Tasaka K, et al. **Nippon Sanka Fujinka Gakkai Zasshi** 1985 Dec;37(12):2821-6 (Eng. Abstr.) **(Jpn)**

[The state of gametes and the type of maturation of follicular oocytes in rats neonatally androgenized by LH-RH-induced ovulation] Kitaev EM, et al. **Biull Eksp Biol Med** 1986 Jan;101(1):78-9 (Eng. Abstr.) **(Rus)**

LITHIUM

Modifications in the phagocytosis of human neutrophils induced by vinblastine and cytochalasin B: the effects of lithium. Carulli G, et al. **Acta Haematol (Basel)** 1985;74(2):81-5

Kidney function in a selected lithium population. A prospective, controlled, lithium-withdrawal study. Bendz H. **Acta Psychiatr Scand** 1985 Nov;72(5):451-63

Is lithium justified after one manic episode? Mander AJ. **Acta Psychiatr Scand** 1986 Jan;73(1):60-7

Visually stimulated saccadic eye movements in patients treated with lithium. Opgenoorth E, et al. **Acta Psychiatr Scand** 1986 Jan;73(1):54-9

Longitudinal evaluation of glomerular filtration rate during long-term lithium therapy. Vaamonde CA, et al. **Am J Kidney Dis** 1986 Mar;7(3):213-6

A possible synergistic effect of alprazolam and lithium carbonate [letter] Cerra D, et al. **Am J Psychiatry** 1986 Apr;143(4):552

Lithium-antidepressant combinations in the treatment of depressed, physically ill geriatric patients. Kushnir SL. **Am J Psychiatry** 1986 Mar;143(3):378-9

Lithium augmentation in psychotic depression refractory to combined drug treatment. Nelson JC, et al. **Am J Psychiatry** 1986 Mar;143(3):363-6

Lithium ion transport by erythrocytes of randomly selected blood donors and manic-depressive patients: lack of association with affective illness. Richelson E, et al. **Am J Psychiatry** 1986 Apr;143(4):457-62

Use of lithium and flupenthixol in a patient with pervasive developmental disorder [letter] Shafey H. **Am J Psychiatry** 1986 May;143(5):681

Ion selective liquid membrane electrode for the assay of lithium in blood serum. Metzger E, et al. **Anal Chem** 1986 Jan;58(1):132-5

Lithium Information Center. One model of a computer-based psychiatric information service. Carroll JA, et al. **Arch Gen Psychiatry** 1986 May;43(5):483-5

Low levels and lack of predictors of somatotherapy and psychotherapy received by depressed patients. Keller MB, et al. **Arch Gen Psychiatry** 1986 May;43(5):458-66

Renal function of patients in long-term treatment with lithium citrate alone or in combination with neuroleptics and antidepressant drugs. Lassen E, et al. **Arch Gen Psychiatry** 1986 May;43(5):481-2

Acute and short-term effects of lithium on glutamate metabolism in rat brain. Marcus SR, et al. **Biochem Pharmacol** 1986 Feb 1;35(3):365-9

Lii-Nao countertransport and Li leak in erythrocytes are differentially affected by membrane enrichment with cholesteryl hemisuccinate. Levy

R, et al. **Biochim Biophys Acta** 1986 Jan 29;854(2):325-8

Effect of lithium on RBC water permeability [letter] Ballast CL, et al. **Biol Psychiatry** 1986 Apr;21(4):426-7

Lithium stimulation of in vitro granulopoiesis: evidence for mediation via sodium transport pathways. Gallicchio VS. **Br J Haematol** 1986 Mar;62(3):455-66

Lymphocytes from patients receiving lithium do not inhibit CFU-C growth. Irvine AE, et al. **Br J Haematol** 1986 Mar;62(3):467-77

Synergism of spironolactone and lithium in mania. Gillman MA, et al. **Br Med J [Clin Res]** 1986 Mar 8;292(6521):661-2

Determination of lithium in blood serum--a comparison between molecular absorption spectrophotometry and emission flame spectrometry. Popov P, et al. **Clin Chim Acta** 1986 Feb 15; 154(3):223-5

Effect of ibuprofen on lithium plasma and red blood cell concentrations. Kristoff CA, et al. **Clin Pharm** 1986 Jan;5(1):51-5

Influence of intravenous acetylsalicylic acid and sodium salicylate on human renal function and lithium clearance. Reimann IW, et al. **Eur J Clin Pharmacol** 1985;29(4):435-41

Effect of lithium on stem cell and stromal cell proliferation in vitro. Doukas MA, et al. **Exp Hematol** 1986 Mar;14(3):215-21

Deuterium NMR study of head-group deuterated phosphatidylserine in pure and binary phospholipid bilayers. Interactions with monovalent cations Na+ and Li+. Roux M, et al. **FEBS Lett** 1986 Apr 7; 199(1):33-8

Effects of prenatal exposure to lithium on indoleamines in maturing mouse brain. Hoff KM, et al. **Gen Pharmacol** 1986;17(1):101-3

Lignocaine induces lithium transport across bimolecular lipid membrane. Rajaji D, et al. **Indian J Biochem Biophys** 1984 Dec;21(6):392-3

Effect of lithium therapy on inflammatory response. O'Riordan JW, et al. **Inflammation** 1986 Mar;10(1):49-57

Lithium intoxication. Bazilinski N, et al. **Int J Artif Organs** 1986 Jan; 9(1):5-6

Use of lithium and flupenthixol in a patient with pervasive developmental disorder [letter] Shafey H. **J Am Acad Child Psychiatry** 1986 Jan; 25(1):137-8

Lithium dosage guide for prepubertal children: a preliminary report. Weller EB, et al. **J Am Acad Child Psychiatry** 1986 Jan;25(1):92-5

Li+ as substrate of the synaptosomal Na+/H+ antiporter. Schmalzing G, et al. **J Biol Chem** 1986 Feb 25;261(6):2759-67

Prediction of lithium dose: a mathematical alternative to the test-dose method. Zetin M, et al. **J Clin Psychiatry** 1986 Apr;47(4):175-8

Dental caries prevalence in Texas schoolchildren using water supplies with high and low lithium and fluoride. Curzon ME, et al. **J Dent Res** 1986 Mar;65(3):421-3

A kinetic analysis of Na-Li countertransport in human red blood cells. Hannaert PA, et al. **J Gen Physiol** 1986 Mar;87(3):353-68

Interactions of lithium and protons with the sodium-proton exchanger of dog red blood cells. Parker JC. **J Gen Physiol** 1986 Feb; 87(2):189-200

Effects of chronic lithium treatment on brain monoamine metabolism and amphetamine-induced locomotor stimulation in rats. Berggren U. **J Neural Transm** 1985;64(3-4):239-50

Lithium distribution in the brain of normal mice and of 'quaking' dysmyelinating mutants. Heurteaux C, et al. **J Neurochem** 1986 Apr; 46(4):1317-21

Indirect dopaminergic effects of tofisopam, a 2,3-benzodiazepine, and their inhibition by lithium. Chopin P, et al. **J Pharm Pharmacol** 1985 Dec;37(12):917-9

A potentiometric study of lithium complexation with catecholamines. Sandmann BJ, et al. **J Pharm Sci** 1986 Jan;75(1):73-7

Toxicokinetics of lithium intoxication treated by hemodialysis. Jaeger A, et al. **J Toxicol Clin Toxicol** 1985-86;23(7-8):501-17

Lithium and mitotic index [letter] Genest P, et al. **Lancet** 1971 Dec 11; 2(7737):1325

Behavioral and receptor binding studies of phencyclidine (PCP) and lithium interaction in the rat. Mattia A, et al. **Life Sci** 1986 Mar 17; 38(11):975-84

In vivo measurement of lithium in the body by a neutron activation analysis technique. Glaros D, et al. **Med Phys** 1986 Jan-Feb; 13(1):45-9

Results of genotoxicity testing of mazindol (degonan), lithium carbonicum (contemnol) and dropropizine (ditustat) in Chinese hamster V79 and human EUE cells. Slameňová D, et al. **Mutat Res** 1986 Mar; 169(3):171-7

The effect of lithium on cultured nervous tissue. Gajkowska B, et al. **Neuropatol Pol** 1985;23(3):315-33

Conditioned taste aversions and changes in motor activity in lithium-treated rats. Mediating role of the area postrema. Ladowsky RL, et al. **Neuropharmacology** 1986 Jan;25(1):71-7

Therapeutic experience with lithium in childhood aggressivity. Vetró A, et al. **Neuropsychobiology** 1985;14(3):121-7

On the mechanism of lithiation of uridine derivatives with lithium dialkylamides. Hayakawa H, et al. **Nucleic Acids Symp Ser** 1985; (16):109-12

Interstrain correlation between behavioural effects of lithium and effects on cortical cyclic AMP. Hamburger-Bar R, et al. **Pharmacol Biochem Behav** 1986 Jan;24(1):9-13

Lithium and twenty-four hour rhythms of serum corticosterone, prolactin and growth hormone in pigmented eye rats. Seggie J, et al. **Prog Neuropsychopharmacol Biol Psychiatry** 1985;9(5-6):755-8

Effects of lithium and rubidium on shock-induced changes in open-field activity. Hines G. **Psychopharmacology (Berlin)** 1986;88(2):209-12

The prophylactic lithium treatment in affective disorders and the possibilities of the outcome prediction. Hanuš H, et al. **Sb Ved Pr Lek Fak Univ Karlovy** 1984;27(1):5-75

[Lithium and other preventive agents in affective disorders in 1984] Souček K. **Cesk Psychiatr** 1985 Dec;81(6):363-6 **(Cze)**

LORAZEPAM

Benzodiazepines, but not antidepressants or neuroleptics, induce dose-dependent development of tolerance to lorazepam in psychiatric patients. Aranko K, et al. **Acta Psychiatr Scand** 1985 Nov; 72(5):436-46

Psychomotor tasks and recovery from anesthesia [letter] Millar K. **Anesth Analg** 1986 May;65(5):543-4

Relative bioavailability in humans for oral tablets and solutions of lormetazepam. Zecca L, et al. **Arzneimittelforschung** 1985; 35(12):1870-2

Intramuscular lorazepam to restrain violent patients [letter] Bick PA, et al. **Lancet** 1986 Jan 25;1(8474):206

Lorazepam in resistant mania [letter] Jobling M, et al. **Lancet** 1986 Mar 1;1(8479):510

Cognitive-behavioural treatment for benzodiazepine dependence [letter] Sanchez-Craig M, et al. **Lancet** 1986 Feb 15;1(8477):388

Acute treatment of manic agitation with lorazepam. Lenox RH, et al. **Psychosomatics** 1986 Jan;27(1 Suppl):28-32

Benzodiazepines combined with neuroleptics for management of severe disruptive behavior. Salzman C, et al. **Psychosomatics** 1986 Jan; 27(1 Suppl):17-22

[Simple-blind clinical study with sublingual lorazepam vs. injectable diazepam as premedication in colonoscopies] Costas CD, et al. **Acta Gastroenterol Latinoam** 1985;15(1):43-8 (Eng. Abstr.) **(Spa)**

MALATES

The role of malate in hormone-induced enhancement of mitochondrial respiration. Bobyleva-Guarriero V, et al. **Arch Biochem Biophys** 1986 Mar;245(2):477-82

The role of malate in exercise-induced enhancement of mitochondrial respiration. Bobyleva-Guarriero V, et al. **Arch Biochem Biophys** 1986 Mar;245(2):470-6

MANIC DISORDER

Is lithium justified after one manic episode? Mander AJ. **Acta Psychiatr Scand** 1986 Jan;73(1):60-7

How does verapamil exert an antimanic effect? [letter] Sandyk R, et al. **Am J Psychiatry** 1986 Mar;143(3):388

Synergism of spironolactone and lithium in mania. Gillman MA, et al. **Br Med J [Clin Res]** 1986 Mar 8;292(6521):661-2

Clonazepam: a novel therapeutic adjunct. Freinhar JP, et al. **Int J Psychiatry Med** 1985-86;15(4):321-8

Verapamil treatment of acute mania. Brotman AW, et al. **J Clin Psychiatry** 1986 Mar;47(3):136-8

Antimanic effects of clonazepam. Chouinard G. **Psychosomatics** 1985 Dec; 26(12 Suppl):7-12

Acute treatment of manic agitation with lorazepam. Lenox RH, et al. **Psychosomatics** 1986 Jan;27(1 Suppl):28-32

MATERNAL BEHAVIOR

Thermal control of mother-young contact in Norway rats: factors mediating the chronic elevation of maternal temperature. Adels LE, et al. **Physiol Behav** 1986 Jan;36(1):183-96

Maternal aggression in rats: lack of interaction between chlordiazepoxide and fluprazine. Olivier B, et al. **Psychopharmacology (Berlin)** 1986; 88(1):40-3

MEMORY

Deficits in spatial-memory tasks following lesions of septal dopaminergic terminals in the rat. Simon H, et al. **Behav Brain Res** 1986 Jan; 19(1):7-16
The effects of physostigmine and scopolamine on recognition memory in monkeys. Aigner TG, et al. **Behav Neural Biol** 1986 Jan; 45(1):81-7
Substance P facilitation of memory: effects in an appetitively motivated learning task. Schlesinger K, et al. **Behav Neural Biol** 1986 Mar; 45(2):230-9
Leu-enkephalin impairs memory of an appetitive maze response in mice. Linden D, et al. **Behav Neurosci** 1986 Feb;100(1):33-8
Pilocarpine and physostigmine attenuate spatial memory impairments produced by lesions of the nucleus basalis magnocellularis. Murray CL, et al. **Behav Neurosci** 1986 Feb;100(1):23-32
Behavioral changes following central injection of cysteamine in rats. Bakhit C, et al. **Brain Res** 1986 Feb 12;365(1):159-63
Modulating effects of posttraining epinephrine on memory: involvement of the amygdala noradrenergic system. Liang KC, et al. **Brain Res** 1986 Mar 12;368(1):125-33
Effects of bifemelane hydrochloride (MCI-2016) on experimental amnesia (passive avoidance failure) in rodents. Tobe A, et al. **Jpn J Pharmacol** 1985 Oct;39(2):153-61
Difference in learning and retention by Albino-Swiss mice. Part 2. Effect of some anxiolytic drugs. Valzelli L, et al. **Methods Find Exp Clin Pharmacol** 1985 Nov;7(11):569-72
Conformational changes in muscarinic receptors may produce diminished cholinergic neurotransmission and memory deficits in aged rats. Lippa AS, et al. **Neurobiol Aging** 1985 Winter;6(4):317-23
A psychopharmacological perspective of cognitive functions. I. Theoretical overview and methodological considerations. Wolkowitz OM, et al. **Neuropsychobiology** 1985;14(2):88-96 (73 ref.)
Effects of phencyclidine, N-allyl-N-normetazocine (SKF-10,047), and verapamil on performance in a radial maze. McCann DJ, et al. **Pharmacol Biochem Behav** 1986 Feb;24(2):187-91

MEMORY, SHORT-TERM

Effect of stress-related hormones on short term memory. Gibbs ME, et al. **Behav Brain Res** 1986 Jan;19(1):1-6
Drug effects on memory: assessment of a combined active and passive avoidance task. Sahgal A, et al. **Behav Brain Res** 1985 Oct; 17(3):251-5

MENTAL DISORDERS

Benzodiazepines, but not antidepressants or neuroleptics, induce dose-dependent development of tolerance to lorazepam in psychiatric patients. Aranko K, et al. **Acta Psychiatr Scand** 1985 Nov; 72(5):436-46
The use of psychotropic drugs in the treatment of compulsive opiate abusers: the rationale for their use. Kleber HD. **Adv Alcohol Subst Abuse** 1985 Fall-1986 Winter;5(1-2):103-19 (65 ref.)
Abstinence symptomatology and psychiatric diagnosis in cocaine abusers. Clinical observations. Gawin FH, et al. **Arch Gen Psychiatry** 1986 Feb; 43(2):107-13
Reliability of adverse drug reaction assessment in psychiatric inpatients. Grohmann R, et al. **Eur Arch Psychiatry Neurol Sci** 1985; 235(3):158-63
Changes in psychological diagnosis and prescription in a practice employing a counsellor. Martin E, et al. **Fam Pract** 1985 Dec; 2(4):241-3
Drugs in nursing homes [letter] Sandifer MG. **Hosp Community Psychiatry** 1986 Mar;37(3):291-2
Hope for the chronic mentally ill. Macinick CG, et al. **Issues Ment Health Nurs** 1984;6(3-4):255-9
Extended EMIT-DAU phencyclidine screen. Ragan FA Jr, et al. **J Clin Psychiatry** 1986 Apr;47(4):194-5
Interhemispheric fusion. Mandell AJ. **J Psychoactive Drugs** 1985 Oct-Dec; 17(4):257-66
Oral liquid neuroleptics: administer with care. Kerr LE. **J Psychosoc Nurs Ment Health Serv** 1986 Mar;24(3):33-5
Current scope of psychopharmacological research in Europe. Copenhagen, May 2-3, 1985. **Pharmacopsychiatry** 1986 Jan; 19(1):1-54
Nosological developments in European psychiatry and psychopharmacology. Pichot P. **Pharmacopsychiatry** 1986 Jan; 19(1):23-5
Neuropeptides in the cerebrospinal fluid (CSF) in psychiatric disorders. Rafaelsen OJ, et al. **Prog Neuropsychopharmacol Biol Psychiatry** 1985; 9(5-6):533-8
Rating scales and checklists for child psychopharmacology. Conners CK, et al. **Psychopharmacol Bull** 1985;21(4):809-43
DSM-III-R and pediatric psychopharmacology. Rapoport JL. **Psychopharmacol Bull** 1985;21(4):803-6
Measurement of compliance. Sleator EK. **Psychopharmacol Bull** 1985; 21(4):1089-93
The inpatient care of the chronically mentally ill. Talbott JA, et al. **Schizophr Bull** 1986;12(1):129-40
[Biologic therapy in psychiatry] Vencovský E. **Cesk Psychiatr** 1986 Feb; 82(1):9-14 (Eng. Abstr.) **(Cze)**
[Lithium in psychiatry. Review and advice to nonpsychiatrists] Schou M. **Rev Med Liege** 1986 Feb 1;41(3):92-6 **(Fre)**
[The neurobiologic model. Contribution of drugs] Benkefat C, et al. **Soins Psychiatr** 1986 Jan;(63):15-20 **(Fre)**
[Pharmacologic intervention in psychogeriatrics] Brunet A. **Union Med Can** 1986 Jan;115(1):28-34 (Eng. Abstr.) **(Fre)**
[The new biological revolution in psychiatry: a Latin American point of view (1st part)] Alarcón R. **Acta Psiquiatr Psicol Am Lat** 1985 Jun; 31(2):131-42 (Eng. Abstr.) **(Spa)**

MENTAL PROCESSES

Humoral-hormonal control of functions in expert chess players. Kassil GN, et al. **Hum Physiol** 1985 Jul-Aug;11(4):285-90

MEPROBAMATE

Pesticide-drug interaction in rats. Fenyvesi G, et al. **Arch Toxicol [Suppl]** 1985;8:269-71
A possible role of endogenous adenosine in the sedative action of meprobamate. DeLong RE, et al. **Eur J Pharmacol** 1985 Dec 3; 118(3):359-62

MESORIDAZINE

Priapism and psychotropic drug therapy [letter] Lazarus A. **J Clin Psychopharmacol** 1986 Feb;6(1):60-1

METHOTRIMEPRAZINE

Action of antidepressant neuroleptics, chlorprothixene and levomepromazine, on the central noradrenergic system: comparison with other antidepressants. Antkiewicz-Michaluk L. **Pol J Pharmacol Pharm** 1985 Sep-Oct;37(5):673-83
Effect of chemical immobilisation on the heart rate and haematological values in captive gazelles. Furley CW. **Vet Rec** 1986 Feb 15; 118(7):178-80

METHYLPHENIDATE

Methylphenidate treatment of cocaine abusers without attention deficit disorder: a negative report. Gawin F, et al. **Am J Drug Alcohol Abuse** 1985;11(3-4):193-7
Prediction of methylphenidate (Ritalin) responsiveness through sensory integrative testing. Kimball JG. **Am J Occup Ther** 1986 Apr; 40(4):241-8
Behavioral effects of low-dose methylphenidate in childhood attention deficit disorder: implications for a mechanism of stimulant drug action. Solanto MV. **J Am Acad Child Psychiatry** 1986 Jan;25(1):96-101
Short term effects of methylphenidate on the cognitive, learning and academic performance of children with attention deficit disorder in the laboratory and the classroom. Douglas VI, et al. **J Child Psychol Psychiatry** 1986 Mar;27(2):191-211
Gradual vs. abrupt withdrawal of methylphenidate in two older dependent males. Keeley KA, et al. **J Subst Abuse Treat** 1985;2(2):123-5
Effects of methylphenidate and pentobarbital on the spontaneous activity levels of rats with selective hippocampal system damage. Shull RN, et al. **Life Sci** 1986 Mar 24;38(12):1135-41
Components of attention, methylphenidate dosage, and blood levels in children with attention deficit disorder. Sebrechts MM, et al. **Pediatrics** 1986 Feb;77(2):222-8

MOTIVATION

Interaction of the cholinergic and catecholaminergic systems of the brain during a change in the motivational behavior of animals. Sadykhova EF, et al. **Neurosci Behav Physiol** 1985 Nov-Dec;15(6):471-6
[Effect of psychotropic substances on the development of alcoholic motivation in noninbred white rats] Burov IuV, et al. **Biull Eksp Biol Med** 1986 Mar;101(3):289-91 (Eng. Abstr.) **(Rus)**

MOTOR ACTIVITY

Interaction between nootropic drugs and methamphetamine on avoidance acquisition but not on locomotor activity in mice. Sansone M, et al. **Arch Int Pharmacodyn Ther** 1985 Dec;278(2):229-35
Effect of forebrain commissurotomy on recovery from unilateral 6-OHDA lesions of the substantia nigra and circling induced by apomorphine. Steiner H, et al. **Behav Brain Res** 1985 Oct; 17(3):245-9
Relationship of limbic dopamine levels to amphetamine- and anticholinergic-induced hyperactivity in the rat. Carey RJ. **Biol Psychiatry** 1986 Mar;21(3):317-21

Behavioral changes following central injection of cysteamine in rats. Bakhit C, et al. **Brain Res** 1986 Feb 12;365(1):159-63

Conditioned rotational behavior in rats with unilateral 6-hydroxydopamine lesions of the substantia nigra. Carey RJ. **Brain Res** 1986 Feb 19;365(2):379-82

Further behavioral analysis of GABA-mediated inhibition in the early chick embryo. Maderdrut JL, et al. **Brain Res** 1986 Feb; 390(1):157-60

Differential effects of striatal injections of dopaminergic, cholinergic and GABAergic drugs upon swimming behavior of rats. Vrijmoed-de Vries MC, et al. **Brain Res** 1986 Jan 29;364(1):77-90

Differences in amphetamine and morphine sensitivity in lateralized and non-lateralized rats: locomotor activity and drug self-administration. Glick SD, et al. **Eur J Pharmacol** 1985 Dec 3;118(3):239-44

Alterations in motor behaviour produced by the isomers of 3-PPP in the MPTP-treated marmoset. Nomoto M, et al. **Eur J Pharmacol** 1986 Feb 11;121(1):123-8

Typical and atypical antidepressant drug effects on locomotor activity after intra-accumbens injections in the rat. Oosterloo SK, et al. **Eur J Pharmacol** 1985 Nov 26;118(1-2):45-51

The effects of chronic bromocriptine treatment on behaviour and dopamine receptor binding in the rat striatum. Traub M, et al. **Eur J Pharmacol** 1985 Nov 26;118(1-2):147-54

Study on the mechanism of the long-lasting antagonistic effect of caerulein on amphetamine-induced hyperactivity in rats. Matsubara K, et al. **Gen Pharmacol** 1986;17(1):13-7

Sub-chronic administration of (-)-3-PPP and central dopamine receptor sensitivity changes. Hjorth S, et al. **J Neural Transm** 1985; 64(3-4):187-98

Monoamine neurotransmitter metabolism and locomotor activity during chemical hypoxia. Freeman GB, et al. **J Neurochem** 1986 Mar; 46(3):733-8

Possible involvement of the central nervous system in long-term effect of caerulein on amphetamine-induced hyperactivity in rats. Matsubara K, et al. **Jpn J Pharmacol** 1985 Nov;39(3):317-21

Effect of subchronic treatment with methamphetamine on apomorphine-induced changes in locomotor activity in mice. Watanabe H, et al. **Jpn J Pharmacol** 1986 Jan;40(1):185-7

A comparative study of the locomotor activity effects of apomorphine and the 'atypical dopamine agonists' (piribedil and S3608). Offermeier J, et al. **Life Sci** 1986 Mar 10;38(10):895-903

Effects of methylphenidate and pentobarbital on the spontaneous activity levels of rats with selective hippocampal system damage. Shull RN, et al. **Life Sci** 1986 Mar 24;38(12):1135-41

Neuropathology and amphetamine-induced turning resulting from AF64A injections into the striatum of the rat. Stwertka SA, et al. **Life Sci** 1986 Mar 24;38(12):1105-10

Dissociation between circling behaviour and striatal dopamine activity following unilateral deltamethrin administration to rats. Brodie ME, et al. **Naunyn Schmiedebergs Arch Pharmacol** 1985 Dec;331(4):341-6

Biochemical correlates of motor changes caused by the manipulation of dopamine function in the substantia nigra of the mouse. Bradbury AJ, et al. **Neuropharmacology** 1985 Dec;24(12):1155-61

The effects of yohimbine on exploratory and locomotor behaviour are attributable to its effects at noradrenaline and not at benzodiazepine receptors. Chopin P, et al. **Neuropharmacology** 1986 Jan;25(1):53-7

Conditioned taste aversions and changes in motor activity in lithium-treated rats. Mediating role of the area postrema. Ladowsky RL, et al. **Neuropharmacology** 1986 Jan;25(1):71-7

Central noradrenaline depletion attenuates amphetamine-induced locomotor behavior. Mohammed AK, et al. **Neurosci Lett** 1986 Feb 28;64(2):139-44

Lateralized and compulsive exteroceptive orientation in rats treated with apomorphine. Pisa M, et al. **Neurosci Lett** 1986 Feb 14;64(1):41-6

Locomotor depression in mice by norcocaine does not involve central alpha 2-adrenergic or presynaptic dopamine receptors. Reith ME, et al. **Pharmacol Biochem Behav** 1986 Feb;24(2):305-7

Antagonism by dopamine, but not noradrenaline receptor blockers of the anti-immobility activity of desipramine after different treatment schedules in the rat. Pulvirenti L, et al. **Pharmacol Res Commun** 1986 Jan;18(1):73-80

Effects of neuroleptics on hippocampal stimulation-induced 'wet-dog shaking' in rats. Araki H, et al. **Physiol Behav** 1986 Jan;36(1):69-74

Opioid benzodiazepine tifluadom and drug-induced hyperactivity in mice: lack of benzodiazepine-like effects. Sansone M, et al. **Pol J Pharmacol Pharm** 1985 Sep-Oct;37(5):585-90

Acute low-level formaldehyde behavioural and neurochemical toxicity in the rat. Boja JW, et al. **Prog Neuropsychopharmacol Biol Psychiatry** 1985;9(5-6):671-4

Comparison of the effects of amphetamine and a fluorinated analogue on locomotion and exploratory activity in the mouse. Dubin RE, et al. **Prog Neuropsychopharmacol Biol Psychiatry** 1985;9(5-6):681-5

Lateralizing effects of apomorphine on taxis, postural support and rotation in rats. Pisa M, et al. **Prog Neuropsychopharmacol Biol Psychiatry** 1985; 9(5-6):525-31

Central noradrenaline depletion antagonizes aspects of d-amphetamine-induced hyperactivity in the rat. Archer T, et al. **Psychopharmacology (Berlin)** 1986;88(2):141-6

Effects of lithium and rubidium on shock-induced changes in open-field activity. Hines G. **Psychopharmacology (Berlin)** 1986;88(2):209-12

Effects of amphetamine and apomorphine on locomotor activity after kainic acid lesion of the nucleus accumbens septi in the rat. Kafetzopoulos E. **Psychopharmacology (Berlin)** 1986;88(3):271-4

Locomotor activity and neurotensin: resolution of discrepancies in effects? Sahgal A, et al. **Psychopharmacology (Berlin)** 1986;88(1):131-2

Effects of insecticidal carbamates on brain acetylcholine content, acetylcholinesterase activity and behavior in mice. Kobayashi H, et al. **Toxicol Lett** 1985 Dec;29(2-3):153-9

[The effect of various new GABAergics on motor and oral stereotypes with apomorphine in the rat] Vamvakidès A, et al. **J Pharmacol** 1985 Oct-Dec;16(4):403-11 (Eng. Abstr.) **(Fre)**

[Effect of chronic psychogenic stress on a number of behavioral and neurochemical characteristics of rats] Danchev ND, et al. **Biull Eksp Biol Med** 1986 Jan;101(1):57-9 (Eng. Abstr.) **(Rus)**

[Neurochemical aspects of the emotional reactivity and motor activity of rats in new circumstances] Kulagin DA, et al. **Usp Fiziol Nauk** 1986 Jan-Mar;17(1):92-109 (99 ref.) **(Rus)**

MSH

D-2 dopaminergic agonists and adenosine 3',5'-monophosphate directly regulate the synthesis of alpha-melanocyte-stimulating hormone-like peptides by cultured rat melanotrophs. Beaulieu M, et al. **Endocrinology** 1986 Mar;118(3):1032-9

Stimulation of adenosine 3',5'-monophosphate production in rat Sertoli cells by alpha-melanotropin-stimulating hormone (alpha MSH) and des-acetyl alpha MSH. Boitani C, et al. **Endocrinology** 1986 Apr; 118(4):1513-8

A diurnal rhythm in proopiomelanocortin messenger ribonucleic acid that varies concomitantly with the content and secretion of beta-endorphin in the intermediate lobe of the rat pituitary. Millington WR, et al. **Endocrinology** 1986 Feb;118(2):829-34

In vitro study of frog (Rana ridibunda Pallas) interrenal function by use of a simplified perifusion system. VIII. Structure-activity relationship of synthetic ACTH fragments and gamma-MSH. Leboulenger F, et al. **Gen Comp Endocrinol** 1986 Feb;61(2):187-96

Comparative effects of corticotropin-releasing factor, arginine vasopressin, and related neuropeptides on the secretion of ACTH and alpha-MSH by frog anterior pituitary cells and neurointermediate lobes in vitro. Tonon MC, et al. **Gen Comp Endocrinol** 1986 Mar; 61(3):438-45

The size of enzymes acetylating alpha-melanocyte-stimulating hormone and beta-endorphin. Chappell MC, et al. **J Biol Chem** 1986 Jan 25; 261(3):1088-91

The hypothalamo-hypophyseal rat explant in vitro: endocrinological studies of the pars intermedia dopaminergic neural input. Davis MD. **J Physiol (Lond)** 1986 Jan;370:381-93

ACTH-(1-24) and alpha-MSH antagonize dopamine receptor-mediated inhibition of striatal dopamine and acetylcholine release. Versteeg DH, et al. **Life Sci** 1986 Mar 3;38(9):835-40

Modulation by Leu-enkephalin of peptide release from perifused neurointermediate pituitary. II. Inhibition of calcium-mediated secretion of alpha-MSH and beta-endorphin. Al Zein M, et al. **Neuroendocrinology** 1986;42(3):248-54

[Role of alpha-MSH and related peptides in the central nervous system] Delbende C, et al. **Rev Neurol (Paris)** 1985;141(6-7):429-39 (117 ref.) (Eng. Abstr.) **(Fre)**

NEUROREGULATORS

GABAA receptors and opioid receptors as examples of multiple site receptor proteins. Barnard E. **Alcohol Drug Res** 1985-86;6(2-3):63-5

Inhibitory neuromodulation of release of amino acid neurotransmitters. Peris J, et al. **Alcohol Drug Res** 1985-86;6(4):253-64 (61 ref.)

Neurotransmitters of the cochlea and cochlear nucleus: immunocytochemical evidence. Altschuler RA, et al. **Am J Otolaryngol** 1986 Mar-Apr;7(2):100-6 (59 ref.)

Deficits in inhibitory avoidance after neurotoxic lesions of the ventral striatum are neurochemically and behaviorally selective. Schwarting R, et al. **Behav Brain Res** 1985 Dec;18(3):279-83

Influences of amino acids on the circadian rhythms of brain neurotransmitters. Angelova C, et al. **Bibl Nutr Dieta** 1986; (38):72-81

Effects of dietary vanadium exposure on levels of regional brain neurotransmitters and their metabolites. Sharma RP, et al. **Biochem Pharmacol** 1986 Feb 1;35(3):461-5

External calcium, intrasynaptosomal free calcium and neurotransmitter release. Ashley RH. **Biochim Biophys Acta** 1986 Jan 29; 854(2):207-12

Presynaptic calcium diffusion from various arrays of single channels. Implications for transmitter release and synaptic facilitation. Fogelson AL, et al. **Biophys J** 1985 Dec;48(6):1003-17

Long-term potentiation is associated with an increase in calcium-dependent, potassium-stimulated release of [14C]glutamate from hippocampal slices: an ex vivo study in the rat. Feasey KJ, et al. **Brain Res** 1986 Jan 29;364(1):39–44

Tryptamine enhancement of neurotransmitter release under conditions that normally depress calcium influx. Friedman RN, et al. **Brain Res** 1986 Jan 29;364(1):172–6

Comparative effects of the neurotoxins N-chloroethyl-N-ethyl-2-bromobenzylamine hydrochloride (DSP4) and 6-hydroxydopamine on hypothalamic noradrenergic, dopaminergic and 5-hydroxytryptaminergic neurons in the male rat. Lookingland KJ, et al. **Brain Res** 1986 Feb 19;365(2):228–34

Mechanism of the calcium-dependent stimulation of transmitter release by 4-aminopyridine in synaptosomes. Tapia R, et al. **Brain Res** 1985 Dec 30;361(1–2):373–82

Neurotransmitter phenotypic plasticity in the mammalian embryo. Jonakait GM, et al. **Curr Top Dev Biol** 1986;20:165–75 (60 ref.)

Changes in gamma-aminobutyrate, glutamate, aspartate, glycine, and taurine contents in the striatum after unilateral nigrostriatal lesions in rats. Tanaka Y, et al. **Exp Neurol** 1986 Feb;91(2):259–68

Temperature dependence of neurotransmitter release in the antarctic fish Pagothenia borchgrevinki. Pockett S, et al. **Experientia** 1986 Apr 15; 42(4):414–5

Amino acid neurotransmitters in the CNS. Characteristics of the acidic amino acid exchange. Erecińska M, et al. **FEBS Lett** 1986 Apr 7; 199(1):95–9

Acute cyanide intoxication and central transmitter systems. Persson SA, et al. **Fundam Appl Toxicol** 1985 Dec;5(6 Pt 2):S150–9

Evidence for an excitatory amino acid as the transmitter of the auditory nerve in the in vitro mouse cochlear nucleus. Martin MR. **Hear Res** 1985;20(3):215–20

Effects of L-aspartate and oxaloacetic acid on click-evoked cochlear potentials. Sun YW, et al. **Hear Res** 1986;21(1):83–6

Calcium and transmitter release. Cohen I, et al. **Int Rev Neurobiol** 1985; 27:299–336 (103 ref.)

Retinal neurochemistry of three elasmobranch species: an immunohistochemical approach. Brunken WJ, et al. **J Comp Neurol** 1986 Jan 1;243(1):1–12

Biochemical and morphological correlates of transmitter type in C2, an identified histaminergic neuron in Aplysia. Schwartz JH, et al. **J Comp Neurol** 1986 Mar 15;245(3):401–21

Excitatory amino acid transmitters in neuronal circuits of the cat visual cortex. Tsumoto T, et al. **J Neurophysiol** 1986 Mar;55(3):469–83 (61 ref.)

L-glutamate: a neurotransmitter candidate for cone photoreceptors in the monkey retina. Sarthy PV, et al. **J Neurosci** 1986 Mar;6(3):637–43

The bag cells of Aplysia as a multitransmitter system: identification of alpha bag cell peptide as a second neurotransmitter. Sigvardt KA, et al. **J Neurosci** 1986 Mar;6(3):803–13

Effect of some centrally administered putative amino acid neurotransmitters on carrageenan-induced paw oedema in rats. Bhattacharya SK, et al. **J Pharm Pharmacol** 1986 Feb;38(2):144–6

Inhibitors of calcium buffering depress evoked transmitter release at the squid giant synapse. Adams DJ, et al. **J Physiol (Lond)** 1985 Dec; 369:145–59

Effects of neurotransmitters or drugs on the in vivo release of dopamine and its metabolites. Kito S, et al. **Jpn J Pharmacol** 1986 Jan; 40(1):57–67

Effect of 450191-S, a 1H-1,2,4-triazolyl benzophenone derivative, on cerebral content of neuroactive amino acids. Tomono S, et al. **Jpn J Pharmacol** 1985 Dec;39(4):558–61

Studies of neurotransmitter chemistry of central nervous system neurons in primary tissue culture. Thomas WE. **Life Sci** 1986 Jan 27; 38(4):297–308 (87 ref.)

GTP-binding proteins mediate transmitter inhibition of voltage-dependent calcium channels. Holz GG 4th, et al. **Nature** 1986 Feb 20–26;319(6055):670–2

Single channels and ionic currents in peptidergic nerve terminals. Lemos JR, et al. **Nature** 1986 Jan 30–Feb 5;319(6052):410–2

Modifying channel function [news] Stevens CF. **Nature** 1986 Feb 20–26; 319(6055):622

Facilitation of transmitter release through available transmitter regulation. An explanation not involving residual calcium theory. Sarrazin C. **Neurol Res** 1985 Dec;7(4):194–8

Adenosine modulation of striatal neurotransmitter release monitored in vivo using voltammetry. O'Neill RD. **Neurosci Lett** 1986 Jan 2; 63(1):11–6

Effects of amino acid neurotransmitter candidates on an identified insect motoneurone. Wafford KA, et al. **Neurosci Lett** 1986 Jan 16; 63(2):135–40

Model peptidergic systems at the insect neuromuscular junction. O'Shea M, et al. **Peptides** 1985;6 Suppl 3:417–24

Neurotransmitter release and its facilitation in crayfish. VII. Another voltage dependent process beside Ca entry controls the time course of phasic release. Parnas H, et al. **Pflugers Arch** 1986 Feb; 406(2):121–30

Neurotransmitter release and its facilitation in crayfish. VIII. Modulation of release by hyperpolarizing pulses. Parnas I, et al. **Pflugers Arch** 1986 Feb;406(2):131–7

Neurotransmitter regulation of anterior pituitary hormones. Tuomisto J, et al. **Pharmacol Rev** 1985 Sep;37(3):249–332 (1515 ref.)

Neurotransmitter metabolites and endocrine responses in depression. Hasey GM, et al. **Prog Neuropsychopharmacol Biol Psychiatry** 1985; 9(5–6):613–7

Postmortem neurochemistry in schizophrenia. Bracha HS, et al. **Psychiatr Clin North Am** 1986 Mar;9(1):133–41 (38 ref.)

Neurohumoral interactions in the posttraumatic period and possibilities of their correction. Bazarevitch GJ, et al. **Resuscitation** 1986 Jan; 13(2):115–21

Mechanism of transmitter release: voltage hypothesis and calcium hypothesis. Zucker RS, et al. **Science** 1986 Feb 7;231(4738):574–9

Neurobiochemical alterations induced by the artificial sweetener aspartame (NutraSweet). Coulombe RA Jr, et al. **Toxicol Appl Pharmacol** 1986 Mar 30;83(1):79–85

Excitatory amino acid analogs evoke release of endogenous amino acids and acetyl choline from chick retina in vitro. Campochiaro P, et al. **Vision Res** 1985;25(10):1375–86

The signature hypothesis: co-localizations of neuroactive substances as anatomical probes for circuitry analyses. Lam DM, et al. **Vision Res** 1985;25(10):1353–64 (48 ref.)

[Comparison of effects of electroacupuncture stimulations of two different intensities and frequencies on monoamine neurotransmitters in rat brain regions] Wang YJ, et al. **Chen Tzu Yen Chiu** 1985;10(1):24–9 (Eng. Abstr.) **(Chi)**

[Influence of monoamines on the dl-tetrahydropalmatine-induced inhibition of single-unit activity in the nucleus accumbens] Liu GO, et al. **Yao Hsueh Hsueh Pao** 1985 Jul;20(7):500–4 (Eng. Abstr.) **(Chi)**

[Hydergine: interaction with the neurotransmitter systems of the central nervous system] Markstein R. **J Pharmacol** 1985;16 Suppl 3:1–19 (60 ref.) (Eng. Abstr.) **(Fre)**

[Principles of transmembranous signal transduction in the action of hormones and neurotransmitters] Schultz G, et al. **Arzneimittelforschung** 1985;35(12A):1879–85 (72 ref.) (Eng. Abstr.) **(Ger)**

[Possible general mechanism of the presynaptic action of mediators] Abramets II, et al. **Dokl Akad Nauk SSSR** 1986 Mar–Apr; 287(1):245–8 **(Rus)**

NEUROTENSIN

Isolated canine ileal mucosal cells in short-term culture: a model for study of neurotensin release. Barber DL, et al. **Am J Physiol** 1986 Mar; 250(3 Pt 1):G374–84

Regulation of neurotensin release from canine enteric primary cell cultures. Barber DL, et al. **Am J Physiol** 1986 Mar; 250(3 Pt 1):G385–90

Neurotensin excites neurons in the arcuate nucleus of the rat hypothalamus in vitro. Herbison AE, et al. **Brain Res** 1986 Feb 5;364(2):391–5

Neurotensinlike immunoreactive neurons in the hedgehog (Erinaceus europaeus) and the sheep (Ovis aries) central nervous system. Papadopoulos GC, et al. **J Comp Neurol** 1986 Feb 8;244(2):193–203

Binding of [3H]neurotensin in human brain: properties and distribution. Kanba KS, et al. **J Neurochem** 1986 Mar;46(3):946–52

Autoradiographic localization of [3H]neurotensin-binding sites in the hippocampal region of the rat and primate brain. Köhler C, et al. **Neuroscience** 1985 Nov;16(3):577–87

Hyperthermic effect of neurotensin in the rabbit. Vybíral S, et al. **Pflugers Arch** 1986 Mar;406(3):312–4

Central nervous system neurotensin and feeding. Hawkins MF. **Physiol Behav** 1986 Jan;36(1):1–8

Further evidence that central neurotensin inhibits pituitary prolactin secretion by stimulating dopamine release from the hypothalamus. Tojo K, et al. **Proc Soc Exp Biol Med** 1986 Apr;181(4):517–22

Locomotor activity and neurotensin: resolution of discrepancies in effects? Sahgal A, et al. **Psychopharmacology (Berlin)** 1986;88(1):131–2

Action of neurotensin on size, composition, and growth of pancreas and stomach in the rat. Feurle GE, et al. **Regul Pept** 1985 Dec; 13(1):53–62

Neurotensin-like immunoreactivity released into the portal vein by duodenal acidification in the dog. Mogard M, et al. **Scand J Gastroenterol** 1986 Jan;21(1):97–103

[Endocrine impact of resections of the small intestine] De Graef J, et al. **Acta Gastroenterol Belg** 1985 May–Jun;48(3):286–8 (Eng. Abstr.) **(Fre)**

NEUROTIC DISORDERS

[Participation of the cholinergic system in central mechanisms of the cortico-limbic regulation of visceral functions] Beller NN, et al. **Fiziol Zh SSSR** 1986 Jan;72(1):61–8 **(Rus)**

[Stages in the development of neuroses in the dog and effects of preparations with antidepressive and tranquilizing properties] Mekhedova AIa, et al. **Zh Vyssh Nerv Deiat** 1985 Nov–Dec; 35(6):1147–55 (Eng. Abstr.) **(Rus)**

NIALAMIDE

Effect of nialamide on the metabolism of dopamine injected into the nucleus accumbens of old rats. Cousin KM, et al. **J Pharmacol Exp Ther** 1986 Apr;237(1):25-30

NITRAZEPAM

Residual effect of single and repeated doses of midazolam and nitrazepam in relation to their plasma concentrations. Godtlibsen OB, et al. **Eur J Clin Pharmacol** 1986;29(5):595-600

Prescribing and dispensing of benzodiazepines by pharmacists. Newgreen DB, et al. **Med J Aust** 1986 Mar 31;144(7):370-1

NOMIFENSINE

Successful treatment of bulimia with nomifensine. Nassr DG. **Am J Psychiatry** 1986 Mar;143(3):373-4

Treatment of bulimia with nomifensine. Pope HG Jr, et al. **Am J Psychiatry** 1986 Mar;143(3):371-3

Disposition of nomifensine after acute and prolonged dosing. Lindberg RL, et al. **Clin Pharmacol Ther** 1986 Apr;39(4):384-8

Metabolism of nomifensine after oral and intravenous administration. Lindberg RL, et al. **Clin Pharmacol Ther** 1986 Apr;39(4):378-83

Cognitive symptoms in late-life depression and their treatment. Siegfried K. **J Affective Disord** 1985;Suppl 1:S33-40

Gas chromatographic-mass spectrometric determination of nomifensine using a stable isotope-labeled analogue as an internal standard. Bagchi SP, et al. **J Chromatogr** 1985 Nov 8;344:362-6

Haemolytic anaemia caused by nomifensine [letter] Woodliff HJ, et al. **Med J Aust** 1986 Feb 3;144(3):163

[The circulatory system in patients with depression during treatment with antidepressive drugs. II. Effect of therapeutic doses of thymoleptics on ECG records in patients with endogenous depression] Rajewska J. **Psychiatr Pol** 1985 Jul-Aug;19(4):278-84 (Eng. Abstr.) **(Pol)**

NOREPINEPHRINE

Effects of morphine on hypothalamic corticotropin-releasing factor (CRF), norepinephrine and dopamine in non-stressed and stressed rats. Suemaru S, et al. **Acta Med Okayama** 1985 Dec;39(6):463-70

Noradrenaline evokes an alpha-adrenoceptor-mediated inotropic effect in human ventricular myocardium. Aass H, et al. **Acta Pharmacol Toxicol (Copenh)** 1986 Jan;58(1):88-90

Effect of long-term application of Oxyphenon on biogenic amine levels in female rat brain. Hrbek J, et al. **Acta Univ Palacki Olomuc Fac Med** 1985;112:295-301

Comparison of the effect of single and repeated administration of Oxyphenon on norepinephrine and dopamine levels in female rat brains. Hrbek J, et al. **Acta Univ Palacki Olomuc Fac Med** 1985;112:309-12

Effect of Oxyphenon on norepinephrine and dopamine levels in male rat brain. Hrbek J, et al. **Acta Univ Palacki Olomuc Fac Med** 1985; 112:303-8

Cardiovascular haemodynamics and the response of vasopressin, aldosterone, plasma renin activity and plasma catecholamines to head-up tilt in young and old healthy subjects. Vargas E, et al. **Age Ageing** 1986 Jan;15(1):17-28

Modulation of luteinizing hormone immunoreactivity and bioactivity by dopamine but not norepinephrine in women. Barnes RB, et al. **Am J Obstet Gynecol** 1986 Feb;154(2):445-50

Norepinephrine inhibition of pulsatile LH release: receptor specificity. Bergen H, et al. **Am J Physiol** 1986 Feb;250(2 Pt 1):E205-11

Role of protein kinase C in inhibition of renin release caused by vasoconstrictors. Kurtz A, et al. **Am J Physiol** 1986 Apr; 250(4 Pt 1):C563-71

Effects of diet and photoperiod on NE turnover and GDP binding in Siberian hamster brown adipose tissue. McElroy JF, et al. **Am J Physiol** 1986 Mar;250(3 Pt 2):R383-8

Effect of amine on temperature-responsive neuron in slice preparation of rat brain stem. Watanabe T, et al. **Am J Physiol** 1986 Apr; 250(4 Pt 2):R553-9

An association between norepinephrine-to-epinephrine ratio and suicidal ideation in depression [letter] **Am J Psychiatry** 1986 May; 143(5):683-4

The role of intracellular sodium activity in the inotropy potentiation among high [Ca]o' norepinephrine and strophanthidin. Abete P, et al. **Arch Int Pharmacodyn Ther** 1985 Nov;278(1):87-96

Catecholaminergic and serotoninergic brain structures in European green frogs: an autoradiographical study. *Diederen JH, et al.* **Basic Appl Histochem** 1985;29(4):297-308

6-Hydroxydopamine treatment does not affect the young rat's ability to modify its response when changing from food to water deprivation. Brenner E, et al. **Behav Brain Res** 1986 Jan;19(1):89-92

Influences of amino acids on the circadian rhythms of brain neurotransmitters. Angelova C, et al. **Bibl Nutr Dieta** 1986; (38):72-81

Inactivation of the early calcium uptake and noradrenaline release evoked by potassium in cultured chromaffin cells. Artalejo CR, et al. **Biochem Biophys Res Commun** 1986 Jan 14;134(1):1-7

Phosphopeptide analysis of phenylalanine hydroxylase isolated from liver cells exposed to hormonal stimuli. Fisher MJ, et al. **Biochem J** 1986 Jan 15;233(2):507-11

Urinary excretion of free tyramine and of norepinephrine and its metabolites in unipolar depressed patients. Roy A, et al. **Biol Psychiatry** 1986 Feb;21(2):221-4

Recovery of pulsatile luteinizing hormone secretion following permanent disruption of the ascending noradrenergic fiber tract in the ovariectomized rat. Clifton DK, et al. **Biol Reprod** 1985 Nov; 33(4):808-14

Gonadotropin-releasing hormone release by superfused hypothalami in response to norepinephrine. Nowak FV, et al. **Biol Reprod** 1985 Nov; 33(4):790-6

Effects of noradrenaline on 45Ca2+ efflux from isolated rat islets of Langerhans. Morgan NG, et al. **Biosci Rep** 1985 Dec;5(12):1053-60

Noradrenergic stimulation of supraoptic neuronal activity and vasopressin release in vitro: mediation by an alpha 1-receptor. Armstrong WE, et al. **Brain Res** 1986 Feb 12;365(1):192-7

Cardiovascular and neuroendocrine responses to behavioral stress after central or peripheral barodenervation in rats. Buchholz RA, et al. **Brain Res** 1986 Feb 19;365(2):360-4

Activation of the locus coeruleus induced by selective stimulation of the ventral tegmental area. Deutch AY, et al. **Brain Res** 1986 Jan 22; 363(2):307-14

Locus coeruleus neurons in culture have a developmentally transient alpha 1 adrenergic response. Finlayson PG, et al. **Brain Res** 1986 Mar; 390(2):292-5

Specific detection of noradrenaline in the rat brain by using antibodies. Geffard M, et al. **Brain Res** 1986 Jan 22;363(2):395-400

Responses of adrenal catecholamine secretion to lateral hypothalamic stimulation and lesion in rats. Katafuchi T, et al. **Brain Res** 1986 Jan 15;363(1):141-4

Modulating effects of posttraining epinephrine on memory: involvement of the amygdala noradrenergic system. Liang KC, et al. **Brain Res** 1986 Mar 12;368(1):125-33

Effects of intrahypothalamically administered norepinephrine, serotonin and bombesin on thermoregulation in the deermouse (Peromyscus maniculatus). Lin LH, et al. **Brain Res** 1986 Feb 5;364(2):212-9

Locus coeruleus norepinephrine-containing neurons: effects produced by acute and subchronic treatment with antipsychotic drugs and amphetamine. Ramirez OA, et al. **Brain Res** 1986 Jan 1; 362(1):165-70

Blockade of norepinephrine-induced long-lasting potentiation in the hippocampal dentate gyrus by an inhibitor of protein synthesis. Stanton PK, et al. **Brain Res** 1985 Dec 30;361(1-2):276-83

Noradrenaline modifies sympathetic preganglionic neuron spike and afterpotential. Yoshimura M, et al. **Brain Res** 1986 Jan 8; 362(2):370-4

Effects of dopamine and norepinephrine on neuronal activity of the olfactory tubercle. Guevara-Aguilar R, et al. **Brain Res Bull** 1985 Dec; 15(6):665-8

Alterations in noradrenergic innervation of the brain following dorsal bundle lesions in neonatal rats. Klisans-Fuenmayor D, et al. **Brain Res Bull** 1986 Jan;16(1):47-54

Adrenergic mechanisms of barbital dependence in mice. Germany A, et al. **Cell Mol Biol** 1985;31(5):369-71

Adrenergic coronary tone during submaximal exercise in the dog is produced by circulating catecholamines. Evidence for adrenergic denervation supersensitivity in the myocardium but not in coronary vessels. Chilian WM, et al. **Circ Res** 1986 Jan;58(1):68-82

Plasma noradrenaline and its relationship to plasma oestradiol in normal women during the menstrual cycle. Davidson L, et al. **Clin Exp Pharmacol Physiol** 1985 Sep-Oct;12(5):489-93

Treatment of childhood hyperactivity with desipramine: plasma drug concentration, cardiovascular effects, plasma and urinary catecholamine levels, and clinical response. Donnelly M, et al. **Clin Pharmacol Ther** 1986 Jan;39(1):72-81

Lymphatic transport rate of noradrenaline during adrenergic thermogenesis. Pácha J, et al. **Comp Biochem Physiol [C]** 1986; 83(1):161-4

Plasma catecholamines and vascular reactivity in acute and chronic renal failure. Campese VM, et al. **Contrib Nephrol** 1985;49:128-33

Relationship between plasma noradrenaline and blood pressure in uremia. Zuccalà A, et al. **Contrib Nephrol** 1985;49:134-9

Catecholamine-mediated injury to endothelium in rabbit *perfused aorta: a quantitat*ive analysis by scanning electron microscopy. Makhmudov RM, et al. **Cor Vasa** 1985;27(6):456-63

Human aqueous humor catecholamines. Autzen T, et al. **Curr Eye Res** 1985 Dec;4(12):1269-71

Desensitization of reticular neurons after ionophoretically applied noradrenalin in rats. Hricovíni M, et al. **Endocrinol Exp (Bratisl)** 1985 Dec;19(4):291-6

Acute influence of cigarette smoke in platelets, catecholamines and neurophysins in the normal conditions of daily life. de Lorgeril M, et

al. **Eur Heart J** 1985 Dec;6(12):1063-8

Reproducibility of plasma catecholamine concentrations at rest and during exercise in man. Péronnet F, et al. **Eur J Appl Physiol** 1986; 54(6):555-8

Noradrenergic-serotonergic interactions and nociception in the rat. Archer T, et al. **Eur J Pharmacol** 1986 Jan 29;120(3):295-307

Supersensitivity of alpha 2-adrenoceptors modulating [3H]5-HT release after noradrenergic denervation with DSP4. Benkirane S, et al. **Eur J Pharmacol** 1985 Dec 10;119(1-2):131-3

Reserpine-resistant responses to nerve stimulation in the cat nictitating membrane involve the release of newly synthesized noradrenaline. Duval N, et al. **Eur J Pharmacol** 1986 Mar 11;122(1):93-101

Plasma catecholamines and glucose during moderate exercise in the trout: comparison with bursts of violent activity. Ristori MT, et al. **Exp Biol** 1985;44(4):247-53

Visual discrimination learning and interhemispheric transfer in the cat, as affected by 6-hydroxydopamine. Sprague JM, et al. **Exp Brain Res** 1985;61(1):43-53

On steroid noradrenergic system interaction during the hypothalamic differentiation period in the female rat. Vidal MJ, et al. **Exp Clin Endocrinol** 1985 Dec;86(2):165-70

Acute cold exposure increases the glucagon sensitivity of thermogenic metabolism in the rat. Howland RJ. **Experientia** 1986 Feb 15; 42(2):162-3

Norepinephrine with its precursors and their antagonists haloperidol and phentolamine interact with dye free radicals in opposite ways. Marinov BS. **FEBS Lett** 1986 Mar 17;198(1):130-4

Brain monoamines and peptides: role in the control of eating behavior. Leibowitz SF. **Fed Proc** 1986 Apr;45(5):1396-403

Alpha- and beta-adrenergic mechanisms mediate blood pressure control by norepinephrine and angiotensin in ducks. Butler DG, et al. **Gen Comp Endocrinol** 1986 Feb;61(2):323-9

Three phase contractile response of rabbit pulmonary artery to norepinephrine: influence of ruthenium red and calcium. Howell RE, et al. **Gen Pharmacol** 1986;17(1):105-8

Are hypertensive effects of aldosterone, angiotensin, vasopressin, and norepinephrine chronically additive? Cowley AW Jr, et al. **Hypertension** 1986 Apr;8(4):332-43

Weight-reducing diets and sodium intake [letter] Strazzullo P. **Hypertension** 1986 Apr;8(4):357-9

Cardiac function and plasma catecholamines during upright exercise in healthy young subjects. Kelbaek H, et al. **Int J Cardiol** 1986 Mar; 10(3):223-35

Free plasma catecholamines, heart rates, lactate levels, and oxygen uptake in competition weight lifters, cyclists, and untrained control subjects. Lehmann M, et al. **Int J Sports Med** 1986 Feb;7(1):18-21

Plasma norepinephrine concentration reflects pharmacological alteration of sympathetic activity in the conscious cat. Hubbard JW, et al. **J Auton Nerv Syst** 1986 Jan;15(1):93-100

A study of the relationship between dopamine and noradrenaline content and transmural pressure in the mesenteric arteries of the dog. Azevedo I, et al. **J Auton Pharmacol** 1986 Mar;6(1):33-7

Comparison of the effects of labetalol and SCH 19927, the R1R isomer of labetalol, on the rat isolated right ventricle and aorta. Doggrell SA, et al. **J Auton Pharmacol** 1985 Dec;5(4):279-88

Perfusion with calcium free solution potentiates prazosin blockade of noradrenaline induced pressor responses in the mesenteric bed of the rat. Downing OA, et al. **J Auton Pharmacol** 1985 Dec;5(4):295-9

Norepinephrine decreases EGF binding in primary rat hepatocyte cultures. Cruise JL, et al. **J Cell Physiol** 1986 Apr;127(1):39-44

Noradrenergic and serotoninergic innervation of cortical, thalamic, and tectal visual structures in Old and New World monkeys. Morrison JH, et al. **J Comp Neurol** 1986 Jan 1;243(1):117-38

Unchanged pressor effect of norepinephrine in normal man following the oral administration of two angiotensin converting enzyme inhibitors, captopril and HOE 498. Vierhapper H, et al. **J Hypertens** 1986 Feb; 4(1):9-11

Urinary norepinephrine excretion in panic and phobic disorders. Dajas F, et al. **J Neural Transm** 1986;65(1):75-81

GABA-noradrenergic interaction: evidence for differential sites of action for GABA-A and GABA-B receptors. Suzdak PD, et al. **J Neural Transm** 1985;64(3-4):163-72

Stimulation of amino acid uptake and Na+,K+-ATPase activity by norepinephrine in superior cervical sympathetic ganglia excised from adult rats. Ando M, et al. **J Neurochem** 1986 May;46(5):1487-92

Stimulatory effect of ascorbic acid on norepinephrine biosynthesis in digitonin-permeabilized adrenal medullary chromaffin cells. Morita K, et al. **J Neurochem** 1986 Mar;46(3):939-45

Doses of 6-hydroxydopamine sufficient to deplete norepinephrine are not sufficient to decrease plasticity in the visual cortex. Trombley P, et al. **J Neurosci** 1986 Jan;6(1):266-73

Noradrenergic hyperinnervation of the motor trigeminal nucleus: alterations in membrane properties and responses to synaptic input. Vornov JJ, et al. **J Neurosci** 1986 Jan;6(1):30-7

Responses to norepinephrine resistant to inhibition by alpha and beta adrenoceptor antagonists. Bond RA, et al. **J Pharmacol Exp Ther** 1986 Feb;236(2):408-15

Contribution of Ca++ and calmodulin to the action of norepinephrine on renal prostaglandin synthesis and vascular tone. Cooper CL, et al. **J Pharmacol Exp Ther** 1986 Feb;236(2):424-31

Presynaptic alpha-2 adrenoceptor activation and coupling of the receptor-presynaptic effector system in the perfused rat heart: affinity and efficacy of phenethylamines and imidazoline derivatives. Fuder H, et al. **J Pharmacol Exp Ther** 1986 Apr;237(1):237-45

Effects of melatonin and control injections on pineal serotonin and norepinephrine: afternoon injections lower serotonin levels thirty-six percent at light-dark transition. Catalá MD, et al. **J Pineal Res** 1984; 1(1):75-82

Temporal effects of norepinephrine on pineal serotonin in vitro. Walker RF, et al. **J Pineal Res** 1986;3(1):33-40

Evidence for a noradrenergic transmission in the control of parturition in the rat. Legrand C, et al. **J Reprod Fertil** 1986 Jan;76(1):415-24

Effects of bifemelane hydrochloride (MCI-2016) on acetylcholine and norepinephrine release from cortical slices of bilaterally carotid-artery-ligated Mongolian gerbils. Saito K, et al. **Jpn J Pharmacol** 1985 Nov;39(3):406-9

A noradrenaline-induced inhibition from locus coeruleus of nucleus accumbens neuron receiving input from hippocampus. Unemoto H, et al. **Jpn J Pharmacol** 1985 Oct;39(2):233-9

Diurnal rhythm of alpha 2-noradrenergic receptors in the paraventricular nucleus and other brain areas: relation to circulating corticosterone and feeding behavior. Jhanwar-Uniyal M, et al. **Life Sci** 1986 Feb 3; 38(5):473-82

Effects of cocaine on the electrical activity of single noradrenergic neurons from locus coeruleus. Pitts DK, et al. **Life Sci** 1986 Mar 31; 38(13):1229-34

Epinephrine and norepinephrine stimulation of adenylate cyclase in bovine retina homogenate: evidence for interaction with the dopamine D1 receptor. Vanderheyden P, et al. **Life Sci** 1986 Mar 31; 38(13):1221-7

Stimulation of 3H-norepinephrine release by trifluoperazine from rat pineal glands. Yurko KA, et al. **Life Sci** 1986 Apr 14;38(15):1393-7

In vitro effects of betamethasone, adrenaline and noradrenaline on normal human T-lymphocyte rosettes. Kumar R, et al. **Mater Med Pol** 1985 Jul-Sep;17(3):170-1

Modulation of visual cortical plasticity by acetylcholine and noradrenaline. Bear MF, et al. **Nature** 1986 Mar 13-19; 320(6058):172-6

Islet-activating protein (pertussis toxin) diminishes alpha 2-adrenoceptor mediated effects on noradrenaline release. Allgaier C, et al. **Naunyn Schmiedebergs Arch Pharmacol** 1985 Nov;331(2-3):235-9

Effects of a monoamine oxidase A inhibitor, FLA 668 (+) on the adrenergic mechanisms of the dog saphenous vein. Caramona MM, et al. **Naunyn Schmiedebergs Arch Pharmacol** 1985 Nov;331(2-3):181-5

Further evidence for, and nature of, the facilitatory GABAergic influence on central noradrenergic transmission. Dennis T, et al. **Naunyn Schmiedebergs Arch Pharmacol** 1985 Nov;331(2-3):225-34

Further characterization of brain 3,4-dihydroxyphenylethyleneglycol (DHPG) formation: dependence on noradrenergic activity and site of formation. Li PP, et al. **Naunyn Schmiedebergs Arch Pharmacol** 1986 Jan;332(1):26-33

Opioid peptides decrease noradrenaline release and blood pressure in the rabbit at peripheral receptors. Szabo B, et al. **Naunyn Schmiedebergs Arch Pharmacol** 1986 Jan;332(1):50-6

Release of [3H]noradrenaline by alpha 1-adrenoceptor agonists. Vizi ES, et al. **Neurochem Res** 1986 Jan;11(1):71-84

Interaction between corticosterone and alpha-2-noradrenergic system of the paraventricular nucleus in relation to feeding behavior. Roland CR, et al. **Neuroendocrinology** 1986;42(4):296-305

The neurotropic effect of pituitary somatotropin and a fragment of it. Bulatov AA, et al. **Neurosci Behav Physiol** 1985 Sep-Oct; 15(5):419-22

Stimulation of noradrenaline synthesis by the calcium ionophore A23187 and its modulation by presynaptic receptors. Birch PJ, et al. **Neurosci Lett** 1985 Dec 4;62(2):187-92

Comparison between the actions of avian pancreatic polypeptide, neuropeptide Y and norepinephrine on the excitability of rat supraoptic vasopressin neurons. Day TA, et al. **Neurosci Lett** 1985 Dec 4; 62(2):181-5

Norepinephrine depletion in the paraventricular nucleus inhibits the adrenocortical responses to neural stimuli. Feldman S, et al. **Neurosci Lett** 1986 Feb 28;64(2):191-5

Frequency- and *reserpine-dependent* chemical coding of sympathetic transmission: differential release of noradrenaline and neuropeptide Y from pig spleen. Lundberg JM, et al. **Neurosci Lett** 1986 Jan 2; 63(1):96-100

Central noradrenaline depletion attenuates amphetamine-induced locomotor behavior. Mohammed AK, et al. **Neurosci Lett** 1986 Feb 28;64(2):139-44

The norepinephrine and dopamine content of the cat carotid body in vivo under normoxic and hypoxic conditions. Starlinger H, et al. **Neurosci Lett** 1986 Feb 14;64(1):65-8

Different developmental schedules of dopaminergic and noradrenergic neurons in dissociation culture of fetal rat midbrain and hindbrain. Ahnert-Hilger G, et al. **Neuroscience** 1986;17(1):157-65

Serotoninergic but not noradrenergic neurons in rat central nervous system adapt to long-term treatment with monoamine oxidase inhibitors. Blier P, et al. **Neuroscience** 1985 Dec;16(4):949-55

Release and turnover of noradrenaline in isolated median eminence: lack of negative feedback modulation. Vizi ES, et al. **Neuroscience** 1985 Dec; 16(4):907-16

Alteration of fetal heart rate caused by extrauterine environmental changes. Masuyama I, et al. **Nippon Juigaku Zasshi** 1986 Feb; 48(1):61-8

An effect of noradrenaline on resting potential and Na activity in sheep cardiac Purkinje fibres. Glitsch HG, et al. **Pflugers Arch** 1986 Feb; 406(2):144-50

Effects of dopamine and noradrenaline on Ca channels of cultured sensory and sympathetic neurons of chick. Marchetti C, et al. **Pflugers Arch** 1986 Feb;406(2):104-11

Effects of preshock experience on enhancement of rat brain noradrenaline turnover induced by psychological stress. Tsuda A, et al. **Pharmacol Biochem Behav** 1986 Jan;24(1):115-9

Effects of an extract of Ginkgo biloba on noradrenergic systems of rat cerebral cortex. Brunello N, et al. **Pharmacol Res Commun** 1985 Nov; 17(11):1063-72

Antagonism by dopamine, but not noradrenaline receptor blockers of the anti-immobility activity of desipramine after different treatment schedules in the rat. Pulvirenti L, et al. **Pharmacol Res Commun** 1986 Jan;18(1):73-80

Norepinephrine and the antibody response. Sanders VM, et al. **Pharmacol Rev** 1985 Sep;37(3):229-48 (256 ref.)

Evidence for the site of action of glycerol trinitrate and diltiazem in inhibiting vasoconstrictor responses to norepinephrine in isolated renal arteries. Gross GJ, et al. **Pharmacology** 1986;32(1):1-10

Action of antidepressant neuroleptics, chlorprothixene and levomepromazine, on the central noradrenergic system: comparison with other antidepressants. Antkiewicz-Michaluk L. **Pol J Pharmacol Pharm** 1985 Sep-Oct;37(5):673-83

Possible relationship of the locus coeruleus--hippocampal noradrenergic neurons to depression and mode of action of antidepressant drugs. Kostowski W. **Pol J Pharmacol Pharm** 1985 Nov-Dec;37(6):727-43 (57 ref.)

The influence of beta-agonists on normal and clonidine-decelerated noradrenaline turnover in the rat brain. Nowak G, et al. **Pol J Pharmacol Pharm** 1985 Nov-Dec;37(6):765-72

Studies on the utility of urinary 3,4-dihydroxyphenylethylene-glycol (DHPG) measurement. Li PP, et al. **Prog Neuropsychopharmacol Biol Psychiatry** 1985;9(5-6):717-20

Adrenergic stimulation of prostacyclin production in the rat tail artery. II. The role of calcium. Golub MS, et al. **Prostaglandins Leukotrienes Med** 1985 Dec;20(3):313-24

Effects of S-adenosyl-methionine on plasma norepinephrine, blood pressure, and heart rate in healthy volunteers. Sherer MA, et al. **Psychiatry Res** 1986 Feb;17(2):111-8

Central noradrenaline depletion antagonizes aspects of d-amphetamine-induced hyperactivity in the rat. Archer T, et al. **Psychopharmacology (Berlin)** 1986;88(2):141-6

Effects of antidepressant drugs, selective noradrenaline-or 5-hydroxytryptamine uptake inhibitors, on apomorphine-induced hypothermia in mice. Pawlowski L, et al. **Psychopharmacology (Berlin)** 1986;88(2):240-6

Involvement of noradrenaline in potentiation of the head-twitch response by GABA-related drugs. Singh L, et al. **Psychopharmacology (Berlin)** 1986;88(3):315-9

Plasma catecholamines at rest and exercise in subjects with high- and low-trait anxiety. Péronnet F, et al. **Psychosom Med** 1986 Jan-Feb; 48(1-2):52-8

Presynaptic modulation by noradrenaline and an opioid of the substance P-induced release of [3H]acetylcholine from the myenteric plexus. Vizi ES, et al. **Regul Pept** 1985 Nov 28;12(4):317-25

Influence of serotinin and norepinephrine on flow capacity/pressure characteristics of feline isolated cerebral arteries. Lou HC, et al. **Stroke** 1986 Jan-Feb;17(1):91-4

Neurobiochemical alterations induced by the artificial sweetener aspartame (NutraSweet). Coulombe RA Jr, et al. **Toxicol Appl Pharmacol** 1986 Mar 30;83(1):79-85

[Difference in vasoconstrictor responses of the internal and external carotid arteries to norepinephrine] Kawai Y, et al. **Nippon Heikatsukin Gakkai Zasshi** 1985 Aug;21(4):274-6 **(Jpn)**

[Influence of noradrenaline denervation supersensitivity on urination] Wada T, et al. **Nippon Heikatsukin Gakkai Zasshi** 1985 Aug; 21(4):280-2 **(Jpn)**

[Selected elements of the physiology of physical exertion as the introduction to physiopathology in obstetrics and perinatology. II. Factors of physiological regulation of energy metabolism during physical exertion. Neurohormonal regulation: the adrenergic system] Brodziński W. **Ginekol Pol** 1985 Oct;56(10):585-91 (Eng. Abstr.) **(Pol)**

[Effect of adrenaline and noradrenaline on the vascular antiaggregation activity in cats] Gabrielian ES, et al. **Farmakol Toksikol** 1986 Jan-Feb; 49(1):56-8 (Eng. Abstr.) **(Rus)**

[Experience in analyzing the functional structure of thermogenesis based on pharmacologic testing] Iudanova LA, et al. **Fiziol Zh SSSR** 1986 Jan;72(1):109-15 (Eng. Abstr.) **(Rus)**

[Mechanism of action of noradrenaline on cutaneous thermoreceptors] Kozyreva TV, et al. **Fiziol Zh SSSR** 1985 Nov;71(11):1344-50 (Eng. Abstr.) **(Rus)**

[Role of brain noradrenergic mechanisms in disturbing the circadian rhythm of the functioning hypothalamo-hypophyseo-adrenal cortex system in white rats in early ontogeny] Maslova LN, et al. **Ontogenez** 1986 Jan-Feb;17(1):56-61 (Eng. Abstr.) **(Rus)**

NORTRIPTYLINE

Change in serum antidepressant level at a constant dose of medication [letter] Chisholm DD. **Am J Psychiatry** 1986 Mar;143(3):388

Amitriptyline metabolism: association with debrisoquin hydroxylation in nonsmokers. Mellström B, et al. **Clin Pharmacol Ther** 1986 Apr; 39(4):369-71

Cardiac antiarrhythmic effect of nortriptyline. Madakasira S. **Gen Hosp Psychiatry** 1986 Mar;8(2):123-5

OBSESSIVE-COMPULSIVE DISORDER

High-affinity imipramine binding and serotonin uptake in platelets of eight adolescent and ten adult obsessive-compulsive patients. Weizman A, et al. **Am J Psychiatry** 1986 Mar;143(3):335-9

DDAVP as a possible method to enhance positive benefit of behaviour therapy. Greenberg D, et al. **Br J Psychiatry** 1985 Dec;147:713-5

The Leyton Obsessional Inventory-Child Version. Berg CJ, et al. **J Am Acad Child Psychiatry** 1986 Jan;25(1):84-91

Fluoxetine in the treatment of obsessive compulsive disorder. Fontaine R, et al. **Prog Neuropsychopharmacol Biol Psychiatry** 1985; 9(5-6):605-8

ORGANIC MENTAL DISORDERS

[Value of amineptin in the treatment of different depressive states. Apropos of 112 cases treated as part of a national multi-centric study] Marie-Cardine M, et al. **Encephale** 1985 Jul-Aug;11(4):175-7 (Eng. Abstr.) **(Fre)**

OXAZEPAM

The metabolic disposition of oxazepam in rats. Sisenwine SF, et al. **Drug Metab Dispos** 1986 Jan-Feb;14(1):41-5

The behavioral actions of diazepam and oxazepam are similar. Mewaldt SP, et al. **Psychopharmacology (Berlin)** 1986;88(2):165-71

PARASYMPATHOMIMETICS

Cholinergic stimulation of the hypothalamus and natriuresis in rats: role of the renal nerves. Silva-Netto CR, et al. **Am J Physiol** 1986 Feb; 250(2 Pt 2):F322-8

Stimulatory cholinergic effect on the release of antiaggregatory activity into the circulation of cat and man and its modification by beta-adrenergic antagonists. Swies J, et al. **Eur J Clin Invest** 1985 Dec; 15(6):320-6

Phorbol esters mimic some cholinergic actions in hippocampal pyramidal neurons. Malenka RC, et al. **J Neurosci** 1986 Feb;6(2):475-80

Differences between negative chrono-, dromo- and inotropic actions of cholinomimetics in the dog isolated atrium. Kobayashi M, et al. **Jpn Heart J** 1985 Sep;26(5):801-5

Effects of cholinergic drugs on aversive operant behavior induced by dorsal central gray stimulation in rats. Moriyama M, et al. **Jpn J Pharmacol** 1985 Nov;39(3):339-47

Cerebral neocortical neurons in the aged rat: spontaneous activity, properties of pyramidal tract neurons and effect of acetylcholine and cholinergic drugs. Lamour Y, et al. **Neuroscience** 1985 Dec; 16(4):835-44

Microwave facilitation of methylatropine antagonism of central cholinomimetic drug effects. Quock RM, et al. **Radiat Res** 1986 Mar; 105(3):328-40

PARGYLINE

N-dealkylation and N-oxidation of two alpha-methyl-substituted pargyline analogues in rat liver microsomes. Weli AM, et al. **Acta Pharm Suec** 1985;22(5):249-64

Effects of pargyline, reserpine and neurotoxin lesions on [3H]tryptamine binding sites in rat brain. Cascio CS, et al. **Eur J Pharmacol** 1986 Jan 14;120(1):101-5

PEMOLINE

Pemoline and urinary excretion of catecholamines and indoleamines in

children with attention deficit disorder. Zametkin AJ, et al. **Am J Psychiatry** 1986 Mar;143(3):359-62
Pemoline and the prostate [letter] Lindau W, et al. **Lancet** 1986 Mar 29; 1(8483):738

PENTOBARBITAL

Oxygen consumption in fetal lambs after maternal administration of sodium pentobarbital. Rurak DW, et al. **Am J Obstet Gynecol** 1986 Mar;154(3):674-8
Comparison of drug effects on fixed-ratio performance and chain performance maintained under a second-order fixed-ratio schedule. Winsauer PJ, et al. **J Exp Anal Behav** 1985 Nov;44(3):367-76
Sex differences in the induction of physical dependence on pentobarbital in the rat. Suzuki T, et al. **Jpn J Pharmacol** 1985 Dec;39(4):453-9
Effects of methylphenidate and pentobarbital on the spontaneous activity levels of rats with selective hippocampal system damage. Shull RN, et al. **Life Sci** 1986 Mar 24;38(12):1135-41
Effects of diazepam and pentobarbital on discrete lever-press avoidance response in mice: baseline-dependent changes. Kuribara H, et al. **Yakubutsu Seishin Kodo** 1985 Dec;5(4):343-8

PEPTIDES

Cleavage at acyl-proline bonds with sodium in liquid ammonia: application with nanomolar amounts of peptides and separation of products by high-performance liquid chromatography for structural analysis. Hempel J, et al. **Anal Biochem** 1985 Dec;151(2):225-30
Epitope specific immunity elicited by totally synthetic monovalent or polyvalent vaccines. Chedid L, et al. **Ann Sclavo** 1984;1(2):77-85
A rapid, sensitive mass spectrometric method for investigating microscale chemical reactions of surface adsorbed peptides and proteins. Chait BT, et al. **Biochem Biophys Res Commun** 1986 Jan 14;134(1):420-6
Time-resolved fluorescence and 1H NMR studies of tyrosyl residues in oxytocin and small peptides: correlation of NMR-determined conformations of tyrosyl residues and fluorescence decay kinetics. Ross JB, et al. **Biochemistry** 1986 Feb 11;25(3):607-12
Gut peptides in lactation. Holst N, et al. **Br J Obstet Gynaecol** 1986 Feb, 93(2):188-93
Changes in dynorphin, enkephalin and cholecystokinin content of hippocampus and substantia nigra after amygdala kindling. Iadarola MJ, et al. **Brain Res** 1986 Feb 12;365(1):185-91
Interaction of neuropeptides and biogenic amines on cyclic adenosine monophosphate accumulation in hypothalamic nuclei. Redgate ES, et al. **Brain Res** 1986 Feb 12;365(1):61-9
The regulation of the corticomelanotropic cell activity in Aves--II. Effect of various peptides on the release of ACTH from dispersed, perfused duck pituitary cells. Castro MG, et al. **Comp Biochem Physiol** [A] 1986; 83(1):71-5
Opioid potentiated chromatophorotropin regulation of pigment migration in the land crab Gecarcinus lateralis. Martinez EA, et al. **Comp Biochem Physiol** [C] 1986;83(1):77-82
Peptide characterization of secretin preparations. Wolfe MM, et al. **Dig Dis Sci** 1986 Mar;31(3):257-64
Peptide histidine isoleucine amide stimulates thyroid hormone secretion and coexists with vasoactive intestinal polypeptide in intrathyroid nerve fibers from laryngeal ganglia. Grunditz T, et al. **Endocrinology** 1986 Feb;118(2):783-90
Peptides and histamine release from rat peritoneal mast cells. Devillier P, et al. **Eur J Pharmacol** 1985 Oct 29;117(1):89-96
Binding sites for calcium, lipid and p11 on p36, the substrate of retroviral tyrosine-specific protein kinases. Johnsson N, et al. **FEBS Lett** 1986 Mar 31;198(2):361-4
Chemical characterization and opioid activity of an exorphin isolated from in vivo digests of casein. Meisel H. **FEBS Lett** 1986 Feb 17; 196(2):223-7
Effect of inhibition of acid secretion on the regulatory peptides in the rat stomach. Allen JM, et al. **Gastroenterology** 1986 Apr;90(4):970-7
Common patterns of neuroendocrine integration in vertebrates and invertebrates. Acher R. **Gen Comp Endocrinol** 1986 Mar;61(3):452-8
Comparative effects of corticotropin-releasing factor, arginine vasopressin, and related neuropeptides on the secretion of ACTH and alpha-MSH by frog anterior pituitary cells and neurointermediate lobes in vitro. Tonon MC, et al. **Gen Comp Endocrinol** 1986 Mar; 61(3):438-45
Circular dichroism and fluorescence spectroscopic analyses of a proline-rich glycoprotein from human parotid saliva. Loomis RE, et al. **Int J Pept Protein Res** 1985 Dec;26(6):621-9
Inhibitin: a specific inhibitor of sodium/sodium exchange in erythrocytes. Morgan K, et al. **J Clin Invest** 1986 Feb;77(2):538-44
Distribution of immunoreactive somatostatin (ISRIF) in the nervous system of the squid, Loligo pealei. Feldman SC. **J Comp Neurol** 1986 Mar 8;245(2):238-57
Ketomethylene pseudopeptide analogues of substance P: synthesis and biological activity. Ewenson A, et al. **J Med Chem** 1986 Feb; 29(2):295-9
Effects of peptide hormones in urate crystal inflammation. Denko CW, et al. **J Rheumatol** 1985 Oct;12(5):971-5
Stimulation by serotonin of immunoreactive peptide histidine isoleucine release from rat hypothalamus in vitro. Inoue T, et al. **Neurosci Lett** 1986 Feb 14;64(1):17-22
Coexistence of peptide immunoreactivity in sensory neurons of the cat. Leah JD, et al. **Neuroscience** 1985 Nov;16(3):683-90
Peptides of the APUD system in amphibian skins. de Magistris L, et al. **Peptides** 1985;6 Suppl 3:203-8
Peptides as modifiers of Na+-induced pinocytosis in starved Amoeba proteus. Josefsson JO, et al. **Peptides** 1985;6 Suppl 3:485-8
The fish neuropeptide urotensin I: its physiology and pharmacology. Lederis K, et al. **Peptides** 1985;6 Suppl 3:353-61
Effects of sauvagine, urotensin I and CRF on food intake in rats. Negri L, et al. **Peptides** 1985;6 Suppl 3:53-7
Synthesis and biological activity of highly potent octapeptide analogs of somatostatin. Cai RZ, et al. **Proc Natl Acad Sci USA** 1986 Mar; 83(6):1896-900
Pro-opiomelanocortin-related peptides in cerebrospinal fluid: a study of manic-depressive disorder. Berrettini WH, et al. **Psychiatry Res** 1985 Dec;16(4):287-302
Permeability of the blood-brain barrier to neuropeptides: the case for penetration. Banks WA, et al. **Psychoneuroendocrinology** 1985; 10(4):385-99
Generation of anaphylatoxin activity related to C3a, by treatment of human serum with the nitrogen nucleophile N2H4 or the chaotrope KSCN. von Zabern I, et al. **Scand J Immunol** 1985 Dec; 22(6):639-51
Stimulation of gonadotropin release by a non-GnRH peptide sequence of the GnRH precursor. Millar RP, et al. **Science** 1986 Apr 4; 232(4746):68-70
[Very high efficiency chromatography of peptides] Sasagawa T, et al. **Tanpakushitsu Kakusan Koso** 1985 Nov;30(12):1320-35 (167 ref.) **(Jpn)**
[Peptide factors of gonadal autoregulation] Neamţu C. **Rev Med Chir Soc Med Nat Iasi** 1985 Jul-Sep;89(3):542-4 (0 ref.) **(Rum)**
[Enzymatic synthesis of peptides] Mitin IuV. **Antibiot Med Biotekhnol** 1986 Feb;31(2):93-8 (Eng. Abstr.) **(Rus)**
[Response of the secretory glands of the stomach to peptide injection into the hypothalamus, caudate nucleus and amygdala] Barashkova GM, et al. **Fiziol Zh SSSR** 1985 Dec;71(12):1513-20 (Eng. Abstr.) **(Rus)**
[Hypothalamic monoamines and nonapeptides in the regulation of thyroid function in the early ontogeny of birds] Karpezo NA, et al. **Ontogenez** 1985 Nov-Dec;16(6):589-96 (Eng. Abstr.) **(Rus)**

PERPHENAZINE

Liquid chromatographic method for perphenazine and its sulfoxide in pharmaceutical dosage forms for determination of stability. Beaulieu N, et al. **J Assoc Off Anal Chem** 1986 Jan-Feb;69(1):167-9

PERSONALITY ASSESSMENT

Rating scales and checklists for child psychopharmacology. Conners CK, et al. **Psychopharmacol Bull** 1985;21(4):809-43

PERSONALITY DISORDERS

Positive effects of carbamazepine on behavioral dyscontrol in borderline personality disorder. Gardner DL, et al. **Am J Psychiatry** 1986 Apr; 143(4):519-22
Clonazepam: a novel therapeutic adjunct. Freinhar JP, et al. **Int J Psychiatry Med** 1985-86;15(4):321-8

PERSONALITY INVENTORY

The Leyton Obsessional Inventory-Child Version. Berg CJ, et al. **J Am Acad Child Psychiatry** 1986 Jan;25(1):84-91
Scales of potential use in the psychopharmacologic treatment of depressed children and adolescents. Petti TA. **Psychopharmacol Bull** 1985; 21(4):951-77

PHENCYCLIDINE

Place-aversion conditioned by phencyclidine in rats: development of tolerance and pharmacologic antagonism. Iwamoto ET. **Alcohol Drug Res** 1985-86;6(4):265-76
A caution against use of verapamil in phencyclidine intoxication [letter] McCann DJ, et al. **Am J Psychiatry** 1986 May;143(5):679
Identification of polypeptides of the phencyclidine receptor of rat hippocampus by photoaffinity labeling with [3H]azidophencyclidine. Haring R, et al. **Biochemistry** 1986 Feb 11;25(3):612-20
Right to healthy birth: medico-legal issues in phencyclidine ingestion. Kaufman KR, et al. **Child Abuse Negl** 1986;10(1):41-4
Phencyclidine-specific Fab fragments alter phencyclidine disposition in dogs. Owens SM, et al. **Drug Metab Dispos** 1986 Jan-Feb; 14(1):52-8
Anticonvulsant properties of phencyclidine-like drugs in mice. Hayes BA,

et al. **Eur J Pharmacol** 1985 Oct 29;117(1):121-5

Treatment of depression in chronic cocaine and phencyclidine abuse with desipramine. Giannini AJ, et al. **J Clin Pharmacol** 1986 Mar; 26(3):211-4

Extended EMIT-DAU phencyclidine screen. Ragan FA Jr, et al. **J Clin Psychiatry** 1986 Apr;47(4):194-5

Comparison of drug effects on fixed-ratio performance and chain performance maintained under a second-order fixed-ratio schedule. Winsauer PJ, et al. **J Exp Anal Behav** 1985 Nov;44(3):367-76

Acetylcholine synthesis and release by a sympathetic ganglion in the presence of 2-(4-phenylpiperidino) cyclohexanol (AH5183). Collier B, et al. **J Neurochem** 1986 Mar;46(3):822-30

A review of thirty cases of rhabdomyolysis-associated acute renal failure among phencyclidine users. Patel R, et al. **J Toxicol Clin Toxicol** 1985-86;23(7-8):547-56

Behavioral and receptor binding studies of phencyclidine (PCP) and lithium interaction in the rat. Mattia A, et al. **Life Sci** 1986 Mar 17; 38(11):975-84

Quinacrine and 2-(4-phenylpiperidino)cyclohexanol (AH5183) inhibit acetylcholine release and synthesis in rat brain slices. Jope RS, et al. **Mol Pharmacol** 1986 Jan;29(1):45-51

A parametric study of the behavioral effects of phencyclidine in adult cats. Levine MS, et al. **Neuropharmacology** 1985 Dec;24(12):1181-5

A comparison of the discriminative stimulus properties of phencyclidine, given intraperitoneally or intraventricularly in rats. Slifer BL, et al. **Neuropharmacology** 1985 Dec;24(12):1175-9

2-(4-phenylpiperidino) cyclohexanol (AH5183) decreases quantal size at the frog neuromuscular junction. Van der Kloot W. **Pflugers Arch** 1986 Jan;406(1):83-5

Effects of phencyclidine, N-allyl-N-normetazocine (SKF-10,047), and verapamil on performance in a radial maze. McCann DJ, et al. **Pharmacol Biochem Behav** 1986 Feb;24(2):187-91

Structure-activity relationships of phencyclidine derivatives in rat cerebellum. Pang K, et al. **Pharmacol Biochem Behav** 1986 Jan; 24(1):127-34

Demonstration of a receptor in Torpedo synaptic vesicles for the acetylcholine storage blocker L-trans-2-(4-phenyl[3,4-3H]-piperidino) cyclohexanol. Bahr BA, et al. **Proc Natl Acad Sci USA** 1986 Apr; 83(7):2267-70

[Phencyclidine: behavioral effects and molecular targets] Vignon J. **Biochimie** 1985 Sep;67(9):XI-XVI **(Fre)**

[Identification of psychotropic drugs. IV. Analysis of phencyclidine and its analogues] Shimamine M, et al. **Eisei Shikenjo Hokoku** 1985; (103):93-6 (Eng. Abstr.) **(Jpn)**

PHENCYCLIDINE ABUSE

Extended EMIT-DAU phencyclidine screen. Ragan FA Jr, et al. **J Clin Psychiatry** 1986 Apr;47(4):194-5

PHENELZINE

Phenelzine poisoning. Breheny FX, et al. **Anaesthesia** 1986 Jan; 41(1):53-6

Phenelzine overdose treated with dantrolene sodium. Kaplan RF, et al. **JAMA** 1986 Feb 7;255(5):642-4

PHENETHYLAMINES

Pemoline and urinary excretion of catecholamines and indoleamines in children with attention deficit disorder. Zametkin AJ, et al. **Am J Psychiatry** 1986 Mar;143(3):359-62

Determination of beta-phenylethylamine concentrations in human plasma, platelets, and urine and in animal tissues by high-performance liquid chromatography with fluorometric detection. Tsuji M, et al. **Anal Biochem** 1986 Feb 15;153(1):116-20

The effect of repeated administration of (-) deprenyl on the phenylethylamine-induced stereotypy in rats. Timár J, et al. **Arch Int Pharmacodyn Ther** 1986 Jan;279(1):50-60

Effects of substituted phenylethylamines on blowfly feeding behavior. Long TF, et al. **Comp Biochem Physiol [C]** 1986;83(1):201-9

In vivo voltammetry in the suprachiasmatic nucleus of the rat: effects of RU24969, methiothepin and ketanserin. Martin KF, et al. **Eur J Pharmacol** 1986 Feb 11;121(1):135-9

Synthesis, identification, and acute toxicity of alpha-benzylphenethylamine and alpha-benzyl-N-methylphenethylamine. Contaminants in clandestine preparation of amphetamine and methamphetamine. Noggle FT Jr, et al. **J Assoc Off Anal Chem** 1985 Nov-Dec;68(6):1213-22

Clinical studies on the phenylethylamine hypothesis of affective disorder: urine and blood phenylacetic acid and phenylalanine dietary supplements. Sabelli HC, et al. **J Clin Psychiatry** 1986 Feb; 47(2):66-70

Presynaptic alpha-2 adrenoceptor activation and coupling of the receptor-presynaptic effector system in the perfused rat heart: affinity and efficacy of phenethylamines and imidazoline derivatives. Fuder H, et al. **J Pharmacol Exp Ther** 1986 Apr;237(1):237-45

Discriminative stimulus properties of amphetamine and structurally related phenalkylamines. Young R, et al. **Med Res Rev** 1986 Jan-Mar; 6(1):99-130 (74 ref.)

Effects of a monoamine oxidase A inhibitor, FLA 668 (+) on the adrenergic mechanisms of the dog saphenous vein. Caramona MM, et al. **Naunyn Schmiedebergs Arch Pharmacol** 1985 Nov;331(2-3):181-5

The functional consequences of inhibition of monoamine oxidase type B: comparison of the pharmacological properties of L-deprenyl and MDL 72145. Fozard JR, et al. **Naunyn Schmiedebergs Arch Pharmacol** 1985 Nov;331(2-3):186-93

Selective inhibition of monoamine oxidase by p-aminosubstituted phenylalkylamines in catecholaminergic neurones. Ask AL, et al **Neuropharmacology** 1986 Jan;25(1):33-40

Inhibition of monoamine oxidase A-form and semicarbazide-sensitive amine oxidase by selective and reversible monoamine oxidase-A inhibitors, amiflamine and FLA 788(+). Morikawa F, et al. **Pharmacology** 1986;32(1):38-45

WHO Expert Committee on Drug Dependence. Twenty-second report. **WHO Tech Rep Ser** 1985;729:1-31

Metabolism of deprenyl, a selective monoamine oxidase (MAO) B inhibitor in rat: relationship of metabolism to MAO-B inhibitory potency. Yoshida T, et al. **Xenobiotica** 1986 Feb;16(2):129-36

[Baygon (2-isopropoxyphenyl-N-methyl carbamate) activation of enzymatic deamination of 2-phenyl-ethylamine] Zeinalov TA. **Vopr Med Khim** 1985 Sep-Oct;31(5):60-4 (Eng. Abstr.) **(Rus)**

PHENOBARBITAL

Stability of phenobarbital sodium diluted in 0.9% sodium chloride injection. Nahata MC, et al. **Am J Hosp Pharm** 1986 Feb; 43(2):384-5

Effects of phenobarbital treatment on 3-methylindole toxicosis in ponies. Turk MA, et al. **Am J Vet Res** 1986 Apr;47(4):901-5

Effect of butalbital and phenobarbital pretreatment on antipyrine clearance in the rat. Tse FL, et al. **Arch Int Pharmacodyn Ther** 1986 Feb; 279(2):181-94

Substrate and phenobarbital induction of the biliary excretion of exogenous organic anions in rats. Fischer E, et al. **Arch Toxicol [Suppl]** 1985;8:345-7

Increased response of cytochrome P-450 dependent biotransformation reactions in rat liver to repeated administration of inducers. Kleeberg U, et al. **Arch Toxicol [Suppl]** 1985;8:361-5

Chronic treatment with phenobarbital decreases the expression of rat liver EGF and insulin receptors. Hwang DL, et al. **Biochem Biophys Res Commun** 1986 Mar 13;135(2):501-6

Induction of alpha 2u globulin mRNA by phenobarbital in rat liver: characterization of a cDNA clone. Osorio-Almeida ML, et al. **Biochem Biophys Res Commun** 1986 Feb 13;134(3):1182-9

Identification of human cytochromes P-450 analogous to forms induced by phenobarbital and 3-methylcholanthrene in the rat. Adams DJ, et al. **Biochem J** 1985 Dec 15;232(3):869-76

Studies on rat liver cytochrome P-450s involved in the metabolism of antipyrine: phenobarbital- and 3-methylcholanthrene-inducible isozymes possessing 4-hydroxylase activity. Buppodom P, et al. **Biochem Pharmacol** 1986 Apr 15;35(8):1404-6

Induction of UDP-glucuronyl transferase mRNA in embryonic chick livers by phenobarbital. Jackson MR, et al. **Biochem Pharmacol** 1986 Apr 1;35(7):1191-8

Effect of phenobarbital on the oligosaccharide structure of rat alpha-acid glycoprotein. Monnet D, et al. **Biochim Biophys Acta** 1986 Mar 19; 881(1):10-4

Effects of phenobarbital steady state levels on antipyrine clearance and distribution in the rat. Pei YY, et al. **Biopharm Drug Dispos** 1986 Jan-Feb;7(1):11-9

The phenotypic stability of altered hepatic foci: effect of the short-term withdrawal of phenobarbital and of the long-term feeding of purified diets after the withdrawal of phenobarbital. Glauert HP, et al. **Carcinogenesis** 1986 Jan;7(1):117-21

Results of spin immunoassay for simultaneous measurement of phenytoin and phenobarbital in serum compared with those of liquid chromatography. Sayo H, et al. **Chem Pharm Bull (Tokyo)** 1985 Jul; 33(7):2866-70

A comparison of the toxicity effects of the anticonvulsant eterobarb (antilon, DMMP) and phenobarbital in normal human volunteers. Smith DB, et al. **Epilepsia** 1986 Mar-Apr;27(2):149-55

Synthesis and pharmacological properties of N,N'-bis-acylderivatives of phenobarbital. Cid E, et al. **Farmaco [Prat]** 1986 Jan;41(1):36-40

Cytochrome P-450-dependent H2O2 production demonstrated in vivo. Influence of phenobarbital and allylisopropylacetamide. Premereur N, et al. **FEBS Lett** 1986 Apr 7;199(1):19-22

Complete amino acid sequence of a cytochrome P-450 isolated from beta-naphthoflavone-induced rabbit liver microsomes. Comparison with phenobarbital-induced and constitutive isozymes and identification of invariant residues. Ozols J. **J Biol Chem** 1986 Mar 25; 261(9):3965-79

Phenobarbitone enhances [35S]TBPS binding to extensively washed rat cortical membranes. Honoré T, et al. **J Pharm Pharmacol** 1985 Dec;

37(12):928-9

Rates of progesterone oxidation by rabbit liver microsomes before and after phenobarbitone treatment. Senciall IR, et al. **J Steroid Biochem** 1985 Dec;23(6A):1007-12

Effect of estrogen, testosterone, and phenobarbital on uterine weight and liver microsomal enzymes in prepuberal mice. Robl JM, et al. **Pediatr Pharmacol (New York)** 1985;5(3):157-64

Comparison of in vivo and in vitro methods for assessing the effects of phenobarbital on the hepatic drug-metabolizing enzyme system. Chadwick RW, et al. **Toxicol Lett** 1985 Dec;29(2-3):95-105

Induction of renal and hepatic mixed function oxidases in the hamster and guinea pig. Smith JH, et al. **Toxicology** 1986 Feb;38(2):209-18

[Effect of phenobarbital on the kinetics of the change in the level of paramagnetic metalloprotein complexes in dinitrophenol poisoning] Luk'ianchuk VD. **Farmakol Toksikol** 1985 Nov-Dec;48(6):102-4 (Eng. Abstr.) **(Rus)**

[Comparative study of the effect of zixoryn and phenobarbital on the toxicity of anthracycline antibiotics and liver monooxygenase activity in mice] Bogush TA, et al. **Vestn Akad Med Nauk SSSR** 1985;(11):82-6 (Eng. Abstr.) **(Rus)**

[Activity of the liver monooxygenase system after induction with phenobarbital in the early neonatal period] Guliaeva LF, et al. **Vopr Med Khim** 1985 Sep-Oct;31(5):49-53 (Eng. Abstr.) **(Rus)**

PHENOTHIAZINE TRANQUILIZERS

Flow injection analysis of three N-substituted phenothiazine drugs with amperometric detection at a carbon fibre array electrode. Belal F, et al. **Analyst** 1985 Dec;110(12):1493-6

Phenothiazine drugs and metabolites: molecular conformation and dopaminergic, alpha adrenergic and muscarinic cholinergic receptor binding. Dahl SG, et al. **Biochem Pharmacol** 1986 Apr 15;35(8):1263-9

Effects of phenothiazines on cultured retinal pigment epithelial cells. Matsumura M, et al. **Ophthalmic Res** 1986;18(1):47-54

PHENOTHIAZINES

Differential inotropic actions of ethmozine and ethacizin (diethylamine analog of ethmozine). Urthaler F, et al. **Am Heart J** 1986 Mar;111(3):462-5

[Quantitative determination of fluoracizine in biological material] Nikolaeva EG. **Sud Med Ekspert** 1986 Jan-Mar;29(1):46-7 (Eng. Abstr.) **(Rus)**

[Isolation and detection of fluoracizine in biological material] Nikolaeva G. **Sud Med Ekspert** 1986 Jan-Mar;29(1):42-3 (Eng. Abstr.) **(Rus)**

PHENOXYBENZAMINE

Recovery of pulsatile luteinizing hormone secretion following permanent disruption of the ascending noradrenergic fiber tract in the ovariectomized rat. Clifton DK, et al. **Biol Reprod** 1985 Nov;33(4):808-14

Phenoxybenzamine partially inhibits alpha 2-adrenoceptors without affecting their presynaptic function. McKernan RM, et al. **Neuropharmacology** 1986 Jan;25(1):47-52

PHENYLALANINE

The effects of amino acids on protein degradation and translocation of non-histone proteins to the nucleus in lymphocytes. Polet H, et al. **Biochim Biophys Acta** 1986 Apr 8;886(1):33-9

Formation of m-tyrosine and o-tyrosine from L-phenylalanine in various tissues of rats. Ishimitsu S, et al. **Chem Pharm Bull (Tokyo)** 1985 Sep;33(9):3887-92

Aromatic amino acid requirement of the lactating sow. Lellis WA, et al. **J Anim Sci** 1985 Dec;61(6):1448-53

Clinical studies on the phenylethylamine hypothesis of affective disorder: urine and blood phenylacetic acid and phenylalanine dietary supplements. Sabelli HC, et al. **J Clin Psychiatry** 1986 Feb;47(2):66-70

PHENYLPROPANOLAMINE

Elimination of labetalol-induced false positives in drug analyses [letter] Wu A, et al. **Clin Chem** 1986 Feb;32(2):407

Phenylpropanolamine and blood pressure [letter] Morgan JP, et al. **Clin Pharmacol Ther** 1986 Jan;39(1):102-3

Clinical response and urethral pressure profile changes after phenylpropanolamine in dogs with primary sphincter incompetence. Richter KP, et al. **J Am Vet Med Assoc** 1985 Sep 15;187(6):605-11

Leukocytosis following intravenous phenylpropanolamine use--possible association. Paulman PM, et al. **Nebr Med J** 1986 Feb;71(2):40-1

PHENYTOIN

Metabolic effects of phenytoin toxicity [letter] Wagner KJ, et al. **Ann Emerg Med** 1986 Apr;15(4):509-10

Inability of ibuprofen to alter single dose phenytoin disposition. Bachmann KA, et al. **Br J Clin Pharmacol** 1986 Feb;21(2):165-9

Lamotrigine (BW430C), a potential anticonvulsant. Effects on the central nervous system in comparison with phenytoin and diazepam. Cohen AF, et al. **Br J Clin Pharmacol** 1985 Dec;20(6):619-29

Antipyrine metabolite kinetics in healthy human volunteers during multiple dosing of phenytoin and carbamazepine. Shaw PN, et al. **Br J Clin Pharmacol** 1985 Dec;20(6):611-8

Results of spin immunoassay for simultaneous measurement of phenytoin and phenobarbital in serum compared with those of liquid chromatography. Sayo H, et al. **Chem Pharm Bull (Tokyo)** 1985 Jul;33(7):2866-70

Influence of bile on the gastrointestinal absorption of phenytoin in rats. Shinkuma D, et al. **Chem Pharm Bull (Tokyo)** 1985 Nov;33(11):5023-7

Comparison of the effects of sesame oil and oleic acid as suspension vehicles on gastrointestinal absorption of phenytoin in rats. Shinkuma D, et al. **Chem Pharm Bull (Tokyo)** 1985 Nov;33(11):4989-94

Influence of vehicle on gastrointestinal absorption of phenytoin in rats. Shinkuma D, et al. **Chem Pharm Bull (Tokyo)** 1985 Nov;33(11):4981-8

The Ames Seralyzer Reagent Strip System evaluated for measuring serum phenytoin. Mace PF, et al. **Clin Chem** 1986 Feb;32(2):391

Alternative method for predicting phenytoin levels [letter] Jochsberger T. **Drug Intell Clin Pharm** 1986 Feb;20(2):155-6

Hypolipidemic activity of antiepileptic 5-phenylhydantoins in mice. Maguire JH, et al. **Eur J Pharmacol** 1985 Oct 29;117(1):135-8

Gingival growths. Miller AS, et al. **Gen Dent** 1986 Jan-Feb;34(1):60, 62

Proteoglycans and glycosaminoglycans in phenytoin-induced gingival overgrowth. Dahllöf G, et al. **J Periodont Res** 1986 Jan;21(1):13-21

Storage of phenytoin capsules [letter] Martin ED, et al. **Med J Aust** 1985 Dec 9-23;143(12-13):634-5

Electrophysiological interactions between quinidine-lidocaine and quinidine-phenytoin in guinea-pig papillary muscle. Sánchez-Chapula J. **Naunyn Schmiedebergs Arch Pharmacol** 1985 Dec;331(4):369-75

The pharmacokinetics of phenytoin in perfused human placenta. Shah YG, et al. **Pediatr Pharmacol (New York)** 1985;5(3):165-79

Perinatal induction of hepatic aminopyrine N-demethylase by maternal exposure to phenytoin. Shapiro BH, et al. **Pediatr Pharmacol (New York)** 1985;5(3):201-7

[Interaction between diazoxide and phenytoin (letter)] Turck D, et al. **Presse Med** 1986 Jan 11;15(1):31 **(Fre)**

[Cerebellar injury caused by phenytoin] Bechinger D, et al. **Dtsch Med Wochenschr** 1986 Feb 7;111(6):237-8 **(Ger)**

[Determination of the active substance of a rovral preparation in biosubstrates] Dzhagatspanian SA, et al. **Gig Sanit** 1986 Jan;(1):58-60 **(Rus)**

PHOBIC DISORDERS

Effect of a selective serotonin uptake inhibitor in agoraphobia with panic attacks. A double-blind comparison of zimeldine, imipramine and placebo. Evans L, et al. **Acta Psychiatr Scand** 1986 Jan;73(1):49-53

CO2 inhalation in the treatment of panic attacks. Griez E, et al. **Behav Res Ther** 1986;24(2):145-50

The effect of phobic anxiety on plasma beta-endorphin: a single-subject experiment. Thyer BA, et al. **Behav Res Ther** 1986;24(2):237-41

DDAVP as a possible method to enhance positive benefit of behaviour therapy. Greenberg D, et al. **Br J Psychiatry** 1985 Dec;147:713-5

Agoraphobia: relative and combined effectiveness of therapist-assisted in vivo exposure and imipramine. Mavissakalian M, et al. **J Clin Psychiatry** 1986 Mar;47(3):117-22

Urinary norepinephrine excretion in panic and phobic disorders. Dajas F, et al. **J Neural Transm** 1986;65(1):75-81

Clonazepam for panic disorders and agitation. Fontaine R. **Psychosomatics** 1985 Dec;26(12 Suppl):13-8

Disabling fear of AIDS responsive to imipramine. Jenike MA, et al. **Psychosomatics** 1986 Feb;27(2):143-4

PHYSOSTIGMINE

On acute effects of some drugs on the higher nervous activity in man. Scopolamine (0.6 mg), physostigmine (1.0 mg) and their interaction. Part LIII. Hrbek J, et al. **Acta Univ Palacki Olomuc Fac Med** 1985;112:185-226

Effects of scopolamine (0.6 mg), physostigmine (1.0 mg), and their complex on the blood pressure, the body temperature and the heart rate in man. Hrbek J, et al. **Acta Univ Palacki Olomuc Fac Med** 1985;112:279-94

Effects of physostigmine doses (0.1 mg, 0.3 mg, 0.6 mg) on the blood pressure, the body temperature and the heart rate in man. Hrbek J, et al. **Acta Univ Palacki Olomuc Fac Med** 1985;112:263-77

On acute effects of some drugs on the higher nervous activity in man. Physostigmine (0.1 mg, 0.3 mg, 0.6 mg). Part LIV. Hrbek J, et al. **Acta Univ Palacki Olomuc Fac Med** 1985;112:227-62

Mechanism of antagonism by physostigmine of acute flunitrazepam intoxication. Vatashsky E, et al. **Anesthesiology** 1986 Feb; 64(2):248-52

Pharmacokinetics of biliary excretion of physostigmine in rat. Boyer AW, et al. **Arch Int Pharmacodyn Ther** 1985 Dec;278(2):180-92

The effects of physostigmine and scopolamine on recognition memory in monkeys. Aigner TG, et al. **Behav Neural Biol** 1986 Jan; 45(1):81-7

High-affinity hemicholinium-3 binding to brain membranes: reduction by treatment with physostigmine in vivo. Swann AC, et al. **Brain Res** 1986 Jan 22;363(2):401-3

Urinary pharmacokinetics of physostigmine in the rat. Somani SM, et al. **Eur J Drug Metab Pharmacokinet** 1985 Oct-Dec;10(4):343-7

Protection from quinidine or physostigmine against in vitro inhibition by sarin of acetylcholinesterase activity. Singh AK, et al. **Life Sci** 1986 Jan 13;38(2):165-72

Acute effects of physostigmine and neostigmine in man. Janowsky DS, et al. **Milit Med** 1986 Jan;151(1):48-51

[Physostigmine salicylate therapy of poisoning due to anticholinergic substances] Albrecht K, et al. **Anaesthesiol Reanim** 1985;10(3):145-54 (Eng. Abstr.) **(Ger)**

[A further therapeutic possibility in sudden deafness] Görisch I, et al. **Z Arztl Fortbild (Jena)** 1986;80(2):69-70 **(Ger)**

PILOCARPINE

Individual responsiveness to topical pilocarpine and the effects of variations in application technique. Berggren L. **Acta Ophthalmol (Copenh)** 1985 Dec;63(6):642-6

Stability of pilocarpine hydrochloride and pilocarpine nitrate ophthalmic solutions submitted by U.S. hospitals. Kreienbaum MA, et al. **Am J Hosp Pharm** 1986 Jan;43(1):109-17

Pilocarpine and physostigmine attenuate spatial memory impairments produced by lesions of the nucleus basalis magnocellularis. Murray CL, et al. **Behav Neurosci** 1986 Feb;100(1):23-32

The secretory activity of rat nasal glands and the effect of cholinergic drugs. Klaassen AB, et al. **Cell Tissue Res** 1986;243(3):655-9

Multiple agonist binding sites of muscarinic acetylcholine receptors and their relation to the negative inotropic action of agonists in guinea-pig heart. Mizushima A, et al. **Eur J Pharmacol** 1985 Dec 17; 119(3):177-82

Pilocarpine prodrugs I. Synthesis, physicochemical properties and kinetics of lactonization of pilocarpic acid esters. Bundgaard H, et al. **J Pharm Sci** 1986 Jan;75(1):36-43

[The effect of adrenaline, pilocarpine and timolol on axoplasmic transport in the optic nerve. I. Findings in normotensive eyes] Brožek B, et al. **Cesk Oftalmol** 1985 Feb;41(1):13-6 (Eng. Abstr.) **(Cze)**

[Determination of pilocarpine and isopilocarpine by high performance liquid chromatography in normal phase. The stability of eye drops with a pilocarpine base and comparison of this method with a colorimetric method using hydroxylamine] Balansard G, et al. **Pharm Acta Helv** 1986; 61(2):47-50 (Eng. Abstr.) **(Fre)**

[Metabolism of pilocarpine in the rabbit eye following local administration] Schmitz J, et al. **Fortschr Ophthalmol** 1985; 82(6):613-7 (Eng. Abstr.) **(Ger)**

PITUITARY HORMONE RELEASING HORMONES

Short-term effects of oestradiol and 4-hydroxyoestradiol on gonadotrophin-releasing hormone induced luteinizing hormone secretion by rat pituitary cells in culture. Emons G, et al. **Acta Endocrinol (Copenh)** 1986 Mar;111(3):312-20

Acute effects of GnRF-induced gonadotrophin secretion upon ovarian steroid secretion in the ferret. Matson C, et al. **Acta Endocrinol (Copenh)** 1986 Mar;111(3):373-7

Gonadotropin-releasing hormone in practice [letter] Ory SJ, et al. **Arch Intern Med** 1986 Apr;146(4):804

Mapping of gonadotropin-releasing hormone receptor binding site. Keinan D, et al. **Biochemistry** 1985 Dec 17;24(26):7728-32

The molecular basis of gonadotropin-releasing hormone action. Conn PM. **Endocr Rev** 1986 Feb;7(1):3-10 (71 ref.)

Induction of ovulation in primate models. Kenigsberg D, et al. **Endocr Rev** 1986 Feb;7(1):34-43 (45 ref.)

Gonadal regulation of hypothalamic gonadotropin-releasing hormone release in primates. Plant TM. **Endocr Rev** 1986 Feb;7(1):75-88 (103 ref.)

Plasma beta-endorphin levels in anovulatory states: changes after treatments for the induction of ovulation. Petraglia F, et al. **Fertil Steril** 1986 Feb;45(2):185-90

Activity of gonadotropin-releasing hormone neurons during the preovulatory luteinizing hormone surge. Steele PA, et al. **Fertil Steril** 1986 Feb;45(2):179-84

Primary structure of gonadotropin-releasing hormone from lamprey brain. Sherwood NM, et al. **J Biol Chem** 1986 Apr 15;261(11):4812-9

Testosterone maintains pituitary and serum FSH and spermatogenesis in gonadotrophin-releasing hormone antagonist-suppressed rats. Rea MA, et al. **J Endocrinol** 1986 Jan;108(1):101-7

Progesterone pretreatment has a direct effect on GnRH-induced preovulatory follicles to determine their ability to develop into normal corpora lutea in anoestrous ewes. Hunter MG, et al. **J Reprod Fertil** 1986 Jan;76(1):349-63

Effects of age and photoperiod on the responsiveness of the pituitary gland of the vole (Microtus agrestis) to stimulation by GnRH. Kinch RF, et al. **J Reprod Fertil** 1986 Jan;76(1):75-82

Relationship between pituitary GnRH-binding sites and pituitary release of gonadotrophins in post-partum beef cows. Leung K, et al. **J Reprod Fertil** 1986 Jan;76(1):53-63

Hormonal therapy of cryptorchidism. A randomized, double-blind study comparing human chorionic gonadotropin and gonadotropin-releasing hormone. Rajfer J, et al. **N Engl J Med** 1986 Feb 20;314(8):466-70

GnRH release from the mediobasal hypothalamus. In vitro regulation by oxytocin. Gambacciani M, et al. **Neuroendocrinology** 1986; 42(2):181-3

Monitoring gonadotropin-releasing hormone administration by measurement of urinary steroid conjugates. De Vane GW, et al. **Obstet Gynecol** 1986 May;67(5):710-7

Hormonal treatment of undescended testis. Toublanc JE. **Prog Clin Biol Res** 1985;203:207-11

[Dose-effect study of Berlin-Chemie's GnRHvet in castrated heifers by luteinizing hormone detection] Schneider F, et al. **Arch Exp Veterinarmed** 1985 Nov;39(6):894-900 (Eng. Abstr.) **(Ger)**

[Restoration of pituitary-ovarian function by pulsatile administration of GnRH during the early puerperium] Masaoka K, et al. **Nippon Naibunpi Gakkai Zasshi** 1985 Nov 20;61(11):1239-48 (Eng. Abstr.) **(Jpn)**

PITUITARY HORMONES

The effect of training on responses of beta-endorphin and other pituitary hormones to insulin-induced hypoglycemia. Mikines KJ, et al. **Eur J Appl Physiol** 1985;54(5):476-9

Alternative routes of peptide hormone administration. Pontiroli AE, et al. **Spec Top Endocrinol Metab** 1985;7:77-99 (120 ref.)

[Mechanisms of action of beta-endorphin on the secretion of hypophyseal hormones] Slavnov VN, et al. **Probl Endokrinol (Mosk)** 1986 Jan-Feb; 32(1):49-52 (Eng. Abstr.) **(Rus)**

PITUITARY HORMONES, ANTERIOR

Responses of plasma adrenocorticotropin and cortisol to intravenous injection of synthetic ovine corticotropin releasing factor in the morning and early evening in normal human subjects. Watabe T, et al. **Endocrinol Jpn** 1985 Oct;32(5):771-9

Effects of gamma-aminobutyric acid receptor agonists on the secretion of growth hormone, luteinizing hormone, adrenocorticotrophic hormone and thyroid-stimulating hormone from the rat pituitary gland in vitro. Anderson RA, et al. **J Endocrinol** 1986 Jan;108(1):1-8

Sulfated LH subunits and a tyrosine-sulfated secretory protein (secretogranin II) in female rat adenohypophyses: changes with age and stimulation of release by LHRH. Cozzi MG, et al. **Mol Cell Endocrinol** 1986 Jan;44(1):47-54

Neurotransmitter regulation of anterior pituitary hormones. Tuomisto J, et al. **Pharmacol Rev** 1985 Sep;37(3):249-332 (1515 ref.)

PROGESTERONE

Prepubertal rat ovary: hormonal modulation of beta-adrenergic receptors and of progesterone response to adrenergic stimulation. Aguado LI, et al. **Biol Reprod** 1986 Feb;34(1):45-50

Gonadotropin-releasing hormone effects on placental hormones during gestation: II. Progesterone, estrone, estradiol and estriol. Siler-Khodr TM, et al. **Biol Reprod** 1986 Mar;34(2):255-64

Androgen and progesterone effects on follicle-stimulating hormone and luteinizing hormone secretion in anestrous mares. Thompson DL Jr, et al. **Biol Reprod** 1986 Feb;34(1):51-7

Hypothalamic site of progesterone action on gonadotropin release. Hanker JP, et al. **Horm Metab Res** 1985 Dec;17(12):679-82

Serum inflammatory responses of transcortin binding activities and of total and free corticosterone and progesterone levels in developing rats: a kinetic approach. Savu L, et al. **Int J Tissue React** 1985;7(6):443-8

Serotonin-induced stimulation of progesterone production by cow luteal cells in vitro. Battista PJ, et al. **J Reprod Fertil** 1986 Jan; 76(1):231-8

Progesterone pretreatment has a direct effect on GnRH-induced preovulatory follicles to determine their ability to develop into normal corpora lutea in anoestrous ewes. Hunter MG, et al. **J Reprod Fertil** 1986 Jan;76(1):349-63

The antiprogesterone steroid RU-486 does not impair gonadotropin-stimulated luteal adenylyl cyclase activity or gonadotropin release by pituitary cells. Rojas FJ, et al. **J Steroid Biochem** 1985 Dec;23(6A):1053-8

Rates of progesterone oxidation by rabbit liver microsomes before and after phenobarbitone treatment. Senciall IR, et al.

J Steroid Biochem 1985 Dec;23(6A):1007-12

Effect of ovarian steroids to stimulate region-specific hypothalamic 5-hydroxytryptamine synthesis in ovariectomized rats. King TS, et al. **Neuroendocrinology** 1986;42(4):344-50

Regulating estrus and therapy of repeat-breeder and anestrous Holstein heifers using progesterone releasing intravaginal devices (PRIDs). Fukui Y, et al. **Nippon Juigaku Zasshi** 1985 Dec;47(6):943-50

[The effect of sex factors on the interaction of progesterone and glucocorticoids during increased tyrosine aminotransferase and tryptophane pyrrolase activity in the liver in rats] Németh S. **Bratisl Lek Listy** 1986 Jan;85(1):19-23 (Eng. Abstr.) **(Slo)**

PROLACTIN

Effects of prolactin administration on the zona glomerulosa of the rat adrenal cortex: stereology and plasma hormone concentrations. Mazzocchi G, et al. **Acta Endocrinol (Copenh)** 1986 Jan;111(1):101-5

ACTH and prolactin deficiency. Puig ML, et al. **Acta Endocrinol (Copenh)** 1986 Mar;111(3):296-9

Influence of sequential doses of 5-hydroxytryptophan on prolactin release. Sueldo CE, et al. **Am J Obstet Gynecol** 1986 Feb;154(2):424-7

A possible role of arachidonate metabolism in the mechanism of prolactin release. Judd AM, et al. **Am J Physiol** 1986 Mar; 250(3 Pt 1):E288-95

Effect of amphetamine on brain catecholamines, brain beta-endorphin, serum prolactin, catechol-O-methyltransferase and monoamine oxidase of various organs in the rat. Agarwal DP, et al. **Arzneimittelforschung** 1985;35(11):1639-42

Changes in growth hormone and prolactin release after superior cervical ganglionectomy of rats. Cardinali DP, et al. **Brain Res** 1986 Jan 22; 363(2):350-3

T-cell dysregulation in patients with hyperprolactinemia: effect of bromocriptine treatment. Vidaller A, et al. **Clin Immunol Immunopathol** 1986 Mar;38(3):337-43

Effects of phorbol ester on GH, TSH and PRL release by superfused rat adenohypophysis. Ikeda H, et al. **Endocrinol Jpn** 1985 Oct; 32(5):759-65

Prolactin release after 5-hydroxytryptophan treatment requires an intact neurointermediate pituitary lobe. Johnston CA, et al. **Endocrinology** 1986 Feb;118(2):805-10

Maturation of the prolactin and proopiomelanocortin-derived peptide responses to ether stress and morphine: neurochemical analysis. Johnston CA, et al. **Endocrinology** 1986 Feb;118(2):797-804

Prolactin (PRL), follicle-stimulating hormone, and luteinizing hormone are regulators of testicular PRL receptors in golden hamsters. Klemcke HG, et al. **Endocrinology** 1986 Feb;118(2):773-82

Effects of hyperprolactinemia on estrous cyclicity, serum luteinizing hormone, prolactin, estradiol, and progesterone concentrations, and catecholamine activity in microdissected brain areas. Wise PM. **Endocrinology** 1986 Mar;118(3):1237-45

Synthetic human growth hormone releasing factor (h-GRF-1-44-NH2) dose response effect on growth hormone and prolactin secretion in healthy adult men. Boissel JP, et al. **Eur J Clin Pharmacol** 1986; 29(5):609-14

Pharmacokinetics of a long-acting bromocriptine preparation (Parlodel LA) and its effect on release of prolactin and growth hormone. del Pozo E, et al. **Eur J Clin Pharmacol** 1986;29(5):615-8

Studies on the prolactin-releasing capacity of luteinizing hormone releasing hormone in male subjects. Gooren LJ, et al. **Exp Clin Endocrinol** 1985 Dec;86(3):300-4

Antagonistic effects of prolactin and oxytocin on tail fin regression and acid phosphatase activity in metamorphosing Ambystoma tigrinum. Platt JE, et al. **Gen Comp Endocrinol** 1986 Mar;61(3):376-82

Effect of thyrotropin-releasing hormone and dopamine on the in vitro secretion of prolactin by the bullfrog pituitary gland. Seki T, et al. **Gen Comp Endocrinol** 1986 Feb;61(2):197-202

Prolactin induces yawning and the stretch-yawning syndrome in young adult male rats. Laping NJ, et al. **Horm Behav** 1986 Mar; 20(1):49-59

Effect of adrenergic antagonism on the growth hormone, prolactin and cortisol response to a synthetic opioid agonist in man. Bouloux PM, et al. **Horm Res** 1986;23(2):83-90

The role of neuropeptides in modulating PRL and GH secretion. Lancranjan I, et al. **Int J Neurol** 1980;14(2-4):175-88 (60 ref.)

Angiotensin II and dopamine modulate both cAMP and inositol phosphate productions in anterior pituitary cells. Involvement in prolactin secretion. Enjalbert A, et al. **J Biol Chem** 1986 Mar 25; 261(9):4071-5

Increased dopaminergic activity inhibits basal and metoclopramide-stimulated prolactin and thyrotropin secretion. Agner T, et al. **J Clin Endocrinol Metab** 1986 Apr;62(4):778-82

Evaluation of hypothalamic dopaminergic function by neuropharmacologic means in aged women. Cocchi D, et al. **J Neural Transm** 1985;64(3-4):199-210

Inhibition of prolactin release and blockade of adenohypophyseal cell cyclic AMP accumulation are two dissociable effects of dopaminergic and non-dopaminergic drugs. Lafond J, et al. **Mol Cell Endocrinol** 1986 Mar;44(3):219-25

Increase of rat serum prolactin by adenosine analogs and their blockade by the methylxanthine aminophylline. Stewart SF, et al. **Naunyn Schmiedebergs Arch Pharmacol** 1985 Nov;331(2-3):140-5

Reduction of motor behavioral deficits in senescent animals via chronic prolactin administration. I. Rotational behavior. Joseph JA, et al. **Neurobiol Aging** 1986 Jan-Feb;7(1):31-5

Indolealkylamines and prolactin secretion. A structure-activity study in the central nervous system of the rat. Seeman G, et al. **Neuropharmacology** 1985 Dec;24(12):1195-200

24-hour plasma levels of prolactin, cortisol, growth hormone and catecholamines in schizophrenic patients. Kemali D, et al. **Neuropsychobiology** 1985;14(3):109-14

Restricted feeding regimen affects the diurnal prolactin surge but not nocturnal surge in pseudopregnant rats. Murakami N, et al. **Nippon Juigaku Zasshi** 1986 Feb;48(1):29-34

Submaximal plasma prolactin response to TRH and dopamine activity in man. Spoov J. **Pharmacopsychiatry** 1985 Nov;18(6):330-2

Endocrine response to acute cold exposure by lactating and non-lactating Norway rats. Adels LE, et al. **Physiol Behav** 1986 Jan;36(1):179-81

Further evidence that central neurotensin inhibits pituitary prolactin secretion by stimulating dopamine release from the hypothalamus. Tojo K, et al. **Proc Soc Exp Biol Med** 1986 Apr;181(4):517-22

Changes in pituitary prolactin responsiveness to TRH during pregnancy. Voogt JL. **Proc Soc Exp Biol Med** 1986 May;182(1):58-62

Effect of normal aging on the prolactin response to graded doses of sulpiride and to arginine. Nair NP, et al. **Prog Neuropsychopharmacol Biol Psychiatry** 1985;9(5-6):633-7

Lithium and twenty-four hour rhythms of serum corticosterone, prolactin and growth hormone in pigmented eye rats. Seggie J, et al. **Prog Neuropsychopharmacol Biol Psychiatry** 1985;9(5-6):755-8

Immediate effects of intermittent administration of domperidone upon prolactin release in normal women. Ulloa-Aguirre A, et al. **Rev Invest Clin** 1985 Oct-Dec;37(4):341-5

Abnormalities in the regulation of prolactin in patients on maintenance hemodialysis. Leu ML, et al. **Taiwan I Hsueh Hui Tsa Chih** 1985 Sep; 84(9):1059-70

[Effect of chlorpromazine on the graft versus host reaction] Grin J, et al. **Acta Physiol Pharmacol Latinoam** 1985;35(3):337-47 (Eng. Abstr.) **(Spa)**

PROMAZINE

Termini generated at the site of the DNA breakage mediated by photoexcited promazines. Decuyper J, et al. **Biochem Pharmacol** 1986 Apr 15;35(8):1345-50

Liquid chromatographic determination of identity, content, and content uniformity of desipramine, fluphenazine, and promazine. Beaulieu N, et al. **J Assoc Off Anal Chem** 1986 Jan-Feb;69(1):178-9

PROMETHAZINE

Pesticide-drug interaction in rats. Fenyvesi G, et al. **Arch Toxicol [Suppl]** 1985;8:269-71

Irreversible binding with biological macromolecules and effects in bacterial mutagenicity tests of the radical cation of promethazine and photoactivated promethazine. Comparison with chlorpromazine. De Mol NJ, et al. **Chem Biol Interact** 1986 Jan;57(1):73-83

No promethazine in Nyquil [letter] Lewis ET. **N Engl J Med** 1986 Apr 3;314(14):927

[The quantitative analysis of aminophylline 0.32 g cum promethazine SR suppositories] Vogel E. **Pharmazie** 1985 Nov;40(11):801 **(Ger)**

PROPANEDIOLS

Diol metabolism and diol dehydratase in Clostridium glycolicum. Hartmanis MG, et al. **Arch Biochem Biophys** 1986 Feb 15; 245(1):144-52

Results of genotoxicity testing of mazindol (degonan), lithium carbonicum (contemnol) and dropropizine (ditustat) in Chinese hamster V79 and human EUE cells. Slameňová D, et al. **Mutat Res** 1986 Mar; 169(3):171-7

Metabolism and disposition of propylene glycol monomethyl ether (PGME) beta isomer in male rats. Miller RR, et al. **Toxicol Appl Pharmacol** 1986 Mar 30;83(1):170-7

PROPRANOLOL

Pharmacodynamic interaction of gallopamil and propranolol in the conscious dog. Lehmann HD. **Arzneimittelforschung** 1985; 35(12):1795-801

Studies on the uptake and release of propranolol and the effects of propranolol on catecholamines in cultures of bovine adrenal chromaffin cells. Boksa P. **Biochem Pharmacol** 1986 Mar 1;35(5):805-15

Age-dependent propranolol clearance in perfused rat liver. Iwamoto K, et al. **Biochem Pharmacol** 1986 Apr 1;35(7):1149-52

Mechanism of cationic amphiphilic drug inhibition of purified lysosomal phospholipase A1. Kubo M, et al. **Biochemistry** 1985 Nov 5; 24(23):6515-20

The effect of propranolol and thioridazine on positive and negative symptoms of schizophrenia. Eccleston D, et al. **Br J Psychiatry** 1985 Dec;147:623-30

Changes of transition temperatures of phosphatidylcholine and phosphatidylglycerol in presence of amphiphilic drugs. Harder A, et al. **Chem Phys Lipids** 1986 Jan;39(1-2):65-71

Comparison of four beta-blockers as assessed by 24-hour ECG recording. Escoubet B, et al. **Clin Pharmacol Ther** 1986 Apr;39(4):361-8

Phenylpropanolamine and blood pressure [letter] Morgan JP, et al. **Clin Pharmacol Ther** 1986 Jan;39(1):102-3

Influence of vagal cooling on cardiac output in normal and beta-blocked exercising dogs. Versteeg PG, et al. **Eur J Appl Physiol** 1986; 54(6):617-23

Beta-adrenoceptor blocking effects and plasma levels of bornaprolol and propranolol in man. Thuillez C, et al. **Eur J Clin Pharmacol** 1985; 29(4):405-11

Theoretical Michaelis-Menten elimination model for propranolol. McAinsh J, et al. **Eur J Drug Metab Pharmacokinet** 1985 Jul-Sep; 10(3):241-5

Hepatic uptake of propranolol [letter] Forker EL, et al. **Hepatology** 1986 Mar-Apr;6(2):340-1

Effects of propranolol on the impulse activity of cardiovascular sympathetic afferent fibers. Lombardi F, et al. **Hypertension** 1986 Jan; 8(1):50-5

Determination of alpha-naphthoxylactic acid, a major metabolite of propranolol, in plasma by high-performance liquid chromatography [letter] Harrison PM, et al. **J Chromatogr** 1986 Jan 10;374(1):223-5

A modified, sensitive liquid chromatographic method for measurement of propranolol with fluorescence detection. Koshakji RP, et al. **J Pharm Sci** 1986 Jan;75(1):87-9

Influence of food on the intravenous and oral dose kinetics of propranolol in the dog. Bai SA, et al. **J Pharmacokinet Biopharm** 1985 Jun; 13(3):229-41

Propranolol inhibits the compensatory increase in androgen secretion after unilateral orchidectomy in rats. Moger WH, et al. **J Reprod Fertil** 1986 Jan;76(1):251-6

Glucagon for propranolol overdose [letter] Mofenson HC, et al. **JAMA** 1986 Apr 18;255(15):2025-6

Low incidence of shivering with chronic propranolol therapy [letter] Lee DS, et al. **Lancet** 1986 Mar 1;1(8479):500

Modification of cellular immune functions in humans by endurance exercise training during beta-adrenergic blockade with atenolol or propranolol. Watson RR, et al. **Med Sci Sports Exerc** 1986 Feb; 18(1):95-100

In vitro receptor occupancy allows to establish equieffective doses of beta-blockers with different pharmacodynamic profiles in man. Investigations with propranolol and bufuralol. Wellstein A, et al. **Methods Find Exp Clin Pharmacol** 1985 Dec;7(12):645-51

Mutagenic evaluation of propranolol in somatic and germ cells of mice. Aruna N, et al. **Mutat Res** 1986 Mar;173(3):207-10

Anticonvulsant effects of propranolol and their pharmacological modulation. Fischer W, et al. **Pol J Pharmacol Pharm** 1985 Nov-Dec; 37(6):883-96

Effects of propranolol and indomethacin on muscarinic airway reactivity in unanesthetized guinea pigs. Roum JH, et al. **Proc Soc Exp Biol Med** 1986 Apr;181(4):569-74

The coronary vasodilator mediator released by hypoxia and isoprenaline is not affected by cyclo-oxygenase inhibition. Broadley KJ, et al. **Prostaglandins** 1986 Feb;31(2):295-306

Effects of propranolol on conditioned suppression, discriminated punishment and discriminated non-reward in the rat. Salmon P, et al. **Psychopharmacology (Berlin)** 1986;88(2):252-7

The effects of propranolol metipranolol, and pindolol on the cardiovascular system of rabbits in vivo. Geršl V. **Sb Ved Pr Lek Fak Univ Karlovy** 1984;27(1):103-15

[Bioavailability of propranolol administered by the rectal route in man] Cid E, et al. **Therapie** 1985 Nov-Dec;40(6):447-9 (Eng. Abstr.) **(Fre)**

[Effect of beta-receptor block on QT/QS2 behavior during isometric and dynamic exercise] De Caprio L, et al. **G Ital Cardiol** 1985 Oct; 15(10):960-4 (Eng. Abstr.) **(Ita)**

[Effects of propranolol on the hepato-portal and systemic hemodynamics. Experimental model] Ussia G, et al. **Minerva Chir** 1985 Nov 30; 40(22):1541-6 (Eng. Abstr.) **(Ita)**

[Experience in analyzing the functional structure of thermogenesis based on pharmacologic testing] Iudanova LA, et al. **Fiziol Zh SSSR** 1986 Jan;72(1):109-15 (Eng. Abstr.) **(Rus)**

PROSTAGLANDINS

Effect of intragastric pH, prostaglandins and prostaglandin synthesis inhibitors on the release of gastrin and somatostatin into the gastric lumen of anaesthetized rats. Alino SF, et al. **Acta Physiol Scand** 1986 Jan;126(1):1-8

Mechanism of action of vasoactive hormones on prostaglandin synthesis in the kidney. Cooper CL, et al. **Adv Prostaglandin Thromboxane Leukotriene Res** 1985;15:437-9

Role of the renal kinin-prostaglandin system in diltiazem-induced natriuresis. Seino M, et al. **Am J Physiol** 1986 Feb; 250(2 Pt 2):F197-202

Role of endogenous prostaglandins in somatostatin-induced inhibition of gastrointestinal hormone secretion. Koop H, et al. **Hepatogastroenterology** 1985 Dec;32(6):288-92

Inhibition of prostaglandin generation in the rabbit brain in-vivo by AD-1590, a non-steroidal anti-inflammatory agent with potent antipyretic activity. Nakamura H, et al. **J Pharm Pharmacol** 1985 Dec; 37(12):894-8

Contribution of Ca++ and calmodulin to the action of norepinephrine on renal prostaglandin synthesis and vascular tone. Cooper CL, et al. **J Pharmacol Exp Ther** 1986 Feb;236(2):424-31

Comparative effects of glucocorticoids and prostaglandins on small intestine of infant rats. Neu J, et al. **Pediatr Res** 1986 Feb; 20(2):109-12

Dissociation of hyperreninemia and renal prostaglandin synthesis in the adrenalectomized rat. Boucher LD, et al. **Prostaglandins** 1986 Jan; 31(1):143-55

Role of prostacyclin on steroidogenesis by frog interrenal gland in vitro. Delarue C, et al. **Prostaglandins** 1986 Jan;31(1):5-17

[Contribution of prostaglandins to the activity of guinea-pig phrenic and chicken esophageal parasympathetic nerves] Takeuchi T, et al. **Nippon Yakurigaku Zasshi** 1985 Oct;86(4):261-8 (Eng. Abstr.) **(Jpn)**

PSYCHIATRIC STATUS RATING SCALES

Rating scales and assessment instruments for use in pediatric psychopharmacology research. **Psychopharmacol Bull** 1985; 21(4):714-1124

Behavioral and cognitive measures used in psychopharmacological studies of infantile autism. Campbell M, et al. **Psychopharmacol Bull** 1985; 21(4):1047-53

Rating scales and checklists for child psychopharmacology. Conners CK, et al. **Psychopharmacol Bull** 1985;21(4):809-43

Scales of potential use in the psychopharmacologic treatment of depressed children and adolescents. Petti TA. **Psychopharmacol Bull** 1985; 21(4):951-77

PSYCHIATRY

The uncertain future of clinical psychiatry. Lesse S. **Am J Psychother** 1986 Jan;40(1):4-16

Psychobiology and psychopharmacology: issues in clinical research training. Janowsky DS, et al. **J Clin Psychopharmacol** 1986 Feb; 6(1):1-7

DSM-III-R and pediatric psychopharmacology. Rapoport JL. **Psychopharmacol Bull** 1985;21(4):803-6

[The new biological revolution in psychiatry: a Latin American point of view (2)] Alarcón RD. **Acta Psiquiatr Psicol Am Lat** 1985 Sep; 31(3):173-90 (Eng. Abstr.) **(Spa)**

PSYCHOMOTOR AGITATION

Alternative approaches in the treatment of psychotic agitation. Campbell R, et al. **Psychosomatics** 1986 Jan;27(1 Suppl):23-7

Clonazepam for panic disorders and agitation. Fontaine R. **Psychosomatics** 1985 Dec;26(12 Suppl):13-8

Acute treatment of manic agitation with lorazepam. Lenox RH, et al. **Psychosomatics** 1986 Jan;27(1 Suppl):28-32

Benzodiazepines combined with neuroleptics for management of severe disruptive behavior. Salzman C, et al. **Psychosomatics** 1986 Jan; 27(1 Suppl):17-22

PSYCHOMOTOR PERFORMANCE

The effect of antipsychotic drugs on driving and driving related psychomotor functions. Judd LL. **Accid Anal Prev** 1985 Aug; 17(4):319-22

Psychomotor tasks and recovery from anesthesia [letter] Millar K. **Anesth Analg** 1986 May;65(5):543-4

Physical performance during sustained converting enzyme inhibition with Hoe 498 in conscious dogs. Becker RH, et al. **Arch Int Pharmacodyn Ther** 1985 Dec;278(2):303-13

Comparison of midazolam and triazolam for residual effects. Wehli L, et al. **Arzneimittelforschung** 1985;35(11):1700-4

Reduction of motor behavioral deficits in senescent animals via chronic prolactin administration. I. Rotational behavior. Joseph JA, et al. **Neurobiol Aging** 1986 Jan-Feb;7(1):31-5

Effects of clorazepate dipotassium and placebo on psychomotor skills. Moodley P, et al. **Percept Mot Skills** 1985 Dec;61(3 Pt 2):1121-2

Reward, performance, and the response strength method in self-stimulating rats: validation and neuroleptics. Hamilton AL, et al. **Physiol Behav** 1985 Dec;35(6):897-904

Dose-dependent impairment in the performance of a go-no go successive discrimination by chlordiazepoxide. Cole SO, et al.

Psychopharmacology (Berlin) 1986;88(2):184–6
Chlorpromazine and pimozide alter reinforcement efficacy and motor performance. Heyman GM, et al. **Psychopharmacology (Berlin)** 1986; 88(3):346–53
Chronic effects of ethosuximide, phenytoin, clonazepam, and valproic acid on the delayed-matching-to-sample performance of pigeons. Poling A, et al. **Psychopharmacology (Berlin)** 1986;88(3):301–4
Hormonal and behavioral effects associated with intravenous L-tryptophan administration. Winokur A, et al. **Psychopharmacology (Berlin)** 1986;88(2):213–9
[Psychopathological and neurophysiological indicators in endogenous depression and the therapeutic effect of thymoleptics. II. Comparison of the effects of various thymoleptics on the psychopathological symptoms of endogenous depressive syndromes] Strzyżewski W, et al. **Psychiatr Pol** 1985 Sep–Oct;19(5):363–9 (Eng. Abstr.) **(Pol)**
[Psychopathological and neurophysiological indicators in endogenous depression and the therapeutic effect of thymoleptics. I. Analysis of the clinical effect of antidepressive drugs with various pharmacological profiles] Twarowska-Hauser J, et al. **Psychiatr Pol** 1985 Sep–Oct; 19(5):357–62 (Eng. Abstr.) **(Pol)**

PSYCHOPHARMACOLOGY

27th annual psychopharmacology meeting. Jeseník Spa, January 1985. Abstracts. **Act Nerv Super (Praha)** 1985 Dec;27(4):246–328
Psychobiology and psychopharmacology: issues in clinical research training. Janowsky DS, et al. **J Clin Psychopharmacol** 1986 Feb; 6(1):1–7
Perspectives in Canadian neuro-psychopharmacology. Proceedings of the eighth annual meeting of the Canadian College of Neuropsychopharmacology. May 5–8, 1985, London, Ontario. **Prog Neuropsychopharmacol Biol Psychiatry** 1985;9(5–6):463–768
Rating scales and assessment instruments for use in pediatric psychopharmacology research. **Psychopharmacol Bull** 1985; 21(4):714–1124
Rating scales and checklists for child psychopharmacology. Conners CK, et al. **Psychopharmacol Bull** 1985;21(4):809–43
DSM-III-R and pediatric psychopharmacology. Rapoport JL. **Psychopharmacol Bull** 1985;21(4):803–6
Measurement of compliance. Sleator EK. **Psychopharmacol Bull** 1985; 21(4):1089–93
Measures of cognitive functioning appropriate for use in pediatric psychopharmacological research studies. Swanson JM. **Psychopharmacol Bull** 1985;21(4):887–90
[The new biological revolution in psychiatry: a Latin American point of view (2)] Alarcón RD. **Acta Psiquiatr Psicol Am Lat** 1985 Sep; 31(3):173–90 (Eng. Abstr.) **(Spa)**

PSYCHOPHYSIOLOGIC DISORDERS

Captopril in the treatment of psychogenic polydipsia [letter] Goldstein JA. **J Clin Psychiatry** 1986 Feb;47(2):99
Measures of cognitive functioning appropriate for use in pediatric psychopharmacological research studies. Swanson JM. **Psychopharmacol Bull** 1985;21(4):887–90
[Central nervous system control mechanisms and the development of disease--their significance for psychosomatic medicine] Weiner H. **Psychother Psychosom Med Psychol** 1985 Dec;35(12):310–4 (Eng. Abstr.) **(Ger)**

PSYCHOTHERAPY

Interpersonal psychotherapy adapted for ambulatory cocaine abusers. Rounsaville BJ, et al. **Am J Drug Alcohol Abuse** 1985; 11(3–4):171–91
Combined psychotherapy and pharmacotherapy for depression. A systematic analysis of the evidence. Conte HR, et al. **Arch Gen Psychiatry** 1986 May;43(5):471–9
Low levels and lack of predictors of somatotherapy and psychotherapy received by depressed patients. Keller MB, et al. **Arch Gen Psychiatry** 1986 May;43(5):458–66
Changes in psychological diagnosis and prescription in a practice employing a counsellor. Martin E, et al. **Fam Pract** 1985 Dec; 2(4):241–3
A new perspective on intervention in heavy, chronic drug use. Spotts JV, et al. **Int J Addict** 1985 Oct;20(10):1545–65
Hope for the chronic mentally ill. Macinick CG, et al. **Issues Ment Health Nurs** 1984;6(3–4):255–9
[The prognosis of schizophrenia] Lungershausen E. **Fortschr Med** 1986 Feb 6;104(5):97–100 (Eng. Abstr.) **(Ger)**

PSYCHOTIC DISORDERS

Drugs and depression. Harris B. **Am J Nurs** 1986 Mar;86(3):292–3
Does carbamazepine-induced reduction of plasma haloperidol levels worsen psychotic symptoms? Arana GW, et al. **Am J Psychiatry** 1986 May;143(5):650–1
Neuroleptic dosage for Asians: a failure to replicate. Sramek JJ, et al. **Am J Psychiatry** 1986 Apr;143(4):535–6
Serine, glycine and carbohydrates in schizoaffective disorders. Bruinvels J, et al. **Bibl Nutr Dieta** 1986;(38):168–72
The oldest patient with Capgras syndrome? Burns A. **Br J Psychiatry** 1985 Dec;147:719–20
Neuroleptics in culture-bound syndromes [letter] Harrison-Read PE. **Br J Psychiatry** 1986 Jan;148:106–7
Eye movement dysfunctions and psychosis. Holzman PS. **Int Rev Neurobiol** 1985;27:179–205 (91 ref.)
Monosymptomatic hypochondriacal psychosis manifesting as delusions of infestation: case studies of treatment with haloperidol. Andrews E, et al. **J Clin Psychiatry** 1986 Apr;47(4):188–90
Stability of the postpsychotic depression syndrome. Siris SG, et al. **J Clin Psychiatry** 1986 Feb;47(2):86–8
Intramuscular lorazepam to restrain violent patients [letter] Bick PA, et al. **Lancet** 1986 Jan 25;1(8474):206
New pharmacologic approaches in the treatment of psychosis. Proceedings of a symposium. Philadelphia, June 29, 1985. **Psychosomatics** 1986 Jan;27(1 Suppl):1–38
Alternative approaches in the treatment of psychotic agitation. Campbell R, et al. **Psychosomatics** 1986 Jan;27(1 Suppl):23–7
Treatment of acute psychosis with non-neuroleptic agents. Cohen BM, et al. **Psychosomatics** 1986 Jan;27(1 Suppl):7–16
[Droleptan] Peutillot JF. et al. **Soins Psychiatr** 1985 Nov;(61):I–II**(Fre)**
[Psychiatric indications for beta-adrenergic inhibitors] Féline A, et al. **Therapie** 1985 Nov–Dec;40(6):413–6 (Eng. Abstr.) **(Fre)**
[EEG changes with leponex medication] Kursawe HK, et al. **Psychiatr Neurol Med Psychol (Leipz)** 1985 Dec;37(12):705–12 (Eng. Abstr.) **(Ger)**
[Behavioral changes in rhesus monkeys induced by repeated administration of ephedrine] Kato S. **Seishin Shinkeigaku Zasshi** 1985; 87(8):583–94 (Eng. Abstr.) **(Jpn)**

QUINIDINE

Effects of quinidine on pharmacokinetics and pharmacodynamics of digitoxin achieving steady-state conditions. Kuhlmann J, et al. **Clin Pharmacol Ther** 1986 Mar;39(3):288–94
Analysis of nonlinear tissue distribution of quinidine in rats by physiologically based pharmacokinetics. Harashima H, et al. **J Pharmacokinet Biopharm** 1985 Aug;13(4):425–40
Comparative electropharmacology of mexiletine, lidocaine and quinidine in a canine Purkinje fiber model. Burke GH, et al. **J Pharmacol Exp Ther** 1986 Apr;237(1):232–6
Effects of quinidine on the transmembrane potentials of young and adult canine cardiac Purkinje fibers. Morikawa Y, et al. **J Pharmacol Exp Ther** 1986 Mar;236(3):832–7
An adult male patient with unexplained fever. Molitor L. **JEN** 1986 Jan–Feb;12(1):63–4
The pharmacodynamic response of the basal skin potential to quinidine gluconate. Ando HY, et al. **Life Sci** 1986 Feb 3;38(5):417–24
Protection from quinidine or physostigmine against in vitro inhibition by sarin of acetylcholinesterase activity. Singh AK, et al. **Life Sci** 1986 Jan 13;38(2):165–72
Electrophysiological interactions between quinidine-lidocaine and quinidine-phenytoin in guinea-pig papillary muscle. Sánchez-Chapula J. **Naunyn Schmiedebergs Arch Pharmacol** 1985 Dec;331(4):369–75
Quinidine blockage of K+ channels in the basolateral membrane of larval bullfrog skin. Van Driessche W, et al. **Pflugers Arch** 1985; 405 Suppl 1:S77–82
[The in vitro liberation behavior of quinidine from drug forms with prolonged release by various liberation methods] Appelt B, et al. **Pharmazie** 1986 Jan;41(1):44–6 (Eng. Abstr.) **(Ger)**
[A relived case by plasma exchange in serious complications of quinidine induced thrombocytopenic purpura] Tani S, et al. **Nippon Naika Gakkai Zasshi** 1985 Nov;74(11):1567–72 **(Jpn)**
[Effects of Ca++ on A-V conduction. Comparison with the effects of quinidine] González-Morales MA, et al. **Arch Farmacol Toxicol** 1985 Dec;11(3):155–64 (Eng. Abstr.) **(Spa)**

REACTION TIME

Choice reaction time in workers exposed to styrene vapour. Mackay CJ, et al. **Hum Toxicol** 1986 Mar;5(2):85–9

RECEPTORS, ADRENERGIC

Norepinephrine inhibition of pulsatile LH release: receptor specificity. Bergen H, et al. **Am J Physiol** 1986 Feb;250(2 Pt 1):E205–11
Inhibition of monoamine oxidase in monoaminergic neurones in the rat brain by irreversible inhibitors. Fagervall I, et al. **Biochem Pharmacol** 1986 Apr 15;35(8):1381–7
Evidence that epinephrine acts preferentially as an antilipolytic agent in abdominal human subcutaneous fat cells: assessment by analysis of beta and alpha 2 adrenoceptor properties. Berlan M, et al. **Eur J Clin Invest** 1985 Dec;15(6):341–8

Down-regulation of dopamine D-2, 5-HT2 receptors and beta-adrenoceptors in rat brain after prolonged treatment with a new potential antidepressant, Lu 19-005. Nowak G, et al. **J Neural Transm** 1985;64(3-4):227-38

Antagonism by dopamine, but not noradrenaline receptor blockers of the anti-immobility activity of desipramine after different treatment schedules in the rat. Pulvirenti L, et al. **Pharmacol Res Commun** 1986 Jan;18(1):73-80

[Effect of changes in the catecholamine content in the brain on the chemoreactive properties of the sensorimotor cortex neurons of rats] Kruglikov RI, et al. **Izv Akad Nauk SSSR [Biol]** 1985 Nov-Dec;(6):832-40 (Eng. Abstr.) **(Rus)**

[Role of brain noradrenergic mechanisms in disturbing the circadian rhythm of the functioning hypothalamo-hypophyseo-adrenal cortex system in white rats in early ontogeny] Maslova LN, et al. **Ontogenez** 1986 Jan-Feb;17(1):56-61 (Eng. Abstr.) **(Rus)**

[Adrenergic reactivity of the heart and coronary vessels in hemotransfusion shock] Khomaziuk AI, et al. **Vestn Akad Med Nauk SSSR** 1985;(12):74-80 (Eng. Abstr.) **(Rus)**

RECEPTORS, ADRENERGIC, ALPHA

Noradrenaline evokes an alpha-adrenoceptor-mediated inotropic effect in human ventricular myocardium. Aass H, et al. **Acta Pharmacol Toxicol (Copenh)** 1986 Jan;58(1):88-90

Cortical beta- and alpha 2- adrenoceptor binding, hypothalamic noradrenaline and pineal melatonin concentrations measured at different times of the day after repeated treatment of rats with imipramine, zimeldine, alaproclate and amiflamine. Ask AL, et al. **Acta Pharmacol Toxicol (Copenh)** 1986 Jan;58(1):16-24

Phenothiazine drugs and metabolites: molecular conformation and dopaminergic, alpha adrenergic and muscarinic cholinergic receptor binding. Dahl SG, et al. **Biochem Pharmacol** 1986 Apr 15;35(8):1263-9

Noradrenergic stimulation of supraoptic neuronal activity and vasopressin release in vitro: mediation by an alpha 1-receptor. Armstrong WE, et al. **Brain Res** 1986 Feb 12;365(1):192-7

Locus coeruleus neurons in culture have a developmentally transient alpha 1 adrenergic response. Finlayson PG, et al. **Brain Res** 1986 Mar;390(2):292-5

Adrenergic coronary tone during submaximal exercise in the dog is produced by circulating catecholamines. Evidence for adrenergic denervation supersensitivity in the myocardium but not in coronary vessels. Chilian WM, et al. **Circ Res** 1986 Jan;58(1):68-82

Selective alpha 2 receptor blockade facilitates the insulin response to adrenaline but not to glucose in man. Struthers AD, et al. **Clin Endocrinol (Oxf)** 1985 Nov;23(5):539-46

Supersensitivity of alpha 2-adrenoceptors modulating [3H]5-HT release after noradrenergic denervation with DSP4. Benkirane S, et al. **Eur J Pharmacol** 1985 Dec 10;119(1-2):131-3

Antidepressant drugs given repeatedly increase binding to alpha 1-adrenoceptors in the rat cortex. Maj J, et al. **Eur J Pharmacol** 1985 Dec 10;119(1-2):113-6

Alpha 1-adrenergic activation of brown adipocytes leads to an increased formation of inositol polyphosphates. Nånberg E, et al. **FEBS Lett** 1986 Jan 20;195(1-2):319-22

Alpha- and beta-adrenergic mechanisms mediate blood pressure control by norepinephrine and angiotensin in ducks. Butler DG, et al. **Gen Comp Endocrinol** 1986 Feb;61(2):323-9

Selectivities of some agonists acting at alpha 1- and alpha 2-adrenoreceptors in the rat vas deferens. Leedham JA, et al. **J Auton Pharmacol** 1986 Mar;6(1):39-46

Chronic treatment with the potential antidepressant drug rolipram: the effect on the behavioural responses to adrenergic and dopaminergic receptor agonists with some biochemical correlates. Przegaliński E, et al. **J Neural Transm** 1985;64(3-4):211-26

Presynaptic alpha-2 adrenoceptor activation and coupling of the receptor-presynaptic effector system in the perfused rat heart: affinity and efficacy of phenethylamines and imidazoline derivatives. Fuder H, et al. **J Pharmacol Exp Ther** 1986 Apr;237(1):237-45

Modulation of peripheral beta-1 and alpha-2 receptor sensitivities by the administration of the tricyclic antidepressant, imipramine, alone and in combination with alpha-2 antagonists to rats. Keith RA, et al. **J Pharmacol Exp Ther** 1986 Feb;236(2):356-63

Diurnal rhythm of alpha 2-noradrenergic receptors in the paraventricular nucleus and other brain areas: relation to circulating corticosterone and feeding behavior. Jhanwar-Uniyal M, et al. **Life Sci** 1986 Feb 3;38(5):473-82

Desensitization of epinephrine-initiated platelet aggregation does not alter binding to the alpha 2-adrenergic receptor or receptor coupling to adenylate cyclase. Motulsky HJ, et al. **Mol Pharmacol** 1986 Jan;29(1):1-6

Islet-activating protein (pertussis toxin) diminishes alpha 2-adrenoceptor mediated effects on noradrenaline release. Allgaier C, et al. **Naunyn Schmiedebergs Arch Pharmacol** 1985 Nov;331(2-3):235-9

Effects of combined administration of L-tryptophan and tricyclic antidepressants on alpha 2- and beta-adrenoceptors and monoamine levels in rat brain. Russell VA, et al. **Neurochem Res** 1985 Dec;10(12):1661-71

Interaction between corticosterone and alpha-2-noradrenergic system of the paraventricular nucleus in relation to feeding behavior. Roland CR, et al. **Neuroendocrinology** 1986;42(4):296-305

Locomotor depression in mice by norcocaine does not involve central alpha 2-adrenergic or presynaptic dopamine receptors. Reith ME, et al. **Pharmacol Biochem Behav** 1986 Feb;24(2):305-7

Excitatory amino acid recognition sites coupled with inositol phospholipid metabolism: developmental changes and interaction with alpha 1-adrenoceptors. Nicoletti F, et al. **Proc Natl Acad Sci USA** 1986 Mar;83(6):1931-5

[Epinephrine uptake and release and presynaptic alpha 2-adrenoceptic regulation in the guinea pig hypothalamus] Fujii Y, et al. **Nippon Yakurigaku Zasshi** 1986 Jan;87(1):11-7 (Eng. Abstr.) **(Jpn)**

RECEPTORS, ADRENERGIC, BETA

Cortical beta- and alpha 2- adrenoceptor binding, hypothalamic noradrenaline and pineal melatonin concentrations measured at different times of the day after repeated treatment of rats with imipramine, zimeldine, alaproclate and amiflamine. Ask AL, et al. **Acta Pharmacol Toxicol (Copenh)** 1986 Jan;58(1):16-24

Increase in the cardiotonic action and in the therapeutic margin of digoxin by the adrenergic beta-stimulant doxaminol in cats. Sponer G, et al. **Arzneimittelforschung** 1985;35(11):1663-7

Prepubertal rat ovary: hormonal modulation of beta-adrenergic receptors and of progesterone response to adrenergic stimulation. Aguado LI, et al. **Biol Reprod** 1986 Feb;34(1):45-50

Influence of vagal cooling on cardiac output in normal and beta-blocked exercising dogs. Versteeg PG, et al. **Eur J Appl Physiol** 1986;54(6):617-23

Alpha- and beta-adrenergic mechanisms mediate blood pressure control by norepinephrine and angiotensin in ducks. Butler DG, et al. **Gen Comp Endocrinol** 1986 Feb;61(2):323-9

Chronic treatment with the potential antidepressant drug rolipram: the effect on the behavioural responses to adrenergic and dopaminergic receptor agonists with some biochemical correlates. Przegaliński E, et al. **J Neural Transm** 1985;64(3-4):211-26

Possible involvement of beta 2-adrenoceptors in hyperthermic effect of l-ephedrine in rats. Yamahara J, et al. **J Pharmacobiodyn** 1985 Aug;8(8):591-6

Modulation of peripheral beta-1 and alpha-2 receptor sensitivities by the administration of the tricyclic antidepressant, imipramine, alone and in combination with alpha-2 antagonists to rats. Keith RA, et al. **J Pharmacol Exp Ther** 1986 Feb;236(2):356-63

Hamster and rat pineal gland beta-adrenoceptor characterization with iodocyanopindolol and the effect of decreased catecholamine synthesis on the receptor. Craft CM, et al. **J Pineal Res** 1985;2(1):51-66

Agonist interactions with beta-adrenergic receptors following chronic administration of desipramine or the atypical antidepressants, iprindole and mianserin. Hancock AA, et al. **J Recept Res** 1985;5(5-6):311-34

In vitro receptor occupancy allows to establish equieffective doses of beta-blockers with different pharmacodynamic profiles in man. Investigations with propranolol and bufuralol. Wellstein A, et al. **Methods Find Exp Clin Pharmacol** 1985 Dec;7(12):645-51

Effects of combined administration of L-tryptophan and tricyclic antidepressants on alpha 2- and beta-adrenoceptors and monoamine levels in rat brain. Russell VA, et al. **Neurochem Res** 1985 Dec;10(12):1661-71

Catecholamine excretion and beta-adrenergic responsiveness in estrogen-treated rats. Carlberg KA, et al. **Pharmacology** 1986;32(3):147-56

Variability of chronic antidepressant treatments on beta-adrenergic receptor sites. Suranyi-Cadotte BE, et al. **Prog Neuropsychopharmacol Biol Psychiatry** 1985;9(5-6):765-8

The modulation of head-twitch behaviour by drugs acting on beta-adrenoceptors: evidence for the involvement of both beta 1- and beta 2-adrenoceptors. Handley SL, et al. **Psychopharmacology (Berlin)** 1986;88(3):320-4

RECEPTORS, CHOLINERGIC

Acetylcholine receptors in the gastrulating chick embryo. Laasberg T, et al. **Experientia** 1986 Apr 15;42(4):439-40

Chlorpromazine inhibition of muscarinic-cholinergic responses in the rat parotid gland. Van der Ven PF, et al. **J Dent Res** 1986 Mar;65(3):382-6

Enhanced elevation of corticosterone following arecoline administration to rats selectively bred for increased cholinergic function. Overstreet DH, et al. **Psychopharmacology (Berlin)** 1986;88(1):129-30

[Reactivity of the cholinoceptive cortical neurons to the repeated action of acetylcholine] Kotliar BI, et al. **Biull Eksp Biol Med** 1986 Mar;101(3):259-60 (Eng. Abstr.) **(Rus)**

RECEPTORS, DOPAMINE

Effect of prolonged dopamine receptor blockade on lactotroph activity in the rat pituitary gland. Prysor-Jones RA, et al. **Acta Endocrinol (Copenh)** 1985 Dec;110(4):469-74

Studies of neurotensin-dopamine receptor interactions in striatal membranes of the male rat. The influence of 6-hydroxydopamine-induced dopamine receptor supersensitivity. Fuxe K, et al. **Acta Physiol Scand** 1986 Jan;126(1):147-9

Effect of dithiocarbamate fungicides and thiurams on 3H-haloperidol binding in rat brain. Komulainen H, et al. **Arch Toxicol [Suppl]** 1985; 8:77-9

Phenothiazine drugs and metabolites: molecular conformation and dopaminergic, alpha adrenergic and muscarinic cholinergic receptor binding. Dahl SG, et al. **Biochem Pharmacol** 1986 Apr 15; 35(8):1263-9

Postnatal ontogeny of dopamine D2 receptors in rat striatum. Murrin LC, et al. **Biochem Pharmacol** 1986 Apr 1;35(7):1159-62

Guanine nucleotide effects on agonist binding at D2 dopamine receptors in bovine anterior pituitary. Simmonds SH, et al. **Biochem Pharmacol** 1986 Mar 1;35(5):731-5

Isolation and characterization of D2-dopamine receptors. Strange PG, et al. **Biochem Soc Trans** 1985 Dec;13(6):1099-100

Relationship of limbic dopamine levels to amphetamine- and anticholinergic-induced hyperactivity in the rat. Carey RJ. **Biol Psychiatry** 1986 Mar;21(3):317-21

Performance deficit induced by low doses of dopamine agonists in rats. Toward a model for approaching the neurobiology of negative schizophrenic symptomatology? Carnoy P, et al. **Biol Psychiatry** 1986 Jan;21(1):11-22

Carbamazepine and dopaminergic supersensitivity [letter] Csernansky JG, et al. **Biol Psychiatry** 1986 Feb;21(2):238-9

Chronic treatment with five different neuroleptics elicits behavioral supersensitivity to opiate infusion into the nucleus accumbens. Stinus L, et al. **Biol Psychiatry** 1986 Jan;21(1):34-48

Central dopamine hyperactivity in rats mimics abnormal acoustic startle response in schizophrenics. Swerdlow NR, et al. **Biol Psychiatry** 1986 Jan;21(1):23-33

B-HT 958 lowers blood pressure and heart rate in the rat through stimulation of dopamine receptors. Brown MJ, et al. **Br J Pharmacol** 1986 Feb;87(2):361-70

Asymmetry in D-2 binding in female rat striata. Drew KL, et al. **Brain Res** 1986 Jan 15;363(1):192-5

The sialagogue response of striatal dopamine receptors to L-dopa is not influenced by castration or chronic estrogen treatment. Pazo JH, et al. **Brain Res Bull** 1986 Jan;16(1):1-4

Inhibition of dopaminergic agonist-induced gnawing behavior by neuroleptic drugs in mice. Yen-Koo HC, et al. **Drug Chem Toxicol** 1985;8(6):495-502

D-2 dopaminergic agonists and adenosine 3',5'-monophosphate directly regulate the synthesis of alpha-melanocyte-stimulating hormone-like peptides by cultured rat melanotrophs. Beaulieu M, et al. **Endocrinology** 1986 Mar;118(3):1032-9

Some atypical neuroleptics inhibit [3H]SCH 23390 binding in vivo. Andersen PH, et al. **Eur J Pharmacol** 1986 Jan 14;120(1):143-4

A central site of dopamine agonist action to modify gastric secretion in the rat. Costall B, et al. **Eur J Pharmacol** 1985 Oct 29;117(1):61-9

Dopamine D1 receptor mediation of the discriminative stimulus properties of SKF 38393. Cunningham KA, et al. **Eur J Pharmacol** 1985 Dec 10; 119(1-2):121-5

A novel long-lasting dopamine receptor blocker: haloperidol-bovine serum albumin conjugate. Garrigues AM, et al. **Eur J Pharmacol** 1985 Dec 3;118(3):313-9

Guanine nucleotide regulation of agonist interactions at [3H]SCH23390-labeled D1 dopamine receptors in rat striatum. Hess EJ, et al. **Eur J Pharmacol** 1986 Feb 11;121(1):31-8

Evidence for a functional role of dopamine type-1 (D-1) receptors in the substantia nigra of rats. Matthews RT, et al. **Eur J Pharmacol** 1986 Jan 14;120(1):87-93

[3H]SCH 23390 binding sites increase after chronic blockade of D-1 dopamine receptors. Porceddu ML, et al. **Eur J Pharmacol** 1985 Dec 3;118(3):367-70

Dopamine receptors mediating yawning: are they autoreceptors? Serra G, et al. **Eur J Pharmacol** 1986 Jan 21;120(2):187-92

Dopaminergic modulation of ACTH-induced grooming. Spruijt BM, et al. **Eur J Pharmacol** 1986 Jan 29;120(3):249-56

The effects of chronic bromocriptine treatment on behaviour and dopamine receptor binding in the rat striatum. Traub M, et al. **Eur J Pharmacol** 1985 Nov 26;118(1-2):147-54

[3H]spiperone and [3H]quinuclidinyl benzilate binding in striatal membranes from rats chronically treated with manganese chloride throughout development and for over two years. Leung TK, et al. **Gen Pharmacol** 1986;17(1):121-3

Selective antagonism of the hypotensive effects of dopamine agonists in spontaneously hypertensive rats. McCoy CE, et al. **Hypertension** 1986 Apr;8(4):298-302

Ganglionic dopamine receptors as mediators of the inhibition of neurogenic vasoconstriction produced by fenoldopam. Lokhandwala MF, et al. **J Auton Pharmacol** 1985 Dec;5(4):301-5

D-2 dopamine receptor-mediated inhibition of pro-opiomelanocortin synthesis in rat intermediate lobe. Abolition by pertussis toxin or activators of adenylate cyclase. Cote TE, et al. **J Biol Chem** 1986 Apr 5;261(10):4555-61

In vivo displacement by 3-PPP enantiomers of N,N-dipropyl-5,6-ADTN from dopamine receptor-binding sites in rat striatum. Carlsson A, et al. **J Neural Transm** 1985;64(3-4):173-85

Sub-chronic administration of (-)-3-PPP and central dopamine receptor sensitivity changes. Hjorth S, et al. **J Neural Transm** 1985; 64(3-4):187-98

Down-regulation of dopamine D-2, 5-HT2 receptors and beta-adrenoceptors in rat brain after prolonged treatment with a new potential antidepressant, Lu 19-005. Nowak G, et al. **J Neural Transm** 1985;64(3-4):227-38

A homologous series of N-alkylated cis-(+)-(1 S, 2 R)-5-methoxy-1-methyl-2-aminotetralins: central dopamine receptor antagonists showing profiles ranging from classical antagonism to selectivity for autoreceptors. Svensson K, et al. **J Neural Transm** 1986; 65(1):29-38

(+)-UH 232 and (+)-UH 242: novel stereoselective dopamine receptor antagonists with preferential action on autoreceptors. Svensson K, et al. **J Neural Transm** 1986;65(1):1-27

Dopaminergic regulation of cone retinomotor movement in isolated teleost retinas: I. Induction of cone contraction is mediated by D2 receptors. Dearry A, et al. **J Neurochem** 1986 Apr;46(4):1006-21

[3H]Fluphenazine binding to brain membranes: simultaneous measurement of D-1 and D-2 receptor sites. Morgan DG, et al. **J Neurochem** 1986 May;46(5):1623-31

Identification of dopamine 'D3' and 'D4' binding sites, labelled with [3H]2-amino-6,7-dihydroxy-1,2,3,4-tetrahydronaphthalene, as high agonist affinity states of the D1 and D2 dopamine receptors, respectively. Urwyler S, et al. **J Neurochem** 1986 Apr;46(4):1058-67

Evidence for dopamine release and metabolism beyond the control of nerve impulses and dopamine receptors in rat substantia nigra. Nissbrandt H, et al. **J Pharm Pharmacol** 1985 Dec;37(12):884-9

Regulation of dopamine synthesis in the medial prefrontal cortex is mediated by release modulating autoreceptors: studies in vivo. Galloway MP, et al. **J Pharmacol Exp Ther** 1986 Mar;236(3):689-98

Characterization of dopaminergic receptor sites in bovine pineal gland. Govitrapong P, et al. **J Pineal Res** 1984;1(3):215-26

Elevation of acetylcholine levels in striatum of rat brain by LY163502, trans-(-)-5,5a,6,7,8,9a,10-octahydro-6-propylpyrimido less than 4,5-g greater than quinolin-2-amine dihydrochloride, a potent and stereospecific dopamine (D2) agonist. Bymaster FP, et al. **Life Sci** 1986 Jan 27;38(4):317-22

Evidence for a D2 dopamine receptor in frog retina that decreases cyclic AMP accumulation and serotonin N-acetyltransferase activity. Iuvone PM. **Life Sci** 1986 Jan 27;38(4):331-42

Pharmacological profile of the abeorphine 201-678, a potent orally active and long lasting dopamine agonist. Jaton AL, et al. **Life Sci** 1986 Jan 13;38(2):155-63

Epinephrine and norepinephrine stimulation of adenylate cyclase in bovine retina homogenate: evidence for interaction with the dopamine D1 receptor. Vanderheyden P, et al. **Life Sci** 1986 Mar 31; 38(13):1221-7

ACTH-(1-24) and alpha-MSH antagonize dopamine receptor-mediated inhibition of striatal dopamine and acetylcholine release. Versteeg DH, et al. **Life Sci** 1986 Mar 3;38(9):835-40

Dopamine, acting through D-2 receptors, inhibits rat striatal adenylate cyclase by a GTP-dependent process. Cooper DM, et al. **Mol Pharmacol** 1986 Feb;29(2):113-9

[3H]-domperidone labels only a single population of receptors which convert from high to low affinity for dopamine in rat brain. Grigoriadis D, et al. **Naunyn Schmiedebergs Arch Pharmacol** 1986 Jan; 332(1):21-5

Analysis of [3H]spiperone binding sites in the rat striatum and frontoparietal cortex by means of quantitative receptor autoradiography after inactivation of dopamine receptors by N-ethoxycarbonyl-2-ethoxy-1,2-dihydroquinoline in vivo: selective protection by sulpiride in the striatum. Fuxe K, et al. **Neurosci Lett** 1986 Feb 28;64(2):163-8

Locomotor depression in mice by norcocaine does not involve central alpha 2-adrenergic or presynaptic dopamine receptors. Reith ME, et al. **Pharmacol Biochem Behav** 1986 Feb;24(2):305-7

Different behavioural patterns induced by the dopamine agonist apomorphine analysed by multivariate statistics. Ståhle L, et al. **Pharmacol Biochem Behav** 1986 Feb;24(2):291-8

Dopaminergic activity of four analogs of butaclamol. Collu R, et al. **Pharmacol Res Commun** 1985 Dec;17(12):1153-7

Modulation by dopaminergic and serotonergic systems of cholinergic interneurons in nucleus accumbens and striatum. Bluth R, et al. **Pol J Pharmacol Pharm** 1985 Nov-Dec;37(6):753-63

Effect of DA1 receptor blockade with SCH 23390 on the renal response

to electrical stimulation of the renal nerves. Bradley T, et al. **Proc Soc Exp Biol Med** 1986 Apr;181(4):492-7

Persistence of low hypothalamic dopaminergic activity after removal of chronic estrogen treatment. Gottschall PE, et al. **Proc Soc Exp Biol Med** 1986 Jan;181(1):78-86

Neuroleptics, dopamine, and schizophrenia. Pickar D. **Psychiatr Clin North Am** 1986 Mar;9(1):35-48

RECEPTORS, DRUG

A common structural model for central nervous system drugs and their receptors. Lloyd EJ, et al. **J Med Chem** 1986 Apr;29(4):453-62

Effects of antidepressants on uptake and receptor systems in the brain. Fuller RW, et al. **Prog Neuropsychopharmacol Biol Psychiatry** 1985; 9(5-6):485-90 (22 ref.)

[Ergot alkaloids and central monoaminergic receptors] Goldstein M. **J Pharmacol** 1985;16 Suppl 3:21-7 (Eng. Abstr.) **(Fre)**

RECEPTORS, ENDOGENOUS SUBSTANCES

Chronic treatment with phenobarbital decreases the expression of rat liver EGF and insulin receptors. Hwang DL, et al. **Biochem Biophys Res Commun** 1986 Mar 13;135(2):501-6

Mapping of gonadotropin-releasing hormone receptor binding site. Keinan D, et al. **Biochemistry** 1985 Dec 17;24(26):7728-32

Ontogeny of receptors for thyrotropin-releasing hormone in the rat brain. Blanchard L, et al. **Brain Res** 1986 Jan;389(1-2):35-8

Prolactin (PRL), follicle-stimulating hormone, and luteinizing hormone are regulators of testicular PRL receptors in golden hamsters. Klemcke HG, et al. **Endocrinology** 1986 Feb;118(2):773-82

Corticotropin-releasing factor binding to the anterior pituitary receptor is modulated by divalent cations and guanyl nucleotides. Perrin MH, et al. **Endocrinology** 1986 Mar;118(3):1171-9

Covalent cross-linking of growth hormone-releasing factor to pituitary receptors. Veliçelebi G, et al. **Endocrinology** 1986 Apr; 118(4):1278-83

Glucocorticoids increase cholecystokinin receptors and amylase secretion in pancreatic acinar AR42J cells. Logsdon CD. **J Biol Chem** 1986 Feb 15;261(5):2096-101

Phorbol ester or diacylglycerol modulates somatostatin binding to its receptors on rat pancreatic acinar cell membranes. Matozaki T, et al. **J Biol Chem** 1986 Jan 25;261(3):1414-20

Norepinephrine decreases EGF binding in primary rat hepatocyte cultures. Cruise JL, et al. **J Cell Physiol** 1986 Apr;127(1):39-44

A study of the cerebral cortex cholecystokinin receptor using two radiolabelled probes: evidence for a common CCK 8 and CCK 4 cholecystokinin receptor binding site. Clark CR, et al. **J Neurochem** 1986 Apr;46(4):1094-101

A search for receptors modulating the release of gamma-[3H]aminobutyric acid in rabbit caudate nucleus slices. Limberger N, et al. **J Neurochem** 1986 Apr;46(4):1109-17

Relationship between pituitary GnRH-binding sites and pituitary release of gonadotrophins in post-partum beef cows. Leung K, et al. **J Reprod Fertil** 1986 Jan;76(1):53-63

Characterization of luteinizing hormone-releasing hormone receptor binding in rat pituitary cell monolayer cultures; influence of intercellular communication. Andries M, et al. **Mol Cell Endocrinol** 1986 Feb; 44(2):147-58

Study of species specificity in growth hormone-releasing factor (GRF) interaction with vasoactive intestinal peptide (VIP) receptors using GRF and intestinal VIP receptors from rat and human: evidence that Ac-Tyr1hGRF is a competitive VIP antagonist in the rat. Laburthe M, et al. **Mol Pharmacol** 1986 Jan;29(1):23-7

Cholecystokinin and its receptors in vertebrates and invertebrates. Vigna SR. **Peptides** 1985;6 Suppl 3:283-7

Distribution of corticotropin-releasing factor receptors in primate brain. Millan MA, et al. **Proc Natl Acad Sci USA** 1986 Mar;83(6):1921-5

Excitatory amino acid recognition sites coupled with inositol phospholipid metabolism: developmental changes and interaction with alpha 1-adrenoceptors. Nicoletti F, et al. **Proc Natl Acad Sci USA** 1986 Mar; 83(6):1931-5

[Thyroliberin receptors in the brain of ground squirrels (Citellus undulatus) during winter hibernation] Iarygin KN, et al. **Dokl Akad Nauk SSSR** 1986;286(5):1268-71 **(Rus)**

RECEPTORS, ENDORPHIN

GABAA receptors and opioid receptors as examples of multiple site receptor proteins. Barnard E. **Alcohol Drug Res** 1985-86;6(2-3):63-5

Identification of distinct binding site subunits of mu and delta opioid receptors. Howard AD, et al. **Biochemistry** 1986 Jan 28;25(2):357-60

Examination of spinal monoamine receptors through which brainstem opiate-sensitive systems act in the rat. Jensen TS, et al. **Brain Res** 1986 Jan 15;363(1):114-27

Interaction between growth hormone releasing factor (GRF) and somatostatin analogue (SMS 201-995) in normal subjects. Losa M, et al. **Clin Endocrinol (Oxf)** 1985 Dec;23(6):715-20

The stimulation of food intake by selective agonists of mu, kappa and delta opioid receptors. Gosnell BA, et al. **Life Sci** 1986 Mar 24; 38(12):1081-8

Pharmacology of opioids. Part 1. Basic aspects. Mather LE. **Med J Aust** 1986 Apr 14;144(8):424-7

Proposals for the mu-active conformation of the enkephalin analog Tyr-cyclo[(-N gamma-D-A2-bu-Gly-Phe-Leu-). Maigret B, et al. **Mol Pharmacol** 1986 Mar;29(3):314-20

Opioid peptides decrease noradrenaline release and blood pressure in the rabbit at peripheral receptors. Szabo B, et al. **Naunyn Schmiedebergs Arch Pharmacol** 1986 Jan;332(1):50-6

Behavioural and spectrum power effects of opioid peptides in chicks. Nisticò G, et al. **Peptides** 1985;6 Suppl 3:137-41

Developmental, behavioral, and opiate receptor changes after prenatal or postnatal beta-endorphin, CRF, or Tyr-MIF-1. Zadina JE, et al. **Psychoneuroendocrinology** 1985;10(4):367-83

[The role of mu- and delta-opiate receptors in the realization of the autonomic effects of opioid peptides] Martynova ER, et al. **Biull Eksp Biol Med** 1986 Jan;101(1):60-3 (Eng. Abstr.) **(Rus)**

RECEPTORS, GABA-BENZODIAZEPINE

[3H]muscimol and [3H]quinuclidinyl benzilate binding in rat cortex in the abstinence after long-term barbital treatment. Nordberg A, et al. **Acta Physiol Scand** 1986 Jan;126(1):153-6

GABAA receptors and opioid receptors as examples of multiple site receptor proteins. Barnard E. **Alcohol Drug Res** 1985-86;6(2-3):63-5

Diazepam inhibits potassium-induced aldosterone secretion in adrenal glomerulosa cell. Shibata H, et al. **Biochem Biophys Res Commun** 1986 Mar 28;135(3):994-9

The gamma-aminobutyrate/benzodiazepine receptor from pig brain. Purification and characterization of the receptor complex from cerebral cortex and cerebellum. Kirkness EF, et al. **Biochem J** 1986 Jan 1; 233(1):265-70

Isolation of the gamma-aminobutyric acid/benzodiazepine receptor. Stephenson FA. **Biochem Soc Trans** 1985 Dec;13(6):1097-9

Effect of single or repeated estrogen administration on tuberoinfundibular GABA neurons and anterior pituitary GABA receptors: biochemical and functional studies. Apud JA, et al. **Brain Res** 1985 Dec 30; 361(1-2):146-53

Dark-rearing affects the development of benzodiazepine receptors in the central visual structures of rat brain. Schliebs R, et al. **Brain Res** 1986 Jan;389(1-2):179-85

Ontogeny of the GABA receptor complex in chick brain: studies in vivo and in vitro. Tehrani MH, et al. **Brain Res** 1986 Feb;390(1):91-8

Enhancement of GABA binding by the benzodiazepine partial agonist CGS9896. Meiners BA, et al. **Eur J Pharmacol** 1985 Dec 10; 119(1-2):61-5

GABAB receptors in the rabbit uterus may mediate contractile responses. Riesz M, et al. **Eur J Pharmacol** 1985 Dec 17;119(3):199-204

Long-term exposure of cortical cell cultures to clonazepam reduces benzodiazepine receptor binding. Sher PK. **Exp Neurol** 1986 May; 92(2):360-8

Benzodiazepine receptors resolved. Richards JG, et al. **Experientia** 1986 Feb 15;42(2):121-6 (56 ref.)

Presence of gamma-aminobutyric acid and its specific receptor binding sites in the human term placenta. Erdö SL, et al. **Gynecol Obstet Invest** 1985;20(4):199-203

Computer-controlled large scale production of high specific activity [11C]RO 15-1788 for PET studies of benzodiazepine receptors. Suzuki K, et al. **Int J Appl Radiat Isot** 1985 Dec;36(12):971-6

The postganglionic excitatory innervation of the mouse urinary bladder and its modulation by prejunctional GABAB receptors. Santicioli P, et al. **J Auton Pharmacol** 1986 Mar;6(1):53-66

Diazepam in blood of Danish drivers: occurrence as shown by gas-liquid chromatographic assay following radioreceptor screening. Worm K, et al. **J Forensic Sci Soc** 1985 Nov-Dec;25(6):407-12

GABA-noradrenergic interaction: evidence for differential sites of action for GABA-A and GABA-B receptors. Suzdak PD, et al. **J Neural Transm** 1985;64(3-4):163-72

Is GABA-stimulated [3H]flunitrazepam binding modulated by benzodiazepine receptor ligands? [letter] Mennini T. **J Neurochem** 1986 Apr;46(4):1326-7

Autoradiographic localization of benzodiazepine receptor binding in dissociated cultures of fetal mouse cerebral cortex. Sher PK, et al. **J Neurochem** 1986 Mar;46(3):899-904

Antibodies recognising the GABAA/benzodiazepine receptor including its regulatory sites. Stephenson FA, et al. **J Neurochem** 1986 Mar; 46(3):854-61

In vitro uptake of benzodiazepines by rat pineal gland. Lowenstein PR, et al. **J Pineal Res** 1984;1(3):207-13

Characterization of benzodiazepine binding sites after short-wave photo-affinity labeling with flunitrazepam. Herblin WF. **Life Sci** 1986 Feb 10;38(6):507-14

Discriminative and aversive properties of beta-carboline-3-carboxylic acid ethyl ester, a benzodiazepine receptor inverse agonist, in rhesus monkeys. Takada K, et al. **Life Sci** 1986 Mar 17;38(11):1049-56

A comparison of methods for removal of endogenous GABA from brain membranes prepared for binding assays. Fisher TE, et al. **Neurochem Res** 1986 Jan;11(1):1-8

Modulation of the GABA-benzodiazepine receptor complex by taurine in rat brain membranes. Malminen O, et al. **Neurochem Res** 1986 Jan; 11(1):85-94

The effects of yohimbine on exploratory and locomotor behaviour are attributable to its effects at noradrenaline and not at benzodiazepine receptors. Chopin P, et al. **Neuropharmacology** 1986 Jan;25(1):53-7

Septal driving of hippocampal theta rhythm: role of gamma-aminobutyrate-benzodiazepine receptor complex in mediating effects of anxiolytics. Quintero S, et al. **Neuroscience** 1985 Dec; 16(4):875-84

Benzodiazepine binding sites in mice forebrain and kidneys: evidence for similar regulation by GABA agonists. Rägo LK, et al. **Pharmacol Biochem Behav** 1986 Jan;24(1):1-3

Benzodiazepine-like effects of inosine on punished behavior of pigeons. Witkin JM, et al. **Pharmacol Biochem Behav** 1986 Jan;24(1):121-5

Effects of the benzodiazepine receptor ligands midazolam, Ro 15-1788, and Ro 5-4864, alone and in combinations, on platelet serotonin uptake. Lingjaerde O. **Pharmacopsychiatry** 1986 Jan;19(1):15-8

The effects of compounds related to gamma-aminobutyrate and benzodiazepine receptors on behavioural responses to anxiogenic stimuli in the rat: extinction and successive discrimination. Buckland C, et al. **Psychopharmacology (Berlin)** 1986;88(3):285-95

Effects of chlordiazepoxide training dose on the mixed agonist-antagonist properties of benzodiazepine receptor antagonist Ro 15-1788, in a drug discrimination procedure. De Vry J, et al. **Psychopharmacology (Berlin)** 1986;88(2):177-83

A comparison between chlordiazepoxide and CL 218,872, a synthetic non-benzodiazepine ligand for benzodiazepine receptors, on serotonin and catecholamine turnover in brain. McElroy JF, et al. **Psychopharmacology (Berlin)** 1986;88(1):105-8

The neonatal development of benzodiazepine receptor subtypes in the rat cerebral cortex and cerebellum. Watanabe Y, et al. **Yakubutsu Seishin Kodo** 1985 Dec;5(4):335-42

[GABA receptor function and manic depressive disease] Hetmar O, et al. **Nord Med** 1986;101(2):62-5 (Eng. Abstr.) **(Dan)**

[Gamma-aminobutyric acid (GABA) activates three types of receptor-ionophore complex] Akaike N. **Yakugaku Zasshi** 1985 Oct; 105(10):926-36 (Eng. Abstr.) **(Jpn)**

[Interaction of piracetam with 3H-imipramine binding sites and the GAMA-benzodiazepine receptor complex of brain membranes] Rozhanets VV, et al. **Biull Eksp Biol Med** 1986 Jan;101(1):40-2 (Eng. Abstr.) **(Rus)**

RECEPTORS, SEROTONIN

Serotonin receptor involvement in the avoidance learning deficit caused by p-chloroamphetamine-induced serotonin release. Ogren SO. **Acta Physiol Scand** 1986 Mar;126(3):449-62

Clonazepam-induced up-regulation of serotonin1 and serotonin2 binding sites in rat frontal cortex. Wagner HR, et al. **Adv Neurol** 1986; 43:645-51

Inhibition of monoamine oxidase in monoaminergic neurones in the rat brain by irreversible inhibitors. Fagervall I, et al. **Biochem Pharmacol** 1986 Apr 15;35(8):1381-7

Increased tryptophan hydroxylase activity in serotonergic nerve terminals spared by 5,7-dihydroxytryptamine. Stachowiak MK, et al. **Biochem Pharmacol** 1986 Apr 15;35(8):1241-8

5-Carboxamidotryptamine is a selective agonist at 5-hydroxytryptamine receptors mediating vasodilatation and tachycardia in anaesthetized cats. Connor HE, et al. **Br J Pharmacol** 1986 Feb;87(2):417-26

Characterization and localization of serotonin receptors in human brain postmortem. Biegon A, et al. **Brain Res** 1986 Jan 15;363(1):91-8

Effects of pargyline, reserpine and neurotoxin lesions on [3H]tryptamine binding sites in rat brain. Cascio CS, et al. **Eur J Pharmacol** 1986 Jan 14;120(1):101-5

Inhibition of forskolin-stimulated adenylate cyclase activity by 5-HT receptor agonists. Devivo M, et al. **Eur J Pharmacol** 1985 Dec 17; 119(3):231-4

Effects of antidepressant drug combinations on cortical 5-HT2 receptors and wet-dog shakes in rats. Koshikawa F, et al. **Eur J Pharmacol** 1985 Dec 3;118(3):273-81

Presynaptic serotonin receptors regulate [3H]serotonin release from rat spinal cord synaptosomes. Stauderman KA, et al. **Eur J Pharmacol** 1986 Jan 14;120(1):107-9

[3H]DOB: a specific agonist radioligand for 5-HT2 serotonin receptors. Titeler M, et al. **Eur J Pharmacol** 1985 Oct 29;117(1):145-6

Subtypes of the 5-HT receptor mediating the behavioural responses to 5-methoxy-N,N-dimethyltryptamine in the rat. Tricklebank MD, et al. **Eur J Pharmacol** 1985 Oct 29;117(1):15-24

Down-regulation of dopamine D-2, 5-HT2 receptors and beta-adrenoceptors in rat brain after prolonged treatment with a new potential antidepressant, Lu 19-005. Nowak G, et al. **J Neural Transm** 1985;64(3-4):227-38

Identification of multiple binding sites for [3H]5-hydroxytryptamine in the rat CNS. Blurton PA, et al. **J Neurochem** 1986 May; 46(5):1392-8

Stimulation of the serotonin autoreceptor prevents the calcium-calmodulin-dependent increase of serotonin biosynthesis in rat raphe slices. Sawada M, et al. **J Neurochem** 1986 Mar;46(3):963-7

Stereoselective blockade at the 5-HT autoreceptor and inhibition of radioligand binding to central 5-HT recognition sites by the optical isomers of methiothepin. Hibert M, et al. **Neuropharmacology** 1986 Jan; 25(1):1-4

Effects of MK-212 (6-chloro-2[1-piperazinyl]pyrazine) on schedule-controlled behavior and their reversal by 5-HT antagonists in the pigeon. Mansbach RS, et al. **Neuropharmacology** 1986 Jan; 25(1):13-9

Modulation by dopaminergic and serotonergic systems of cholinergic interneurons in nucleus accumbens and striatum. Bluth R, et al. **Pol J Pharmacol Pharm** 1985 Nov-Dec;37(6):753-63

Head-twitch response induced by ergometrine in mice: behavioural evidence for direct stimulation of central 5-hydroxytryptamine receptors by ergometrine. Balsara JJ, et al. **Psychopharmacology (Berlin)** 1986;88(3):275-8

Evidence that serotonin receptors are involved in the anticonvulsant effect of yohimbine in mice. Ludvig N, et al. **Psychopharmacology (Berlin)** 1986;88(1):82-5

1-(1-Naphthyl)piperazine, a central serotonin agonist. Fuller RW, et al. **Res Commun Chem Pathol Pharmacol** 1986 Jan;51(1):37-45

Dependence of the antagonism at human platelet 5-HT2 receptors by ketanserin on the reaction pH. De Clerck F, et al. **Thromb Res** 1985 Dec 1;40(5):581-96

[In vivo study of central serotoninergic receptors in man using positron tomography] Baron JC, et al. **Rev Neurol (Paris)** 1985; 141(8-9):537-45 (Eng. Abstr.) **(Fre)**

REFLEX

Effects of graded changes in reflex renal nerve activity on renal function. Beers ET, et al. **Am J Physiol** 1986 Mar;250(3 Pt 2):F559-65

Cardiovascular and neuroendocrine responses to behavioral stress after central or peripheral barodenervation in rats. Buchholz RA, et al. **Brain Res** 1986 Feb 19;365(2):360-4

Inhibition of the swallowing reflex by local application of serotonergic agents into the nucleus of the solitary tract. Kessler JP, et al. **Eur J Pharmacol** 1985 Nov 26;118(1-2):77-85

Effects of antidepressant drug combinations on cortical 5-HT2 receptors and wet-dog shakes in rats. Koshikawa F, et al. **Eur J Pharmacol** 1985 Dec 3;118(3):273-81

Dopamine receptors mediating yawning: are they autoreceptors? Serra G, et al. **Eur J Pharmacol** 1986 Jan 21;120(2):187-92

Supraspinal depressant action of diazepam on the crossed extensor reflex. Kawasaki K, et al. **Neurosci Lett** 1986 Jan 16;63(2):175-9

[Attack of yawning, case report] Miyazaki M, et al. **Rinsho Shinkeigaku** 1985 Sep;25(9):1007-9 (Eng. Abstr.) **(Jpn)**

REINFORCEMENT SCHEDULE

Brief exposure to contingent reinforcement produces a sustained increment in the strength of an elicited response. Hutchinson RR, et al. **J Exp Anal Behav** 1986 Mar;45(2):189-94

Effects of chlorpromazine on fixed-ratio responding: modification by fixed-interval discriminative stimuli. Witkin JM. **J Exp Anal Behav** 1986 Mar;45(2):195-205

RESERPINE

Ultrastructural alterations of the egg chambers of Galleria mellonella L. (Lepidoptera) developing after reserpine administration. Głowacka SK, et al. **Acta Biol Hung** 1985;36(1):25-44

Modification of reserpine induced rigidity by dopaminergic and alpha-adrenergic drugs. Anderson RJ. **Acta Neurol Scand** 1985 Dec; 72(6):584-9

The effect of reserpine treatment on choline acetyltransferase activity in rat submaxillary glands. Ekström J. **Acta Physiol Scand** 1986 Jan; 126(1):103-6

NPY--a mediator of reserpine-resistant, non-adrenergic vasoconstriction in cat spleen after preganglionic denervation? Lundberg JM, et al. **Acta Physiol Scand** 1986 Jan;126(1):151-2

Stability of reserpine injections and tablets submitted by U.S. hospitals. Coffman HD, et al. **Am J Hosp Pharm** 1986 Jan;43(1):103-9

Effect of denervation and/or reserpine-induced changes on adrenomedullary catecholamines in pigeon: a fluorescence histochemical study. Mahata SK, et al. **Basic Appl Histochem** 1985;29(4):331-6

Studies on the effect of reserpine on the peroxidase activity of submaxillary gland. Chakraborty R, et al. **Biochem Pharmacol** 1986 Apr 15; 35(8):1235-9

Reserpine-induced effects in the adrenergic neuron as studied with cytofluorimetric scanning. Larsson PA, et al. **Brain Res Bull** 1986 Jan; 16(1):63-74

Effects of pargyline, reserpine and neurotoxin lesions on [3H]tryptamine binding sites in rat brain. Cascio CS, et al. **Eur J Pharmacol** 1986 Jan 14;120(1):101-5

Reserpine-resistant responses to nerve stimulation in the cat nictitating membrane involve the release of newly synthesized noradrenaline. Duval N, et al. **Eur J Pharmacol** 1986 Mar 11;122(1):93-101

Metorphamide levels in chromaffin cells increase after treatment with reserpine. Eiden LE, et al. **J Neurochem** 1986 May;46(5):1651-4

Effects of d-amphetamine and dopamine synthesis inhibitors on dopamine and acetylcholine neurotransmission in the striatum. I. Release in the absence of vesicular transmitter stores. Parker EM, et al. **J Pharmacol Exp Ther** 1986 Apr;237(1):179-92

Frequency- and reserpine-dependent chemical coding of sympathetic transmission: differential release of noradrenaline and neuropeptide Y from pig spleen. Lundberg JM, et al. **Neurosci Lett** 1986 Jan 2; 63(1):96-100

Reserpine and the monoaminergic regulation of adrenal dopamine beta-hydroxylase activity. Lima L, et al. **Neuroscience** 1986; 17(1):235-45

[Histoenzymatic studies of the kidneys of albino rats after experimental administration of serpasil and deslanoside] Zarebska A. **Patol Pol** 1985 Apr-Jun;36(2):200-7 (Eng. Abstr.) **(Pol)**

RUBIDIUM

Modulation of Ca2+-dependent K+ transport by modifications of the NAD+/NADH ratio in intact human red cells. Alvarez J, et al. **Biochim Biophys Acta** 1986 Apr 14;856(2):408-11

Influence of medium amino acids on the ouabain sensitive and insensitive 86Rb+-fluxes in HeLa cells. Schaefer A, et al. **Experientia** 1986 Apr 15;42(4):436-7

Effects of lithium and rubidium on shock-induced changes in open-field activity. Hines G. **Psychopharmacology (Berlin)** 1986;88(2):209-12

SCHIZOPHRENIA

Enkephalin analogue in schizophrenia. Double blind cross-over trial. Joergensen A, et al. **Acta Psychiatr Scand** 1986 Jan;73(1):45-8

Social skills training for schizophrenic individuals at risk for relapse. Liberman RP, et al. **Am J Psychiatry** 1986 Apr;143(4):523-6

Physiologic dysfunction of dorsolateral prefrontal cortex in schizophrenia. II. Role of neuroleptic treatment, attention, and mental effort. Berman KF, et al. **Arch Gen Psychiatry** 1986 Feb;43(2):126-35

Dopamine agonist treatment of schizophrenia with N-propylnorapomorphine. Tamminga CA, et al. **Arch Gen Psychiatry** 1986 Apr;43(4):398-402

Vitamin C status in schizophrenia. Subotičanec K. **Bibl Nutr Dieta** 1986;(38):173-81

Central dopamine hyperactivity in rats mimics abnormal acoustic startle response in schizophrenics. Swerdlow NR, et al. **Biol Psychiatry** 1986 Jan;21(1):23-33

Acute schizophrenia. Johnstone EC. **Br J Hosp Med** 1985 Oct; 34(4):198-201

Chronic schizophrenia. Morgan R. **Br J Hosp Med** 1985 Oct; 34(4):202-5

The effect of propranolol and thioridazine on positive and negative symptoms of schizophrenia. Eccleston D, et al. **Br J Psychiatry** 1985 Dec;147:623-30

Homovanillic acid (HVA) urinary excretion and day/night rhythm of chronic schizophrenic patients. Preliminary observations. Mathieu P, et al. **Encephale** 1985 Sep-Oct;11(5):199-202

The universal enervating triad: psychopharmaceutical considerations of anxiety, schizophrenia, and depression. Miller TW, et al. **Issues Ment Health Nurs** 1984;6(3-4):275-91

Stability of the postpsychotic depression syndrome. Siris SG, et al. **J Clin Psychiatry** 1986 Feb;47(2):86-8

A comparison of parenteral loxapine and haloperidol in hostile and aggressive acutely schizophrenic patients. Tuason VB. **J Clin Psychiatry** 1986 Mar;47(3):126-9

The natural course of schizophrenia and effective maintenance drug treatment. Davis JM, et al. **J Clin Psychopharmacol** 1986 Feb; 6(1 Suppl):2S-10S (79 ref.)

Dosage strategies with long-acting injectable neuroleptics, including haloperidol decanoate. Kane JM. **J Clin Psychopharmacol** 1986 Feb; 6(1 Suppl):20S-23S

Drug-behavior therapy outcomes with chronic schizophrenics [letter] Liberman RP, et al. **J Clin Psychopharmacol** 1986 Feb;6(1):52-3

The efficacy of antipsychotic drugs and family therapies in the maintenance treatment of schizophrenia. Schooler NR. **J Clin Psychopharmacol** 1986 Feb;6(1 Suppl):11S-19S (29 ref.)

A clinical trial comparing intramuscular haloperidol decanoate and oral haloperidol in chronic schizophrenic patients: efficacy, safety, and dosage equivalence. Vasavan Nair NP, et al. **J Clin Psychopharmacol** 1986 Feb;6(1 Suppl):30S-37S

Treatment of uncooperative psychiatric patients in the community: Mental Health Act in need of reform. Brahams, D. **Lancet** 1986 Apr 12; 1(8485):863-4

Postmortem central catecholamines and antemortem cognitive impairment in elderly schizophrenics and controls. Bridge TP, et al. **Neuropsychobiology** 1985;14(2):57-61

24-hour plasma levels of prolactin, cortisol, growth hormone and catecholamines in schizophrenic patients. Kemali D, et al. **Neuropsychobiology** 1985;14(3):109-14

Pharmacotherapy of chronic hospitalized schizophrenics: prescription practices. Wilson WH, et al. **Neuropsychobiology** 1985;14(2):75-82

Approaches to the assessment of schizophrenia in Europe. Berner P, et al. **Pharmacopsychiatry** 1986 Jan;19(1):33-6

A German multicentre study on the long-term treatment of schizophrenic outpatients. Pietzcker A. **Pharmacopsychiatry** 1985 Nov;18(6):333-8

Early treatment events and prediction of response to neuroleptics in schizophrenia. Awad AG, et al. **Prog Neuropsychopharmacol Biol Psychiatry** 1985;9(5-6):585-8

The assessment of a psychosocial treatment with chronic schizophrenic patients using neuropsychopharmacological indices. Bütter HJ, et al. **Prog Neuropsychopharmacol Biol Psychiatry** 1985;9(5-6):593-7

Cholecystokinin peptides, dopamine and schizophrenia--a review. Nair NP, et al. **Prog Neuropsychopharmacol Biol Psychiatry** 1985; 9(5-6):515-24 (60 ref.)

Postmortem neurochemistry in schizophrenia. Bracha HS, et al. **Psychiatr Clin North Am** 1986 Mar;9(1):133-41 (38 ref.)

Integrating treatments in schizophrenia. Carpenter WT Jr, et al. **Psychiatr Clin North Am** 1986 Mar;9(1):153-64 (46 ref.)

The two-syndrome concept and neuroendocrinology of schizophrenia. Crow TJ, et al. **Psychiatr Clin North Am** 1986 Mar;9(1):99-113 (74 ref.)

Neuroleptics, dopamine, and schizophrenia. Pickar D. **Psychiatr Clin North Am** 1986 Mar;9(1):35-48

Cerebrospinal fluid studies of monoamine metabolism in schizophrenia. van Kammen DP, et al. **Psychiatr Clin North Am** 1986 Mar; 9(1):81-97 (94 ref.)

CSF dopamine turnover and positive schizophrenic symptoms after withdrawal of long-term neuroleptic treatment. Frecska E, et al. **Psychiatry Res** 1985 Nov;16(3):221-6

Neuroleptic withdrawal in chronic schizophrenia: CT and endocrine variables relating to psychopathology. Naber D, et al. **Psychiatry Res** 1985 Nov;16(3):207-19

Neuronal cholecystokinin and schizophrenia: pathogenic and therapeutic studies. Tamminga CA, et al. **Psychopharmacology (Berlin)** 1986; 88(3):387-91

A controlled trial of prostaglandin E1 precursor in chronic neuroleptic resistant schizophrenic patients. Vaddadi KS, et al. **Psychopharmacology (Berlin)** 1986;88(3):362-7

[Catamnestic evaluation of the treatment of schizophrenia using insulin coma] Pavlovský P, et al. **Cesk Psychiatr** 1985 Dec;81(6):391-6 (Eng. Abstr.) **(Cze)**

[Regression analysis of clinical data for purposes of predicting the efficacy of psychopharmacotherapy of episodes of schizophrenia] Zaitsev SG, et al. **Zh Nevropatol Psikhiatr** 1986;86(1):91-7 (Eng. Abstr.) **(Rus)**

[Chronic treatment of schizophrenia with injectable bromperidol decanoate] Suárez Richards M. **Acta Psiquiatr Psicol Am Lat** 1985 Sep; 31(3):222-8 (Eng. Abstr.) **(Spa)**

SCHIZOPHRENIA, PARANOID

Clonazepam: a novel therapeutic adjunct. Freinhar JP, et al. **Int J Psychiatry Med** 1985-86;15(4):321-8

Comparing the effects of pimozide and placebo in a single case experiment. Klieser E, et al. **Pharmacopsychiatry** 1985 Nov;18(6):339-42

Effects of haloperidol on somatostatin-like immunoreactivity in the CSF of Schizophrenic patients. Gattaz WF, et al. **Psychiatry Res** 1986 Jan; 17(1):1-6

[Comparison of the effects of chlorprothixene and haloperidol on hypothalamic function in patients with paranoid schizophrenia] Horodnicki JM, et al. **Psychiatr Pol** 1985 May-Jun;19(3):181-7 (Eng. Abstr.) **(Pol)**

[Changes in the serum thioridazine level after administration of pridinol] Sidorowicz S, et al. **Psychiatr Pol** 1985 Sep-Oct;19(5):423-4 **(Pol)**

SELF STIMULATION

Lateralized decrease in self-stimulation induced by haloperidol in rats with unilateral 6-hydroxydopamine lesions. Carey RJ. **Behav Brain Res** 1985 Dec;18(3):215-22

Pharmaco-ontogeny of reward: enhancement of self-stimulation by D-amphetamine and cocaine in 3- and 10-day-old rats. Barr GA, et al. **Brain Res** 1986 Jan;389(1-2):193-202

Auto-titration technique using intracranial self-stimulation and effects of antianxiety drugs. Ichimaru Y, et al. **Jpn J Pharmacol** 1985 Nov; 39(3):331-8

Antagonism of the effects of the atypical benzodiazepine, Ro 5-4864 on intracranial self-stimulation in the rat. Pellow S, et al. **Pharmacol Biochem Behav** 1986 Feb;24(2):193-7

Reward, performance, and the response strength method in self-stimulating rats: validation and neuroleptics. Hamilton AL, et al. **Physiol Behav** 1985 Dec;35(6):897-904

SENSORY DEPRIVATION

Visual behavior of monocularly deprived kittens treated with 6-hydroxydopamine. Gordon B, et al. **Brain Res** 1986 Jan; 389(1-2):21-9

Effects of neonatal monocular enucleation on the number of GAD-positive puncta in rat visual cortex. Ribak CE, et al. **Exp Brain Res** 1986;62(1):203-6

SEROTONIN

Ablation of serotonergic nerves in the rat pancreas. Lack of effects on hormone secretion and intrinsic blood flow. Jansson L, et al. **Acta Endocrinol (Copenh)** 1985 Dec;110(4):515-21

Mechanisms by which 5HT stimulates ovulation in the immature rat treated with pregnant mare serum gonadotrophin. Wilson CA, et al. **Acta Endocrinol (Copenh)** 1986 Feb;111(2):235-40

Serotonin-containing nerve fibers in the rat spinal cord: electron microscopic immunohistochemistry. Mizukawa K, et al. **Acta Med Okayama** 1986 Feb;40(1):1-10

Evidence for a modulatory influence of centrally administered substance P on a 5-hydroxytryptamine-mediated behavioural response in the male rat. Ogren SO, et al. **Acta Physiol Scand** 1985 Dec;125(4):743-5

Serotonin receptor involvement in the avoidance learning deficit caused by p-chloroamphetamine-induced serotonin release. Ogren SO. **Acta Physiol Scand** 1986 Mar;126(3):449-62

Evidence for a role of brain serotonergic neurotransmission in avoidance learning. Ogren SO. **Acta Physiol Scand [Suppl]** 1985;544:1-71

Bufotenine reconsidered. McLeod WR, et al. **Acta Psychiatr Scand** 1985 Nov;72(5):447-50

Reengineering the brain serotonin system: localized application of specific neurotoxins and fetal serotonergic neurons into the adult CNS. Azmitia EC. **Adv Neurol** 1986;43:493-507

The primate serotonergic system: a review of human and animal studies and a report on Macaca fascicularis. Azmitia EC, et al. **Adv Neurol** 1986;43:407-68 (83 ref.)

Biochemical pharmacology of the serotonin system. Fuller RW. **Adv Neurol** 1986;43:469-80 (76 ref.)

Biochemical mechanisms in 5-hydroxytryptamine-induced human platelet aggregation. de Clerck F, et al. **Agents Actions** 1985 Dec; 17(2):220-8

Substance P, 5-hydroxytryptamine, and bradykinin stimulate abdominal visceral afferents. Lew WY, et al. **Am J Physiol** 1986 Mar; 250(3 Pt 2):R465-73

Effect of amine on temperature-responsive neuron in slice preparation of rat brain stem. Watanabe T, et al. **Am J Physiol** 1986 Apr; 250(4 Pt 2):R553-9

High-affinity imipramine binding and serotonin uptake in platelets of eight adolescent and ten adult obsessive-compulsive patients. Weizman A, et al. **Am J Psychiatry** 1986 Mar;143(3):335-9

Pemoline and urinary excretion of catecholamines and indoleamines in children with attention deficit disorder. Zametkin AJ, et al. **Am J Psychiatry** 1986 Mar;143(3):359-62

Effect of luminally administered serotonin and substance P on jejunal handling of water and electrolytes. McFadden D, et al. **Am J Surg** 1986 Jan;151(1):81-6

Serotonin transport by platelet plasma and granule membranes. Rudnick G, et al. **Ann NY Acad Sci** 1985;456:277-8

Neurochemical effects of buspirone in rat hippocampus: evidence for selective activation of 5HT neurons. Mennini T, et al. **Arch Int Pharmacodyn Ther** 1986 Jan;279(1):40-9

Catecholaminergic and serotoninergic brain structures in European green frogs: an autoradiographical study. Diederen JH, et al. **Basic Appl Histochem** 1985;29(4):297-308

The behavioral effects of depletions of brain serotonin induced by 5,7-dihydroxytryptamine vary with time after administration. Gately PF, et al. **Behav Neural Biol** 1986 Jan;45(1):31-42

Influences of amino acids on the circadian rhythms of brain neurotransmitters. Angelova C, et al. **Bibl Nutr Dieta** 1986; (38):72-81

Uptake of tryptophan into the brain: dietary influences on serotoninergic function. Bender DA. **Bibl Nutr Dieta** 1986;(38):82-6

Structural requirements for cocaine congeners to interact with dopamine and serotonin uptake sites in mouse brain and to induce stereotyped behavior. Reith ME, et al. **Biochem Pharmacol** 1986 Apr 1; 35(7):1123-9

Recent advances in high-performance liquid chromatographic analysis of small molecules. Application of high-performance liquid chromatography with electrochemical detection to the study of neurotransmitters in vivo. Routledge C, et al. **Biochem Soc Trans** 1985 Dec;13(6):1058-61

Human serotonectin: a blood glycoprotein that binds serotonin. Chemical and physiological characterization. Mella A, et al. **Biochim Biophys Acta** 1986 Feb 19;880(2-3):139-46

Seasonal variation of platelet serotonin uptake and 3H-imipramine binding in normal and depressed subjects. Egrise D, et al. **Biol Psychiatry** 1986 Mar;21(3):283-92

The inhibitory action of 5-hydroxytryptamine on gastric secretory function in rats. Cho CH, et al. **Br J Pharmacol** 1986 Feb; 87(2):371-7

5-Carboxamidotryptamine is a selective agonist at 5-hydroxytryptamine receptors mediating vasodilatation and tachycardia in anaesthetized cats. Connor HE, et al. **Br J Pharmacol** 1986 Feb;87(2):417-26

Serotonergic innervation of the forebrain in the North American opossum. Martin GF, et al. **Brain Behav Evol** 1985;26(3-4):196-228

Ontogenesis of [3H]serotonin binding sites in the hypothalamus of the female rat: relation to serotonin-induced LH release in moxestrol-pretreated rats. Becú-Villalobos D, et al. **Brain Res** 1986 Feb;390(1):111-6

Brain serotonin synthesis and Na+,K+-ATPase activity are increased postnatally after prenatal administration of L-tryptophan. Hernández-Rodriguez J, et al. **Brain Res** 1986 Mar;390(2):221-6

Altered responsiveness to substance P and 5-hydroxytryptamine in cat dorsal horn neurons after 5-HT depletion with p-chlorophenylalanine. Jeftinija S, et al. **Brain Res** 1986 Mar 12;368(1):107-15

Synaptic connections between serotoninergic axon terminals and tyrosine hydroxylase-immunoreactive neurons in the arcuate nucleus of the rat hypothalamus. A combination of electron microscopic autoradiography and immunocytochemistry. Kiss J, et al. **Brain Res** 1986 Feb 5; 364(2):284-94

Modulatory action of serotonin on glutamate-induced excitation of cerebellar Purkinje cells. Lee M, et al. **Brain Res** 1985 Dec 30; 361(1-2):107-13

Distribution of enkephalin-immunoreactive cell bodies in relation to serotonin-containing neurons in the raphe nuclei of the cat: immunohistochemical evidence for the coexistence of enkephalins and serotonin in certain cells. Léger L, et al. **Brain Res** 1986 Jan 1; 362(1):63-73

Effects of intrahypothalamically administered norepinephrine, serotonin and bombesin on thermoregulation in the deermouse (Peromyscus maniculatus). Lin LH, et al. **Brain Res** 1986 Feb 5;364(2):212-9

Excitation of lateral horn neurons of the neonatal rat spinal cord by 5-hydroxytryptamine. Ma RC, et al. **Brain Res** 1986 Jan; 389(1-2):89-98

Studies on serotonin-accumulating cells in rabbit retinal cultures. Osborne NN, et al. **Brain Res** 1986 Jan 8;362(2):287-98

Serotonergic mechanisms in brains of suicide victims. Owen F, et al. **Brain Res** 1986 Jan 1;362(1):185-8

Serotonin decreases a background current and increases calcium and calcium-activated current in pedal neurons of Hermissenda. Jacklet JW, et al. **Cell Mol Neurobiol** 1985 Dec;5(4):407-12

The organization of serotonin-immunoreactive neuronal systems in the brain of the crested newt, Triturus cristatus carnifex Laur. Fasolo A, et al. **Cell Tissue Res** 1986;243(2):239-47

Ultrastructural localization of serotonin in the intrapulmonary neuroepithelial bodies of neonatal rabbits by use of immunoelectron microscopy. Lauweryns JM, et al. **Cell Tissue Res** 1986;243(3):455-9

Distributional pattern of serotonin-immunoreactive nerve fibers in the lateral geniculate nucleus of the rat, cat and monkey (Macaca fuscata). Ueda S, et al. **Cell Tissue Res** 1986;243(2):249-53

Determination of serotonin and melatonin in rat pineal gland by high-performance liquid chromatography with ultraviolet and fluorometric dual detection. Wakabayashi H, et al

Chem Pharm Bull (Tokyo) 1985 Sep;33(9):3875-80

Tolbutamide increases hypothalamic serotonin activity in the rat. Grunstein HS, et al. **Diabetes** 1986 Apr;35(4):475-80

Noradrenergic-serotonergic interactions and nociception in the rat. Archer T, et al. **Eur J Pharmacol** 1986 Jan 29;120(3):295-307

8-Hydroxy-2-(di-n-propylamino) tetralin (8-OH-DPAT) elicits eating in free-feeding rats by acting on central serotonin neurons. Bendotti C, et al. **Eur J Pharmacol** 1986 Feb 11;121(1):147-50

Supersensitivity of alpha 2-adrenoceptors modulating [3H]5-HT release after noradrenergic denervation with DSP4. Benkirane S, et al. **Eur J Pharmacol** 1985 Dec 10;119(1-2):131-3

d- and l-isomers of fenfluramine differ markedly in their interaction with brain serotonin and catecholamines in the rat. Invernizzi R, et al. **Eur J Pharmacol** 1986 Jan 14;120(1):9-15

Central serotonergic responses and behavioural adaptation to repeated immobilisation: the effect of the corticosterone synthesis inhibitor metyrapone. Kennett GA, et al. **Eur J Pharmacol** 1985 Dec 17; 119(3):143-52

Inhibition of the swallowing reflex by local application of serotonergic agents into the nucleus of the solitary tract. Kessler JP, et al. **Eur J Pharmacol** 1985 Nov 26;118(1-2):77-85

Presynaptic serotonin receptors regulate [3H]serotonin release from rat spinal cord synaptosomes. Stauderman KA, et al. **Eur J Pharmacol** 1986 Jan 14;120(1):107-9

Enhancement of cerebellar Purkinje cell complex discharge activity by microiontophoretic serotonin. Strahlendorf JC, et al. **Exp Brain Res** 1986;61(3):614-24

Lack of inhibition of thrombin-induced rise in intracellular Ca2+ levels and 5-hydroxytryptamine secretion by 1-oleoyl-2-acetylglycerol in human platelets. Krishnamurthi S, et al. **FEBS Lett** 1986 Feb 17; 196(2):365-9

Verapamil reversal of serotonin-induced jejunal secretion of water and electrolytes in awake dogs. Zinner MJ, et al. **Gastroenterology** 1986 Mar;90(3):515-9

Effects of prenatal exposure to lithium on indoleamines in maturing mouse brain. Hoff KM, et al. **Gen Pharmacol** 1986;17(1):101-3

Effects of serotonin on the internal anal sphincter: in vivo manometric study in rats. Goldberg M, et al. **Gut** 1986 Jan;27(1):49-54

Effect of whole body irradiation on urinary 5-HT metabolites under the influence of newly synthesized chemical radioprotector. Thakur DK. **Indian J Med Sci** 1985 Oct;39(10):236-9

Pre- and postnatal development of 5-hydroxytryptamine-immunoreactive cells in the superior cervical ganglion of the rat. Häppölä O, et al. **J Auton Nerv Syst** 1986 Jan;15(1):21-31

Inositol 1,4,5-trisphosphate induces aggregation and release of 5-hydroxytryptamine from saponin-permeabilized human platelets. Watson SP, et al. **J Biol Chem** 1986 Apr 25;261(12):5368-72

Automated method to estimate catecholamine and indoleamine content and turnover rates. Freeman GB, et al. **J Chromatogr** 1986 Jan 24; 374(2):239-49

Serotonin syndrome: a case report. Price WA, et al. **J Clin Pharmacol** 1986 Jan;26(1):77-8

Therapeutic effects of serotonin uptake inhibitors in depression. Asberg M, et al. **J Clin Psychiatry** 1986 Apr;47 Suppl:23-35 (199 ref.)

Reversibility of serotonin irritation syndrome with atmospheric anions. Giannini AJ, et al. **J Clin Psychiatry** 1986 Mar;47(3):141-3

Use of serotonergic agents in the clinical assessment of central serotonin function. Murphy DL, et al. **J Clin Psychiatry** 1986 Apr; 47 Suppl:9-15 (77 ref.)

Postnatal development of serotonin nerve fibers in the somatosensory cortex of mice studied by immunohistochemistry. Fujimiya M, et al. **J Comp Neurol** 1986 Apr 8;246(2):191-201

Noradrenergic and serotoninergic innervation of cortical, thalamic, and tectal visual structures in Old and New World monkeys. Morrison JH, et al. **J Comp Neurol** 1986 Jan 1;243(1):117-38

New approaches to the study of bulbospinal (B3) serotonergic neurons in the control of blood pressure. Chalmers JP, et al. **J Hypertension [Suppl]** 1985 Dec;3(4):S5-9

Enzyme-linked immunosorbent assay (ELISA) for detection of antibodies to protein-reactive drugs and metabolites: criteria for identification of antibody activity. Detection and hapten specificity of anti-DNP, anti-captopril and anti-sulphanilamidobenzoic acid. Coleman JW, et al. **J Immunol Methods** 1986 Apr 3;88(1):37-44

Oxidation of 5-hydroxytryptamine and 5,7-dihydroxytryptamine. A new oxidation pathway and formation of a novel neurotoxin. Wrona MZ, et al. **J Med Chem** 1986 Apr;29(4):499-505

Identification of multiple binding sites for [3H]5-hydroxytryptamine in the rat CNS. Blurton PA, et al. **J Neurochem** 1986 May; 46(5):1392-8

Dopaminergic regulation of cone retinomotor movement in isolated teleost retinas: II. Modulation by gamma-aminobutyric acid and serotonin. Dearry A, et al. **J Neurochem** 1986 Apr;46(4):1022-31

Monoamine neurotransmitter metabolism and locomotor activity during chemical hypoxia. Freeman GB, et al. **J Neurochem** 1986 Mar; 46(3):733-8

Brain dialysis: in vivo metabolism of dopamine and serotonin by monoamine oxidase A but not B in the striatum of unrestrained rats. Kato T, et al. **J Neurochem** 1986 Apr;46(4):1277-82

Effect of intrastriatal injection of diisopropylfluorophosphate on acetylcholine, dopamine, and serotonin metabolism. Robinson SE, et al. **J Neurochem** 1986 May;46(5):1632-8

Stimulation of the serotonin autoreceptor prevents the calcium-calmodulin-dependent increase of serotonin biosynthesis in rat raphe slices. Sawada M, et al. **J Neurochem** 1986 Mar;46(3):963-7

VIP neurons as prime synaptic targets for serotonin afferents in rat suprachiasmatic nucleus: a combined radioautographic and immunocytochemical study. Bosler O, et al. **J Neurocytol** 1985 Oct; 14(5):749-63

Influence of long-term immobilization stress on regional blood-brain barrier permeability, cerebral blood flow and 5-HT level in conscious normotensive young rats. Sharma HS, et al. **J Neurol Sci** 1986 Jan; 72(1):61-76

Serotonin decreases the duration of action potentials recorded from tetraethylammonium-treated bullfrog dorsal root ganglion cells. Holz GG 4th, et al. **J Neurosci** 1986 Mar;6(3):620-6

Regulation of the circadian clock in the Aplysia eye: mimicry of neural action by serotonin. Nadakavukaren JJ, et al. **J Neurosci** 1986 Jan; 6(1):14-21

Serotonin enhances the excitatory acetylcholine response in the RB cell cluster of Aplysia californica. Simmons LK, et al. **J Neurosci** 1986 Mar; 6(3):774-81

Prostaglandin D2-induced potentiation of hexobarbitone hypnosis in rats: role of 5-hydroxytryptamine. Bhattacharya SK, et al. **J Pharm Pharmacol** 1985 Dec;37(12):915-6

Mechanisms of the relaxations induced by 5-hydroxytryptamine on the rat isolated caecum. Uguru MO, et al. **J Pharm Pharmacol** 1986 Feb; 38(2):140-3

Influence of chlorpromazine on the accumulation of 5-hydroxytryptamine by interaction with ATP. Gasco MR, et al. **J Pharm Sci** 1985 Nov; 74(11):1188-91

In vivo actions of a calcium channel blocker (nimodipine) on the cerebrovascular response to infused 5-hydroxytryptamine. McCalden TA, et al. **J Pharmacol Exp Ther** 1986 Apr;237(1):36-9

Effects of melatonin and control injections on pineal serotonin and norepinephrine: afternoon injections lower serotonin levels thirty-six percent at light-dark transition. Catalá MD, et al. **J Pineal Res** 1984; 1(1):75-82

Studies on the kinetics of melatonin and N-acetylserotonin in the rat at mid-light and mid-dark. Chan MY, et al. **J Pineal Res** 1984; 1(3):227-36

Differential effect of carbidopa on the concentration of rat pineal and hypothalamic indoleamines. Oxenkrug GF, et al. **J Pineal Res** 1984; 1(4):349-53

Melatonin and N-acetylserotonin stress responses: effects of type of stimulation and housing conditions. Seggie J, et al. **J Pineal Res** 1985; 2(1):39-49

Temporal effects of norepinephrine on pineal serotonin in vitro. Walker RF, et al. **J Pineal Res** 1986;3(1):33-40

Serotonin-induced stimulation of progesterone production by cow luteal cells in vitro. Battista PJ, et al. **J Reprod Fertil** 1986 Jan; 76(1):231-8

Different sensitivities of vasoconstrictor responses to serotonin and KCl of isolated and perfused dog mesenteric arteries with and without endothelia. Chiba S, et al. **Jpn J Pharmacol** 1985 Oct;39(2):271-3

Do antipsychotic drugs and serotonin down regulate [3H]-spiroperidol binding sites in human cortex? Andorn AC. **Life Sci** 1986 Apr 7; 38(14):1251-60

Biochemical characterization of serotonin stimulated phosphoinositide turnover. Conn PJ, et al. **Life Sci** 1986 Feb 17;38(7):663-9

Serotonin content of rabbit lung and small intestine during perinatal development. de Bock V, et al. **Life Sci** 1986 Feb 3;38(5):431-5

Liquid chromatographic assay for cerebrospinal fluid serotonin. Linnoila M, et al. **Life Sci** 1986 Feb 24;38(8):687-94

3H-5-hydroxytryptamine accumulation by rat brain synaptic vesicles in a membrane-impermeant medium, and selective reduction by 5,7-dihydroxytryptamine. Ruth JA, et al. **Life Sci** 1986 Mar 31; 38(13):1193-201

High affinity [3H]imipramine binding and serotonin uptake to platelets of adolescent females suffering from anorexia nervosa. Weizman R, et al. **Life Sci** 1986 Mar 31;38(13):1235-42

Investigations of nerve populations influencing ion transport that can be stimulated electrically, by serotonin and by a nicotinic agonist. Keast JR, et al. **Naunyn Schmiedebergs Arch Pharmacol** 1985 Nov; 331(2-3):260-6

Catecholaminergic-serotonergic balance in the CNS and reproductive cycling in aging rats. Cooper RL, et al. **Neurobiol Aging** 1986 Jan-Feb; 7(1):9-15

Immunocytochemical changes in serotonin in the forebrain and pituitary of aging fish. Margolis-Nunno H, et al. **Neurobiol Aging** 1986 Jan-Feb; 7(1):17-21

Effect of ovarian steroids to stimulate region-specific hypothalamic 5-hydroxytryptamine synthesis in ovariectomized rats. King TS, et al.

Neuroendocrinology 1986;42(4):344-50

Serotonin and dopamine independently regulate pituitary beta-endorphin release in vivo. Sapun-Malcolm D, et al. **Neuroendocrinology** 1986; 42(3):191-6

Indolealkylamines and prolactin secretion. A structure-activity study in the central nervous system of the rat. Seeman G, et al. **Neuropharmacology** 1985 Dec;24(12):1195-200

Descending serotonergic fibers in the dorsolateral and ventral funiculi of cat spinal cord. Hylden JL, et al. **Neurosci Lett** 1985 Dec 18; 62(3):299-304

Stimulation by serotonin of immunoreactive peptide histidine isoleucine release from rat hypothalamus in vitro. Inoue T, et al. **Neurosci Lett** 1986 Feb 14;64(1):17-22

Serotonin immunoreactivity in the circumesophageal nervous system of Hermissenda crassicornis. Land PW, et al. **Neurosci Lett** 1985 Dec 4; 62(2):199-205

Immunohistochemical demonstration of serotonin nerve fibers in the subthalamic nucleus of the rat, cat and monkey. Mori S, et al. **Neurosci Lett** 1985 Dec 18;62(3):305-9

Changes in brain serotonin levels affect leukocytes, lymphocytes, T-cell subpopulations and natural killer cell activity in rats. Steplewski Z, et al. **Neurosci Lett** 1985 Dec 4;62(2):277-82

Serotonin-immunoreactive projections to the hippocampus from the interpeduncular nucleus in the rat. Wirtshafter D, et al. **Neurosci Lett** 1986 Mar 14;64(3):259-62

Serotoninergic but not noradrenergic neurons in rat central nervous system adapt to long-term treatment with monoamine oxidase inhibitors. Blier P, et al. **Neuroscience** 1985 Dec;16(4):949-55

Neurons reactive to antibodies against serotonin in the stomatogastric nervous system and in the alimentary canal of locust and crickets (Orthoptera, Insecta). Klemm N, et al. **Neuroscience** 1986; 17(1):247-61

Neuropeptides and 5-HT immunoreactivity in the gastric nerves of the dogfish (Scyliorhinus stellaris). Cimini V, et al. **Peptides** 1985; 6 Suppl 3:373-7

TFMPP may produce its stimulus effects via a 5-HT1B mechanism. McKenney JD, et al. **Pharmacol Biochem Behav** 1986 Jan;24(1):43-7

Alteration of the turnover of dopamine and 5-hydroxytryptamine in rat brain associated with hypothermia. Okuda C, et al. **Pharmacol Biochem Behav** 1986 Jan;24(1):79-83

Effects of the benzodiazepine receptor ligands midazolam, Ro 15-1788, and Ro 5-4864, alone and in combinations, on platelet serotonin uptake. Lingjaerde O. **Pharmacopsychiatry** 1986 Jan;19(1):15-8

The effect of insulin on the central serotonergic system of the rat. Juszkiewicz M. **Pol J Pharmacol Pharm** 1985 Sep-Oct;37(5):591-600

Serotonergic regulation of the brain and gut beta-endorphin and dynorphin content in the rat. Majeed NH, et al. **Pol J Pharmacol Pharm** 1985 Nov-Dec;37(6):909-18

Implication of the serotoninergic system in the decreased ACTH response to stress after lesion of the amygdaloid central nucleus. Beaulieu S, et al. **Prog Neuropsychopharmacol Biol Psychiatry** 1985;9(5-6):665-9

Serotonin, septal lesions, and shock-escape learning in rats. Mattingly BA, et al. **Psychol Rep** 1986 Feb;58(1):3-9

A comparison between chlordiazepoxide and CL 218,872, a synthetic non-benzodiazepine ligand for benzodiazepine receptors, on serotonin and catecholamine turnover in brain. McElroy JF, et al. **Psychopharmacology (Berlin)** 1986;88(1):105-8

Effects of peripheral 5-HT on consumption of flavoured solutions. Montgomery AM, et al. **Psychopharmacology (Berlin)** 1986; 88(2):262-6

Effects of antidepressant drugs, selective noradrenaline-or 5-hydroxytryptamine uptake inhibitors, on apomorphine-induced hypothermia in mice. Pawlowski L, et al. **Psychopharmacology (Berlin)** 1986;88(2):240-6

The effect of radioprotective compounds on brain serotonine metabolisation of irradiated experimental animals. Bodó K, et al. **Radiobiol Radiother (Berl)** 1985;26(5):589-97

1-(1-Naphthyl)piperazine, a central serotonin agonist. Fuller RW, et al. **Res Commun Chem Pathol Pharmacol** 1986 Jan;51(1):37-45

Neurohumoral interactions in the posttraumatic period and possibilities of their correction. Bazarevitch GJ, et al. **Resuscitation** 1986 Jan; 13(2):115-21

Exogenous serotonin and gastric mucosal blood flow in conscious dogs. Bech K, et al. **Scand J Gastroenterol** 1985 Dec;20(10):1285-90

Influence of serotinin and norepinephrine on flow capacity/pressure characteristics of feline isolated cerebral arteries. Lou HC, et al. **Stroke** 1986 Jan-Feb;17(1):91-4

The inhibitory effects of ferriprotoporphyrin IX on platelet aggregation and release of serotonin. Essien EM. **Thromb Res** 1985 Dec 1; 40(5):609-22

Unsaturated platelet-activating factor: influence on aggregation, serotonin release and thromboxane synthesis of human thrombocytes. Korth R, et al. **Thromb Res** 1986 Mar 1;41(5):699-706

[Fluorohistochemical changes of serotonin in the APUD cells after injection of 6-hydroxydopamine intraperitoneally] Peng JY, et al. **Chen Tzu Yen Chiu** 1985;10(4):298-303 (Eng. Abstr.) **(Chi)**

[The effect of vagus nerve stimulation and various drugs on chemical mediator release in anesthetized dogs] Kitamura S, et al. **Nippon Kyobu Shikkan Gakkai Zasshi** 1985 Dec;23(12):1449-55 (Eng. Abstr.) **(Jpn)**

[Catecholamine and serotonin content in the lymph nodes following deafferentation] Izranov VA. **Biull Eksp Biol Med** 1986 Mar; 101(3):276-7 (Eng. Abstr.) **(Rus)**

[Effect of lithium oxybutyrate on the serotonin and 5-hydroxyindoleacetic acid content in the brain of rabbits] Saratikov AS, et al. **Biull Eksp Biol Med** 1986 Mar;101(3):312-5 (Eng. Abstr.) **(Rus)**

[Effect of serotonin on thermoregulation in normothermic hibernators and during arousal from deep hypothermia] Sitnikov VD, et al. **Biull Eksp Biol Med** 1986 Jan;101(1):5-7 (Eng. Abstr.) **(Rus)**

[Role of the pituitary in modulating the effect of the dopaminergic and serotoninergic systems on the immune response] Al'perina EL, et al. **Fiziol Zh SSSR** 1985 Nov;71(11):1428-32 (Eng. Abstr.) **(Rus)**

[Effect of activation of the cholinergic system of the small intestine on its contractile responses induced by serotonin] Ovsiannikov VI, et al. **Fiziol Zh SSSR** 1985 Nov;71(11):1413-8 (Eng. Abstr.) **(Rus)**

[Method for the separate determination of total, thrombocyte and free serotonin in the blood plasma] Rabinovich NL, et al. **Lab Delo** 1985; (12):729-31 (Eng. Abstr.) **(Rus)**

[Effect of synaptic activation and serotonin application on the calcium current in Helix neurons] Kononenko NI, et al. **Neirofiziologiia** 1986; 18(1):77-85 (Eng. Abstr.) **(Rus)**

SEX BEHAVIOR, ANIMAL

Altered endocrine and behavioral responses with reproductive aging in the male Japanese quail. Ottinger MA, et al. **Horm Behav** 1986 Mar; 20(1):83-94

Effect of bicuculline on sexual activity in castrated male rats. Fernandez-Guasti A, et al. **Physiol Behav** 1986;36(2):235-7

Chronic gonadotropin-releasing hormone agonist treatment suppresses ovulation and sexual behavior in group-living female rhesus monkeys. Wallen K, et al. **Physiol Behav** 1986;36(2):369-75

SLEEP

Hypnotic activity of an imidazo-pyridine (zolpidem). Nicholson AN, et al. **Br J Clin Pharmacol** 1986 Feb;21(2):205-11

Effect of timiperone, a new antipsychotic drug, on the sleep-wakefulness cycle in cats. Tanaka M, et al. **Jpn J Pharmacol** 1985 Nov; 39(3):391-4

Effects of ECT on sleep and CSF biogenic amines in affective illness. Hoffmann G, et al. **Psychiatry Res** 1985 Nov;16(3):199-206

Effects of repeated zimelidine administration on sleep parameters in the rat. Reyes RB, et al. **Psychopharmacology (Berlin)** 1986;88(1):54-7

SLEEP DEPRIVATION

Effect of midazolam and sleep deprivation on day-time sleep propensity. Borbély AA, et al. **Arzneimittelforschung** 1985;35(11):1696-9

Abstinence from night sleep as a treatment for endogenous depressions. The earliest observations in a Danish mental hospital (1954) and an analysis of the causal mechanism. Ostenfeld I. **Dan Med Bull** 1986 Feb; 33(1):45-9

Effect of 24-hour sleep deprivation on biogenic amine turnover. Bol'shakova TD, et al. **Hum Physiol** 1985 Jul-Aug;11(4):291-5

SLEEP, REM

Sleep, depression and the effects of antidepressant drugs. Gaillard JM, et al. **Acta Psychiatr Belg** 1985 Sep-Oct;85(5):561-7

SLEEP STAGES

Influence of proopiomelanocortin-derived peptides on the sleep-waking cycle of the rat. Chastrette N, et al. **Neurosci Lett** 1985 Dec 18; 62(3):365-70

Effect of hypoxia on ventilatory and arousal responses to CO2 during NREM sleep with and without flurazepam in young adults. Gothe B, et al. **Sleep** 1986;9(1):24-37

SOCIAL ADJUSTMENT

Social skills training for schizophrenic individuals at risk for relapse. Liberman RP, et al. **Am J Psychiatry** 1986 Apr;143(4):523-6

SODIUM

Changes in intracellular sodium with chloride secretion in dog tracheal epithelium. Shorofsky SR, et al. **Am J Physiol** 1986 Apr; 250(4 Pt 1):C646-50

Body sodium in rats: response to DOCA, adrenalectomy, changes in salt intake, and a salt load. Simpson FO, et al. **Am J Physiol** 1986 Mar; 250(3 Pt 2):F551-8

Effects of sodium depletion and angiotensin II on osmotic regulation of vasopressin. Wade CE, et al. **Am J Physiol** 1986 Feb; 250(2 Pt 2):R287-91

Interference with central actions of angiotensin II suppresses sodium appetite. Weiss ML, et al. **Am J Physiol** 1986 Feb; 250(2 Pt 2):R250-9

Glucose and sodium transport in brush-border membrane vesicles from fetal rabbit kidney. Beck JC. **Ann NY Acad Sci** 1985;456:457-9

Different temperature sensitivity and cation specificity of two distinct D-glucose/Na+ cotransport systems in the intestinal brush-border membrane. Brot-Laroche E, et al. **Ann NY Acad Sci** 1985;456:47-50

Ion-coupled neurotransmitter transport across the synaptic plasma membrane. Kanner BI, et al. **Ann NY Acad Sci** 1985;456:153-61 (40 ref.)

The duck red cell model of volume-sensitive chloride-dependent cation transport. McManus TJ, et al. **Ann NY Acad Sci** 1985;456:183-6

The role of intracellular sodium activity in the inotropy potentiation among high [Ca]o' norepinephrine and strophanthidin. Abete P, et al. **Arch Int Pharmacodyn Ther** 1985 Nov;278(1):87-96

An unusual pattern of Na+ and K+ movements across the horse erythrocyte membrane. Contreras A, et al. **Biochim Biophys Acta** 1986 Apr 14;856(2):388-91

Lii-Nao countertransport and Li leak in erythrocytes are differentially affected by membrane enrichment with cholesteryl hemisuccinate. Levy R, et al. **Biochim Biophys Acta** 1986 Jan 29;854(2):325-8

Sodium current and gating current experiments on the node of Ranvier. Meves H. **Biomed Biochim Acta** 1986;45(1-2):S33-8

Lithium stimulation of in vitro granulopoiesis: evidence for mediation via sodium transport pathways. Gallicchio VS. **Br J Haematol** 1986 Mar;62(3):455-66

Elevation of sodium levels in the cerebral ventricles of anaesthetized dogs triggers the release of an inhibitor of ouabain-sensitive sodium, potassium-ATPase into the circulation. Jandhyala BS, et al. **Clin Sci** 1986 Jan;70(1):103-10

Deuterium NMR study of head-group deuterated phosphatidylserine in pure and binary phospholipid bilayers. Interactions with monovalent cations Na+ and Li+. Roux M, et al. **FEBS Lett** 1986 Apr 7; 199(1):33-8

Plasma levels and cardiovascular, endocrine, and excretory effects of atrial natriuretic peptide during different sodium intakes in man. Weidmann P, et al. **J Clin Endocrinol Metab** 1986 May;62(5):1027-36

Inhibitin: a specific inhibitor of sodium/sodium exchange in erythrocytes. Morgan K, et al. **J Clin Invest** 1986 Feb;77(2):538-44

Sodium transport by rat cortical collecting tubule. Effects of vasopressin and desoxycorticosterone. Reif MC, et al. **J Clin Invest** 1986 Apr; 77(4):1291-8

Changes in body water and plasma constituents during bullfrog development: effects of temperature and hormones. Brown SC, et al. **J Exp Zool** 1986 Jan;237(1):25-33

Unusual responses of cultured Fundulus heteroclitus melanophores to epinephrine and ions, paradox of K+ versus Na+. Clark CR, et al. **J Exp Zool** 1985 Dec;236(3):361-4

A kinetic analysis of Na-Li countertransport in human red blood cells. Hannaert PA, et al. **J Gen Physiol** 1986 Mar;87(3):353-68

Interactions of lithium and protons with the sodium-proton exchanger of dog red blood cells. Parker JC. **J Gen Physiol** 1986 Feb; 87(2):189-200

Methylation of critical carboxyl groups in the vicinity of the sodium channel of guinea-pig atrium. Freeman SE, et al. **J Mol Cell Cardiol** 1986 Jan;18(1):99-108

Characterization of sodium-dependent [3H]GBR-12935 binding in brain: a radioligand for selective labelling of the dopamine transport complex. Janowsky A, et al. **J Neurochem** 1986 Apr;46(4):1272-6

An effect of noradrenaline on resting potential and Na activity in sheep cardiac Purkinje fibres. Glitsch HG, et al. **Pflugers Arch** 1986 Feb; 406(2):144-50

Supersensitivity of the renal tubule to catecholamines in the chronically denervated canine kidney. Szénási G, et al. **Pflugers Arch** 1986 Jan; 406(1):57-9

SOMATOFORM DISORDERS

Forms of atypical depression and their response to antidepressant drugs. Davidson J, et al. **Psychiatry Res** 1986 Feb;17(2):87-95

SOMATOSTATIN

Effect of intragastric pH, prostaglandins and prostaglandin synthesis inhibitors on the release of gastrin and somatostatin into the gastric lumen of anaesthetized rats. Alino SF, et al. **Acta Physiol Scand** 1986 Jan;126(1):1-8

Effect and mechanism of vagal nerve stimulation on somatostatin secretion in dogs. Ahrén B, et al. **Am J Physiol** 1986 Feb;250(2 Pt 1):E212-7

Somatostatin induces ectopic activity fronts via a local intestinal mechanism during fed state or pentagastrin. Schippers E, et al. **Am J Physiol** 1986 Feb;250(2 Pt 1):G149-54

Inhibition of gastrin release by gastric inhibitory peptide mediated by somatostatin. Wolfe MM, et al. **Am J Physiol** 1986 Mar; 250(3 Pt 1):G331-5

The structure and hormone content of the endocrine pancreas of the one-humped camel (Camelus dromedarius). Khatim MS, et al. **Anat Anz** 1985;159(1-5):181-6

Somatostatin, insulin and glucagon secretion by the perfused pancreas from the cysteamine-treated rat. Silvestre RA, et al. **Biochem Biophys Res Commun** 1986 Feb 13;134(3):1291-7

Conversion of somatostatin-28 to somatostatin-14 during maturation of epithelial cells in the porcine jejunum. Schäfer G, et al. **Biochim Biophys Acta** 1986 Mar 14;885(3):240-7

Inhibition by somatostatin of the release of growth hormone induced by lysine-vasopressin in normal subjects. Chiodera P, et al. **Biomed Pharmacother** 1985;39(6):334-7

Behavioral changes following central injection of cysteamine in rats. Bakhit C, et al. **Brain Res** 1986 Feb 12;365(1):159-63

Neuropeptides in cerebral cortex of macaque monkey (Macaca fuscata fuscata): regional distribution and ontogeny. Hayashi M, et al. **Brain Res** 1986 Feb 5;364(2):360-8

Influence of a benzodiazepine, midazolam, and gamma-aminobutyric acid (GABA) on basal somatostatin secretion from cerebral and diencephalic neurons in dispersed cell culture. Stryker TD, et al. **Brain Res** 1986 Jan 8;362(2):339-43

Effects of hibernation on somatostatin-like immunoreactivity in the brain of the ground squirrel (Spermophilus richardsonii) and European hedgehog (Erinaceus europaeus). Nürnberger F, et al. **Cell Tissue Res** 1986;243(2):263-71

Interaction between growth hormone releasing factor (GRF) and somatostatin analogue (SMS 201-995) in normal subjects. Losa M, et al. **Clin Endocrinol (Oxf)** 1985 Dec;23(6):715-20

Coexpression of somatostatin-like immunoreactivity and catecholaminergic properties in neural crest derivatives: comodulation of peptidergic and adrenergic differentiation in cultured neural crest. García-Arrarás JE, et al. **Dev Biol** 1986 Mar;114(1):247-57

Differential regulation of cholinergic and peptidergic development in the rat striatum in culture. Kessler JA. **Dev Biol** 1986 Jan;113(1):77-89

Modulatory effect of glucose, amino acids, and secretin on CCK-8-induced somatostatin and pancreatic polypeptide release in dogs. Schusdziarra V, et al. **Diabetes** 1986 May;35(5):523-9

Somatostatin release from freshly isolated and cultured rat islets in response to rat insulin and to anti-insulin serum. Schäfer G, et al. **Diabetes Res** 1985 Jul;2(4):201-5

The effect of adding albumin to solutions of somatostatin (SST-14) on inhibiting pentagastrin-stimulated acid secretion in man. Whitehouse I, et al. **Digestion** 1986;33(2):69-73

The role of growth hormone-releasing factor and somatostatin on somatic growth in rats. Wehrenberg WB. **Endocrinology** 1986 Feb; 118(2):489-94

In vivo synthesis and processing of rat hypothalamic prosomatostatin. Camier M, et al. **FEBS Lett** 1986 Feb 3;196(1):14-8

Somatostatin and alpha 2-adrenergic agonists selectively inhibit vasopressin-induced cyclic AMP accumulation in MDCK cells. Friedlander G, et al. **FEBS Lett** 1986 Mar 17;198(1):38-42

Ontogeny of neuropeptidergic systems: luteinizing hormone releasing hormone (LHRH); somatostatin (SRIF) and neurophysin (NF) in the hypothalamus of the domestic pig by immunocytochemistry. Polkowska J, et al. **Folia Histochem Cytobiol** 1985;23(4):193-200

Effect of somatostatin and its analogs on histamine-stimulated cAMP production in isolated guinea pig gastric glands. Nishihara S, et al. **Gastroenterol Jpn** 1985 Dec;20(6):543-7

Endogenous somatostatin and the gut. Lucey MR. **Gut** 1986 Apr; 27(4):457-67 (94 ref.)

Inhibition of pentagastrin-stimulated acid secretion after subcutaneous administration of a new somatostatin analogue. Whitehouse I, et al. **Gut** 1986 Feb;27(2):141-6

Role of endogenous prostaglandins in somatostatin-induced inhibition of gastrointestinal hormone secretion. Koop H, et al. **Hepatogastroenterology** 1985 Dec;32(6):288-92

Antigenic specificity of a new and potent somatostatin antiserum. Tamarit-Rodriguez J, et al. **Horm Metab Res** 1985 Dec;17(12):623-5

Somatostatin actions in primary dissociated cell cultures of mammalian spinal cord neurons. Macdonald RL, et al. **Int J Neurol** 1980; 14(2-4):221-32

Somatostatin immunocytochemistry in the rabbit retina. Sagar SM, et al. **Invest Ophthalmol Vis Sci** 1986 Mar;27(3):316-22

Phorbol ester or diacylglycerol modulates somatostatin binding to its receptors on rat pancreatic acinar cell membranes. Matozaki T, et al. **J Biol Chem** 1986 Jan 25;261(3):1414-20

Distribution of immunoreactive somatostatin (ISRIF) in the nervous system of the squid, Loligo pealei. Feldman SC. **J Comp Neurol** 1986 Mar 8;245(2):238-57

Somatostatin-like immunoreactivity in neurons, nerve terminals, and fibers of the cat spinal cord. Krukoff TL, et al. **J Comp Neurol** 1986 Jan 1;243(1):13-22

Glutamic acid decarboxylase and somatostatin immunoreactivities in rat visual cortex. Lin CS, et al. **J Comp Neurol** 1986 Feb 15; 244(3):369-83

Somatostatinlike immunoreactive neurons in the hedgehog (Erinaceus europaeus) and the sheep (Ovis aries) central nervous system. Papadopoulos GC, et al. **J Comp Neurol** 1986 Feb 8;244(2):174–92

The capability for regulation of insulin secretion by somatostatin in purified pancreatic islet B cells during aging. Magal E, et al. **Mech Ageing Dev** 1986 Jan;33(2):139–46

On the actions of substance P, somatostatin, and vasoactive intestinal polypeptide on rat peritoneal mast cells and in human skin. Piotrowski W, et al. **Naunyn Schmiedebergs Arch Pharmacol** 1985 Dec; 331(4):364–8

Regulation of growth hormone and thyrotropin secretion by somatostatin systems in rat brain. Terry LC, et al. **Neuroendocrinology** 1986; 42(3):218–25

Relationship between cerebrospinal fluid somatostatin and peripheral thyroid hormones with carbamazepine treatment. Joffe RT, et al. **Neuropsychobiology** 1985;14(3):115–7

Correlation of mitochondrial swelling after capsaicin treatment and substance P and somatostatin immunoreactivity in small neurons of dorsal root ganglion in the rat. Chiba T, et al. **Neurosci Lett** 1986 Mar 14;64(3):311–6

Pancreatic peptides regulate Cl– secretion in the marine teleost gill. Davis MS, et al. **Peptides** 1985;6 Suppl 3:379–82

Synthesis and biological activity of highly potent octapeptide analogs of somatostatin. Cai RZ, et al. **Proc Natl Acad Sci USA** 1986 Mar; 83(6):1896–900

Effects of haloperidol on somatostatin–like immunoreactivity in the CSF of Schizophrenic patients. Gattaz WF, et al. **Psychiatry Res** 1986 Jan; 17(1):1–6

Permeability of epidural somatostatin and morphine into the intrathecal space of dogs. Chrubasik J, et al. **Regul Pept** 1986 Jan;13(2):119–24

Effect of atropine on plasma gastrin and somatostatin concentrations during sham feeding in man. Feldman M, et al. **Regul Pept** 1985 Nov 28;12(4):345–52

Gonadotroph–specific expression of metallothionein fusion genes in pituitaries of transgenic mice. Low MJ, et al. **Science** 1986 Feb 28; 231(4741):1002–4

[Somatostatin and gastric acid secretion] Chevalier T, et al. **Gastroenterol Clin Biol** 1986 Jan;10(1):34–40 (75 ref.) **(Fre)**

[Structural and hormonal alterations in the pancreas after hepatectona in dogs] Shobu R, et al. **Nippon Geka Gakkai Zasshi** 1986 Jan; 87(1):61–6 (Eng. Abstr.) **(Jpn)**

[Effects of somatostatin and its analog on gastric secretion. An application of the secretagogues to gastric secretion] Nomura M, et al. **Nippon Yakurigaku Zasshi** 1985 Sep;86(3):189–95 (Eng. Abstr.) **(Jpn)**

SOMATOTROPIN RELEASING HORMONE

Growth hormone releasing factor–like immunoreactivity in human milk. Werner H, et al. **Biochem Biophys Res Commun** 1986 Mar 28; 135(3):1084–9

Total DNA synthesis and cloning in Escherichia coli of a gene coding for the human growth hormone releasing factor. Cravador A, et al. **Biochimie** 1985 Jul–Aug;67(7–8):829–34

Interaction between growth hormone releasing factor (GRF) and somatostatin analogue (SMS 201–995) in normal subjects. Losa M, et al. **Clin Endocrinol (Oxf)** 1985 Dec;23(6):715–20

The inter– and intra–subject variabilities of plasma GH response to human growth hormone–releasing hormone (1–44) NH2 in men. Hotta M, et al. **Endocrinol Jpn** 1985 Oct;32(5):673–80

Effects of age on GH responses to growth hormone–releasing factor in rats. Niimi M, et al. **Endocrinol Jpn** 1985 Aug;32(4):559–62

Electrical stimulation of several limbic areas suppressed the growth hormone (GH) release induced by human pancreatic GH–releasing factor in pentobarbital–anesthetized rats. Kato M, et al. **Endocrinology** 1986 Mar;118(3):955–60

hpGRF–44–NH2, lot no. 92–81–5G–41–47, is (human) growth hormone–releasing factor containing no trace of (ovine) corticotropin–releasing factor. Ling N, et al. **Endocrinology** 1986 Mar; 118(3):1249–51

Identification of a putative GH–releasing factor (GRF) batch as predominantly ovine CRF with a small quantity of human GRF. Tannenbaum GS, et al. **Endocrinology** 1986 Mar;118(3):1246–8

Covalent cross–linking of growth hormone–releasing factor to pituitary receptors. Veliçelebi G, et al **Endocrinology** 1986 Apr; 118(4):1278–83

The role of growth hormone–releasing factor and somatostatin on somatic growth in rats. Wehrenberg WB. **Endocrinology** 1986 Feb; 118(2):489–94

Synthetic human growth hormone releasing factor (h–GRF–1–44–NH2) dose response effect on growth hormone and prolactin secretion in healthy adult men. Boissel JP, et al. **Eur J Clin Pharmacol** 1986; 29(5):609–14

Growth hormone–releasing factor (somatocrinin) stimulates epithelial cell proliferation in the rat digestive tract. Lehy T, et al. **Gastroenterology** 1986 Mar;90(3):646–53

Suppression of the growth hormone (GH) response to clonidine and GH–releasing hormone by exogenous GH. Nakamoto JM, et al. **J Clin Endocrinol Metab** 1986 May;62(5):822–6

Responses of growth hormone (GH) and somatomedin–C to GH–releasing hormone in healthy aging men. Pavlov EP, et al. **J Clin Endocrinol Metab** 1986 Mar;62(3):595–600

Exogenous growth hormone inhibits growth hormone–releasing factor–induced growth hormone secretion in normal men. Rosenthal SM, et al. **J Clin Invest** 1986 Jan;77(1):176–80

Stimulation and inhibition of food intake in sheep by centrally–administered hypothalamic releasing factors. Ruckebusch Y, et al. **Life Sci** 1986 Mar 10;38(10):929–34

Study of species specificity in growth hormone–releasing factor (GRF) interaction with vasoactive intestinal peptide (VIP) receptors using GRF and intestinal VIP receptors from rat and human: evidence that Ac–Tyr1hGRF is a competitive VIP antagonist in the rat. Laburthe M, et al. **Mol Pharmacol** 1986 Jan;29(1):23–7

Relative potencies of human, rat, bovine/caprine, porcine and ovine hypothalamic growth hormone–releasing factors to release growth hormone by the rat anterior pituitary in vitro. Baird A, et al. **Neuroendocrinology** 1986;42(4):273–6

Coexistence of tyrosine hydroxylase and growth hormone–releasing factor in a subpopulation of tubero–infundibular neurons of the rat. Meister B, et al. **Neuroendocrinology** 1986;42(3):237–47

Immunohistochemical localization of GRF–containing neurons in rat brain. VandePol CJ, et al. **Neuroendocrinology** 1986;42(2):143–7

The molecular weight forms of rat growth hormone secreted in response to growth hormone–releasing factor. Wehrenberg WB, et al. **Proc Soc Exp Biol Med** 1986 May;182(1):107–11

[Hormonal growth factors] Chatelain P, et al. **Rev Prat** 1985 Oct 11; 35(45):2725–31 (Eng. Abstr.) **(Fre)**

[Hypothalamic factors: current findings] Sizonenko PC. **Schweiz Med Wochenschr** 1986 Mar 1;116(9):271–4 (Eng. Abstr.) **(Fre)**

[Effect of hypo– and hyperthyroidism, and hypothalamic ventromedial lesions on the plasma growth hormone response to human growth hormone–releasing factor in rats] Tonegawa Y. **Nippon Ika Daigaku Zasshi** 1985 Dec;52(6):624–32 (Eng. Abstr.) **(Jpn)**

SPACE PERCEPTION

Deficits in spatial–memory tasks following lesions of septal dopaminergic terminals in the rat. Simon H, et al. **Behav Brain Res** 1986 Jan; 19(1):7–16

SPATIAL BEHAVIOR

Pesticide–drug interaction in rats. Fenyvesi G, et al. **Arch Toxicol [Suppl]** 1985;8:269–71

Dopamine depletion, stimulation or blockade in the rat disrupts spatial navigation and locomotion dependent upon beacon or distal cues. Whishaw IQ, et al. **Behav Brain Res** 1985 Oct–Nov;18(1):11–29

Disturbances in exploratory behavior and functional recovery in the Y and radial mazes following dopamine depletion of the lateral septum. Taghzouti K, et al. **Behav Neural Biol** 1986 Jan;45(1):48–56

Lateralized and compulsive exteroceptive orientation in rats treated with apomorphine. Pisa M, et al. **Neurosci Lett** 1986 Feb 14;64(1):41–6

STARTLE REACTION

Central dopamine hyperactivity in rats mimics abnormal acoustic startle response in schizophrenics. Swerdlow NR, et al. **Biol Psychiatry** 1986 Jan;21(1):23–33

STEREOTYPED BEHAVIOR

The effect of repeated administration of (–) deprenyl on the phenylethylamine–induced stereotypy in rats. Timár J, et al. **Arch Int Pharmacodyn Ther** 1986 Jan;279(1):50–60

Structural requirements for cocaine congeners to interact with dopamine and serotonin uptake sites in mouse brain and to induce stereotyped behavior. Reith ME, et al. **Biochem Pharmacol** 1986 Apr 1; 35(7):1123–9

Oscillations in apomorphine–induced stereotypies during 1 year of apomorphine administration. Csernansky JG, et al. **Biol Psychiatry** 1986 Apr;21(4):402–5

Inhibition of dopaminergic agonist–induced gnawing behavior by neuroleptic drugs in mice. Yen–Koo HC, et al. **Drug Chem Toxicol** 1985;8(6):495–502

The effect of antimuscarinic agents on haloperidol induced behavioral hypersensitivity. Carvey PM, et al. **Eur J Pharmacol** 1986 Jan 21; 120(2):193–9

Behavior performed at onset of drug action and apomorphine stereotypy. Szechtman H. **Eur J Pharmacol** 1986 Feb 11;121(1):49–56

The effects of chronic bromocriptine treatment on behaviour and dopamine receptor binding in the rat striatum. Traub M, et al. **Eur J Pharmacol** 1985 Nov 26;118(1–2):147–54

Prolactin induces yawning and the stretch–yawning syndrome in young adult male rats. Laping NJ, et al. **Horm Behav** 1986 Mar; 20(1):49-59

Behavioral effects of substance P in rats. Barbeau A, et al. **Int J Neurol** 1980;14(2-4):239-52

Amphetamine-induced circling behaviour in MPTP-lesioned mice. Fung YK, et al. **J Pharm Pharmacol** 1985 Dec;37(12):922-3

Effects of unilateral microinjections of sulpiride into the medial prefrontal cortex on circling behavior of rats. Morency MA, et al. **Prog Neuropsychopharmacol Biol Psychiatry** 1985;9(5-6):735-8

Head-twitch response induced by ergometrine in mice: behavioural evidence for direct stimulation of central 5-hydroxytryptamine receptors by ergometrine. Balsara JJ, et al. **Psychopharmacology (Berlin)** 1986;88(3):275-8

The modulation of head-twitch behaviour by drugs acting on beta-adrenoceptors: evidence for the involvement of both beta 1- and beta 2-adrenoceptors. Handley SL, et al. **Psychopharmacology (Berlin)** 1986;88(3):320-4

Inhibition of head twitch response to quipazine in rats by chronic amitriptyline but not fluvoxamine or citalopram. Pawlowski L, et al. **Psychopharmacology (Berlin)** 1986;88(3):279-84

Involvement of noradrenaline in potentiation of the head-twitch response by GABA-related drugs. Singh L, et al. **Psychopharmacology (Berlin)** 1986;88(3):315-9

[The effect of various new GABAergics on motor and oral stereotypes with apomorphine in the rat] Vamvakidès A, et al. **J Pharmacol** 1985 Oct-Dec;16(4):403-11 (Eng. Abstr.) **(Fre)**

[Behavioral and pharmacological studies of methamphetamine-induced stereotypy of mice by the open field method] Nakamura K, et al. **Yakugaku Zasshi** 1985 Aug;105(8):775-83 (Eng. Abstr.) **(Jpn)**

STRESS, PSYCHOLOGICAL

Emotional trauma and thyroxine [letter] Jackson GL. **Ann Intern Med** 1986 Feb;104(2):289

Cardiovascular and neuroendocrine responses to behavioral stress after central or peripheral barodenervation in rats. Buchholz RA, et al. **Brain Res** 1986 Feb 19;365(2):360-4

Stress: physiological aspects (2). Speirs RL. **Dent Update** 1985 Nov-Dec; 12(10):617-8, 620-3

Effects of essential fatty acid administration on cardiovascular responses to stress in the rat. Mills DE, et al. **Lipids** 1986 Feb;21(2):139-42

Stressor-provoked response patterns in a swim task: modification by diazepam. Prince CR, et al. **Pharmacol Biochem Behav** 1986 Feb; 24(2):323-8

Effects of preshock experience on enhancement of rat brain noradrenaline turnover induced by psychological stress. Tsuda A, et al. **Pharmacol Biochem Behav** 1986 Jan;24(1):115-9

Selective breeding of chickens for corticosterone response to social stress. Gross WB, et al. **Poult Sci** 1985 Dec;64(12):2230-3

Effects of eicosapentaenoic acid (20:5 omega 3) on stress reactivity in rats. Mills DE, et al. **Proc Soc Exp Biol Med** 1986 May; 182(1):127-31

Implication of the serotoninergic system in the decreased ACTH response to stress after lesion of the amygdaloid central nucleus. Beaulieu S, et al. **Prog Neuropsychopharmacol Biol Psychiatry** 1985;9(5-6):665-9

High sensitivity of brain octopamine levels to stress. Ennaceur A, et al. **Psychopharmacology (Berlin)** 1986;88(3):305-9

Stress-induced inhibition of reproductive functions: role of endogenous corticotropin-releasing factor. Rivier C, et al. **Science** 1986 Feb 7; 231(4738):607-9

[Catecholamines and mental stress] Christensen NJ. **Ugeskr Laeger** 1986 Jan 27;148(5):233-7 (Eng. Abstr.) **(Dan)**

[Effect of intensive operator activity on lipid peroxidation processes in the human body] Ivanova SM, et al. **Kosm Biol Aviakosm Med** 1986 Jan-Feb;20(1):20-2 (Eng. Abstr.) **(Rus)**

[Effect of adaptation to brief stress exposure on the realization of the stress reaction, impairment of metabolism and myocardial contraction caused by prolonged emotional-pain stress] Meerson FZ, et al. **Vopr Med Khim** 1986 Jan-Feb;32(1):76-81 (Eng. Abstr.) **(Rus)**

SUBSTANCE P

Complementary action of substance P and vasoactive intestinal peptide on the rat parotid secretion. Ekström J, et al. **Acta Physiol Scand** 1986 Jan;126(1):25-31

Release of substance-P-like immunoreactivity in dog paw lymph after scalding injury. Jonsson CE, et al. **Acta Physiol Scand** 1986 Jan; 126(1):21-4

Evidence for a modulatory influence of centrally administered substance P on a 5-hydroxytryptamine-mediated behavioural response in the male rat. Ogren SO, et al. **Acta Physiol Scand** 1985 Dec;125(4):743-5

Electrophysiological effects of substance P and VIP in the denervated rat parotid gland. Thesleff P. **Acta Physiol Scand** 1986 Mar; 126(3):377-83

Histamine involvement in the local and systemic microvascular effects produced by intradermal substance P. Woodward DF, et al. **Agents Actions** 1985 Dec;17(2):126-30

Substance P, 5-hydroxytryptamine, and bradykinin stimulate abdominal visceral afferents. Lew WY, et al. **Am J Physiol** 1986 Mar; 250(3 Pt 2):R465-73

Effect of luminally administered serotonin and substance P on jejunal handling of water and electrolytes. McFadden D, et al. **Am J Surg** 1986 Jan;151(1):81-6

Nerve fibers in the urethral mucosa of canine penis are immunoreactive for both substance P and calcitonin gene-related peptide. Iwanaga T, et al. **Arch Histol Jpn** 1985 Dec;48(5):547-52

The distribution and origin of substance P-like immunoreactivity in the rat molar pulp and periodontal tissues. Wakisaka S, et al. **Arch Oral Biol** 1985;30(11-12):813-8

Localization of substance P- and enkephalin-like immunoreactivity in the human paravertebral sympathetic ganglia. Del Fiacco M, et al. **Basic Appl Histochem** 1985;29(4):309-20

Substance P facilitation of memory: effects in an appetitively motivated learning task. Schlesinger K, et al. **Behav Neural Biol** 1986 Mar; 45(2):230-9

Self-association and solubility of peptides: solvent-titration study of N alpha-protected C-terminal sequences of substance P. Toniolo C, et al. **Biopolymers** 1986 Feb;25(2):281-9

An examination of the pharmacology of two substance P antagonists and the evidence for tachykinin receptor subtypes. Bailey SJ, et al. **Br J Pharmacol** 1986 Jan;87(1):79-85

Axonal transport of substance P-like immunoreactivity in regenerating rat sciatic nerve. Bisby MA, et al. **Brain Res** 1985 Dec 30; 361(1-2):396-9

Regeneration of primary afferent neurons containing substance P-like immunoreactivity. Bisby MA, et al. **Brain Res** 1986 Feb 12; 365(1):85-95

Selective activation of mesolimbic and mesocortical dopamine metabolism in rat brain by infusion of a stable substance P analogue into the ventral tegmental area. Elliott PJ, et al. **Brain Res** 1986 Jan 15;363(1):145-7

Neuropeptides in cerebral cortex of macaque monkey (Macaca fuscata fuscata): regional distribution and ontogeny. Hayashi M, et al. **Brain Res** 1986 Feb 5;364(2):360-8

Altered responsiveness to substance P and 5-hydroxytryptamine in cat dorsal horn neurons after 5-HT depletion with p-chlorophenylalanine. Jeftinija S, et al. **Brain Res** 1986 Mar 12;368(1):107-15

Facilitation of nicotinic response in the guinea pig prevertebral neurons by substance P. Jiang ZG, et al. **Brain Res** 1986 Jan 15; 363(1):196-8

Coexistence of pancreatic polypeptide and substance P in the chicken retina. Katayama-Kumoi Y, et al. **Brain Res** 1985 Dec 30; 361(1-2):25-35

Comparison of the substance P- and dynorphin-containing projections to the substantia nigra: a radioimmunocytochemical and biochemical study. McLean S, et al. **Brain Res** 1985 Dec 30;361(1-2):185-92

Substance P augments a persistent slow inward calcium-sensitive current in voltage-clamped spinal dorsal horn neurons of the rat. Murase K, et al. **Brain Res** 1986 Feb 19;365(2):369-76

Early postnatal administration of 5,7-dihydroxytryptamine: effects on substance P and thyrotropin-releasing hormone neurons and terminals in rat brain. Towle AC, et al. **Brain Res** 1986 Jan 15;363(1):38-46

Differential regulation of cholinergic and peptidergic development in the rat striatum in culture. Kessler JA. **Dev Biol** 1986 Jan;113(1):77-89

Preferential conformation of substance P in solution. Chassaing G, et al. **Eur J Biochem** 1986 Jan 2;154(1):77-85

Interaction of substance P with tubulin. Maccioni RB, et al. **Eur J Biochem** 1986 Jan 15;154(2):427-35

Multiple-copy genes: production and modification of monomeric peptides from large multimeric fusion proteins. Kempe T, et al. **Gene** 1985; 39(2-3):239-45

Comparison of the histamine-releasing action of substance P on mast cells and basophils from different species and tissues. Ali H, et al. **Int Arch Allergy Appl Immunol** 1986;79(4):413-8

Behavioral effects of substance P in rats. Barbeau A, et al. **Int J Neurol** 1980;14(2-4):239-52

The role of substance P in the nigrostriatal system. Borison RL, et al.

Int J Neurol 1980;14(2-4):189-94

Multiple modes of communication by substance P. Harkins JA, et al. **Int J Neurol** 1980;14(2-4):233-8 (37 ref.)

Response of splanchnic-driven neurons to substance P and eledoisin-related peptide. Felpel LP, et al. **J Auton Nerv Syst** 1986 Mar; 15(3):269-74

Hydrolysis of substance P and its analogs by angiotensin-converting enzyme from rat lung. Characterization of endopeptidase activity of the enzyme. Yokosawa H, et al. **J Biochem (Tokyo)** 1985 Nov; 98(5):1293-9

Interactions of bombesin and substance P at the feline lower esophageal sphincter. Reynolds JC, et al. **J Clin Invest** 1986 Feb;77(2):436-40

Vasoactive intestinal polypeptide and substance P in primary afferent pathways to the sacral spinal cord of the cat. Kawatani M, et al. **J Comp Neurol** 1985 Nov 15;241(3):327-47

Stimulation of cellular proliferation and differentiation in the intact and regenerating planarian Dugesia(G) tigrina by the neuropeptide substance P. Saló E, et al. **J Exp Zool** 1986 Jan;237(1):129-35

Ketomethylene pseudopeptide analogues of substance P: synthesis and biological activity. Ewenson A, et al. **J Med Chem** 1986 Feb; 29(2):295-9

Distribution of substance P neurons in the epithalamus of the rat: an immunohistochemical investigation. Rønnekleiv OK, et al. **J Pineal Res** 1984;1(4):355-70

On the actions of substance P, somatostatin, and vasoactive intestinal polypeptide on rat peritoneal mast cells and in human skin. Piotrowski W, et al. **Naunyn Schmiedebergs Arch Pharmacol** 1985 Dec; 331(4):364-8

Synaptosomal degradation of substance P and some other neuropeptides. Arzumanyan AM, et al. **Neurochem Res** 1985 Dec;10(12):1623-34

Estrous cycle variations in cholecystokinin and substance P concentrations in discrete areas of the rat brain. Frankfurt M, et al. **Neuroendocrinology** 1986;42(3):226-31

Correlation of mitochondrial swelling after capsaicin treatment and substance P and somatostatin immunoreactivity in small neurons of dorsal root ganglion in the rat. Chiba T, et al. **Neurosci Lett** 1986 Mar 14;64(3):311-6

Neuropeptide immunoreactivity of pericellular baskets in the guinea pig trigeminal ganglion. Kuwayama Y, et al. **Neurosci Lett** 1986 Feb 28; 64(2):169-72

Simultaneous release of several tachykinins and calcitonin gene-related peptide from rat spinal cord slices. Saria A, et al. **Neurosci Lett** 1986 Jan 30;63(3):310-4

Antagonism of non-cholinergic excitatory junction potentials in the guinea-pig ileum by a substance P analogue antagonist. Taylor GS, et al. **Neurosci Lett** 1986 Jan 2;63(1):23-6

Sexual differences in the distribution of substance P immunoreactive fibers in the ventral horn of the rat lumbar spinal cord. Uda K, et al. **Neurosci Lett** 1986 Feb 28;64(2):157-62

Inputs to motoneurones in the hypoglossal nucleus of the rat: light and electron microscopic immunocytochemistry for choline acetyltransferase, substance P and enkephalins using monoclonal antibodies. Connaughton M, et al. **Neuroscience** 1986;17(1):205-24

Characterization of substance P-like immunoreactivity in submammalian species by high performance liquid chromatography. Lembeck F, et al. **Peptides** 1985;6 Suppl 3:231-6

Non-cholinergic inotropic responses evoked by electric field stimulation in the isolated rat urinary bladder. Possible participation of substance P. Dveksler G, et al. **Pharmacol Res Commun** 1985 Dec; 17(12):1109-19

Multiple tachykinins (neurokinin A, neuropeptide K and substance P) in capsaicin-sensitive sensory neurons in the guinea-pig. Hua XY, et al. **Regul Pept** 1985 Dec;13(1):1-19

Presynaptic modulation by noradrenaline and an opioid of the substance P-induced release of [3H]acetylcholine from the myenteric plexus. Vizi ES, et al. **Regul Pept** 1985 Nov 28;12(4):317-25

A technique for decalcification and demonstration of substance P-like immunoreactivity. Wakisaka S, et al. **Stain Technol** 1986 Jan; 61(1):39-42

SUBSTANCE USE DISORDERS

Proposed changes in DSM-III substance use disorders: description and rationale. Rounsaville BJ, et al. **Am J Psychiatry** 1986 Apr; 143(4):463-8

SYMPATHOMIMETICS

Potassium secretion by rabbit descending colon: effects of adrenergic stimuli. Smith PL, et al. **Am J Physiol** 1986 Apr; 250(4 Pt 1):G432-9

Arousal and stability: the effects of five new sympathomimetic drugs suggest a new principle for the prevention of space motion sickness. Kohl RL, et al. **Aviat Space Environ Med** 1986 Feb;57(2):137-43

Sympathomimetic drugs and lung surfactant factor [letter] Gerner R. **J Perinat Med** 1985;13(6):317-8

[Effects and cardiovascular dangers of betamimetics] Beaune J, et al. **Rev Fr Gynecol Obstet** 1985 Dec;80(12):905-7 **(Fre)**

[Fetal effects of betamimetics] Domenichini Y. **Rev Fr Gynecol Obstet** 1985 Dec;80(12):907-11 **(Fre)**

[Pharmacological studies on the pressor response in adrenal-enucleated rats] Tomori M. **Nippon Yakurigaku Zasshi** 1986 Jan;87(1):67-76 (Eng. Abstr.) **(Jpn)**

SYNAPTIC RECEPTORS

Studies of neurotensin-dopamine receptor interactions in striatal membranes of the male rat. The influence of 6-hydroxydopamine-induced dopamine receptor supersensitivity. Fuxe K, et al. **Acta Physiol Scand** 1986 Jan;126(1):147-9

Identification of polypeptides of the phencyclidine receptor of rat hippocampus by photoaffinity labeling with [3H]azidophencyclidine. Haring R, et al. **Biochemistry** 1986 Feb 11;25(3):612-20

Seasonal variation of platelet serotonin uptake and 3H-imipramine binding in normal and depressed subjects. Egrise D, et al. **Biol Psychiatry** 1986 Mar;21(3):283-92

An examination of the pharmacology of two substance P antagonists and the evidence for tachykinin receptor subtypes. Bailey SJ, et al. **Br J Pharmacol** 1986 Jan;87(1):79-85

Examination of spinal monoamine receptors through which brainstem opiate-sensitive systems act in the rat. Jensen TS, et al. **Brain Res** 1986 Jan 15;363(1):114-27

Evidence for an excitatory amino acid as the transmitter of the auditory nerve in the in vitro mouse cochlear nucleus. Martin MR. **Hear Res** 1985;20(3):215-20

Behavioral and receptor binding studies of phencyclidine (PCP) and lithium interaction in the rat. Mattia A, et al. **Life Sci** 1986 Mar 17; 38(11):975-84

Stimulation of noradrenaline synthesis by the calcium ionophore A23187 and its modulation by presynaptic receptors. Birch PJ, et al. **Neurosci Lett** 1985 Dec 4;62(2):187-92

[Antidepressant drugs and central monoaminergic receptors] Asakura M, et al. **Yakubutsu Seishin Kodo** 1985 Dec;5(4):303-19 (143 ref.) (Eng. Abstr.) **(Jpn)**

[Interaction of piracetam with 3H-imipramine binding sites and the GAMA-benzodiazepine receptor complex of brain membranes] Rozhanets VV, et al. **Biull Eksp Biol Med** 1986 Jan;101(1):40-2 (Eng. Abstr.) **(Rus)**

[Possible general mechanism of the presynaptic action of mediators] Abramets II, et al. **Dokl Akad Nauk SSSR** 1986 Mar-Apr; 287(1):245-8 **(Rus)**

[Problems of drug recognition. Imipramine receptors] Shimanovskiĭ NL, et al. **Farmakol Toksikol** 1986 Jan-Feb;49(1):103-7 (36 ref.) **(Rus)**

TESTOSTERONE

Androgens and imprinting: differential effects of testosterone on filial preference in the domestic chick. Bolhuis JJ, et al. **Behav Neurosci** 1986 Feb;100(1):51-6

In vitro interactions between Sertoli cells and steroidogenic cells. Perrard-Sapori MH, et al. **Biochem Biophys Res Commun** 1986 Jan 29; 134(2):957-62

High-affinity binding of testosterone in serum from normal developing chick embryos and during the graft-versus-host reaction. Savu L, et al. **Biochim Biophys Acta** 1986 Mar 19;881(1):15-21

Failure of high-dose sustained release luteinizing hormone releasing hormone agonist (buserelin) plus oral testosterone to suppress male fertility. Michel E, et al. **Clin Endocrinol (Oxf)** 1985 Dec; 23(6):663-75

Seasonal variation in plasma testosterone, luteinizing hormone concentrations and LH-RH responsiveness in mature, male rusa deer (Cervus rusa timorensis). van Mourik S, et al. **Comp Biochem Physiol** [A] 1986;83(2):347-51

Hormonal effects of ketoconazole in vivo in the male rat: mechanism of action. Bhasin S, et al. **Endocrinology** 1986 Mar;118(3):1229-32

Stress-induced elevation of testosterone concentration in high ranking baboons: role of catecholamines. Sapolsky RM. **Endocrinology** 1986 Apr; 118(4):1630-5

Suppression of annual plasma testosterone and thyroxine cycles in the edible dormouse Glis glis under constant photoperiod at 24 degrees C. Jallageas M, et al. **Experientia** 1986 Feb 15;42(2):171-3

Elevation of serum testosterone during chronic LHRH agonist treatment in the bull. Melson BE, et al. **J Anim Sci** 1986 Jan;62(1):199-207

Testosterone maintains pituitary and serum FSH and spermatogenesis in gonadotrophin-releasing hormone antagonist-suppressed rats. Rea MA, et al. **J Endocrinol** 1986 Jan;108(1):101-7

Gonadotropin and testosterone response in prepubertal boys with hypospadias. Shima H, et al. **J Urol** 1986 Mar;135(3):539-42

Influence of neonatal injection of estradiol and testosterone on hypothalamo-hypophyseal-gonadal interrelationships and fertility in male rats. Baranov VG, et al. **Neurosci Behav Physiol** 1985 Sep-Oct; 15(5):404-7

Effect of estrogen, testosterone, and phenobarbital on uterine weight and liver microsomal enzymes in prepuberal mice. Robl JM, et al.

Pediatr Pharmacol (New York) 1985;5(3):157–64

Effect of bicuculline on sexual activity in castrated male rats. Fernandez–Guasti A, et al. **Physiol Behav** 1986;36(2):235–7

[The state of gametes and the type of maturation of follicular oocytes in rats neonatally androgenized by LH–RH–induced ovulation] Kitaev EM, et al. **Biull Eksp Biol Med** 1986 Jan;101(1):78–9 (Eng. Abstr.) **(Rus)**

[Effect of RL–175 on testosterone and corticosterone levels in the plasma of male albino rats] Lokhov RE, et al. **Vopr Med Khim** 1985 Nov–Dec; 31(6):86–8 (Eng. Abstr.) **(Rus)**

THIORIDAZINE

The effect of propranolol and thioridazine on positive and negative symptoms of schizophrenia. Eccleston D, et al. **Br J Psychiatry** 1985 Dec;147:623–30

Thioridazine enhances lysosomal accumulation of epidermal growth factor and toxicity of conjugates of epidermal growth factor with Pseudomonas exotoxin. Kuratomi Y, et al. **Exp Cell Res** 1986 Feb; 162(2):436–48

[Changes in the serum thioridazine level after administration of pridinol] Sidorowicz S, et al. **Psychiatr Pol** 1985 Sep–Oct;19(5):423–4 **(Pol)**

THYROID HORMONES

Serum thyroid hormones in the patient under intermittent peritoneal dialysis. Pérez A, et al. **Arch Invest Med (Mex)** 1985 Jul–Sep; 16(3):255–60 **(Eng, Spa)**

Structural and functional impairment of adrenergic input to intraocular cerebellar grafts during thyroid hormone deficiency. Granholm AC, et al. **Cent Nerv Syst Trauma** 1984 Winter;1(2):105–15

Thyroid labeling error [letter] Heflin KC. **Drug Intell Clin Pharm** 1985 Dec;19(12):945

Peptide histidine isoleucine amide stimulates thyroid hormone secretion and coexists with vasoactive intestinal polypeptide in intrathyroid nerve fibers from laryngeal ganglia. Grunditz T, et al. **Endocrinology** 1986 Feb;118(2):783–90

Glucocorticoids and thyroid hormones stimulate biochemical and morphological differentiation of human fetal lung in organ culture. Gonzales LW, et al. **J Clin Endocrinol Metab** 1986 Apr; 62(4):678–91

Effect of hypothyroidism on pituitary cytoplasmic concentrations of messenger RNA encoding thyrotrophin beta and alpha subunits, prolactin and growth hormone. Franklyn JA, et al. **J Endocrinol** 1986 Jan;108(1):43–7

Thyroid hormones modulate the toxicity of 2,3,7,8–tetrachlorodibenzo–p–dioxin (TCDD). Rozman K, et al. **J Toxicol Environ Health** 1985;16(3–4):481–91

Trials of culturing of Mycobacterium leprae using media enriched with thyroid hormones. Massalski W, et al. **Mater Med Pol** 1983 Jan–Jun; 15(1–2):13–4

Decrease in resting metabolic rate during rapid weight loss is reversed by low dose thyroid hormone treatment. Welle SL, et al. **Metabolism** 1986 Apr;35(4):289–91

Relationship between cerebrospinal fluid somatostatin and peripheral thyroid hormones with carbamazepine treatment. Joffe RT, et al. **Neuropsychobiology** 1985;14(3):115–7

Alternative routes of peptide hormone administration. Pontiroli AE, et al. **Spec Top Endocrinol Metab** 1985;7:77–99 (120 ref.)

[Determination of thyroid hormones in the plasma of laying hens using a modified radioimmunoassay] Schäfer K, et al. **DTW** 1985 Nov 26; 92(11–12):459–61 (Eng. Abstr.) **(Ger)**

[Possible regulation of the basic metabolism by thyroid hormones through changes in the sensitivity of mitochondria to cytoplasmic glycopeptide which induces electrogenic anion transport] Galnutdinov MKh, et al. **Dokl Akad Nauk SSSR** 1986 Mar–Apr;287(1):220–2 **(Rus)**

THYROTROPIN

Plasma thyrotrophin (TSH) response to intrahypothalamic injection of an alpha 2–adrenergic receptor agonist (clonidine). Ishikawa K, et al. **Acta Endocrinol (Copenh)** 1986 Jan;111(1):25–9

Pituitary gland: one site of ultrashort–feedback regulation for control of thyrotropin. Kakita T, et al. **Am J Physiol** 1986 Feb; 250(2 Pt 1):E121–4

The effect of maneb, zineb, and ethylenethiourea on the humoral activity of the pituitary–thyroid axis in rat. Laisi A, et al. **Arch Toxicol [Suppl]** 1985;8:253–8

Reparative growth in the rat thyroid: effect of TSH suppression. Stringer BM, et al. **Cell Tissue Kinet** 1986 Jan;19(1):49–56

Stimulatory effect of PMRPamide (Phe–Met–Arg–Phe–NH2) on thyrotropin secretion in rats. Mitsuma T, et al. **Endocrinol Exp (Bratisl)** 1985 Dec;19(4):205–11

Effects of phorbol ester on GH, TSH and PRL release by superfused rat adenohypophysis. Ikeda H, et al. **Endocrinol Jpn** 1985 Oct; 32(5):759–65

Dopamine and L–dopa: inhibition of thyrotropin–stimulated thyroidal thyroxine release. Maayan ML, et al. **Endocrinology** 1986 Feb; 118(2):632–6

Effect of 1,25(OH)2D3 on the TSH secretion from rat pituitary cells. Törnquist K, et al. **Horm Metab Res** 1986 Jan;18(1):69

Effects of histamine and related compounds on thyrotropin secretion in rats. Mitsuma T, et al. **Horm Res** 1986;23(2):99–105

Increased dopaminergic activity inhibits basal and metoclopramide–stimulated prolactin and thyrotropin secretion. Agner T, et al. **J Clin Endocrinol Metab** 1986 Apr;62(4):778–82

Relationship between thyrotropin and thyroxine changes during recovery from severe hypothyroxinemia of critical illness. Hamblin PS, et al. **J Clin Endocrinol Metab** 1986 Apr;62(4):717–22

Modulation of thyrotrophin release from an intracellular pool by pre–exposure to thyrotrophin–releasing hormone and dibutyryl cyclic AMP. Davis JR, et al. **J Endocrinol** 1986 Feb;108(2):211–7

Graded response in the individual thyroid follicle cell to increasing doses of TSH. Nilsson M, et al. **Mol Cell Endocrinol** 1986 Feb; 44(2):165–9

Regulation of thyrotropin secretion by the central epinephrine system. Studies in the chronically cannulated rat. Terry LC. **Neuroendocrinology** 1986;42(2):102–8

Regulation of growth hormone and thyrotropin secretion by somatostatin systems in rat brain. Terry LC, et al. **Neuroendocrinology** 1986; 42(3):218–25

THYROXINE

The role of thyroid and adrenal cortical hormones in the modulation of the gonadal function in birds. Péczely P. **Acta Biol Hung** 1985; 36(1):45–70

Antler cycle and thermolabile and thermostable alkaline phosphatase in white–tailed deer; circannual and circadian rhythms and variation after thyroxine, dexamethasone and ACTH administration. Sempéré AJ, et al. **Acta Endocrinol (Copenh)** 1986 Jan;111(1):133–9

Plasma thyroxine through parturition and early lactation in goats fed silage of grass and rape. Emre Z, et al. **Acta Vet Scand** 1985;26(3):417–8

Effects of thyrotropin–releasing hormone on serum concentrations of thyroxine and triiodothyronine in healthy, thyroidectomized, thyroxine–treated, and propylthiouracil–treated dogs. Li WI, et al. **Am J Vet Res** 1986 Jan;47(1):163–9

Emotional trauma and thyroxine [letter] Jackson GL. **Ann Intern Med** 1986 Feb;104(2):289

Salinity adaptation in fish: interaction of thyroxine with fish gill mitochondria. Shivakumar K, et al. **Arch Biochem Biophys** 1986 Mar; 245(2):356–62

The effect of maneb, zineb, and ethylenethiourea on the humoral activity of the pituitary–thyroid axis in rat. Laisi A, et al. **Arch Toxicol [Suppl]** 1985;8:253–8

Preliminary data on an immunoenzymatic assay of free thyroxin. Proença MT, et al. **Clin Chem** 1986 Apr;32(4):697

Concentration of free thyroxin in serum of a patient with euthyroid hyperthyroxinemia secondary to increased thyroxin–binding prealbumin: results by various methods compared. Skiest D, et al. **Clin Chem** 1986 Apr;32(4):687–9

Effect of heparin on free thyroxin as measured by equilibrium dialysis and ultrafiltration. Wang YS, et al. **Clin Chem** 1986 Apr;32(4):700

The nonequivalence of levothyroxine products [letter] Dong BJ, et al. **Drug Intell Clin Pharm** 1986 Jan;20(1):77–8

Dopamine and L–dopa: inhibition of thyrotropin–stimulated thyroidal thyroxine release. Maayan ML, et al. **Endocrinology** 1986 Feb; 118(2):632–6

Suppression of annual plasma testosterone and thyroxine cycles in the edible dormouse Glis glis under constant photoperiod at 24 degrees C. Jallageas M, et al. **Experientia** 1986 Feb 15;42(2):171–3

Relationship between thyrotropin and thyroxine changes during recovery from severe hypothyroxinemia of critical illness. Hamblin PS, et al. **J Clin Endocrinol Metab** 1986 Apr;62(4):717–22

A novel enzyme immunoassay for total thyroxine using immobilized antibodies and hydrophobic chromatography purified thyroxine–peroxidase conjugate. Ferrua B, et al. **J Immunol Methods** 1986 Mar 13;87(2):137–43

Levothyroxine loses potency with age [letter] Stoffer SS, et al. **JAMA** 1986 Apr 11;255(14):1881–2

Modulation of thyroid parameters by exogenous thyroxine in familial dysalbuminemic hyperthyroxinemia. Premachandra BN, et al. **Metabolism** 1986 Mar;35(3):283–8

Endocrine response to acute cold exposure by lactating and non–lactating Norway rats. Adels LE, et al. **Physiol Behav** 1986 Jan;36(1):179–81

Effect of sodium molybdate on the thyroxine–binding affinity of transport cytosol proteins. Svobodová V, et al. **Physiol Bohemoslov** 1985; 34(6):481–7

Increased clearance rate of plasma thyroxine accompanies estradiol–induced vitellogenesis in male Japanese quail. Robinson GA, et al. **Poult Sci** 1985 Dec;64(12):2397–9

Daily variation of corticosterone and thyroid hormones in broiler cockerels. Smoak KD, et al. **Poult Sci** 1986 Jan;65(1):197–8

Cold exposure and mammary exchanges of circulating thyroxine and

oestrone sulphate in the goat. Goode J, et al. **Q J Exp Physiol** 1986 Jan;71(1):93-8
[Effect of hypo- and hyperthyroidism, and hypothalamic ventromedial lesions on the plasma growth hormone response to human growth hormone-releasing factor in rats] Tonegawa Y. **Nippon Ika Daigaku Zasshi** 1985 Dec;52(6):624-32 (Eng. Abstr.) **(Jpn)**
[The biocellular effect of thyroid hormone on functional differentiation of porcine granulosa cells in culture] Hayashi M, et al. **Nippon Naibunpi Gakkai Zasshi** 1985 Oct 20;61(10):1189-96 (Eng. Abstr.) **(Jpn)**
[Acute negative chronotropic effect of L-thyroxine on the everted sinus-atrium preparation of the bullfrog] Tamura T. **Nippon Seirigaku Zasshi** 1985;47(12):756-66 (Eng. Abstr.) **(Jpn)**
[Structural state of rat liver mitochondrial and microsomal membranes in aging and after treatment with thyroxine] Lemeshko VV, et al. **Ukr Biokhim Zh** 1986 Jan-Feb;58(1):63-8 (Eng. Abstr.) **(Rus)**
[Concentrations of thyroxine, beta carotene, vitamin A and pregnancy in heifers after administration of beta carotene] Bekeová E, et al. **Vet Med (Praha)** 1985 Dec;30(12):715-24 (Eng. Abstr.) **(Slo)**

TRANQUILIZING AGENTS

Influence of tranquilisers on ionic permeability of bimolecular lipid membranes. Rajaji D, et al. **Indian J Biochem Biophys** 1984 Dec;21(6):369-72
Bacterial mutagenicity of the tranquilizing constituents of Valerianaceae roots. von der Hude W, et al. **Mutat Res** 1986 Jan-Feb;169(1-2):23-7
[Mechanism of the tranquilizing action of electron structural analogs of nicotinamide] Akhundov RA, et al. **Biull Eksp Biol Med** 1986 Mar;101(3):329-31 (Eng. Abstr.) **(Rus)**

TRANQUILIZING AGENTS, MAJOR

The effect of antipsychotic drugs on driving and driving related psychomotor functions. Judd LL. **Accid Anal Prev** 1985 Aug;17(4):319-22
Drugs and depression. Harris B. **Am J Nurs** 1986 Mar;86(3):292-3
A cybernetic theory of how psychotropic drugs work [letter] Klein DF. **Am J Psychiatry** 1986 May;143(5):685-6
Lithium augmentation in psychotic depression refractory to combined drug treatment. Nelson JC, et al. **Am J Psychiatry** 1986 Mar;143(3):363-6
Neuroleptic dosage for Asians: a failure to replicate. Sramek JJ, et al. **Am J Psychiatry** 1986 Apr;143(4):535-6
Renal function of patients in long-term treatment with lithium citrate alone or in combination with neuroleptics and antidepressant drugs. Lassen E, et al. **Arch Gen Psychiatry** 1986 May;43(5):481-2
Performance deficit induced by low doses of dopamine agonists in rats. Toward a model for approaching the neurobiology of negative schizophrenic symptomatology? Carnoy P, et al. **Biol Psychiatry** 1986 Jan;21(1):11-22
Chronic treatment with five different neuroleptics elicits behavioral supersensitivity to opiate infusion into the nucleus accumbens. Stinus L, et al. **Biol Psychiatry** 1986 Jan;21(1):34-48
Acute schizophrenia. Johnstone EC. **Br J Hosp Med** 1985 Oct;34(4):198-201
Chronic schizophrenia. Morgan R. **Br J Hosp Med** 1985 Oct;34(4):202-5
Neuroleptics in culture-bound syndromes [letter] Harrison-Read PE. **Br J Psychiatry** 1986 Jan;148:106-7
Differential effects of selective and non-selective neuroleptics on intracellular and extracellular cyclic AMP accumulation in rat striatal slices. Lazareno S, et al. **Brain Res** 1985 Dec 30;361(1-2):91-8
Locus coeruleus norepinephrine-containing neurons: effects produced by acute and subchronic treatment with antipsychotic drugs and amphetamine. Ramirez OA; et al. **Brain Res** 1986 Jan 1;362(1):165-70
Inhibition of dopaminergic agonist-induced gnawing behavior by neuroleptic drugs in mice. Yen-Koo HC, et al. **Drug Chem Toxicol** 1985;8(6):495-502
Some atypical neuroleptics inhibit [3H]SCH 23390 binding in vivo. Andersen PH, et al. **Eur J Pharmacol** 1986 Jan 14;120(1):143-4
Guanine nucleotide regulation of agonist interactions at [3H]SCH23390-labeled D1 dopamine receptors in rat striatum. Hess EJ, et al. **Eur J Pharmacol** 1986 Feb 11;121(1):31-8
The natural course of schizophrenia and effective maintenance drug treatment. Davis JM, et al. **J Clin Psychopharmacol** 1986 Feb;6(1 Suppl):2S-10S (79 ref.)
Dosage strategies with long-acting injectable neuroleptics, including haloperidol decanoate. Kane JM. **J Clin Psychopharmacol** 1986 Feb;6(1 Suppl):20S-23S
Drug-behavior therapy outcomes with chronic schizophrenics [letter] Liberman RP, et al. **J Clin Psychopharmacol** 1986 Feb;6(1):52-3
The efficacy of antipsychotic drugs and family therapies in the maintenance treatment of schizophrenia. Schooler NR. **J Clin Psychopharmacol** 1986 Feb;6(1 Suppl):11S-19S (29 ref.)
Oral liquid neuroleptics: administer with care. Kerr LE. **J Psychosoc Nurs Ment Health Serv** 1986 Mar;24(3):33-5
Do antipsychotic drugs and serotonin down regulate [3H]-spiroperidol binding sites in human cortex? Andorn AC. **Life Sci** 1986 Apr 7;38(14):1251-60
The benzazepine SCH 23390 increases plasma levels of cortisol in the conscious dog. Goiny M, et al. **Naunyn Schmiedebergs Arch Pharmacol** 1986 Jan;332(1):111-2
Laterality of dopamine function and neuroleptic action in the amygdala in the rat. Bradbury AJ, et al. **Neuropharmacology** 1985 Dec;24(12):1163-70
A German multicentre study on the long-term treatment of schizophrenic outpatients. Pietzcker A. **Pharmacopsychiatry** 1985 Nov;18(6):333-8
Effects of neuroleptics on hippocampal stimulation-induced 'wet-dog shaking' in rats. Araki H, et al. **Physiol Behav** 1986 Jan;36(1):69-74
Reward, performance, and the response strength method in self-stimulating rats: validation and neuroleptics. Hamilton AL, et al. **Physiol Behav** 1985 Dec;35(6):897-904
Early treatment events and prediction of response to neuroleptics in schizophrenia. Awad AG, et al. **Prog Neuropsychopharmacol Biol Psychiatry** 1985;9(5-6):585-8
Gamma-type endorphins: neurolepticum-like and antipsychotic action. Van Ree JM, et al. **Prog Neuropsychopharmacol Biol Psychiatry** 1985;9(5-6):561-7
Neuroleptics, dopamine, and schizophrenia. Pickar D. **Psychiatr Clin North Am** 1986 Mar;9(1):35-48
CSF dopamine turnover and positive schizophrenic symptoms after withdrawal of long-term neuroleptic treatment. Frecska E, et al. **Psychiatry Res** 1985 Nov;16(3):221-6
Neuroleptic withdrawal in chronic schizophrenia: CT and endocrine variables relating to psychopathology. Naber D, et al. **Psychiatry Res** 1985 Nov;16(3):207-19
Homovanillic acid in caudate and pre-frontal cortex following acute and chronic neuroleptic administration. Bowers MB Jr, et al. **Psychopharmacology (Berlin)** 1986;88(1):63-5
Maternal aggression in rats: lack of interaction between chlordiazepoxide and fluprazine. Olivier B, et al. **Psychopharmacology (Berlin)** 1986;88(1):40-3
A controlled trial of prostaglandin E1 precursor in chronic neuroleptic resistant schizophrenic patients. Vaddadi KS, et al. **Psychopharmacology (Berlin)** 1986;88(3):362-7
[Influence of monoamines on the dl-tetrahydropalmatine-induced inhibition of single-unit activity in the nucleus accumbens] Liu GQ, et al. **Yao Hsueh Hsueh Pao** 1985 Jul;20(7):500-4 (Eng. Abstr.) **(Chi)**
[Benzamides, a therapeutic response adapted to 2 sides, paranoid and hebephrenic, of schizophrenia] Cassan P. **Ann Med Psychol (Paris)** 1985 Jul;143(7):677-82 **(Fre)**
[The prognosis of schizophrenia] Lungershausen E. **Fortschr Med** 1986 Feb 6;104(5):97-100 (Eng. Abstr.) **(Ger)**
[Psychopathologic changes in chronic schizophrenic patients following withdrawal of neuroleptics: relation to therapeutic, neuroendocrine and computer tomography variables] Albus M, et al. **Fortschr Neurol Psychiatr** 1986 Jan;54(1):15-20 (Eng. Abstr.) **(Ger)**
[Behavioral and pharmacological studies of methamphetamine-induced stereotypy of mice by the open field method] Nakamura K, et al. **Yakugaku Zasshi** 1985 Aug;105(8):775-83 (Eng. Abstr.) **(Jpn)**
[Effect of neuroleptics, narcotic analgesics and narcotic agents on the absorptive activity of the small intestine] Koval'skaia KS, et al. **Farmakol Toksikol** 1986 Jan-Feb;49(1):63-6 (Eng. Abstr.) **(Rus)**

TRANQUILIZING AGENTS, MINOR

Neurochemical effects of buspirone in rat hippocampus: evidence for selective activation of 5HT neurons. Mennini T, et al. **Arch Int Pharmacodyn Ther** 1986 Jan;279(1):40-9
Evidence that the beta-carboline, ZK 91296, can reduce anxiety in animals at doses well below those causing sedation. Pellow S, et al. **Brain Res** 1986 Jan 15;363(1):174-7
Comment: Addiction liability of benzodiazepines and buspirone [letter] Nelson RC. **Drug Intell Clin Pharm** 1986 Mar;20(3):233-4
Capillary gas chromatographic-mass spectrometric determination of buspirone in plasma. Gammans RE, et al. **J Chromatogr** 1985 Dec 13;345(2):285-97
Behavioral studies with anxiolytic drugs. II. Interactions of zopiclone with ethyl-beta-carboline-3-carboxylate and Ro 15-1788 in squirrel monkeys. Barrett JE, et al. **J Pharmacol Exp Ther** 1986 Feb;236(2):313-9
Auto-titration technique using intracranial self-stimulation and effects of antianxiety drugs. Ichimaru Y, et al. **Jpn J Pharmacol** 1985 Nov;39(3):331-8
Effect of 450191-S, a 1H-1,2,4-triazolyl benzophenone derivative, on cerebral content of neuroactive amino acids. Tomono S, et al. **Jpn J Pharmacol** 1985 Dec;39(4):558-61
Difference in learning and retention by Albino-Swiss mice. Part 2. Effect of some anxiolytic drugs. Valzelli L, et al. **Methods Find Exp Clin Pharmacol** 1985 Nov;7(11):569-72

Resistance to the anti-anxiety effect of buspirone in patients with a history of benzodiazepine use [letter] Schweizer E, et al. **N Engl J Med** 1986 Mar 13;314(11):719–20

Septal driving of hippocampal theta rhythm: role of gamma-aminobutyrate-benzodiazepine receptor complex in mediating effects of anxiolytics. Quintero S, et al. **Neuroscience** 1985 Dec; 16(4):875–84

Buspirone: anxiolytic? Pecknold JC, et al. **Prog Neuropsychopharmacol Biol Psychiatry** 1985;9(5–6):639–42

Effects of propranolol on conditioned suppression, discriminated punishment and discriminated non-reward in the rat. Salmon P, et al. **Psychopharmacology (Berlin)** 1986;88(2):252–7

[Quantitative evaluation of the anxiolytic and nootropic effects of potassium orotate in a wide range of doses] Karkishchenko NN, et al. **Farmakol Toksikol** 1986 Jan–Feb;49(1):14–6 (Eng. Abstr.) **(Rus)**

TRANSFER (PSYCHOLOGY)

Visual discrimination learning and interhemispheric transfer in the cat, as affected by 6-hydroxydopamine. Sprague JM, et al. **Exp Brain Res** 1985;61(1):43–53

TRANYLCYPROMINE

Determination of tranylcypromine in plasma using gas chromatography-chemical-ionization mass spectrometry. Edwards DJ, et al. **J Chromatogr** 1985 Nov 8;344:356–61

Discussion of 'Fatal malignant hyperthermia as a result of ingestion of tranylcypromine (Parnate) combined with white wine and cheese' [letter] Reid WH. **J Forensic Sci** 1986 Jan;31(1):8–10

Tranylcypromine and chlordiazepoxide intoxication [letter] Young S, et al. **Med J Aust** 1986 Feb 3;144(3):166–7

TRIAZOLAM

Comparison of midazolam and triazolam for residual effects. Wehli L, et al. **Arzneimittelforschung** 1985;35(11):1700–4

Treatment of triazolam dependence with a tapering withdrawal regimen. Singh AN, et al. **Can Med Assoc J** 1986 Feb 1;134(3):243–5

Hyperphagic and anorectic effects of beta-carbolines in a palatable food consumption test: comparisons with triazolam and quazepam. Cooper SJ. **Eur J Pharmacol** 1986 Jan 29;120(3):257–65

Enhanced bioavailability of triazolam following sublingual versus oral administration. Scavone JM, et al. **J Clin Pharmacol** 1986 Mar; 26(3):208–10

Temporal variation in triazolam pharmacokinetics and pharmacodynamics after oral administration. Smith RB, et al. **J Clin Pharmacol** 1986 Feb; 26(2):120–4

TRIFLUOPERAZINE

Trifluoperazine inhibits Sendai virus-induced hemolysis. MacDonald RI. **Biochim Biophys Acta** 1986 Apr 14;856(2):337–47

Effective short-term treatment of generalized anxiety disorder with trifluoperazine. Mendels J, et al. **J Clin Psychiatry** 1986 Apr; 47(4):170–4

Radioimmunoassay for the 7-hydroxy metabolite of trifluoperazine and its application to a kinetic study in human volunteers. Aravagiri M, et al. **J Pharm Sci** 1985 Nov;74(11):1196–202

Stimulation of 3H-norepinephrine release by trifluoperazine from rat pineal glands. Yurko KA, et al. **Life Sci** 1986 Apr 14;38(15):1393–7

TRIFLUPROMAZINE

[New methods for synthesis of trifluoromethyl compounds directed for medicinal applications] Kumadaki I. **Yakugaku Zasshi** 1985 Aug; 105(8):713–23 (24 ref.) (Eng. Abstr.) **(Jpn)**

TRYPTAMINES

Tryptamine enhancement of neurotransmitter release under conditions that normally depress calcium influx. Friedman RN, et al. **Brain Res** 1986 Jan 29;364(1):172–6

Indole ring binds to 7-methylguanine base by pi-pi stacking interaction. Crystal structure of 7-methylguanosine 5'-monophosphate-tryptamine complex. Kamiichi K, et al. **FEBS Lett** 1986 Jan 20;195(1–2):57–60

11C-labeling of indolealkylamine alkaloids and the comparative study of their tissue distributions. Takahashi T, et al. **Int J Appl Radiat Isot** 1985 Dec;36(12):965–9

Quantification of tryptamine in brain using high-performance liquid chromatography. Larson AA, et al. **J Chromatogr** 1986 Feb 14; 375(1):37–47

Autoradiographic localization of tryptamine binding sites in the rat and dog central nervous system. McCormack JK, et al. **J Neurosci** 1986 Jan;6(1):94–101

An investigation of demethylation in the metabolism of methoxytryptamine and methoxytryptophol. Leone RM, et al. **J Pineal Res** 1985;2(1):87–94

Relative efficacy of melatonin and 5-methoxytryptamine in terms of their antigonadotrophic and counterantigonadotrophic actions in male Syrian hamsters. Reiter RJ, et al. **J Pineal Res** 1984;1(1):91–8

Temperature-sensitive high affinity [3H]tryptamine binding sites in rat brain. Karasawa A, et al. **Life Sci** 1986 Apr 7;38(14):1331–7

Indolealkylamines and prolactin secretion. A structure-activity study in the central nervous system of the rat. Seeman G, et al. **Neuropharmacology** 1985 Dec;24(12):1195–200

Autoradiographic localization and pharmacology of unique [3H]tryptamine binding sites in rat brain. Altar CA, et al. **Neuroscience** 1986;17(1):263–73

TRYPTOPHAN

Direct plasma injection method for the analysis of tryptophan metabolites by high-performance liquid chromatography coupled with precolumn deproteinization. Morita I, et al. **Anal Biochem** 1985 Dec; 151(2):358–64

Recovery of tryptophan from 25-minute acid hydrolysates of protein. Yokote Y, et al. **Anal Biochem** 1986 Feb 1;152(2):245–9

Structure-function relationships in heparin cofactor II: chemical modification of arginine and tryptophan and demonstration of a two-domain structure. Church FC, et al. **Arch Biochem Biophys** 1986 Apr;246(1):175–84

Influences of amino acids on the circadian rhythms of brain neurotransmitters. Angelova C, et al. **Bibl Nutr Dieta** 1986; (38):72–81

Uptake of tryptophan into the brain: dietary influences on serotoninergic function. Bender DA. **Bibl Nutr Dieta** 1986;(38):82–6

Complex photophysics of the single tryptophan of porcine pancreatic phospholipase A2, its zymogen, and an enzyme/micelle complex. Ludescher RD, et al. **Biochemistry** 1985 Dec 3;24(25):7240–9

Tryptophan fluorescence of terminal deoxynucleotidyl transferase: effects of quenchers on time-resolved emission spectra. Robbins DJ, et al. **Biochemistry** 1985 Dec 3;24(25):7250–7

Evidence from pulse radiolysis and flash photolysis of the environment of tryptophan and tyrosine in the coat protein of fd phage. Ghiron CA, et al. **Biochim Biophys Acta** 1986 Feb 14;869(3):363–6

The effects of amino acids on protein degradation and translocation of non-histone proteins to the nucleus in lymphocytes. Polet H, et al. **Biochim Biophys Acta** 1986 Apr 8;886(1):33–9

A new method for decay-associated fluorescence spectroscopy. Application to the tryptophan zwitterion. Privat JP, et al. **Biochimie** 1985 Sep;67(9):949–58

Levels of total and free tryptophan in maternal and in umbilical blood of infants born by vaginal delivery and by elective cesarean section. Zanardo V, et al. **Biol Neonate** 1985;48(6):346–50

The environment of the tryptophan residue in Pseudomonas aeruginosa azurin and its fluorescence properties. Turoverov KK, et al. **Biophys Chem** 1985 Nov;23(1–2):79–89

Brain serotonin synthesis and Na+,K+-ATPase activity are increased postnatally after prenatal administration of L-tryptophan. Hernández-Rodríguez J, et al. **Brain Res** 1986 Mar;390(2):221–6

Effect of scalding on tryptophan catabolism in rats. Guo JS, et al. **Chin Med J [Engl]** 1985 Aug;98(8):587–90

Effect of scalding on tryptophan contents in rat plasma, urine and tissues. Guo JS, et al. **Chin Med J [Engl]** 1985 Aug;98(8):582–6

Production of a novel tryptophan analog, beta-1-indazole-L-alanine with tryptophan synthase of Escherichia coli. Tanaka H, et al. **FEBS Lett** 1986 Feb 17;196(2):357–60

Escherichia coli tryptophan operon directs the in vivo synthesis of a leader peptide. Dekel-Gorodetsky L, et al. **J Bacteriol** 1986 Mar; 165(3):1046–8

Tryptophan degradation in mice initiated by indoleamine 2,3-dioxygenase. Takikawa O, et al. **J Biol Chem** 1986 Mar 15;261(8):3648–53

Selective and differential medium for the primary isolation of members of the Proteeae. Hawkey PM, et al. **J Clin Microbiol** 1986 Mar; 23(3):600–3

Serotonin syndrome: a case report. Price WA, et al. **J Clin Pharmacol** 1986 Jan;26(1):77–8

Motor activity increases tryptophan, 5-hydroxyindoleacetic acid, and homovanillic acid in ventricular cerebrospinal fluid of the conscious rat. Chaouloff F, et al. **J Neurochem** 1986 Apr;46(4):1313–6

Amino acid analysis demonstrates that increased plasma free tryptophan causes the increase of brain tryptophan during exercise in the rat. Chaouloff F, et al. **J Neurochem** 1986 May;46(5):1647–50

Effects of combined administration of L-tryptophan and tricyclic antidepressants on alpha 2- and beta-adrenoceptors and monoamine levels in rat brain. Russell VA, et al. **Neurochem Res** 1985 Dec; 10(12):1661–71

The photolysis of tryptophan with 337.1 nm laser radiation. Borkman RF, et al. **Photochem Photobiol** 1986 Jan;43(1):13–9

Alkaline quenching of bacteriorhodopsin tryptophanyl fluorescence: evidence for aqueous accessibility or a hydrogen-bonded chain. Palmer PL, et al. **Photochem Photobiol** 1985 Nov;42(5):541–7

Photochemical modifications of lac repressor: effect of effectors binding on tryptophan photooxidation. Spodheim-Maurizot M, et al.

Photochem Photobiol 1985 Oct;42(4):353-9

Plasma tryptophan and tyrosine ratios to competing amino acids in relation to antidepressant response to citalopram and maprotiline. A preliminary study. Møller SE, et al. **Psychopharmacology (Berlin)** 1986; 88(1):96-100

Hormonal and behavioral effects associated with intravenous L-tryptophan administration. Winokur A, et al. **Psychopharmacology (Berlin)** 1986;88(2):213-9

[The tryptophan operon of the facultative methylotrophic bacteria Pseudomonas sp. M. III. Characteristics of regulatory 5-MTR mutants] Maksimova NP, et al. **Genetika** 1986 Feb;22(2):194-9 (Eng. Abstr.) **(Rus)**

[Karyological and morphological analysis of bovine kidney cells resistant to tryptophan analogs--inhibitors of tryptophanyl-tRNA synthetase] Palei EL, et al. **Genetika** 1986 Mar;22(3):473-80 (Eng. Abstr.) **(Rus)**

[Determination of tryptophan in protein hydrolysates using ion exchange chromatography] Izatullaev EA, et al. **Lab Delo** 1986;(2):118-9 **(Rus)**

[Selection of cell lines resistant to tryptophan analogs] Palei EL, et al. **Mol Biol (Mosk)** 1986 Jan-Feb;20(1):208-18 (Eng. Abstr.) **(Rus)**

TRYPTOPHAN HYDROXYLASE

Antidepressant effect of a tryptophan hydroxylase activation inhibitor, AGN 2979 [letter] Clerc G, et al. **Am J Psychiatry** 1986 Feb; 143(2):264-5

Increased tryptophan hydroxylase activity in serotonergic nerve terminals spared by 5,7-dihydroxytryptamine. Stachowiak MK, et al. **Biochem Pharmacol** 1986 Apr 15;35(8):1241-8

[Tryptophan-5-hydroxylase activity in the rabbit brain synaptosomes at different times after the single administration of the opioid peptide Tyr-D-Ala-Gly-Phe-NH2] Uzbekov MG. **Biull Eksp Biol Med** 1986 Feb;101(2):159-60 (Eng. Abstr.) **(Rus)**

TYROSINE

Phosphotyrosine as a substrate of acid and alkaline phosphatases. Apostol I, et al. **Acta Biochim Pol** 1985;32(3):187-97

Involvement of tyrosyl residues in the structure-function relationships of D-beta-hydroxybutyrate dehydrogenase: a phospholipid-requiring enzyme. el Kebbaj MS, et al. **Arch Biochem Biophys** 1986 Feb 1; 244(2):671-7

The use of dithionite reduction to identify the essential tyrosine residue in the F1-ATPase from the thermophilic bacterium, PS3, that reacts with 7-chloro-4-nitrobenzofurazan. Verburg JG, et al. **Arch Biochem Biophys** 1986 Feb 15;245(1):8-13

The effect of short-term immunotherapy with Pollinex on anti-IgE and antigen-induced histamine release from sensitive human basophils. Chyrek-Borowska S, et al. **Arch Immunol Ther Exp (Warsz)** 1985; 33(6):777-82

Influences of amino acids on the circadian rhythms of brain neurotransmitters. Angelova C, et al. **Bibl Nutr Dieta** 1986; (38):72-81

Catecholamine synthesis: physiological coupling to precursor supply. Milner JD, et al. **Biochem Pharmacol** 1986 Mar 15;35(6):875-81

Tyrosine motions in relation to the ferric spin equilibrium of cytochrome P-450cam. Fisher MT, et al. **Biochemistry** 1985 Nov 5; 24(23):6696-701

Time-resolved fluorescence and 1H NMR studies of tyrosine and tyrosine analogues: correlation of NMR-determined rotamer populations and fluorescence kinetics. Laws WR, et al. **Biochemistry** 1986 Feb 11; 25(3):599-607

Time-resolved fluorescence and 1H NMR studies of tyrosyl residues in oxytocin and small peptides: correlation of NMR-determined conformations of tyrosyl residues and fluorescence decay kinetics. Ross JB, et al. **Biochemistry** 1986 Feb 11;25(3):607-12

Evidence from pulse radiolysis and flash photolysis of the environment of tryptophan and tyrosine in the coat protein of fd phage. Ghiron CA, et al. **Biochim Biophys Acta** 1986 Feb 14;869(3):363-6

Formation of m-tyrosine and o-tyrosine from L-phenylalanine in various tissues of rats. Ishimitsu S, et al. **Chem Pharm Bull (Tokyo)** 1985 Sep; 33(9):3887-92

Is the C-terminal flanking peptide of rat cholecystokinin double sulphated? Adrian TE, et al. **FEBS Lett** 1986 Feb 3;196(1):5-8

Complete tyrosine O-sulfation of gastrin in adult and neonatal cat pancreas. Cantor P, et al. **FEBS Lett** 1986 Jan 20;195(1-2):272-4

Kinetics of acetylation-deacetylation of angiotensin II. Intramolecular interactions of the tyrosine and histidine side-chains. Moore GJ. **Int J Pept Protein Res** 1985 Nov;26(5):469-81

Evidence for the steric proximity of Tyr 174 and Lys 111 in bovine growth hormone. Nowicki C, et al. **Int J Pept Protein Res** 1985 Dec; 26(6):568-74

Aromatic amino acid requirement of the lactating sow. Lellis WA, et al. **J Anim Sci** 1985 Dec;61(6):1448-53

Exposed tyrosine residues of lambda cro repressor protein evidenced by nitration and photo CIDNP experiments. Shirakawa M, et al. **J Biochem (Tokyo)** 1985 Sep;98(3):799-805

Identification of the site of sulfation of the fourth component of human complement. Hortin G, et al. **J Biol Chem** 1986 Feb 5; 261(4):1786-93

Localization of the structural difference between bovine blood coagulation factors X1 and X2 to tyrosine 18 in the activation peptide. Morita T, et al. **J Biol Chem** 1986 Mar 25;261(9):4008-14

Distribution of tyrosinated and nontyrosinated alpha-tubulin during mitosis. Gundersen GG, et al. **J Cell Biol** 1986 Mar;102(3):1118-26

Sensitive determination of tyrosine metabolites, p-hydroxyphenylacetic acid, 4-hydroxy-3-methoxyphenyl-acetic acid and 4-hydroxy-3-methoxymandelic acid, by gas chromatography-negative-ion chemical-ionization mass spectrometry. Application to a stable isotope-labelled tracer experiment to investigate their metabolism in man. Shimamura M, et al. **J Chromatogr** 1986 Jan 10;374(1):17-26

Selective and differential medium for the primary isolation of members of the Proteeae. Hawkey PM, et al. **J Clin Microbiol** 1986 Mar; 23(3):600-3

Acute effects of oral or parenteral aspartame on catecholamine metabolism in various regions of rat brain. Yokogoshi H, et al. **J Nutr** 1986 Mar; 116(3):356-64

Mechanism of nasal absorption of drugs. II: Absorption of L-tyrosine and the effect of structural modification on its absorption. Huang CH, et al. **J Pharm Sci** 1985 Dec;74(12):1298-301

Phosphorylation of tyrosine in the carboxyl-terminal tryptic peptide of pp60c-src. Laudano AP, et al. **Proc Natl Acad Sci USA** 1986 Feb; 83(4):892-6

Interaction of vanadate with phenol and tyrosine: implications for the effects of vanadate on systems regulated by tyrosine phosphorylation. Tracey AS, et al. **Proc Natl Acad Sci USA** 1986 Feb;83(3):609-13

Plasma tryptophan and tyrosine ratios to competing amino acids in relation to antidepressant response to citalopram and maprotiline. A preliminary study. Møller SE, et al. **Psychopharmacology (Berlin)** 1986; 88(1):96-100

Tyrosine phosphorylation of platelet protein induced by phorbol ester. Ishihara N, et al. **Thromb Haemost** 1985 Oct 30;54(3):579-85

TYROSINE AMINOTRANSFERASE

Effect of acetaldehyde treatment in vivo on rat liver tryptophan oxygenase and tyrosine aminotransferase activities. Shiohara E, et al. **Arukoru Kenkyuto Yakubutsu Ison** 1985 Dec;20(4):388-94

Glucocorticoid regulation of hepatic cytosolic glucocorticoid receptors in vivo and its relationship to induction of tyrosine aminotransferase. Shirwany TA, et al. **Biochim Biophys Acta** 1986 Apr 8;886(1):162-8

The human tyrosine aminotransferase gene mapped to the long arm of chromosome 16 (region 16q22----q24) by somatic cell hybrid analysis and in situ hybridization. Barton DE, et al. **Hum Genet** 1986 Mar; 72(3):221-4

Assignment of the human tyrosine aminotransferase gene to chromosome 16. Natt E, et al. **Hum Genet** 1986 Mar;72(3):225-8

[The effect of sex factors on the interaction of progesterone and glucocorticoids during increased tyrosine aminotransferase and tryptophane pyrrolase activity in the liver in rats] Németh S. **Bratisl Lek Listy** 1986 Jan;85(1):19-23 (Eng. Abstr.) **(Slo)**

TYROSINE HYDROXYLASE

Activation of tyrosine hydroxylase by Ca2+-dependent neutral protease, calpain. Togari A, et al. **Biochem Biophys Res Commun** 1986 Jan 29; 134(2):749-54

Synaptic connections between serotoninergic axon terminals and tyrosine hydroxylase-immunoreactive neurons in the arcuate nucleus of the rat hypothalamus. A combination of electron microscopic autoradiography and immunocytochemistry. Kiss J, et al. **Brain Res** 1986 Feb 5; 364(2):284-94

Regulation of tyrosine hydroxylase-containing amacrine cell number in larval frog retina. Reh TA, et al. **Dev Biol** 1986 Apr;114(2):463-9

Relationship of age, sex, and reproductive status to the quantity of tyrosine hydroxylase in the median eminence and superior cervical ganglion of the rat. Porter JC. **Endocrinology** 1986 Apr;118(4):1426-32

1-Methyl-4-phenyl-1,2,3,6-tetrahydropyridine (MPTP) administration to C57-black mice leads to parallel decrements in neostriatal dopamine content and tyrosine hydroxylase activity. Mayer RA, et al. **Eur J Pharmacol** 1986 Jan 29;120(3):375-7

Isolation and sequence of a cDNA clone which contains the complete coding region of rat phenylalanine hydroxylase. Structural homology with tyrosine hydroxylase, glucocorticoid regulation, and use of alternate polyadenylation sites. Dahl HH, et al. **J Biol Chem** 1986 Mar 25;261(9):4148-53

Effects of phorbol ester on tyrosine hydroxylase phosphorylation and activation in cultured bovine adrenal chromaffin cells. Pocotte SL, et al. **J Biol Chem** 1986 Feb 5;261(4):1873-7

Regulation of guanosine triphosphate cyclohydrolase and tetrahydrobiopterin levels and the role of the cofactor in tyrosine hydroxylation in primary cultures of adrenomedullary chromaffin cells. Abou-Donia MM, et al. **J Neurochem** 1986 Apr;46(4):1190-9

Tyrosine hydroxylase immunoreactive neurons throughout the hypothalamus receive glutamate decarboxylase immunoreactive synapses: a double pre-embedding immunocytochemical study with particulate silver and HRP. van den Pol AN. J **Neurosci** 1986 Mar; 6(3):877-91

Coexistence of tyrosine hydroxylase and growth hormone-releasing factor in a subpopulation of tubero-infundibular neurons of the rat. Meister B, et al. **Neuroendocrinology** 1986;42(3):237-47

Catecholaminergic neurites in senile plaques in prefrontal cortex of aged nonhuman primates. Kitt CA, et al. **Neuroscience** 1985 Nov; 16(3):691-9

VANILMANDELIC ACID

Modifications in a method for vanillylmandelic acid in urine [letter] Anderson GM, et al. **Clin Chem** 1986 Apr;32(4):709

Determination of vanillylmandelic acid with ion-pair chromatography and fluorescence detection. Lindgren K, et al. **Clin Chem** 1986 Apr; 32(4):693-6

Sensitive determination of tyrosine metabolites, p-hydroxyphenylacetic acid, 4-hydroxy-3-methoxyphenyl-acetic acid and 4-hydroxy-3-methoxymandelic acid, by gas chromatography-negative-ion chemical-ionization mass spectrometry. Application to a stable isotope-labelled tracer experiment to investigate their metabolism in man. Shimamura M, et al. **J Chromatogr** 1986 Jan 10;374(1):17-26

[Excretion of catecholamines and their various metabolites in children aged 10-12 years in relation to their mental development] Orgacka H, et al. **Endokrynol Pol** 1985;36(5):285-92 (Eng. Abstr.) **(Pol)**

VASOPRESSINS

Cardiovascular haemodynamics and the response of vasopressin, aldosterone, plasma renin activity and plasma catecholamines to head-up tilt in young and old healthy subjects. Vargas E, et al. **Age Ageing** 1986 Jan;15(1):17-28

Noradrenergic stimulation of supraoptic neuronal activity and vasopressin release in vitro: mediation by an alpha 1-receptor. Armstrong WE, et al. **Brain Res** 1986 Feb 12;365(1):192-7

Spontaneous and stimulated adrenocorticotropin and vasopressin pulsatile secretion in the pituitary venous effluent of the horse. Redekopp C, et al. **Endocrinology** 1986 Apr;118(4):1410-6

Immunoreactivity of hypothalamo-neurohypophysial neurons which secrete corticotropin-releasing hormone (CRH) and vasopressin (Vp): immunocytochemical evidence for a correlation with their functional state in colchicine-treated rats. Alonso G, et al. **Exp Brain Res** 1986; 61(3):497-505

Somatostatin and alpha 2-adrenergic agonists selectively inhibit vasopressin-induced cyclic AMP accumulation in MDCK cells. Friedlander G, et al. **FEBS Lett** 1986 Mar 17;198(1):38-42

Hormone-stimulated polyphosphoinositide breakdown in rat liver plasma membranes. Roles of guanine nucleotides and calcium. Uhing RJ, et al. **J Biol Chem** 1986 Feb 15;261(5):2140-6

Sodium transport by rat cortical collecting tubule. Effects of vasopressin and desoxycorticosterone. Reif MC, et al. **J Clin Invest** 1986 Apr; 77(4):1291-8

[Lithium and the kidney. Acute effects on ADH secretion and enzymuria] Palla R, et al. **Minerva Med** 1986 Feb 28;77(7-8):205-8 (Eng. Abstr.) **(Ita)**

VIOLENCE

Benzodiazepines combined with neuroleptics for management of severe disruptive behavior. Salzman C, et al. **Psychosomatics** 1986 Jan; 27(1 Suppl):17-22

VISUAL PERCEPTION

Visual discrimination learning and interhemispheric transfer in the cat, as affected by 6-hydroxydopamine. Sprague JM, et al. **Exp Brain Res** 1985;61(1):43-53

Generation of end-inhibition in the visual cortex via interlaminar connections. Bolz J, et al. **Nature** 1986 Mar 27-Apr 2; 320(6060):362-5

The role of GABAergic inhibition in the response properties of neurones in cat visual area 18. Vidyasagar TR, et al. **Neuroscience** 1986; 17(1):49-55

WAKEFULNESS

Effect of timiperone, a new antipsychotic drug, on the sleep-wakefulness cycle in cats. Tanaka M, et al. **Jpn J Pharmacol** 1985 Nov; 39(3):391-4

ZIMELIDINE

Effect of a selective serotonin uptake inhibitor in agoraphobia with panic attacks. A double-blind comparison of zimeldine, imipramine and placebo. Evans L, et al. **Acta Psychiatr Scand** 1986 Jan;73(1):49-53

The effects of fluoxetine and zimeldine on the behavior of olfactory bulbectomized rats. Joly D, et al. **Pharmacol Biochem Behav** 1986 Feb; 24(2):199-204

Effects of repeated zimelidine administration on sleep parameters in the rat. Reyes RB, et al. **Psychopharmacology (Berlin)** 1986;88(1):54-7

BIBLIOGRAPHY

ACEPROMAZINE

Effects of acetylpromazine on the hemodynamics of the equine metatarsal artery, as determined by two-dimensional real-time and pulsed Doppler ultrasonography. Walker M, et al. **Am J Vet Res** 1986 May; 47(5):1075-8

ACETYLCHOLINE

Neurochemical mechanisms of mood stabilization. Focus on electroconvulsive therapy. Lerer B, et al. **Ann NY Acad Sci** 1986; 462:366-75 (74 ref.)

Evidence that the acetylcholine binding site is not formed by the sequence alpha 127-143 of the acetylcholine receptor. Criado M, et al. **Biochemistry** 1986 May 20;25(10):2839-46

Acetylcholine receptor: characterization of the voltage-dependent regulatory (inhibitory) site for acetylcholine in membrane vesicles from Torpedo californica electroplax. Takeyasu K, et al. **Biochemistry** 1986 Apr 8;25(7):1770-6

Separation and quantification of choline and acetylcholine by thermospray liquid chromatography/mass spectrometry. Liberato DJ, et al. **Biomed Environ Mass Spectrom** 1986 Apr;13(4):171-4

Stimulative effect of glia maturation factor and acetylcholine on active amino acid uptake and Ca2+,Mg2+-ATPase activity in nodose ganglia excised from adult rats. Ando M, et al. **Brain Res** 1986 May 14; 373(1-2):359-64

Somatostatin and cholecystokinin octapeptide differentially modulate the release of [3H]acetylcholine from caudate nucleus but not cerebral cortex: role of dopamine receptor activation. Arnerić SP, et al. **Brain Res** 1986 May 21;374(1):153-61

Acetylcholine-induced hyperpolarization in identified neurones of the African giant snail (Achatina fulica Férussac). Furukawa Y, et al. **Brain Res** 1986 May 28;374(2):227-35

One perfusion mixture for immunocytochemical detection of noradrenaline, dopamine, serotonin and acetylcholine in the same rat brain. McRae-Degueurce A, et al. **Brain Res** 1986 Jun 18; 376(1):217-9

Inhibitory effects of acetylcholine on aggressive-defense reaction induced by electrical stimulation of the hypothalamus in cats. Kono R, et al. **Brain Res Bull** 1986 Apr;16(4):491-5

Choline analogues: their use in studies of acetylcholine synthesis, storage, and release. Collier B. **Can J Physiol Pharmacol** 1986 Mar; 64(3):341-6

Attenuation of the responses to repeated cholinergic interventions in the isolated dog atrium. Furukawa Y, et al. **Can J Physiol Pharmacol** 1986 Feb;64(2):206-12

Neurochemical effects of choline supplementation. Wecker L. **Can J Physiol Pharmacol** 1986 Mar;64(3):329-33

Absence of role of endothelium in the response of isolated porcine coronary arteries to acetylcholine. Gräser T, et al. **Cardiovasc Res** 1986 Apr;20(4):299-302

Characterization of substance P-induced bronchoconstriction in the guinea-pig: a comparison with acetylcholine. Stewart AG, et al. **Clin Exp Pharmacol Physiol** 1986 Mar;13(3):223-32

Acetylcholine- and inositol 1,4,5-trisphosphate-induced calcium mobilization in Xenopus laevis oocytes. Nadler E, et al. **FEBS Lett** 1986 Apr 21;199(2):208-12

Effects of cyclic nucleotides, betazole hydrochloride and acetylcholine on pepsinogen secretion from isolated rabbit gastric mucosa. Noguchi Y, et al. **Gastroenterol Jpn** 1986 Apr;21(2):129-34

GABA-induced hypothermia in rats: involvement of serotonergic and cholinergic mechanisms. Serrano JS, et al. **Gen Pharmacol** 1986; 17(3):327-32

Response of isolated uterus of rat, hamster and guinea pig to different uterine stimulants. Mehrotra PK, et al. **Indian J Exp Biol** 1985 Oct; 23(10):572-3

Cholinergic stimulation of phosphatidic acid formation by rat cornea in vitro. Proia AD, et al. **Invest Ophthalmol Vis Sci** 1986 Jun; 27(6):905-8

Translocation of cytosolic acetylcholine into synaptic vesicles and demonstration of vesicular release. Michaelson DM, et al. **J Biol Chem** 1986 May 25;261(15):6831-5

Cytochemical identification of cholinergic amacrine cells in cat retina. Pourcho RG, et al. **J Comp Neurol** 1986 May 22;247(4):497-504

Synergistic interaction in bovine pituitary cultures between growth hormone-releasing factor and other hypophysiotrophic factors. Ingram CD, et al. **J Endocrinol** 1986 Apr;109(1):67-74

Vasoactive intestinal polypeptide and acetylcholine are responsible for neurovasodilation in the head of the cat. Bevan JA, et al. **J Hypertension [Suppl]** 1984 Dec;2(3):S427-9

The effect of ascorbate on the acetylcholine release from guinea-pig ileal myenteric plexus. Hayashi E, et al. **J Pharm Pharmacol** 1986 Mar; 38(3):232-5

Extracellular calcium-dependent and -independent effects of methylmercury on spontaneous and potassium-evoked release of acetylcholine at the neuromuscular junction. Atchison WD. **J Pharmacol Exp Ther** 1986 May;237(2):672-80

Chronic effects of paraoxon on transmitter release and the synaptic

contribution to tolerance. Thomsen RH, et al. **J Pharmacol Exp Ther** 1986 Jun;237(3):689-94

Characterization of the acetylcholine-induced potassium current in rabbit cardiac Purkinje fibres. Carmeliet E, et al. **J Physiol (Lond)** 1986 Feb; 371:219-37

Desensitization of the acetylcholine-induced increase of potassium conductance in rabbit cardiac Purkinje fibres. Carmeliet E, et al. **J Physiol (Lond)** 1986 Feb;371:239-55

Changes by acetylcholine of membrane currents in rabbit cardiac Purkinje fibres. Carmeliet E, et al. **J Physiol (Lond)** 1986 Feb;371:201-17

Studies of qingyangshen (root of Cynanchum otophyllum). III. Effect of qingyangshen on acetylcholine concentration in mouse brain. Kuang PG, et al. **J Tradit Chin Med** 1985 Dec;5(4):267-70

L-methionine enhances the contractile responses of rat uterine smooth muscle to acetylcholine and high KCl. Ichida S. **Jpn J Pharmacol** 1986 Mar;40(3):469-71

Pharmacologic evidence for direct dopaminergic regulation of striatal acetylcholine release. Gorell JM, et al. **Life Sci** 1986 Jun 16; 38(24):2239-46

Functional antagonism of D-1 and D-2 dopaminergic mechanisms affecting striatal acetylcholine release. Gorell JM, et al. **Life Sci** 1986 Jun 16;38(24):2247-54

Autoradiographic distribution of high affinity muscarinic and nicotinic cholinergic receptors labeled with [3H]acetylcholine in rat brain. Schwartz RD. **Life Sci** 1986 Jun 9;38(23):2111-9

Location of a polypeptide sequence within the alpha-subunit of the acetylcholine receptor containing the cholinergic binding site. Oblas B, et al. **Mol Pharmacol** 1986 Jun;29(6):649-56

Involvement of dopaminergic, cholinergic, and glutamatergic mechanisms in the actions of phencyclidine-like drugs. Johnson KM, et al. **Natl Inst Drug Abuse Res Monogr Ser** 1986;64:52-66

Channel properties of an insect neuronal acetylcholine receptor protein reconstituted in planar lipid bilayers. Hanke W, et al. **Nature** 1986 May 8-14;321(6066):171-4

Influence of excitatory amino acid receptor antagonists and of baclofen on synaptic transmission in the optic nerve to the suprachiasmatic nucleus in slices of rat hypothalamus. Shibata S, et al. **Neuropharmacology** 1986 Apr;25(4):403-9

Ion channels activated by acetylcholine and gamma-aminobutyric acid in freshly dissociated sympathetic neurones of the rat. Cull-Candy SG, et al. **Neurosci Lett** 1986 May 23;66(3):275-80

M-current in human neocortical neurones. Halliwell JV. **Neurosci Lett** 1986 Jun 6;67(1):1-6

Developmental changes in the interactions of cholinergic and beta-adrenergic agonists on electrophysiologic properties of canine cardiac Purkinje fibers. Moak JP, et al. **Pediatr Res** 1986 Jul; 20(7):613-8

Cholinergic suppression: a postsynaptic mechanism of long-term associative learning. Morielli AD, et al. **Proc Natl Acad Sci USA** 1986 Jun;83(12):4556-60

Acetylcholine raises excitability by inhibiting the fast transient potassium current in cultured hippocampal neurons. Nakajima Y, et al. **Proc Natl Acad Sci USA** 1986 May;83(9):3022-6

Acetylcholine induces vasodilation and prostacyclin synthesis in rat lungs. Feddersen CO, et al. **Prostaglandins** 1986 May;31(5):973-87

[Analysis of the form of cortical neuron reaction to acetylcholine] Kotliar BI, et al. **Biol Nauki** 1986;(4):52-4 (Eng. Abstr.) **(Rus)**

[Reactivity of the cortical neurons to acetylcholine in rats] Kotliar BI, et al. **Zh Vyssh Nerv Deiat** 1986 Jan-Feb;36(1):156-62 (Eng. Abstr.) **(Rus)**

[Plastic reorganization in the synapses of the neocortex in the rat after combined microapplications of mediators] Kotliar BI, et al. **Zh Vyssh Nerv Deiat** 1986 Mar-Apr;36(2):397-9 **(Rus)**

ADJUSTMENT DISORDERS

Animal model of depression: imipramine, bromocriptine and lisuride alleviate motor depression. Golda V, et al. **Act Nerv Super (Praha)** 1986 Mar;28(1):26-7

[Comparative evaluation of the therapeutic efficacy of the antidepressants adepren, linamiphen and emovit] Guliamov MG. **Zh Nevropatol Psikhiatr** 1986;86(4):582-7 (Eng. Abstr.) **(Rus)**

AFFECT

Central nervous system mediation of positive and negative reinforcement in neonatal albino rats. Kehoe P, et al. **Brain Res** 1986 Jun; 392(1-2):69-75

Individual differences in the reinforcing and subjective effects of amphetamine and diazepam. de Wit H, et al. **Drug Alcohol Depend** 1986 Feb;16(4):341-60

Effects of methylphenidate on normal children's mood, event-related potentials, and performance in memory scanning and vigilance. Peloquin LJ, et al. **J Abnorm Psychol** 1986 Feb;95(1):88-98

[A good mood. What everyone can contribute to its success (I)] Demling L. **Fortschr Med** 1986 Feb 20;104(7):64-5 **(Ger)**

AFFECTIVE DISORDERS

Neurochemical mechanisms of mood stabilization. Focus on electroconvulsive therapy. Lerer B, et al. **Ann NY Acad Sci** 1986; 462:366-75 (74 ref.)

Current concepts in clinical therapeutics: major affective disorders, Part 1. Bryant SG, et al. **Clin Pharm** 1986 Apr;5(4):304-18 (165 ref.)

Neurotransmitter precursor therapies in affective disorders. von Lerber-Good WF. **Int J Vitam Nutr Res [Suppl]** 1986;29:69-82 (39 ref.)

Pharmacologic induction of cholinergic system up-regulation and supersensitivity in affective disorders research. Dilsaver SC. **J Clin Psychopharmacol** 1986 Apr;6(2):65-74 (167 ref.)

Neurochemical and neuroendocrine dysregulation in affective disorders. Golden RN, et al. **Psychiatr Clin North Am** 1986 Jun;9(2):313-27

AFFECTIVE DISORDERS, PSYCHOTIC

Symptom exacerbation in psychotically depressed adolescents due to high desipramine plasma concentrations. Conrad CD, et al. **J Clin Psychopharmacol** 1986 Jun;6(3):161-4

[Diagnosis and treatment of affective psychosis at various times] Xu SH. **Chung Hua Shen Ching Ching Shen Ko Tsa Chih** 1985 Oct; 18(5):302-5 (Eng. Abstr.) **(Chi)**

AFTERIMAGE

Effects of haloperidol and nomifensine on the visual aftereffects of tilt and movement. Harris JP, et al. **Psychopharmacology (Berlin)** 1986; 89(2):177-82

AGGRESSION

Beta-adrenergic blockers for the control of aggressive behaviors in patients with chronic schizophrenia. Sorgi PJ, et al. **Am J Psychiatry** 1986 Jun;143(6):775-6

Stimulation of the ventral tegmental area (A10 region) enhances the hypothalamic attack behavior in the cat. Piazza P, et al. **Behav Brain Res** 1986 Feb;19(2):179-82

Chemical lesions of the nucleus accumbens septi in rats: effects on muricide and apomorphine-induced aggression. Pucilowski O, et al. **Behav Brain Res** 1986 Feb;19(2):171-8

Elicitation of intraspecific defensive behaviors in the rat by microinjection of picrotoxin, a gamma-aminobutyric acid antagonist, into the midbrain periaqueductal gray matter. Depaulis A, et al. **Brain Res** 1986 Mar 5; 367(1-2):87-95

Inhibitory effects of acetylcholine on aggressive-defense reaction induced by electrical stimulation of the hypothalamus in cats. Kono R, et al. **Brain Res Bull** 1986 Apr;16(4):491-5

Propranolol treatment of assaultive patients with organic brain disease. A double-blind crossover, placebo-controlled study. Greendyke RM, et al. **J Nerv Ment Dis** 1986 May;174(5):290-4

Drugs as research tools in psychology: cholinergic drugs and aggression. Bell R, et al. **Neuropsychobiology** 1985;14(4):181-92 (84 ref.)

Effects of the potentiation of the GABAergic neurotransmission in the olfactory bulbs on mouse-killing behavior. Molina V, et al. **Pharmacol Biochem Behav** 1986 Mar;24(3):657-64

Effect of 6-OHDA injected into the locus coeruleus on apomorphine-induced aggression. Pucilowski O, et al. **Pharmacol Biochem Behav** 1986 Mar;24(3):773-5

Cholinergic agonists suppress play fighting in juvenile rats. Wilson LI, et al. **Pharmacol Biochem Behav** 1986 May;24(5):1157-9

Testosterone removal in rats results in a decrease in social aggression and a loss of social dominance. Albert DJ, et al. **Physiol Behav** 1986; 36(3):401-7

Plasma catecholamines associated with hypothalamically-elicited defense behavior. Stoddard SL, et al. **Physiol Behav** 1986;36(5):867-73

Parachlorophenylalanine-induced serotonin depletion increases offensive but not defensive aggression in male rats. Vergnes M, et al. **Physiol Behav** 1986;36(4):653-8

[Synthesis and pharmacological studies of derivatives of 5- and 7-(O-hydroxyphenyl)-2,3-dihydro-1,4-diazepins] Kostka K, et al. **Acta Pol Pharm** 1985;42(5):442-7 (Eng. Abstr.) **(Pol)**

AMINO ACIDS

Effects of aspartame ingestion on the carbohydrate-induced rise in tryptophan hydroxylation rate in rat brain. Fernstrom JD, et al. **Am J Clin Nutr** 1986 Aug;44(2):195-205

Separation of amino acid phenylthiohydantoin derivatives by high-pressure liquid chromatography. Meuth JL, et al. **Anal Biochem** 1986 May 1;154(2):478-84

Biosynthesis of an unusual amino acyl moiety contained in bestatin. Okuyama A, et al. **Biochem Int** 1986 Apr;12(4):627-31

Basolateral amino acid transport systems in the perfused exocrine pancreas: sodium-dependency and kinetic interactions between influx and efflux mechanisms. Mann GE, et al. **Biochim Biophys Acta** 1986 Jun 26;858(2):263-74

Measurement of the amino acid metabolite of phencyclidine by selected ion monitoring. Syracuse CD, et al. **Biomed Environ Mass Spectrom** 1986 Mar;13(3):113-5

The response of muscle protein synthesis to nutrient intake in postabsorptive rats: the role of insulin and amino acids. Preedy VR, et al. **Biosci Rep** 1986 Feb;6(2):177-83

Stimulative effect of glia maturation factor and acetylcholine on active amino acid uptake and Ca2+,Mg2+-ATPase activity in nodose ganglia excised from adult rats. Ando M, et al. **Brain Res** 1986 May 14; 373(1-2):359-64

gamma-Endorphin and schizophrenia: amino acid composition of gamma-endorphin and nucleotide sequence of gamma-endorphin cDNA from pituitary glands of schizophrenic patients. Bovenberg RA, et al. **Brain Res** 1986 Jun 18;376(1):29-37

Effects of D-aspartate on excitatory amino acid-induced release of [3H]GABA from goldfish retina. Cha JH, et al. **Brain Res** 1986 Jun 18;376(1):140-8

Selective uptake of neuroactive amino acids by both oligodendrocytes and astrocytes in primary dissociated culture: a possible role for oligodendrocytes in neurotransmitter metabolism. Reynolds R, et al. **Brain Res** 1986 Apr 23;371(2):253-66

Sequential metabolic characteristics following portacaval shunt in rats. de Boer JE, et al. **Eur Surg Res** 1986;18(2):96-106

High-performance liquid chromatography of amino acids, peptides and proteins. LXVII. Evaluation of bandwidth relationships of peptides related to human beta-endorphin, separated by gradient-elution reversed-phase high-performance liquid chromatography. Hearn MT, et al. **J Chromatogr** 1986 Feb 21;352:35-66

Renal hemodynamics during separate and combined infusion of amino acids and dopamine. ter Wee PM, et al. **Kidney Int** 1986 Apr; 29(4):870-4

Hepatic microvascular regulatory mechanisms. V. Effects of lodoxamide tromethamine or phentolamine-HCl on vascular responses elicited by serotonin. Reilly FD, et al. **Microcirc Endothelium Lymphatics** 1984 Dec;1(6):671-89

Mutagenesis by normal metabolites in Escherichia coli: phenylalanine mutagenesis is dependent on error-prone DNA repair. Sargentini NJ, et al. **Mutat Res** 1986 Jul;161(2):113-8

Influence of excitatory amino acid receptor antagonists and of baclofen on synaptic transmission in the optic nerve to the suprachiasmatic nucleus in slices of rat hypothalamus. Shibata S, et al. **Neuropharmacology** 1986 Apr;25(4):403-9

Phencyclidine selectively blocks a spinal action of N-methyl-D-aspartate in mice. Aanonsen LM, et al. **Neurosci Lett** 1986 Jun 18;67(2):191-7

Met-enkephalin selectively increases the spontaneous release of amino acid neurotransmitters from rat striatal slices. Arnerić SP, et al. **Neurosci Lett** 1986 May 6;66(1):73-8

Chronic effects of perchloroethylene and trichloroethylene on the gerbil brain amino acids and glutathione. Briving C, et al. **Neurotoxicology** 1986 Spring;7(1):101-8

Somatostatin and CCK-8 modulate release of striatal amino acids: role of dopamine receptors. Arnerić SP, et al. **Peptides** 1986 Jan-Feb; 7(1):97-103

Norepinephrine and amino acids in prepyriform cortex of rats fed imbalanced amino acid diets. Gietzen DW, et al. **Physiol Behav** 1986; 36(6):1071-80

Effect of mealing on plasma and brain amino acid, and brain monoamine in rats after oral aspartame. Torii K, et al. **Physiol Behav** 1986; 36(4):759-64

AMITRIPTYLINE

Progress in pharmacotherapy of borderline disorders. A double-blind study of amitriptyline, haloperidol, and placebo. Soloff PH, et al. **Arch Gen Psychiatry** 1986 Jul;43(7):691-7

Evaluation of amitriptyline in primary fibrositis. A double-blind, placebo-controlled study. Carette S, et al. **Arthritis Rheum** 1986 May; 29(5):655-9

Amitriptyline normalizes tetrabenazine-induced changes in cerebral microcirculation. Kent TA, et al. **Biol Psychiatry** 1986 May; 21(5-6):483-91

Changes in the behavioural response to a TRH analogue following chronic amitriptyline treatment and repeated electroconvulsive shock in the rat. Bennett GW, et al. **Br J Pharmacol** 1986 May;88(1):129-39

Quantitative homogeneous enzyme immunoassays for amitriptyline, nortriptyline, imipramine, and desipramine. Pankey S, et al. **Clin Chem** 1986 May;32(5):768-72

A two-year naturalistic follow-up of depressed patients treated with cognitive therapy, pharmacotherapy and a combination of both. Blackburn IM, et al. **J Affective Disord** 1986 Jan-Feb;10(1):67-75

Hypochondriacal fears and beliefs in DSM-III melancholia. Changes with amitriptyline. Kellner R, et al. **J Affective Disord** 1986 Jan-Feb; 10(1):21-6

A comparison of the effects of trazodone and amitriptyline on skills performance by geriatric subjects. Burns M, et al. **J Clin Psychiatry** 1986 May;47(5):252-4

Treating delusional depressives with amitriptyline. Spiker DG, et al. **J Clin Psychiatry** 1986 May;47(5):243-6

Long-term amitriptyline treatment alters the affinity state of alpha 2 adrenoceptors in rabbit hindbrain. Hamilton CA, et al. **Life Sci** 1986 Jun 30;38(26):2429-36

Amitriptyline for intractable hiccups [letter] Stalnikowicz R, et al. **N Engl J Med** 1986 Jul 3;315(1):64-5

Leu-enkephalin content in rat brain during prolonged treatment with imipramine or amitriptyline. Herman ZS, et al. **Neuropeptides** 1986 Feb-Mar;7(2):113-24

Weight changes in antidepressants: a comparison of amitriptyline and trazodone. Hecht Orzack M, et al. **Neuropsychobiology** 1986; 15 Suppl 1:28-30

Cognitive performance in geriatric subjects after acute treatment with antidepressants. Moskowitz H, et al. **Neuropsychobiology** 1986; 15 Suppl 1:38-43

Biotransformation of amitriptyline in man: interaction with phenothiazines. Vandel S, et al. **Neuropsychobiology** 1986;15(1):15-9

A double-blind comparative trial of zimelidine, amitriptyline, and placebo in patients with mixed anxiety and depression. Amsterdam JD, et al. **Pharmacopsychiatry** 1986 May;19(3):115-9

Acute effects of different antidepressant drugs on saliva secretion and accommodation range. Knorring L, et al. **Pharmacopsychiatry** 1986 May; 19(3):106-10

Amitriptyline and haloperidol in unstable and schizotypal borderline disorders. Soloff PH, et al. **Psychopharmacol Bull** 1986;22(1):177-82

Comparison of the metabolism of the three antidepressants amitriptyline, imipramine, and chlorimipramine in vitro in rat liver microsomes. Krüger R, et al. **Psychopharmacology (Berlin)** 1986;88(4):505-13

[Prediction of the effect of antidepressants in patients with endogenous depression] Litvinova NM, et al. **Zh Nevropatol Psikhiatr** 1986; 86(4):577-82 (Eng. Abstr.) **(Rus)**

[Changes in the wave composition of evoked potentials during treatment of endogenous depression] Loginov VV, et al. **Zh Nevropatol Psikhiatr** 1986;86(3):431-5 (Eng. Abstr.) **(Rus)**

AMPHETAMINE

Studies on cyproheptadine-amphetamine interaction after pretreatment with 6-hydroxydopamine. Chodera A, et al. **Acta Physiol Pol** 1984 Sep-Dec;35(5-6):426-31

Neuroendocrine responses as a probe into the mechanisms of action of electroconvulsive therapy. Cowen PJ. **Ann NY Acad Sci** 1986; 462:163-71 (32 ref.)

Stereoselective accumulation of hydroxylated metabolites of amphetamine in rat striatum and hypothalamus. Dougan DF, et al. **Br J Pharmacol** 1986 May;88(1):285-90

Inhibition of amphetamine-induced locomotor activity by injection of carbachol into the anterior hypothalamic/preoptic area: pharmacological and electrophysiological studies in the rat. Brudzynski SM, et al. **Brain Res** 1986 Jun 18;376(1):47-56

Crus cerebri lesions abolish amphetamine-induced ascorbate release in the rat neostriatum. Wilson RL, et al. **Brain Res** 1986 Apr 9; 370(2):393-6

Individual differences in the reinforcing and subjective effects of amphetamine and diazepam. de Wit H, et al. **Drug Alcohol Depend** 1986 Feb;16(4):341-60

Effects of dopamine and amphetamine on mouse caudate neurons recorded in vitro. Trulson ME, et al. **Eur J Pharmacol** 1986 May 13; 124(1-2):161-5

Desensitization of rat striatal dopamine-stimulated adenylate cyclase after acute amphetamine administration. Barnett JV, et al. **J Pharmacol Exp Ther** 1986 Jun;237(3):820-5

Comparison of amphetamine metabolism using isolated hepatocytes from five species including human. Green CE, et al. **J Pharmacol Exp Ther** 1986 Jun;237(3):931-6

Effect of glucose on amphetamine-induced motor behavior. White NM, et al. **Life Sci** 1986 Jun 16;38(24):2255-62

Clinical implications of behavioral pharmacology research on phencyclidine. Balster RL. **Natl Inst Drug Abuse Res Monogr Ser** 1986; 64:148-62

Amphetamine-induced stereotypic responses in Roman high- and Roman low-avoidance rats. Driscoll P, et al. **Pharmacol Biochem Behav** 1986 May;24(5):1329-32

Antagonistic behavioral effects of calcitonin and amphetamine in the rat. Twery MJ, et al. **Pharmacol Biochem Behav** 1986 May;24(5):1203-7

The effects of prenatal morphine on the responsiveness to morphine and amphetamine. Wagner GC, et al. **Pharmacol Biochem Behav** 1986 Mar; 24(3):757-9

AMPHETAMINES

Recommendations for demand reduction of amphetamines. Streit F. **Chem Depend** 1980;4(1-2):135-43

Effects of an i.v. lethal dose of 3,4-methylenedioxyamphetamine (MDA) in the dog and antagonism by chlorpromazine. Davis WM, et al. **Gen Pharmacol** 1986;17(2):179-83

Rapid determination of p-hydroxylated methamphetamine metabolites by column liquid chromatography-electrochemistry. Shimosato K, et al. **J Chromatogr** 1986 Apr 25;377:279-86

3,4-Methylenedioxymethamphetamine (MDMA): stereoselective interactions at brain 5-HT1 and 5-HT2 receptors. Lyon RA, et al. **Psychopharmacology (Berlin)** 1986;88(4):525-6

ANOREXIA NERVOSA

Anorexia nervosa and bulimia. Autry JH, et al. **Annu Rev Public Health** 1986;7:535-43

Responses to epinephrine in patients with anorexia nervosa. Nakagawa K, et al. **Endocrinol Jpn** 1985 Dec;32(6):845-9

ANTIDEPRESSIVE AGENTS

Globus hystericus syndrome responsive to antidepressants. Brown SR, et al. **Am J Psychiatry** 1986 Jul;143(7):917-8

Current antidepressants. Hollister LE. **Annu Rev Pharmacol Toxicol** 1986; 26:23-37 (30 ref.)

Synergistic action of alprazolam with tranylcypromine in drug-resistant atypical depression with panic attacks. Ries RK, et al. **Biol Psychiatry** 1986 May;21(5-6):522-6

Fluvoxamine--a baseline study of clinical response, long term tolerance and safety in a general practice population. Martin AJ, et al. **Br J Clin Pract** 1986 Mar;40(3):95-9

Differential effects of antidepressant drugs on [3H]dihydroalprenolol and [3H]imipramine ligand recognition sites in olfactory bulbectomized and sham-lesioned rats. Jesberger JA, et al. **Gen Pharmacol** 1986; 17(3):293-307

Dose effects of antidepressant medication in different populations. A World Health Organization Collaborative Study. **J Affective Disord** 1986;Suppl 2:S1-67

Unipolar depression in the elderly. Reoccurrence on discontinuation of tricyclic antidepressants. Cook BL, et al. **J Affective Disord** 1986 Mar-Apr;10(2):91-4

Quantitative determination of N-[trans-2-(dimethylamino)-cyclopentyl]-N-(3',4'-dichlorophenyl)propamide, its 2H5-labeled analogue and their N-dealkylated metabolites in dog serum by capillary gas chromatography-mass spectrometry. Theis DL, et al. **J Chromatogr** 1986 Mar 7;375(2):299-311

Antidepressant treatment for posttraumatic stress disorder (PTSD) [letter] Harris SE. **J Clin Psychiatry** 1986 May;47(5):275

Antidepressant drug therapy for bulimia: current status. Pope HG Jr, et al. **J Clin Psychiatry** 1986 Jul;47(7):339-45 (73 ref.)

Pharmacologic induction of cholinergic system up-regulation and supersensitivity in affective disorders research. Dilsaver SC. **J Clin Psychopharmacol** 1986 Apr;6(2):65-74 (167 ref.)

The effect of antidepressants on ethylmorphine and imipramine N-demethylation in rat liver microsomes. Daniel W, et al. **J Pharm Pharmacol** 1986 May;38(5):396-8

Effect of chronic administration of antidepressants on duration of immobility in rats forced to swim. Kawashima K, et al. **Jpn J Pharmacol** 1986 Feb;40(2):199-204

Diclofensine and imipramine. A double-blind comparative trial in depressive out-patients. Capponi R, et al. **Neuropsychobiology** 1985; 14(4):173-80

Effects of acute and chronic bupropion on locomotor activity and dopaminergic neurons. Nielsen JA, et al. **Pharmacol Biochem Behav** 1986 Apr;24(4):795-9

Effects of chronically administered antidepressant drugs on animal behavior. Vogel GW, et al. **Physiol Behav** 1986;36(4):659-66

Antidepressants and biochemical theories of depression. McNeal ET, et al. **Psychol Bull** 1986 May;99(3):361-74

Pharmacology of combined antidepressant/H2-blocking drug therapy. Curry SH, et al. **Psychopharmacol Bull** 1986;22(1):220-2

A review of controlled studies of adinazolam mesylate in patients with major depressive disorder. Feighner JP. **Psychopharmacol Bull** 1986; 22(1):186-91

Lithium and bupropion antagonise the phasic changes in locomotor activity caused by dopamine infused into the rat nucleus accumbens. Barnes JC, et al. **Psychopharmacology (Berlin)** 1986;89(3):311-6

Effects of repeated doses of fluvoxamine, mianserin and placebo on memory and measures of sedation. Curran HV, et al. **Psychopharmacology (Berlin)** 1986;89(3):360-3

Similar effects of antidepressant and non-antidepressant drugs on behavior under an interresponse-time greater than 72-s schedule. Pollard GT, et al. **Psychopharmacology (Berlin)** 1986;89(2):253-8

[Cardiovascular tolerability of indalpine in therapeutic doses] Jaillon P, et al. **Therapie** 1986 Jan-Feb;41(1):49-52 (Eng. Abstr.) **(Fre)**

[Pharmacokinetic aspects of the effects and interactions of various neuro- and psychotropic drugs] Melzacka M. **Postepy Hig Med Dosw** 1985 Nov-Dec;39(6):581-611 (204 ref.) (Eng. Abstr.) **(Pol)**

[Critical study of the clinical actions of 5-HTP] Teixeira M. **Actas Luso Esp Neurol Psiquiatr Cienc Afines** 1986 Mar-Apr; 14(2):104-12 **(Por)**

[Prolonged administration of antidepressants induces changes in the pulsed release but not in the reverse uptake of biogenic amines] Dolzhenko AT, et al. **Biull Eksp Biol Med** 1986 May;101(5):569-70 (Eng. Abstr.) **(Rus)**

[The role of GABA-benzodiazepine receptor complex in affecting the anxiolytic effect of 3-hydroxypyridines--new non-benzodiazepine tranquilizers] Voronina TA, et al. **Biull Eksp Biol Med** 1986 May; 101(5):571-3 (Eng. Abstr.) **(Rus)**

[Clinical aspects and significance of measuring concentrations of neuroleptics and antidepressants in the blood] Cheshkova E, et al. **Zh Nevropatol Psikhiatr** 1986;86(4):573-6 (Eng. Abstr.) **(Rus)**

[Comparative evaluation of the therapeutic efficacy of the antidepressants adepren, linamiphen and emovit] Guliamov MG. **Zh Nevropatol Psikhiatr** 1986;86(4):582-7 (Eng. Abstr.) **(Rus)**

ANXIETY

The effect of state anxiety on personality measurement. Reich J, et al. **Am J Psychiatry** 1986 Jun;143(6):760-3

Recent developments in 5HT-related pharmacology of animal models of anxiety. Gardner CR. **Pharmacol Biochem Behav** 1986 May; 24(5):1479-85

5-HT and anxiety: promises and pitfalls. Johnston AL, et al. **Pharmacol Biochem Behav** 1986 May;24(5):1467-70

Are serotonergic neurons involved in the control of anxiety and in the anxiolytic activity of benzodiazepines? Thiebot MH. **Pharmacol Biochem Behav** 1986 May;24(5):1471-7

A double-blind comparative trial of zimelidine, amitriptyline, and placebo in patients with mixed anxiety and depression. Amsterdam JD, et al. **Pharmacopsychiatry** 1986 May;19(3):115-9

[Anxiety: a practical therapeutic approach] Turmel J, et al. **Union Med Can** 1986 Mar;115(3):175-7 (Eng. Abstr.) **(Fre)**

ANXIETY DISORDERS

How antipanic drugs might work [letter] Nesse RM, et al. **Am J Psychiatry** 1986 Jul;143(7):945

Lack of preference for diazepam in anxious volunteers. de Wit H, et al. **Arch Gen Psychiatry** 1986 Jun;43(6):533-41

An interim multicentre report on 677 anxious geriatric out-patients treated with buspirone. Napoliello MJ. **Br J Clin Pract** 1986 Feb;40(2):71-3

Psychopharmacology and psychotherapy in the treatment of anxiety. Freedman AM. **Curr Psychiatr Ther** 1986;23:101-18 (47 ref.)

Alprazolam treatment for panic disorders. Alexander PE, et al. **J Clin Psychiatry** 1986 Jun;47(6):301-4

Pharmacotherapy of the panic disorders. Ballenger JC. **J Clin Psychiatry** 1986 Jun;47 Suppl:27-32 (55 ref.)

Nonsteroidal anti-inflammatory drugs and panic disorder [letter] Goldstein JA. **J Clin Psychiatry** 1986 May;47(5):277

Pharmacotherapeutic considerations in anxiety disorders. Hollister LE. **J Clin Psychiatry** 1986 Jun;47 Suppl:33-6 (21 ref.)

Current trends in clinical research on panic attacks, agoraphobia, and related anxiety disorders. Klerman GL. **J Clin Psychiatry** 1986 Jun; 47 Suppl:37-9 (10 ref.)

Early placebo response in anxious and depressed patients. Loebel AD, et al. **J Clin Psychiatry** 1986 May;47(5):230-3

Treatment of panic disorder and agoraphobia with clonazepam. Spier SA, et al. **J Clin Psychiatry** 1986 May;47(5):238-42

Cognitive processes in anxiety and depression: discussion paper. Mathews A. **J R Soc Med** 1986 Mar;79(3):158-61

[Alprazolam (Tafil) and bromazepam (Lexotan) in the treatment of anxiety. A randomized, double-blind comparison in psychiatric outpatients] Sonne LM, et al. **Ugeskr Laeger** 1986 Jun 2; 148(23):1392-5 (Eng. Abstr.) **(Dan)**

[Psychopharmacology of panic attacks] Dugas M, et al. **Ann Med Interne (Paris)** 1986;137(2):152-4 (Eng. Abstr.) **(Fre)**

[Rapid response of a disorder to the addition of lithium carbonate: panic resistant to tricyclic antidepressants] Cournoyer J. **Can J Psychiatry** 1986 May;31(4):335-8 (Eng. Abstr.) **(Fre)**

[Clinical methods for studying anxiolytic agents] Guelfi JD. **Therapie** 1986 Jan-Feb;41(1):37-41 (Eng. Abstr.) **(Fre)**

APOMORPHINE

Verapamil's lack of antidopaminergic properties in mice [letter] Renwart N, et al. **Am J Psychiatry** 1986 Jul;143(7):933-4

Neuroendocrine responses as a probe into the mechanisms of action of electroconvulsive therapy. Cowen PJ. **Ann NY Acad Sci** 1986; 462:163-71 (32 ref.)

Chemical lesions of the nucleus accumbens septi in rats: effects on muricide and apomorphine-induced aggression. Pucilowski O, et al. **Behav Brain Res** 1986 Feb;19(2):171-8

Aporphines 65: chemical, microbial synthesis and characterization by gas chromatography/mass spectrometry of (R)-(-)-10-hydroxy 11-methoxy-N-n-propylnoraporphine, a potential metabolite of N-n-propylnorapomorphine. Neumeyer JL, et al. **Biomed Environ Mass Spectrom** 1986 May;13(5):223-9

Differential effects of dopamine agonists on acoustically and electrically elicited startle responses: comparison to effects of strychnine. Davis

M, et al. **Brain Res** 1986 Apr 16;371(1):58-69

Dopaminergic control of male sex behavior in rats: effects of an intracerebrally-infused agonist. Hull EM, et al. **Brain Res** 1986 Apr 2;370(1):73-81

Denervation-like postsynaptic supersensitivity to dopamine agonists induced by microinjection of colchicine into the substantia nigra pars compacta. Kamata K, et al. **Brain Res** 1986 Mar 5;367(1-2):1-7

Effects of acute and chronic carbamazepine administration on apomorphine-elicited stereotypy. Barros HM, et al. **Eur J Pharmacol** 1986 Apr 29;123(3):345-9

Apomorphine enantiomers' effects on dopamine metabolism: receptor and non-receptor related actions. Saller CF, et al. **Eur J Pharmacol** 1986 Feb 18;121(2):181-8

The effect of apomorphine and pergolide on the potassium-evoked overflow of GABA in rat striatum studied by microdialysis. Tossman U, et al. **Eur J Pharmacol** 1986 Apr 16;123(2):295-8

Differential effects of apomorphine on spinal reflex activity following 6-hydroxydopamine or long-term haloperidol pretreatment. Jensen TS, et al. **J Neural Transm** 1986;65(2):125-34

Effects of apomorphine on morphine analgesia during the state of dopaminergic supersensitivity after chronic treatment with haloperidol. Kamata K, et al. **J Pharmacobiodyn** 1986 Jan;9(1):88-94

Reversal of supersensitive apomorphine-induced rotational behavior in mice by continuous exposure to apomorphine. Winkler JD, et al. **J Pharmacol Exp Ther** 1986 Jul;238(1):242-7

In vivo voltammetric study of dopamine release in the striatum following microinjection of apomorphine into the substantia nigra zona reticulata. Kamata K, et al. **Jpn J Pharmacol** 1986 Mar;40(3):472-7

Tracer and maximal specific binding of tritiated spiperone or N-n-propylnorapomorphine to quantify dopamine receptors in rat brain regions in vivo. Van der Werf JF, et al. **Life Sci** 1986 Jul 14; 39(2):155-60

Survival time in hypoxic mice: differentiation between apomorphine-induced hypothermia and antihypoxic properties. Saligaut C, et al. **Methods Find Exp Clin Pharmacol** 1986 Apr;8(4):207-12

Responsiveness to 'autoreceptor' doses of apomorphine inversely correlated with the firing rate of dopaminergic A9 neurons: action of baclofen. Mereu G, et al. **Neurosci Lett** 1986 Apr 11;65(2):161-6

Reduced apomorphine sensitivity of dopamine metabolism in rat striatum after repeated administration of methamphetamine. Kashihara K, et al. **Neurosci Res** 1986 May;3(4):351-5

Effect of 6-OHDA injected into the locus coeruleus on apomorphine-induced aggression. Puciłowski O, et al. **Pharmacol Biochem Behav** 1986 Mar;24(3):773-5

Comparison of motor depressant effects of caerulein and N-propylnorapomorphine in mice. Vasar E, et al. **Pharmacol Biochem Behav** 1986 Mar;24(3):469-78

Antagonism of apomorphine-induced yawning by SCH 23390: evidence against the autoreceptor hypothesis. Morelli M, et al. **Psychopharmacology (Berlin)** 1986;89(2):259-60

Involvement of different dopamine receptors in rat diphasic motility response to apomorphine. Vaccheri A, et al. **Psychopharmacology (Berlin)** 1986;89(3):265-8

Behavioral and biochemical studies of dopamine receptor sensitivity in differentially housed mice. Wilmot CA, et al. **Psychopharmacology (Berlin)** 1986;89(3):364-9

[Pharmacokinetic aspects of the effects and interactions of various neuro- and psychotropic drugs] Melzacka M. **Postepy Hig Med Dosw** 1985 Nov-Dec;39(6):581-611 (204 ref.) (Eng. Abstr.) **(Pol)**

APPETITE

Glucose regulates [3H](+)-amphetamine binding and Na+K+ ATPase activity in the hypothalamus: a proposed mechanism for the glucostatic control of feeding and satiety. Hauger R, et al. **Brain Res Bull** 1986 Feb;16(2):281-8 (41 ref.)

Aldosterone effects on salt appetite in adrenalectomized rats. McEwen BS, et al. **Neuroendocrinology** 1986;43(1):38-43

Amphetamine-induced anorexia: analysis with hypothalamic lesions and knife cuts. McCabe JT, et al. **Pharmacol Biochem Behav** 1986 Apr; 24(4):1047-56

AROMATIC AMINO ACID DECARBOXYLASES

Inhibition of aromatic L-amino acid decarboxylase and tyrosine aminotransferase by the monoamine oxidase inhibitor phenelzine. Dyck LE, et al. **J Neurochem** 1986 Jun;46(6):1899-903

Dopaminergic and noradrenergic sympathetic nerves of the dog have different DOPA decarboxylase activities. Harris T, et al. **Neurosci Lett** 1986 Apr 11;65(2):155-60

AROUSAL

Ontogenesis of unit activity in the raphe dorsalis of the behaving kitten: its relationship with the states of vigilance. Adrien J, et al. **Brain Res** 1986 Feb 26;366(1-2):10-21

Individual differences in the reinforcing and subjective effects of amphetamine and diazepam. de Wit H, et al. **Drug Alcohol Depend** 1986 Feb;16(4):341-60

Effect of sulpiride on vigilance in healthy subjects. Bartfai A, et al. **Int J Psychophysiol** 1986 May;4(1):1-5

Effects of methylphenidate on normal children's mood, event-related potentials, and performance in memory scanning and vigilance. Peloquin LJ, et al. **J Abnorm Psychol** 1986 Feb;95(1):88-98

Contribution to the search for vigilance-indicative EEG variables. Results of a controlled, double-blind study with pyritinol in elderly patients with symptoms of mental dysfunction. Herrmann WM, et al. **Pharmacopsychiatry** 1986 Mar;19(2):75-83

Effects of repeated doses of fluvoxamine, mianserin and placebo on memory and measures of sedation. Curran HV, et al. **Psychopharmacology (Berlin)** 1986;89(3):360-3

Norepinephrine alterations under stress conditions following the regular practice of meditation. Morrell EM, et al. **Psychosom Med** 1986 Mar-Apr;48(3-4):270-7

[Refinement of an EEG diurnal vigilance index. Application to drug trials] Goidenberg F. **Rev Electroencephalogr Neurophysiol Clin** 1986 Mar; 16(1):39-48 (Eng. Abstr.) **(Fre)**

ATTENTION

Effects of methylphenidate on normal children's mood, event-related potentials, and performance in memory scanning and vigilance. Peloquin LJ, et al. **J Abnorm Psychol** 1986 Feb;95(1):88-98

Impaired selective attention in methylazoxymethanol-induced microencephalic rats. Mohammed AK, et al. **Pharmacol Biochem Behav** 1986 Apr;24(4):975-81

Effects of chlordiazepoxide on cued radial maze performance in rats. Hodges H, et al. **Psychopharmacology (Berlin)** 1986;88(4):460-6

ATTENTION DEFICIT DISORDER WITH HYPERACTIVITY

Vicissitudes of follow-up studies: differential effects of parent training and stimulant medication with hyperactives. Firestone P, et al. **Am J Orthopsychiatry** 1986 Apr;56(2):184-94

A neuropathic substrate for stimulant drug effects in hyperactive children. Evans RW, et al. **Clin Neuropharmacol** 1986;9(3):264-81

Measurement of whole blood serotonin as a guide in prescribing psychostimulant medication for children with attentional deficits. Saul RC, et al. **Clin Neuropharmacol** 1986;9(2):189-95

Plasma free tryptophan concentration in children with attention deficit disorder. Hoshino Y, et al. **Folia Psychiatr Neurol Jpn** 1985; 39(4):531-5

Attention deficit disorder in adolescents. Silver LB, et al. **Hosp Community Psychiatry** 1986 Jun;37(6):608-13

Comparing classroom and clinic measures of attention deficit disorder: differential, idiosyncratic, and dose-response effects of methylphenidate. Rapport MD, et al. **J Consult Clin Psychol** 1986 Jun;54(3):334-41

Methylphenidate and cognitive therapy in children with attention deficit disorder: a double-blind trial. Brown RT, et al. **J Dev Behav Pediatr** 1986 Jun;7(3):163-74

Fenfluramine treatment of childhood attention deficit disorder with hyperactivity: a preliminary report. Donnelly M, et al. **Psychopharmacol Bull** 1986;22(1):152-4

The therapeutic effect of clonidine in attention deficit disorder with hyperactivity: a comparison with placebo and methylphenidate. Hunt RD, et al. **Psychopharmacol Bull** 1986;22(1):229-36

Methylphenidate: rate-dependent effects on hyperactivity. Rapport MD, et al. **Psychopharmacol Bull** 1986;22(1):223-8

AUTISM

Short-term efficacy and safety of fenfluramine in hospitalized preschool-age autistic children: an open study. Campbell M, et al. **Psychopharmacol Bull** 1986;22(1):141-7

Fenfluramine treatment of autism: UCLA collaborative study of 81 patients at nine medical centers. Ritvo ER, et al. **Psychopharmacol Bull** 1986;22(1):133-40

AUTISM, INFANTILE

Long-term effects of combined vitamin B6-magnesium administration in an autistic child. Martineau J, et al. **Biol Psychiatry** 1986 May; 21(5-6):511-8

Effects of fenfluramine on eight outpatients with the syndrome of autism. Stubbs EG, et al. **Dev Med Child Neurol** 1986 Apr;28(2):229-35

Side effects of fenfluramine in autistic children. Piggott LR, et al. **J Am Acad Child Psychiatry** 1986 Mar;25(2):287-9

AVOIDANCE LEARNING

The use of avoidance training in studies of modulation of memory storage. Gold PE. **Behav Neural Biol** 1986 Jul;46(1):87-98

Long-term effects of leucine-enkephalin on active avoidance responding in mice. Dana RC, et al. **Behav Neurosci** 1986 Apr;100(2):185–9

Congener characteristics influence aversion conditioning to alcoholic beverages in rats. Franchina JJ, et al. **Behav Res Ther** 1986; 24(3):299–306

The course of the decrease of hypothalamic beta–endorphin induced by training, and the development of the effect of beta–endorphin on the retrieval of inhibitory avoidance in rats. Izquierdo I, et al. **Braz J Med Biol Res** 1985;18(3):391–5

Conditioning of aversion to alcohol orosensory cues in 5– and 10–day rats: subsequent reduction in alcohol ingestion. Molina JC, et al. **Dev Psychobiol** 1986 May;19(3):175–83

Conditioned aversions and their memories in 5–day–old rats during suckling. Kehoe P, et al. **J Exp Psychol [Anim Behav]** 1986 Jan; 12(1):40–7

Escape behavior produced by the blockade of glutamic acid decarboxylase (GAD) in mesencephalic central gray or medial hypothalamus. Brandao ML, et al. **Pharmacol Biochem Behav** 1986 Mar;24(3):497–501

Amphetamine–induced stereotypic responses in Roman high– and Roman low–avoidance rats. Driscoll P, et al. **Pharmacol Biochem Behav** 1986 May;24(5):1329–32

Pharmacological evidence of catecholaminergic involvement in the behavioral effects of luteinizing hormone releasing hormone in rats. Mora S, et al. **Pharmacol Biochem Behav** 1986 Mar;24(3):433–8

Cholecystokinin octapeptide and lithium produce different effects on feeding and taste aversion learning. Ervin GN, et al. **Physiol Behav** 1986;36(3):507–12

Differential effect of chemical lesion and electrocoagulation of the central amygdaloid nucleus on active avoidance responses. Sanchez Riolobos A. **Physiol Behav** 1986;36(3):441–4

Disruption of conditioned taste aversion by ECS: the role of lithium chloride. Shaw N. **Physiol Behav** 1986;36(6):1193–5

Cholinergic suppression: a postsynaptic mechanism of long–term associative learning. Morielli AD, et al. **Proc Natl Acad Sci USA** 1986 Jun;83(12):4556–60

Taste/tactile cue discriminations in taste–aversion learning following depletion of noradrenaline. Archer T, et al. **Scand J Psychol** 1986; 27(1):39–51

[Comparison of the effect of serotonin administered into the dorsal hippocampus on conditioned passive and active avoidance in rats] Gasanov GG, et al. **Biull Eksp Biol Med** 1986 May;101(5):517–9 (Eng. Abstr.) **(Rus)**

[Dynamics of the latent periods of the avoidance response and its correlation with adaptive behavior in the rat] Arushanian EB, et al. **Zh Vyssh Nerv Deiat** 1986 Mar–Apr;36(2):343–50 (Eng. Abstr.) **(Rus)**

AZEPINES

Biochemical studies with the new thienotriazolo–diazepine brotizolam. Bechtel WD, et al. **Arzneimittelforschung** 1986 Mar;36(3A):534–40

Metabolic fate of [14C]–brotizolam in the rat, dog, monkey and man. Bechtel WD, et al. **Arzneimittelforschung** 1986 Mar;36(3A):578–86

Blood level, excretion, and metabolite pattern of [14C]–brotizolam in humans. Bechtel WD, et al. **Arzneimittelforschung** 1986 Mar; 36(3A):575–8

Blood level, distribution, excretion, and metabolite pattern of [14C]–brotizolam in the rat, dog, and rhesus monkey. Bechtel WD, et al. **Arzneimittelforschung** 1986 Mar;36(3A):568–74

Antiemotional and anticonvulsant activity of brotizolam and its effects on motor performance in animals. Böke–Kuhn K, et al. **Arzneimittelforschung** 1986 Mar;36(3A):528–31

General pharmacology of brotizolam in animals. Danneberg P, et al. **Arzneimittelforschung** 1986 Mar;36(3A):540–51

Pharmacological action of some known and possible metabolites of brotizolam. Danneberg P, et al. **Arzneimittelforschung** 1986 Mar; 36(3A):587–91

Effects of brotizolam on the sleep–waking cycle of the cat. Kuhn FJ. **Arzneimittelforschung** 1986 Mar;36(3A):522–7

Effects of brotizolam on cardiovascular functions and autonomic nervous system. Kushiku K, et al. **Arzneimittelforschung** 1986 Mar; 36(3A):552–9

Physical dependence capacity of brotizolam in rhesus monkeys. 2nd communication: primary dependence and barbital substitution. Stockhaus K. **Arzneimittelforschung** 1986 Mar;36(3A):601–5

Physical dependence capacity of brotizolam in rhesus monkeys. 1st communication: primary dependence studies. Stockhaus K, et al. **Arzneimittelforschung** 1986 Mar;36(3A):597–600

Chemistry of brotizolam and its metabolites. Weber KH, et al. **Arzneimittelforschung** 1986 Mar;36(3A):518–21

Evidence for a specific effect of BHT 920, an azepine derivative, on tyrosine hydroxylase in the dopaminergic system of the rat. Jennewein HM, et al. **Eur J Pharmacol** 1986 Apr 29;123(3):363–9

[Synthesis and pharmacological studies of derivatives of 5– and 7–(O–hydroxyphenyl)–2,3–dihydro–1,4–diazepins] Kostka K, et al. **Acta Pol Pharm** 1985;42(5):442–7 (Eng. Abstr.) **(Pol)**

[Synthesis of derivatives of perhydroazepine, perhydro–1,5–oxazocine, morpholine and piperazine containing 3–(isopropylamino)–propan–2–ol group––compounds with potential effect on the circulatory system and central nervous system] Kotełko B, et al. **Acta Pol Pharm** 1985; 42(5):433–6 (Eng. Abstr.) **(Pol)**

[Characteristics of plasmid pBS271 controlling epsilon–caprolactam degradation by bacteria in the genus Pseudomonas] Boronin AM, et al. **Mikrobiologiia** 1986 Mar–Apr;55(2):231–6 (Eng. Abstr.) **(Rus)**

BEHAVIOR

Neuropeptides in behavior and psychiatric syndromes: an overview. Barchas JD, et al. **Res Publ Assoc Res Nerv Ment Dis** 1986; 64:287–307 (129 ref.)

BEHAVIOR, ANIMAL

Development of tolerance to benzodiazepines. II. Baclofen effect on the activity of rats during tolerance to the sedative action of nitrazepam and oxazepam. Chodera A, et al. **Acta Physiol Pol** 1984 Jul–Aug; 35(4):301–9

Neurochemical and behavioral studies on the mode of action of oxypertine. Moroji T, et al. **Arzneimittelforschung** 1986 May; 36(5):804–8

Behavior and brain neurotransmitters: correlations in different strains of mice. Krehbiel D, et al. **Behav Neural Biol** 1986 Jul;46(1):30–45

Suppression of corticosterone synthesis alters the behavior of hippocampally lesioned rats. Ryan JP, et al. **Behav Neural Biol** 1985 Jul;44(1):47–59

Behavioral and physiological effects of chronic 2,450–MHz microwave irradiation of the rat at 0.5 mW/cm2. D'Andrea JA, et al. **Bioelectromagnetics** 1986;7(1):45–56

Changes in the behavioural response to a TRH analogue following chronic amitriptyline treatment and repeated electroconvulsive shock in the rat. Bennett GW, et al. **Br J Pharmacol** 1986 May;88(1):129–39

Reinnervation of the nucleus accumbens and frontal cortex of the rat by dopaminergic grafts and effects on hoarding behavior. Herman JP, et al. **Brain Res** 1986 May 7;372(2):210–6

Correlation between pentobarbital suppressed cerebellar cyclic GMP and performance of a swimming task. McCaslin PP, et al. **Brain Res** 1986 May 28;374(2):367–70

Evidence that serotonin mediates non–cholinergic neocortical low voltage fast activity, non–cholinergic hippocampal rhythmical slow activity and contributes to intelligent behavior. Vanderwolf CH, et al. **Brain Res** 1986 May 28;374(2):342–56

Involvement of neuronal cell bodies of the mesencephalic locomotor region in the initiation of locomotor activity of freely behaving rats. Brudzynski SM, et al. **Brain Res Bull** 1986 Mar;16(3):377–81

Effect of GABAergic drugs in the behavioral 'despair' test in rats. Borsini F, et al. **Eur J Pharmacol** 1986 Feb 18;121(2):265–8

Antagonism of drug–induced yawning and penile erections in rats. Gower AJ, et al. **Eur J Pharmacol** 1986 Mar 18;122(2):239–44

A system for assessing toxicity of chemicals by continuous monitoring of homecage behaviors. Evans HL, et al. **Fundam Appl Toxicol** 1986 May;6(4):721–32

Correlation of indices of stress with intensity of electrical shock for cows. Lefcourt AM, et al. **J Dairy Sci** 1986 Mar;69(3):833–42

The inhibition of the cage–leaving response––a model for studies of the serotonergic neurotransmission in the rat. Rényi L, et al. **J Neural Transm** 1986;65(3–4):193–210

5,7–Dihydroxytryptamine lesions of crayfish serotonin–containing neurons: effect on the lateral giant escape reaction. Glanzman DL, et al. **J Neurosci** 1986 Jun;6(6):1560–9

Effect of tryptamine on the behavior of mice. Sugimoto Y, et al. **J Pharmacobiodyn** 1986 Jan;9(1):68–73

Structural modifications of pro–opiomelanocortin–derived peptides alter their behavioral effects markedly. Hirsch MD, et al. **J Pharmacol Exp Ther** 1986 May;237(2):378–85

Reversal of supersensitive apomorphine–induced rotational behavior in mice by continuous exposure to apomorphine. Winkler JD, et al. **J Pharmacol Exp Ther** 1986 Jul;238(1):242–7

Behavioral and neurochemical evaluation of phenylpropanolamine. Woolverton WL, et al. **J Pharmacol Exp Ther** 1986 Jun; 237(3):926–30

An inhalational behavioral chamber. Pradhan SN, et al. **J Pharmacol Methods** 1986 Jun;15(3):189–99

The effect of thioridazine on haloperidol induced behavioral hypersensitivity. Klawans HL, et al. **Life Sci** 1986 May 12; 38(19):1707–14

Sex dependent behavioral response to frontal cortical suction lesions in the rat. Lipsey JR, et al. **Life Sci** 1986 Jun 16;38(24):2185–92

Neurobehavioral screening in rats: validation study. Alder S, et al. **Methods Find Exp Clin Pharmacol** 1986 May;8(5):279–89

Collaborative Behavioral Teratology Study: protocol design and testing procedures. Adams J, et al. **Neurobehav Toxicol Teratol** 1985 Nov–Dec; 7(6):579–86

Dopaminergic mediation of long–term behavioral effects of in utero drug exposure. Middaugh LD, et al. **Neurobehav Toxicol Teratol** 1985 Nov–Dec;7(6):685–9

Neurochemical and electrophysiological disturbances mediate developmental behavioral alterations produced by medicines. Mirmiran M, et al. **Neurobehav Toxicol Teratol** 1985 Nov–Dec;7(6):677–83

Collaborative Behavioral Teratology Study: statistical approach. Nelson CJ, et al. **Neurobehav Toxicol Teratol** 1985 Nov–Dec;7(6):587–90

Effect of chronic administration of the 6–aza analogue of mianserin (Org. 3770) and its enantiomers on behaviour and changes in noradrenaline metabolism of olfactory–bulbectomized rats in the 'open field' apparatus. O'Connor WT, et al. **Neuropharmacology** 1986 Mar;25(3):267–70

The anxiolytic but not the sedative properties of tracazolate are reversed by the benzodiazepine receptor antagonist, Ro 15–1788. File SE, et al. **Neuropsychobiology** 1985;14(4):193–7

Histidyl–proline, a rapidly degraded metabolite of thyrotropin releasing hormone, has behavioural activity. Coggins PJ, et al. **Pharmacol Biochem Behav** 1986 May;24(5):1229–33

Serotonergic mechanisms in the behavioral effects of buspirone and gepirone. Eison AS, et al. **Pharmacol Biochem Behav** 1986 Mar; 24(3):701–7

Phencyclidine–induced wet–dog shakes observed in rats after withdrawal from reserpine treatment. Nabeshima T, et al. **Pharmacol Biochem Behav** 1986 May;24(5):1275–9

Effect of sodium pentobarbital on behavioral thermoregulation in rats and mice. Strek KS, et al. **Pharmacol Biochem Behav** 1986 Apr; 24(4):1147–50

Effects of chronically administered antidepressant drugs on animal behavior. Vogel GW, et al. **Physiol Behav** 1986;36(4):659–66

The effects of a 5–HT1 receptor ligand isapirone (TVX Q 7821) on 5–HT synthesis and the behavioural effects of 5–HT agonists in mice and rats. Goodwin GM, et al. **Psychopharmacology (Berlin)** 1986;89(3):382–7

Antagonism of apomorphine–induced yawning by SCH 23390: evidence against the autoreceptor hypothesis. Morelli M, et al. **Psychopharmacology (Berlin)** 1986;89(2):259–60

Similar effects of antidepressant and non–antidepressant drugs on behavior under an interresponse–time greater than 72–s schedule. Pollard GT, et al. **Psychopharmacology (Berlin)** 1986;89(2):253–8

[A unique psychopharmacologic profile of adrafinil in mice] Rambert FA, et al. **J Pharmacol** 1986 Jan–Mar;17(1):37–52 (Eng. Abstr.) **(Fre)**

[The influence on labyrinth behavior of rats of anticonvulsant acting drugs: comparison of propranolol, phenobarbital, phenytoin and diazepam] Kluge S, et al. **Pharmazie** 1986 Apr;41(4):297–8 **(Ger)**

[Effects of central acting drugs on the mirror staircase test] Houri D. **Nippon Yakurigaku Zasshi** 1986 Feb;87(2):135–42 (Eng. Abstr.) **(Jpn)**

[Behavioral pharmacological properties of nicergoline. Effects on gross–behavior in rats and monkeys and on DRL response, CER, and CAR in rats] Yamamura M, et al. **Nippon Yakurigaku Zasshi** 1986 Feb; 87(2):209–21 (Eng. Abstr.) **(Jpn)**

[Effect of stress–inducing factors on monkey behavior. II. Hormonal indices and their relation to behavior in the modelling of emotional stress in hamadryas baboons] Butovskaia ML, et al. **Biol Nauki** 1986; (2):59–64 (Eng. Abstr.) **(Rus)**

BENZAZEPINES

Study on bradycardia induced by diltiazem in the rabbit sinoatrial node. Miyamoto J, et al. **Arzneimittelforschung** 1986 May;36(5):808–10

Effects of diltiazem on PR intervals in healthy young adults. Araki H, et al. **Clin Ther** 1986;8(2):196–202

The influence of diltiazem hydrochloride on trough serum digoxin concentrations. North DS, et al. **Drug Intell Clin Pharm** 1986 Jun; 20(6):500–3

Dopamine D1 receptors characterized with [3H]SCH 23390. Solubilization of a guanine nucleotide–sensitive form of the receptor. Niznik HB, et al. **J Biol Chem** 1986 Jun 25;261(18):8397–406

Dopamine receptor agonists: 3–allyl–6–chloro–2,3,4,5–tetrahydro–1–(4–hydroxyphenyl)–1H–3–benzazepine–7,8–diol and a series of related 3–benzazepines. Ross ST, et al. **J Med Chem** 1986 May;29(5):733–40

Effects of diltiazem on renal blood flow and renal function during angiotensin II infusion in anesthetized dogs. Yamaguchi I, et al. **J Pharmacobiodyn** 1986 Mar;9(3):257–64

Cardiotonic activity of a new inotropic agent, 3,4–dihydro–6–[4–(3,4–dimethoxybenzoyl)–1–piperazinyl]–2(1H)–quinolinone (OPC–8212), in the dog with and without beta–blocker and Ca++–antagonist pretreatment. Hori M, et al. **Jpn Circ J** 1986 Jan;50(1):37–44

Influence of diltiazem on cyclosporin clearance [letter] Griño JM, et al. **Lancet** 1986 Jun 14;1(8494):1387

Cyclosporin–diltiazem interaction [letter] Pochet JM, et al. **Lancet** 1986 Apr 26;1(8487):979

Specific binding of 3H–SCH 23390 to dopamine D1 receptors in vivo. Andersen PH, et al. **Life Sci** 1986 Apr 21;38(16):1507–14

Regulation of agonist and antagonist binding to striatal D–1 dopamine receptors: studies using the selective D–1 antagonist [3H]SK&F R–83566. Flaim KE, et al. **Life Sci** 1986 Jun 9;38(23):2087–96

Electrophysiological study of the effects of D1 and D2 dopamine antagonists on the interaction of converging inputs from the sensory–motor cortex and substantia nigra neurons in the rat. Vives F, et al. **Neuroscience** 1986 Feb;17(2):349–59

Reduction of the rewarding effect of brain stimulation by a blockade of dopamine D1 receptor with SCH 23390. Nakajima S, et al. **Pharmacol Biochem Behav** 1986 Apr;24(4):919–23

Antagonism of apomorphine–induced yawning by SCH 23390: evidence against the autoreceptor hypothesis. Morelli M, et al. **Psychopharmacology (Berlin)** 1986;89(2):259–60

[Physical performance capacity, metabolism and hormonal behavior as affected by diltiazem] Kindermann W, et al. **Z Kardiol** 1986 Feb; 75(2):99–106 (Eng. Abstr.) **(Ger)**

BENZODIAZEPINE TRANQUILIZERS

Metabolic interaction between morphine and various benzodiazepines. Pacifici GM, et al. **Acta Pharmacol Toxicol (Copenh)** 1986 Apr; 58(4):249–52

Ineffectiveness of clonidine in the treatment of the benzodiazepine withdrawal syndrome: report of three cases. Goodman WK, et al. **Am J Psychiatry** 1986 Jul;143(7):900–3

How antipanic drugs might work [letter] Nesse RM, et al. **Am J Psychiatry** 1986 Jul;143(7):945

Benzodiazepine sensitivity in normal human subjects. Hommer DW, et al. **Arch Gen Psychiatry** 1986 Jun;43(6):542–51

Benzodiazepine antagonist Ro 15–1788 in self–poisoning [letter] Lheureux P, et al. **Arch Intern Med** 1986 Jun;146(6):1241

Patterns of benzodiazepine abuse and dependence. Busto U, et al. **Br J Addict** 1986 Feb;81(1):87–94

Management of benzodiazepine dependence––update 1986. Lader MH, et al. **Br J Addict** 1986 Feb;81(1):7–10

The behavior of 1,4–benzodiazepine drugs in acidic media. V. Kinetics of hydrolysis of flutazolam and haloxazolam in aqueous solution. Kuwayama T, et al. **Chem Pharm Bull (Tokyo)** 1986 Jan;34(1):320–6

Residual effects of zopiclone and benzodiazepine hypnotics on psychomotor performance related to car driving. Harrison C, et al. **Drugs Exp Clin Res** 1985;11(12):823–9

Alternative treatments for withdrawing the long–term benzodiazepine user: a pilot study. Nathan RG, et al. **Int J Addict** 1986 Feb; 21(2):195–211

Distribution of temazepam in body fluids and tissues in lethal overdose. Martin CD, et al. **J Anal Toxicol** 1986 Mar–Apr;10(2):77–8

A new method for the determination in blood and urine of a novel triazolobenzodiazepine (estazolam) by HPLC. Scotto di Tella A, et al. **J Anal Toxicol** 1986 Mar–Apr;10(2):65–7

LC/MS determination of bromazepam, clopenthixol, and reserpine in serum of a non–fatal case of intoxication. Tas AC, et al. **J Anal Toxicol** 1986 Mar–Apr;10(2):46–8

High–performance liquid chromatography systems for the separation of benzodiazepines and their metabolites. Gill R, et al. **J Chromatogr** 1986 Mar 28;356(1):37–46

Determination of lormetazepam in plasma by gas chromatography and electron–capture detection. Zecca L, et al. **J Chromatogr** 1986 Apr 25; 377:368–72

Pharmacokinetics and clinical effects of alprazolam following single and multiple oral doses in patients with panic disorder. Ciraulo DA, et al. **J Clin Pharmacol** 1986 Apr;26(4):292–8

Alprazolam treatment for panic disorders. Alexander PE, et al. **J Clin Psychiatry** 1986 Jun;47(6):301–4

Pharmacotherapy of the panic disorders. Ballenger JC. **J Clin Psychiatry** 1986 Jun;47 Suppl:27–32 (55 ref.)

Pharmacotherapeutic considerations in anxiety disorders. Hollister LE. **J Clin Psychiatry** 1986 Jun;47 Suppl:33–6 (21 ref.)

High dose alprazolam in schizophrenia [letter] Kulik FA, et al. **J Clin Psychopharmacol** 1986 Jun;6(3):191–2

Benzodiazepine dependence in mice after ingestion of drug–containing food pellets. Gallaher EJ, et al. **J Pharmacol Exp Ther** 1986 May; 237(2):462–7

Does alprazolam, in contrast to diazepam, activate alpha 2–adrenoceptors involved in the regulation of rat growth hormone secretion? Eriksson E, et al. **Life Sci** 1986 Apr 21;38(16):1491–8

Does cimetidine inhibit the clearance of temazepam after an overdose? [letter] Dobb GJ, et al. **Med J Aust** 1986 Jul 7;145(1):58–9

Are serotonergic neurons involved in the control of anxiety and in the anxiolytic activity of benzodiazepines? Thiebot MH. **Pharmacol Biochem Behav** 1986 May;24(5):1471–7

The use of benzodiazepines for psychotic disorders: a literature review and preliminary clinical findings. Arana GW, et al. **Psychopharmacol Bull** 1986;22(1):77–87

Benzodiazepines for treatment of panic attacks: a new look. Rickels K, et al. **Psychopharmacol Bull** 1986;22(1):93–9

A comparison of alprazolam and imipramine in the treatment of agoraphobia and panic disorder. Rizley R, et al. **Psychopharmacol Bull** 1986;22(1):167–72

Benzodiazepines: review and update. Byrne BE. **Va Dent J** 1986 Jan–Mar; 63(1):22–30

[Alprazolam (Tafil) and bromazepam (Lexotan) in the treatment of anxiety. A randomized, double–blind comparison in psychiatric outpatients] Sonne LM, et al. **Ugeskr Laeger** 1986 Jun 2; 148(23):1392–5 (Eng. Abstr.) **(Dan)**

[Fatigue. Drug therapy] Meunier H. **Arch Belg** 1985;43(11–12):501–10 **(Fre)**

BENZODIAZEPINONES

Stimulatory effect of pirenzepine on mucosal bicarbonate secretion in rat duodenum in vivo. Säfsten B, et al. **Acta Physiol Scand** 1986 Jun; 127(2):267-8

Pirenzepine and propantheline effects on esophageal pressure responses to bethanechol. Hassan M, et al. **Am J Gastroenterol** 1986 May; 81(5):334-8

Clonazepam in bipolar affective disorder [letter] Zetin M, et al. **Am J Psychiatry** 1986 Aug;143(8):1055

Benzodiazepine antagonist Ro 15-1788 in self-poisoning [letter] Lheureux P, et al. **Arch Intern Med** 1986 Jun;146(6):1241

Biochemical pharmacology of pirenzepine. Similarities with tricyclic antidepressants in antimuscarinic effects only. Bechtel WD, et al. **Arzneimittelforschung** 1986 May;36(5):793-6

Difference in effects of pirenzepine and atropine on carbachol-induced pepsinogen secretion from isolated gastric glands. Sakamoto C, et al. **Biochem Biophys Res Commun** 1986 Apr 14;136(1):193-9

DNA sequence specificity of the pyrrolo[1,4]benzodiazepine antitumor antibiotics. Methidiumpropyl-EDTA-iron(II) footprinting analysis of DNA binding sites for anthramycin and related drugs. Hertzberg RP, et al. **Biochemistry** 1986 Mar 25;25(6):1249-58

Pharmacological analysis of the inhibition by pirenzepine and atropine of vagal-stimulated acid secretion in the isolated stomach of the mouse. Black JW, et al. **Br J Pharmacol** 1986 May;88(1):291-7

The behavior of 1,4-benzodiazepine drugs in acidic media. V. Kinetics of hydrolysis of flutazolam and haloxazolam in aqueous solution. Kuwayama T, et al. **Chem Pharm Bull (Tokyo)** 1986 Jan;34(1):320-6

Plasma and biliary disposition of pirenzepine in man. Lee SP, et al. **Clin Exp Pharmacol Physiol** 1986 Mar;13(3):241-8

Randomized, double-blind, placebo-controlled crossover trial of cimetidine and pirenzepine in nonulcer dyspepsia. Talley NJ, et al. **Gastroenterology** 1986 Jul;91(1):149-56

Alterations in biodistribution of [3H]Ro 15-1788 in mice by acute stress: possible changes in in vivo binding availability of brain benzodiazepine receptor. Inoue O, et al. **Int J Nucl Med Biol** 1985;12(5):369-74

Sensitive high-performance liquid chromatographic determination of pirenzepine in plasma. Meineke I, et al. **J Chromatogr** 1986 Mar 7; 375(2):369-75

Treatment of panic disorder and agoraphobia with clonazepam. Spier SA, et al. **J Clin Psychiatry** 1986 May;47(5):238-42

Clonazepam in the treatment of panic disorder [letter] Judd FK, et al. **Med J Aust** 1986 Jul 7;145(1):59

Gallamine binding to muscarinic M1 and M2 receptors, studied by inhibition of [3H]pirenzepine and [3H]quinuclidinylbenzilate binding to rat brain membranes. Burke RE. **Mol Pharmacol** 1986 Jul; 30(1):58-68

AHN 086: an irreversible ligand of 'peripheral' benzodiazepine receptors. Lueddens HW, et al. **Mol Pharmacol** 1986 Jun;29(6):540-5

The anxiolytic but not the sedative properties of tracazolate are reversed by the benzodiazepine receptor antagonist, Ro 15-1788. File SE, et al. **Neuropsychobiology** 1985;14(4):193-7

Differential interactions between chlordiazepoxide, pentobarbital and benzodiazepine antagonists Ro 15-1788 and CGS 8216 in a drug discrimination procedure. De Vry J, et al. **Pharmacol Biochem Behav** 1986 Apr;24(4):999-1005

The effects of Ro 15-1788 on anxiolytic self-administration in the rhesus monkey. Johanson CE, et al. **Pharmacol Biochem Behav** 1986 Apr; 24(4):855-9

Biochemical and pharmacological characterization of an extremely potent and selective nonpeptide cholecystokinin antagonist. Chang RS, et al. **Proc Natl Acad Sci USA** 1986 Jul;83(13):4923-6

A late-appearing benzodiazepine-induced hypoactivity that is not reversed by a receptor antagonist. Lister RG, et al. **Psychopharmacology (Berlin)** 1986;88(4):520-4

[Dose-dependent telenzepine inhibition of the secretion of human gastric acid stimulated by sham feeding and saliva] Müller P, et al. **Z Gastroenterol** 1986 Mar;24(3):152-6 (Eng. Abstr.) **(Ger)**

BIOGENIC AMINES

Endothelial cell metabolism of biogenic amines. Shepro D, et al. **Annu Rev Physiol** 1986;48:335-45 (66 ref.)

Treatment with GM1 ganglioside increases rat spinal cord indole content. Hadjiconstantinou M, et al. **Brain Res** 1986 Feb 26;366(1-2):343-5

Analysis of temporal and dose-dependent effects of estrogen on monoamines in brain nuclei. Renner K, et al. **Brain Res** 1986 Feb 26; 366(1-2):64-71

The regionalization of [3H]dihydrotetrabenazine binding sites in the mouse brain and its relationship to the distribution of monoamines and their metabolites. Scherman D, et al. **Brain Res** 1986 Apr 2;370(1):176-81

Conjugates of biogenic amines in ventriculocisternal perfusates of conscious African green monkeys. Tyce GM, et al. **Brain Res** 1986 May 7;372(2):269-76

Topographical distribution of amines and major amine metabolites in the rat striatum. Widmann R, et al. **Brain Res** 1986 Mar 5; 367(1-2):244-9

Monoamine levels and turnover in brain: relationship to priming actions of estrogen. Renner KJ, et al. **Brain Res Bull** 1986 Apr; 16(4):469-75

The effects of desipramine, zimelidine, electroconvulsive treatment and lithium on rat brain biogenic amines: a comparison with peripheral changes. Karoum F, et al. **Eur J Pharmacol** 1986 Mar 4; 121(3):377-85

Effects of in-utero exposure to cadmium on the brain biogenic amine levels and tissue metal distribution in rats. Murthy RC, et al. **Ind Health** 1986;24(1):15-21

Determination of biogenic amines in cheese and some other food products by high-performance liquid chromatography in combination with thermo-sensitized reaction detection. Joosten HM, et al. **J Chromatogr** 1986 Apr 4;356(2):311-9

High-performance liquid chromatography of biogenic amines and metabolites in brain, cerebrospinal fluid, urine and plasma. Seegal RF, et al. **J Chromatogr** 1986 Apr 25;377:131-44

Influence of 2,5-hexanedione on rat brain amine synthesis and metabolism. Farr CH, et al. **J Environ Pathol Toxicol Oncol** 1986 Mar-Apr; 6(3-4):361-8

Effects of octopamine, dopamine, and serotonin on production of flight motor output by thoracic ganglia of Manduca sexta. Claassen DE, et al. **J Neurobiol** 1986 Jan;17(1):1-14

Aminergic modulation in lobster stomatogastric ganglion. II. Target neurons of dopamine, octopamine, and serotonin within the pyloric circuit. Flamm RE, et al. **J Neurophysiol** 1986 May;55(5):866-81

Aminergic modulation in lobster stomatogastric ganglion. I. Effects on motor pattern and activity of neurons within the pyloric circuit. Flamm RE, et al. **J Neurophysiol** 1986 May;55(5):847-65

Zolpidem, a novel nonbenzodiazepine hypnotic. II. Effects on cerebellar cyclic GMP levels and cerebral monoamines. Scatton B, et al. **J Pharmacol Exp Ther** 1986 May;237(2):659-65

Behavioral and neurochemical evaluation of phenylpropanolamine. Woolverton WL, et al. **J Pharmacol Exp Ther** 1986 Jun; 237(3):926-30

Concentrations of monoamine metabolites in the cerebrospinal fluid of twins and unrelated individuals--a genetic study. Oxenstierna G, et al. **J Psychiatr Res** 1986;20(1):19-29

Microbore HPLC of biogenic amines in small biological samples. Mefford IN, et al. **Methods Enzymol** 1986;124:402-12

Monoamines as immunomodulators: importance of suppressors and helpers of the bone marrow. Devoino L, et al. **Methods Find Exp Clin Pharmacol** 1986 Mar;8(3):175-81

Binding of psychoactive drugs to rat brain amine receptors, measured ex vivo, and their effects on the metabolism of biogenic amines. Burki HR. **Naunyn Schmiedebergs Arch Pharmacol** 1986 Mar;332(3):258-66

Monoamines and their catabolites in the rabbit carotid body. Effects of reserpine, sympathectomy and carotid sinus nerve section. Leitner LM, et al. **Pflugers Arch** 1986 Jun;406(6):552-6

Norepinephrine and amino acids in prepyriform cortex of rats fed imbalanced amino acid diets. Gietzen DW, et al. **Physiol Behav** 1986; 36(6):1071-80

Effect of mealing on plasma and brain amino acid, and brain monoamine in rats after oral aspartame. Torii K, et al. **Physiol Behav** 1986; 36(4):759-64

Effects of Suanzaorentang on behavior changes and central monoamines. Hsieh MT, et al. **Proc Natl Sci Counc Repub China [B]** 1986 Jan; 10(1):43-8

[Influence of praziquantel on monoamine transmitters in the rat brain] Liu GQ, et al. **Yao Hsueh Hsueh Pao** 1985 Nov;20(11):807-10 (Eng. Abstr.) **(Chi)**

[The influence of central monoaminergic systems on the anticonvulsive action of propranolol] Lasek R, et al. **Pharmazie** 1986 Feb; 41(2):128-30 (Eng. Abstr.) **(Ger)**

[Prolonged administration of antidepressants induces changes in the pulsed release but not in the reverse uptake of biogenic amines] Dolzhenko AT, et al. **Biull Eksp Biol Med** 1986 May;101(5):569-70 (Eng. Abstr.) **(Rus)**

[Effect of splenin on the concentration of biogenic amines in the tissues and blood plasma of the rat] Doroshenko NM, et al. **Fiziol Zh** 1986 May-Jun;32(3):367-70 (Eng. Abstr.) **(Rus)**

[Bombesin and monoamine-containing cells of the rat stomach] Solov'eva IA, et al. **Fiziol Zh SSSR** 1986 Apr;72(4):503-12 (Eng. Abstr.) **(Rus)**

[Neurohistologic and histochemical characteristics of Loeschke's zone of the medulla in the cat] Chaikovskaia LA. **Neirofiziologiia** 1986; 18(2):219-26 (Eng. Abstr.) **(Rus)**

[Brain monoamines and the hypophyseo-gonadal system of adult rats after the androgenization of their mothers during pregnancy] Naumenko EV, et al. **Ontogenez** 1986 May-Jun;17(3):285-92 (Eng. Abstr.) **(Rus)**

BIOPHARMACEUTICS

A time to speak out on bioequivalence and therapeutic equivalence [editorial] Dettelbach HR. **J Clin Pharmacol** 1986 May-Jun; 26(5):307-8

BIPOLAR DISORDER

The management of resistant depression. Levine S. **Acta Psychiatr Belg** 1986 Mar-Apr;86(2):141-51

Renal function and lithium: a longitudinal study. DePaulo JR Jr, et al. **Am J Psychiatry** 1986 Jul;143(7):892-5

Safety of the combination of lithium and neuroleptic drugs. Goldney RD, et al. **Am J Psychiatry** 1986 Jul;143(7):882-4

Identifying lithium-responsive bipolar depressed patients using nuclear magnetic resonance. Rosenthal J, et al. **Am J Psychiatry** 1986 Jun; 143(6):779-80

Rapid reduction of mania by means of reserpine therapy [letter] Telner JI, et al. **Am J Psychiatry** 1986 Aug;143(8):1058

Clonazepam in bipolar affective disorder [letter] Zetin M, et al. **Am J Psychiatry** 1986 Aug;143(8):1055

Electroconvulsive therapy in the treatment of manic episodes. Small JG, et al. **Ann NY Acad Sci** 1986;462:37-49

Lithium counteracts carbamazepine-induced leukopenia while increasing its therapeutic effect. Brewerton TD. **Biol Psychiatry** 1986 Jun; 21(7):677-85

Lithium mechanisms in bipolar illness and altered intracellular calcium functions. Meltzer HL. **Biol Psychiatry** 1986 May;21(5-6):492-510

Regular 48-hour cycling of sleep duration and mood in a 35-year-old woman: use of lithium in time isolation. Welsh DK, et al. **Biol Psychiatry** 1986 May;21(5-6):527-37

Affective disorders and circadian rhythms. Hallonquist JD, et al. **Can J Psychiatry** 1986 Apr;31(3):259-72 (143 ref.)

Activities of superoxide dismutase and glutathione peroxidase in schizophrenic and manic-depressive patients. Abdalla DS, et al. **Clin Chem** 1986 May;32(5):805-7

Who responds to prophylactic lithium? Abou-Saleh MT, et al. **J Affective Disord** 1986 Mar-Apr;10(2):115-25

Folic acid enhances lithium prophylaxis. Coppen A, et al. **J Affective Disord** 1986 Jan-Feb;10(1):9-13

Lymphocyte beta-adrenergic receptor density of patients with recurrent affective illness. Wood K, et al. **J Affective Disord** 1986 Jan-Feb; 10(1):3-8

Lithium-resistant adolescent mania. Hsu LK. **J Am Acad Child Psychiatry** 1986 Mar;25(2):280-3

Carbamazepine and ECT: a paradoxical combination [letter] Cantor C. **J Clin Psychiatry** 1986 May;47(5):276-7

The serotonin syndrome: case responsive to propranolol [letter] Guzé BH, et al. **J Clin Psychopharmacol** 1986 Apr;6(2):119-20

An inverse relationship between mania and obsessive-compulsive disorder: a case report [letter] Keck PE Jr, et al. **J Clin Psychopharmacol** 1986 Apr;6(2):123-4

Bipolar disorder: are there manic-prone and depressive-prone forms? Quitkin FM, et al. **J Clin Psychopharmacol** 1986 Jun;6(3):167-72

Effects of bipolar affective disorder and lithium administration on the cholinergic system in human blood. Jope RS, et al. **J Psychiatr Res** 1986;20(1):9-18

Effects of lithium on visual perception in manic-depressive patients without acute symptomatology. Kropf D, et al. **Neuropsychobiology** 1986;15(1):34-42

Lithium treatment and blood pressure. Vestergaard P, et al. **Pharmacopsychiatry** 1986 Mar;19(2):73-4

Erythrocyte lithium transport during lithium treatment in patients with affective disorders. Zaremba D, et al. **Pharmacopsychiatry** 1986 Mar; 19(2):63-7

Clinical studies on norepinephrine metabolism: how to interpret the numbers. Linnoila M, et al. **Psychiatry Res** 1986 Mar;17(3):229-39

Effects of carbamazepine on serum electrolytes in affectively ill patients. Joffe RT, et al. **Psychol Med** 1986 May;16(2):331-5

Investigating opioid peptides in schizophrenia and depression. Berger PA, et al. **Res Publ Assoc Res Nerv Ment Dis** 1986;64:309-33 (91 ref.)

[Diagnosis and treatment of affective psychosis at various times] Xu SH. **Chung Hua Shen Ching Ching Shen Ko Tsa Chih** 1985 Oct; 18(5):302-5 (Eng. Abstr.) **(Chi)**

[Erythrocyte membrane transport of L-tyrosine and L-tryptophan in 66 patients with depressive syndromes. Preliminary results] Pringuey D, et al. **Acta Psychiatr Belg** 1986 Mar-Apr;86(2):131-40 (Eng. Abstr.) **(Fre)**

[Specific neurohumoral activity of the cerebrospinal fluid of patients with manic-depressive psychosis] Vartanian GA, et al. **Fiziol Cheloveka** 1986 Jan-Feb;12(1):167-70 **(Rus)**

[Changes in the wave composition of evoked potentials during treatment of endogenous depression] Loginov VV, et al. **Zh Nevropatol Psikhiatr** 1986;86(3):431-5 (Eng. Abstr.) **(Rus)**

BLOOD-BRAIN BARRIER

Stimulation of tryptophan uptake into brain microvessels by D-glutamine. Gorgievski-Hrisoho M, et al. **Brain Res** 1986 Mar 5;367(1-2):395-7

Transport of ions across the blood-brain barrier. Betz AL. **Fed Proc** 1986 Jun;45(7):2050-4 (26 ref.)

Blood-CSF barrier to CCK and effect of centrally administered bombesin on release of brain CCK. Zhu XG, et al. **J Neurosci Res** 1986; 15(3):393-403

Blood--brain barrier sodium/potassium pump: modulation by central noradrenergic innervation. Harik SI. **Proc Natl Acad Sci USA** 1986 Jun; 83(11):4067-70

BOMBESIN

The periaqueductal gray: a prerequisite for ACTH-induced excessive grooming. Spruijt BM, et al. **Behav Brain Res** 1986 Apr;20(1):19-25

A substance P antagonist also inhibits specific binding and mitogenic effects of vasopressin and bombesin-related peptides in Swiss 3T3 cells. Zachary I, et al. **Biochem Biophys Res Commun** 1986 May 29; 137(1):135-41

Early events elicited by bombesin and structurally related peptides in quiescent Swiss 3T3 cells. II. Changes in Na+ and Ca2+ fluxes, Na+/K+ pump activity, and intracellular pH. Mendoza SA, et al. **J Cell Biol** 1986 Jun;102(6):2223-33

Blood-CSF barrier to CCK and effect of centrally administered bombesin on release of brain CCK. Zhu XG, et al. **J Neurosci Res** 1986; 15(3):393-403

Effect of vasoactive intestinal peptide, peptide histidine isoleucine and growth hormone-releasing factor-40 on bombesin-like immunoreactivity, somatostatin and gastrin release from the perfused rat stomach. Schusdziarra V, et al. **Peptides** 1986 Jan-Feb; 7(1):127-33

[Bombesin and monoamine-containing cells of the rat stomach] Solov'eva IA, et al. **Fiziol Zh SSSR** 1986 Apr;72(4):503-12 (Eng. Abstr.) **(Rus)**

BRADYKININ

Bradykinin and vasopressin stimulate Na+-K+-Cl- cotransport in cultured endothelial cells. Brock TA, et al. **Am J Physiol** 1986 Jun; 250(6 Pt 1):C888-95

BUTAPERAZINE

[Butaperazine blood level determination by radioimmunoassay following oral application of Tyrylen drug forms] Hergert I, et al. **Pharmazie** 1986 Apr;41(4):289 **(Ger)**

BUTYLAMINES

Terodiline in the treatment of women with urgency and motor urge incontinence. A clinical and urodynamic double-blind cross-over study. Gerstenberg TC, et al. **Br J Urol** 1986 Apr;58(2):129-33

Amines as inhibitors of iron transport in rabbit reticulocytes. Glass J, et al. **J Biol Chem** 1986 Jun 25;261(18):8298-302

Bladder training and terodiline in females with idiopathic urge incontinence and stable detrusor function. Klarskov P, et al. **Scand J Urol Nephrol** 1986;20(1):41-6

[Studies on the synthesis and structure-activity relationships of n-alpha, beta-disubstituted-4-chlorocinnamyl)-sec-butylamines] Peng SQ, et al. **Yao Hsueh Hsueh Pao** 1986 Jan;21(1):20-8 (Eng. Abstr.) **(Chi)**

BUTYROPHENONES

3H-spiperone binding in platelet membranes: a possible biological marker for schizophrenia. Sethi BB, et al. **Acta Psychiatr Scand** 1986 Feb; 73(2):186-90

Effect of azaperone on cardiovascular responsiveness in stress-sensitive pigs. Gregory NG, et al. **J Vet Pharmacol Ther** 1986 Jun; 9(2):164-70

Tracer and maximal specific binding of tritiated spiperone or N-n-propylnorapomorphine to quantify dopamine receptors in rat brain regions in vivo. Van der Werf JF, et al. **Life Sci** 1986 Jul 14; 39(2):155-60

The effects of REM sleep deprivation on striatal dopamine receptor sites. Zwicker AP, et al. **Pharmacol Biochem Behav** 1986 Apr; 24(4):809-12

Prenatal reserpine exposure in rats decreases caudate nucleus dopamine receptor binding in female offspring. Ali SF, et al. **Toxicol Lett** 1986 Jun;31(3):195-201

CARBAMAZEPINE

Determination of carbamazepine by HPLC electrochemical detection and application for estimation of imipramine desipramine, doxepin and nordoxepin. Messiha FS. **Alcohol** 1986 Mar-Apr;3(2):135-8

Lithium counteracts carbamazepine-induced leukopenia while increasing its therapeutic effect. Brewerton TD. **Biol Psychiatry** 1986 Jun;

21(7):677–85

Inhibitory effect of valproic acid on the disposition of carbamazepine and carbamazepine–10,11–epoxide in the rat. Chang SL, et al. **Drug Metab Dispos** 1986 May–Jun;14(3):281–6

Effect of carbamazepine on psychomotor performance in näive subjects. MacPhee GJ, et al. **Eur J Clin Pharmacol** 1986;30(1):37–42

Effects of acute and chronic carbamazepine administration on apomorphine–elicited stereotypy. Barros HM, et al. **Eur J Pharmacol** 1986 Apr 29;123(3):345–9

Carbamazepine and ECT: a paradoxical combination [letter] Cantor C. **J Clin Psychiatry** 1986 May;47(5):276–7

Effect of carbamazepine on body weight in affectively ill patients. Joffe RT, et al. **J Clin Psychiatry** 1986 Jun;47(6):313–4

Use of carbamazepine in acute psychosis: a controlled study. Lenzi A, et al. **J Int Med Res** 1986;14(2):78–84

Severe carbamazepine intoxication after coadministration of erythromycin. Goulden KJ, et al. **J Pediatr** 1986 Jul;109(1):135–8

Inhibition of epoxidation of carbamazepine by valproic acid in the isolated perfused rat liver. Chang SL, et al. **J Pharmacokinet Biopharm** 1985 Oct;13(5):453–66

Interaction between carbamazepine and dextropropoxyphene. Yu YL, et al. **Postgrad Med J** 1986 Mar;62(725):231–3

Effects of carbamazepine on serum electrolytes in affectively ill patients. Joffe RT, et al. **Psychol Med** 1986 May;16(2):331–5

CATATONIA

Relief from catatonic immobility can be maintained [letter] McEvoy JP. **J Clin Psychopharmacol** 1986 Apr;6(2):126–7

CATECHOL ESTROGENS

Active nonaromatic intermediates in the conversion of steroidal estrogens into catechol estrogens. Le Quesne PW, et al. **Biochemistry** 1986 Apr 22;25(8):2065–72

Catecholestrogen production by porcine ovarian cells. Hammond JM, et al. **Endocrinology** 1986 Jun;118(6):2292–9

Inhibition of the preovulatory prolactin surge in the rat by catechol estrogens: functional and temporal specificity. Okatani Y, et al. **Endocrinology** 1986 Jul;119(1):261–7

Absence of reactive intermediates in the formation of catechol estrogens by rat liver microsomes. Jellinck PH, et al. **J Biol Chem** 1986 Jun 15; 261(17):7729–32

Different metabolism by mammalian and horseradish peroxidases in vitro of steroidal estrogens and their catechol metabolites. Metzler M, et al. **J Steroid Biochem** 1986 Feb;24(2):653–5

[Catechol estrogens and their physiologic relevance] Parvizi N. **DTW** 1986 Feb 7;93(2):94–8 (Eng. Abstr.) **(Ger)**

CATECHOLAMINES

Involvement of a serotonergic control in the regulation of plasma levels of immunoreactive beta–endorphin. Cancela LM, et al. **Acta Physiol Pharmacol Latinoam** 1985;35(4):409–13

Effect of prolonged exercise on plasma catecholamines. Stejskal P. **Acta Univ Palacki Olomuc Fac Med** 1982;102:107–15

Peripheral venous catecholamines versus adrenal secretory rates after brain stem stimulation in cats. Bereiter DA, et al. **Am J Physiol** 1986 Jul;251(1 Pt 1):E14–20

Titrimetric determination of catecholamines and related compounds via bromine oxidation and substitution. Amin D. **Analyst** 1986 Feb; 111(2):255–7

Occurrence and functional significance of serotonin and catecholamine uptake by astrocytes. Kimelberg HK. **Biochem Pharmacol** 1986 Jul 15; 35(14):2273–81

Catecholamine content of the preovulatory follicles of the domestic hen. Bahr JM, et al. **Biol Reprod** 1986 Apr;34(3):502–6

Catecholamines in sow graafian follicles at proestrus and at diestrus. Fernández–Pardal J, et al. **Biol Reprod** 1986 Apr;34(3):439–45

Brain serotonin and catecholamine responses to repeated stress in rats. De Souza EB, et al. **Brain Res** 1986 Mar 5;367(1–2):77–86

Plasticity of catecholaminergic terminals in rat paraventricular hypothalamic nucleus after 6–hydroxydopamine lesion: an emphasis on bouton sizes and synaptic frequency. Hwang BH, et al. **Brain Res** 1986 Mar 26;369(1–2):267–74

Relationships between catecholaminergic neurons and cholecystokinin–containing neurons in the caudal part of the dorsomedial medulla oblongata of the rat: light and electron microscopic observations by the 'mirror technique'. Kubota Y, et al. **Brain Res** 1986 Apr 9;370(2):343–8

Innervation of substance P neurons by catecholaminergic terminals in the neostriatum. Kubota Y, et al. **Brain Res** 1986 Jun 4;375(1):163–7

Synthesis and release of catecholamines by the cat carotid body in vitro: effects of hypoxic stimulation. Rigual R, et al. **Brain Res** 1986 May 21;374(1):101–9

Serotonin–immunoreactive nerve fibers of the rat pituitary: effects of anticatecholamine and antiserotonin drugs on staining patterns. Saland LC, et al. **Brain Res** 1986 Mar 19;368(2):310–8

Immunohistochemical study of catecholaminergic cell bodies in the rat spinal cord. Mouchet P, et al. **Brain Res Bull** 1986 Mar; 16(3):341–53

Cysteamine effects on somatostatin, catecholamines, pineal NAT and melatonin in rats. Webb SM, et al. **Brain Res Bull** 1986 Mar; 16(3):315–20

A color reaction of 1,2–diphenols based on colored complex formation with phenylfluorone and iron(III) and its application to the assay of catecholamines in pharmaceutical preparations. Fujita Y, et al. **Chem Pharm Bull (Tokyo)** 1985 Dec;33(12):5385–92

The platelet phenolsulfotransferase is not indispensable for the sulfoconjugation of plasma catecholamines. Kuchel O, et al. **Endocr Res** 1985;11(3–4):225–32

Elevation in plasma catecholamines in response to insulin stress is under both neuronal and nonneuronal control. Khalil Z, et al. **Endocrinology** 1986 Jul;119(1):159–67

The effect of hypothalamic catecholamine synthesis inhibition by alpha–methyltyrosine on gonadotropin secretion during sexual maturation in the male Wistar rat. Raum WJ, et al. **Endocrinology** 1986 Jul;119(1):168–75

Mental and physical components of sawmill operatives' workload. Fibiger W, et al. **Ergonomics** 1986 Mar;29(3):363–75

The effect of bromocriptine on plasma catecholamine concentrations in normal volunteers. Steardo L, et al. **Eur J Clin Pharmacol** 1986; 29(6):713–5

Central and peripheral changes in catecholamine–synthesizing enzyme activities after systemic administration of the neurotoxin DSP–4. Féty R, et al. **Eur J Pharmacol** 1986 May 13;124(1–2):197–202

Effects of catecholamine and monophenolamine agonists on identifiable giant neurones, sensitive to these amines, of an African giant snail (Achatina fulica Férussac). Ku BS, et al. **Eur J Pharmacol** 1986 May 13;124(1–2):21–9

Differential time course of protection by monoamine oxidase inhibition and uptake inhibition against MPTP neurotoxicity on central catecholamine neurons in mice. Sundström E, et al. **Eur J Pharmacol** 1986 Mar 18;122(2):275–8

Effect of adrenergic stimulation on ornithine decarboxylase activity in the rat spleen. Stefanelli C, et al. **Gen Pharmacol** 1986;17(3):355–7

Urinary catecholamines and stress in male and female police cadets. Pollack AC, et al. **Hum Biol** 1986 Apr;58(2):209–20

Effect of graded distension of urinary bladder on arterial blood pressure and neurohumors in rabbits. Shukla M, et al. **Indian J Physiol Pharmacol** 1985 Jul–Sep;29(3):159–64

Simplified automated procedure for measurement of certain catecholamine drugs delivered from aerosol inhalation units. Lukovits FS, et al. **J Assoc Off Anal Chem** 1986 Mar–Apr;69(2):183–6

Control of stimulus–secretion coupling in adrenal medullary chromaffin cells by microfilament–specific macromolecules. Friedman JE, et al. **J Biol Chem** 1986 May 5;261(13):5745–50

Catecholamines induce an increase in nerve growth factor content in the medium of mouse L–M cells. Furukawa Y, et al. **J Biol Chem** 1986 May 5;261(13):6039–47

Analytical differences between the determination of plasma catecholamines by liquid chromatography with electrochemical detection and by radioenzymatic assay. Eisenhofer G. **J Chromatogr** 1986 Apr 25;377:328–33

Determination of free and total catecholamines and salsolinol in urine by ion–pair reversed–phase liquid chromatography with electrochemical detection after a one–step sample clean–up. Odink J, et al. **J Chromatogr** 1986 Apr 25;377:145–54

Determination of catecholamines in plasma by HPLC and amperometric detection. Comparison with a radioenzymatic method. Bauersfeld W, et al. **J Clin Chem Clin Biochem** 1986 Mar;24(3):185–8

Plasma catecholamines, dietary carbohydrate, and glucose intolerance: a comparison between young and old men. Chen M, et al. **J Clin Endocrinol Metab** 1986 Jun;62(6):1193–8

Central adrenergic activity in the mediobasal hypothalamus is temporally related to surge outputs of gonadotrophins in oestrogen–stimulated infant female rats. Clement EM, et al. **J Endocrinol** 1986 Apr; 109(1):45–51

Calcium–independent stimulation of glycogenolysis by arginine vasotocin and catecholamines in liver of the axolotl (Ambystoma mexicanum) in vitro. Janssens PA, et al. **J Endocrinol** 1986 Apr;109(1):75–84

Catecholamine–induced transport systems in trout erythrocyte. Na+/H+ countertransport or NaCl cotransport? Borgese F, et al. **J Gen Physiol** 1986 Apr;87(4):551–66

An improved method for tyrosine hydroxylase immunolabeling of catecholamine cells in whole mounted rat retina. Versaux–Botteri C, et al. **J Histochem Cytochem** 1986 Jun;34(6):743–7

Studies on rat brain catecholamine synthesis and beta–adrenoceptor number following administration of electroconvulsive shock, desipramine and clenbuterol. Nimgaonkar VL, et al. **J Neural Transm** 1986;65(3–4):245–59

Catecholamine–metabolizing enzymes of bovine brain microvessel endothelial cell monolayers. Baranczyk–Kuzma A, et al.

J Neurochem 1986 Jun;46(6):1956-60

A semiautomated analysis method for catecholamines, indoleamines, and some prominent metabolites in microdissected regions of the nervous system: an isocratic HPLC technique employing coulometric detection and minimal sample preparation. Kilpatrick IC, et al. **J Neurochem** 1986 Jun;46(6):1865-76

Expression and regulation of catecholaminergic traits in primary sensory neurons: relationship to target innervation in vivo. Katz DM, et al. **J Neurosci** 1986 Apr;6(4):983-9

Spectrophotometric determination of catecholamines. Salem FB. **J Pharm Belg** 1986 Jan-Feb;41(1):35-8

beta-Endorphin-induced stimulation of central sympathetic outflow: inhibitory modulation by central noradrenergic neurons. Appel NM, et al. **J Pharmacol Exp Ther** 1986 Jun;237(3):695-701

Age-dependent changes in the response of isolated beagle coronary arteries to transmural electrical stimulation and catecholamines. Toda N, et al. **J Pharmacol Exp Ther** 1986 Jul;238(1):319-26

Effects of propranolol on catecholamine synthesis and uptake in the central nervous system of the rat. Tuross N, et al. **J Pharmacol Exp Ther** 1986 Jun;237(3):739-45

High concentrations of catecholamines selectively diminish the sensitivity of CRF-stimulated ACTH release by cultured rat pituitary cells to the suppressive effects of dexamethasone. Lamberts SW, et al. **Life Sci** 1986 Jul 14;39(2):97-102

Histamine-induced fluid efflux in the canine forelimb as affected by carotid occlusion or hemorrhage. Dabney JM, et al. **Microcirc Endothelium Lymphatics** 1984 Jun;1(3):247-71

Rudolf Buchheim lecture. The metabolizing systems involved in the inactivation of catecholamines. Trendelenburg U. **Naunyn Schmiedebergs Arch Pharmacol** 1986 Mar;332(3):201-7

Sensation seeking, paired associate learning and brain catecholamines. Kulcsár Z, et al. **Neuropsychobiology** 1986;15(1):43-8

Carotid sinus nerve C-fibers release catecholamines from the cat carotid body. Almaraz L, et al. **Neurosci Lett** 1986 Jun 18;67(2):153-8

Anatomical evidence for interactions between catecholamine- and adrenocorticotropin-containing neurons. Baker H, et al. **Neuroscience** 1986 Feb;17(2):469-84

Changes in nociception after 6-hydroxydopamine lesions of descending catecholaminergic pathways in mice. Fasmer OB, et al. **Pharmacol Biochem Behav** 1986 May;24(5):1441-4

Lack of evidence for the involvement of catecholaminergic mechanisms in the behavioral anti-methamphetamine effect of L-histidine in the mouse. Itoh Y, et al. **Pharmacol Biochem Behav** 1986 Mar; 24(3):571-4

Short-term feeding-related changes in mediodorsal hypothalamic catecholamine release. Kruissink N, et al. **Pharmacol Biochem Behav** 1986 Mar;24(3):575-9

Pharmacological evidence of catecholaminergic involvement in the behavioral effects of luteinizing hormone releasing hormone in rats. Mora S, et al. **Pharmacol Biochem Behav** 1986 Mar;24(3):433-8

Roles of catecholamine terminals and intrinsic neurons of the ventral tegmentum in self-stimulation investigated in neonatally dopamine-depleted rats. Takeichi T, et al. **Pharmacol Biochem Behav** 1986 Apr;24(4):1101-9

Catecholamine metabolism: basic aspects and clinical significance. Kopin IJ. **Pharmacol Rev** 1985 Dec;37(4):333-64 (301 ref.)

Plasma catecholamines associated with hypothalamically-elicited defense behavior. Stoddard SL, et al. **Physiol Behav** 1986;36(5):867-73

Positive inotropic effects of an ACTH analogue (ACTH 1-17) on myocardial performance. Levi G, et al. **Ric Clin Lab** 1985 Oct-Dec; 15(4):349-56

Trimethyltin as a selective adrenal chemosympatholytic agent in vivo: effect precedes both clinical and histopathological evidence of toxicity. Ally AI, et al. **Toxicology** 1986 Aug;40(2):215-29

Response of the cardiovascular system to catecholamines in rats given small doses of lead. Skoczyńska A, et al. **Toxicology** 1986 Jun; 39(3):275-89

[Separation of catecholamines by micro high-performance liquid chromatography with electrochemical detection] Zou GW, et al. **Yao Hsueh Hsueh Pao** 1985 Nov;20(11):870-3 (Eng. Abstr.) **(Chi)**

[Role of gamma-aminobutyric acid in the process of catecholamine secretion from the adrenal medulla] Kitayama S. **Hiroshima Daigaku Shigaku Zasshi** 1985 Jun;17(1):21-34 **(Jpn)**

[The function of the sympathetic nervous system determined by humoral factors in the maintenance hemodialysis patients] Minami M, et al. **Hokkaido Igaku Zasshi** 1986 Mar;61(2):186-94 (Eng. Abstr.) **(Jpn)**

[Effect of intrathecal beta-endorphin and electrical tooth pulp stimulation on endocrine and cardiovascular functions] Miyata A. **Masui** 1986 Feb; 35(2):250-9 (Eng. Abstr.) **(Jpn)**

[Changes in cardiovascular, sympathoadrenal and metabolic responses during exercise corresponding to the lactate threshold in middle-aged and elderly women] Yoshitake Y. **Nippon Eiseigaku Zasshi** 1986 Feb; 40(6):867-75 (Eng. Abstr.) **(Jpn)**

[Urinary excretion of catecholamines, 17-ketosteroids and 17-hydroxycorticosteroids in children exposed to the toxic effects of cadmium and lead in selected areas of Katowice province] Orgacka H, et al. **Pediatr Pol** 1985 Nov-Dec;60(11-12):775-9 (Eng. Abstr.) **(Pol)**

[Effect of beta-endorphin on catecholamine levels in the rat hypothalamus and cerebral cortex] Slavnov VN, et al. **Biull Eksp Biol Med** 1986 May; 101(5):562-4 (Eng. Abstr.) **(Rus)**

[Combination of the method of catecholamine fluorescence with the technic of retrograde labeling of neurons] Maiskii VA, et al. **Fiziol Zh** 1986 May-Jun;32(3):371-4 (Eng. Abstr.) **(Rus)**

[Indicators of catecholamine excretion in air traffic controllers] Kuprianov VA, et al. **Gig Tr Prof Zabol** 1986 Feb;(2):53-6 **(Rus)**

[Participation of catecholamines in the regulation of an induced wave of gonadotropins in ovariectomized rats] Bukiia NG, et al. **Probl Endokrinol (Mosk)** 1986 Mar-Apr;32(2):47-51 (Eng. Abstr.) **(Rus)**

[Catecholamine content in the wall of the thoracic duct of the dog during postnatal development] Prozorovskaia MP, et al. **Zh Evol Biokhim Fiziol** 1986 Mar-Apr;22(2):203-5 (Eng. Abstr.) **(Rus)**

[Clinico-biochemical approach to the problem of psychogenic disorders and background] Pelipas VE, et al. **Zh Nevropatol Psikhiatr** 1986; 86(3):409-12 (Eng. Abstr.) **(Rus)**

CENTRAL NERVOUS SYSTEM AGENTS

[Effects of central acting drugs on the mirror staircase test] Houri D. **Nippon Yakurigaku Zasshi** 1986 Feb;87(2):135-42 (Eng. Abstr.) **(Jpn)**

CHILD BEHAVIOR DISORDERS

[New indications for fenfluramine (letter)] De Villard R, et al. **Presse Med** 1986 Apr 5;15(14):668 **(Fre)**

CHLORAMINES

The alteration of hamster serum elastase inhibitory capacities by chloramine T, in vitro and in vivo. Williams JC, et al. **Exp Lung Res** 1986;10(4):357-68

Effect of oxidizing agents on rabbit mammary prolactin receptors. Mahajan PB, et al. **Mol Cell Endocrinol** 1986 Jun;46(1):37-42

[Chloramine concentration in the room air of indoor pools] Jessen HJ. **Z Gesamte Hyg** 1986 Mar;32(3):180-1 (Eng. Abstr.) **(Ger)**

CHLORDIAZEPOXIDE

Differential effects of dorsal raphe lesions and intraraphe GABA and benzodiazepines on conflict behavior in rats. Green S, et al. **Behav Neural Biol** 1986 Jul;46(1):13-29

Peptide derivatives as prodrugs. Thomas WA. **Biochem Soc Trans** 1986 Apr;14(2):383-7

Differential interactions between chlordiazepoxide, pentobarbital and benzodiazepine antagonists Ro 15-1788 and CGS 8216 in a drug discrimination procedure. De Vry J, et al. **Pharmacol Biochem Behav** 1986 Apr;24(4):999-1005

Effects of chlordiazepoxide on cued radial maze performance in rats. Hodges H, et al. **Psychopharmacology (Berlin)** 1986;88(4):460-6

Behavioural and pharmacological dissociation of chlordiazepoxide effects on discrimination and punished responding. Hodges H, et al. **Psychopharmacology (Berlin)** 1986;89(2):155-61

P-CHLOROPHENYLALANINE

Involvement of a serotonergic control in the regulation of plasma levels of immunoreactive beta-endorphin. Cancela LM, et al. **Acta Physiol Pharmacol Latinoam** 1985;35(4):409-13

P-chlorophenylalanine attenuates tonic immobility duration in chickens. Hughes RA. **Physiol Behav** 1986;36(3):427-30

Parachlorophenylalanine-induced serotonin depletion increases offensive but not defensive aggression in male rats. Vergnes M, et al. **Physiol Behav** 1986;36(4):653-8

CHLORPROMAZINE

Relationship between the displacement of phosphatidate phosphohydrolase from the membrane-associated compartment by chlorpromazine and the inhibition of the synthesis of triacylglycerol and phosphatidylcholine in rat hepatocytes. Martin A, et al. **Biochim Biophys Acta** 1986 May 21;876(3):581-91

Promazine. A major plasma metabolite of chlorpromazine in a population of chronic schizophrenics. Sgaragli G, et al. **Drug Metab Dispos** 1986 Mar-Apr;14(2):263-6

Effects of an i.v. lethal dose of 3,4-methylenedioxyamphetamine (MDA) in the dog and antagonism by chlorpromazine. Davis WM, et al. **Gen Pharmacol** 1986;17(2):179-83

Chlorpromazine inhibits the mitotic index, cell number, and formation of mouse blastocysts, and delays implantation of CBA mouse embryos.

Kola I, et al. **J Reprod Fertil** 1986 Mar;76(2):527-36

Effects of chlorpromazine-pretreated melanin on lysosomal acid phosphatase and N-acetyl-beta-D-glucosaminidase in bovine ciliary body and iris in vitro. Nakazawa M, et al. **Jpn J Ophthalmol** 1986; 30(1):36-42

Simultaneous determination of the pharmacokinetics and pharmacodynamics of chlorpromazine in the brain of mice. Gotoh Y, et al. **Jpn J Pharmacol** 1986 Feb;40(2):231-7

Prevention of flap necrosis by chlorpromazine. Bibi R, et al. **Plast Reconstr Surg** 1986 Jun;77(6):954-9

Structure of the high-affinity binding site for noncompetitive blockers of the acetylcholine receptor: serine-262 of the delta subunit is labeled by [3H]chlorpromazine. Giraudat J, et al. **Proc Natl Acad Sci USA** 1986 Apr;83(8):2719-23

Inhibition of the formation of 13,14-dihydroprostaglandin F2-alpha induced by chlorpromazine in rat ovary. Kogo H, et al. **Prostaglandins Leukotrienes Med** 1986 Apr;22(1):11-20

Effect of membrane-interacting amphiphiles on association of membrane glycoproteins with assembled cytoskeletal proteins in concanavalin A-activated rabbit platelets. Kometani M, et al. **Thromb Res** 1986 May 15;42(4):567-77

[EEG studies in rats to determine the threshold levels of chlorpromazine with respect to the state of vigilance] Bergschicker R, et al. **Biomed Biochim Acta** 1986;45(3):401-12 (Eng. Abstr.) **(Ger)**

[Neuronal types of rat substantia nigra and striatum and effects on them of chronic chlorpromazine administration. Quantitative light and electron microscopic morphometry] Yoshida H. **Fukuoka Igaku Zasshi** 1986 Feb;77(2):144-72 (Eng. Abstr.) **(Jpn)**

[Determining the serum level of chlorpromazine by high-performance liquid chromatography] Przyborowska M, et al. **Acta Pol Pharm** 1985; 42(5):467-72 (Eng. Abstr.) **(Pol)**

[Healing of bone tissue in rabbits after administration of chlorpromazine as a calmodulin inhibitor] Sikorski L. **Chir Narzadow Ruchu Ortop Pol** 1985;50(5):361-5 (Eng. Abstr.) **(Pol)**

CHOICE BEHAVIOR

Lack of preference for diazepam in anxious volunteers. de Wit H, et al. **Arch Gen Psychiatry** 1986 Jun;43(6):533-41

Effect of beta-endorphin on sociosexual proclivity in a choice paradigm. Wiesner JB, et al. **Pharmacol Biochem Behav** 1986 Mar;24(3):507-11

CLOMIPRAMINE

Clomipramine: an antiobsessive drug. Ananth J. **Can J Psychiatry** 1986 Apr;31(3):253-8 (34 ref.)

Acute effects of desipramine and clomipramine on pituitary-adrenal axis in man. Holl WR, et al. **Horm Metab Res** 1986 Feb;18(2):134-7

A two-year naturalistic follow-up of depressed patients treated with cognitive therapy, pharmacotherapy and a combination of both. Blackburn IM, et al. **J Affective Disord** 1986 Jan-Feb;10(1):67-75

Effect of neonatal clomipramine treatment on adult alcohol drinking in the AA and ANA rat lines. Hilakivi L, et al. **Pharmacol Biochem Behav** 1986 May;24(5):1451-5

Understanding the response lag to tricyclics. I. Application of pulse-loading regimens with intravenous clomipramine. Pollock BG, et al. **Psychopharmacol Bull** 1986;22(1):214-9

Comparison of the metabolism of the three antidepressants amitriptyline, imipramine, and chlorimipramine in vitro in rat liver microsomes. Krüger R, et al. **Psychopharmacology (Berlin)** 1986;88(4):505-13

[Action of clomipramine on gastric secretion in the rat] Taddei E, et al. **Boll Soc Ital Biol Sper** 1986 Feb 28;62(2):191-6 (Eng. Abstr.) **(Ita)**

[Effect of clomipramine and imipramine in vivo on genetic material in the mouse] Theodorescu R. **Rev Med Interna [Neurol Psihiatr]** 1985 Oct-Dec;30(4):309-14 **(Rum)**

CLOPAMIDE

High-performance liquid chromatographic determination of xipamide and clopamide in pharmaceuticals. Sane RT, et al. **J Chromatogr** 1986 Apr 18;356(3):468-72

COCAINE

Topical anesthesia for laceration repair: tetracaine versus TAC (tetracaine, adrenaline, and cocaine). White WB, et al. **Am J Emerg Med** 1986 Jul; 4(4):319-22

Cocaine, phencyclidine, and procaine inhibition of the acetylcholine receptor: characterization of the binding site by stopped-flow measurements of receptor-controlled ion flux in membrane vesicles. Karpen JW, et al. **Biochemistry** 1986 Apr 8;25(7):1777-85

Regional brain homovanillic acid following delta 9-tetrahydrocannabinol and cocaine. Bowers MB Jr, et al. **Brain Res** 1986 Feb 26; 366(1-2):405-7

Intravenous self-administration of fencamfamine and cocaine by beagle dogs under fixed-ratio and progressive-ratio schedules of reinforcement. Risner ME, et al. **Drug Alcohol Depend** 1986 May;17(1):93-102

Cocaine use and dental treatment. Chiodo GT, et al. **Gen Dent** 1986 May-Jun;34(3):218-9

Determination of benzoylecgonine in urine from drug abusers using ion pair high performance liquid chromatography. Svensson JO. **J Anal Toxicol** 1986 May-Jun;10(3):122-4

Crack [letter] Washton AM, et al. **JAMA** 1986 Aug 8;256(6):711

The looming cocaine problem in Australia [editorial] Pierce JP, et al. **Med J Aust** 1986 May 26;144(11):562-3

'Crack'. **Med Lett Drugs Ther** 1986 Jul 18;28(718):69-70

Madarosis from cocaine use [letter] Tames SM, et al. **N Engl J Med** 1986 May 15;314(20):1324

Effects of L-cocaine on local cerebral glucose utilization in the rat. London ED, et al. **Neurosci Lett** 1986 Jul 11;68(1):73-8

Cocaine induced-gingival necrosis. Gariulo AV Jr, et al. **Periodont Case Rep** 1985;7(2):44-5

The discriminative stimulus properties of cocaine and d-amphetamine: the effects of three routes of administration. de la Garza R, et al. **Pharmacol Biochem Behav** 1986 Mar;24(3):765-8

Neuropharmacological assessment of cocaine self-administration into the medial prefrontal cortex. Goeders NE, et al. **Pharmacol Biochem Behav** 1986 May;24(5):1429-40

Effects of a D1 and a D2 dopamine antagonist on the self-administration of cocaine and piribedil by rhesus monkeys. Woolverton WL. **Pharmacol Biochem Behav** 1986 Mar;24(3):531-5

Repeated testing attenuates conditioned place preference with cocaine. Bardo MT, et al. **Psychopharmacology (Berlin)** 1986;89(2):239-43

[Intestinal drug smuggling: the cocaine 'body-packer' syndrome] Deuel W, et al. **Schweiz Rundsch Med Prax** 1986 May 6;75(19):557-60 (Eng. Abstr.) **(Ger)**

COGNITION

A two-year naturalistic follow-up of depressed patients treated with cognitive therapy, pharmacotherapy and a combination of both. Blackburn IM, et al. **J Affective Disord** 1986 Jan-Feb;10(1):67-75

A comparison of the effects of trazodone and amitriptyline on skills performance by geriatric subjects. Burns M, et al. **J Clin Psychiatry** 1986 May;47(5):252-4

Cognitive processes in anxiety and depression: discussion paper. Mathews A. **J R Soc Med** 1986 Mar;79(3):158-61

Cognitive performance in geriatric subjects after acute treatment with antidepressants. Moskowitz H, et al. **Neuropsychobiology** 1986; 15 Suppl 1:38-43

Human cognitive function following binedaline (50 mg and 100 mg) and imipramine (75 mg): results with a new battery on tests. Jones DM, et al. **Psychopharmacology (Berlin)** 1986;89(2):198-202

[Cognitive therapy in the treatment of psychotic and postpsychotic states--an overview] Perris C. **Lakartidningen** 1986 Apr 16; 83(16):1488-91 (61 ref.) **(Swe)**

COMPULSIVE BEHAVIOR

Clomipramine: an antiobsessive drug. Ananth J. **Can J Psychiatry** 1986 Apr;31(3):253-8 (34 ref.)

CONDITIONING (PSYCHOLOGY)

Stereoselective behavioral effects of the isomers of pentobarbital and secobarbital in the pigeon. Wenger GR, et al. **J Pharmacol Exp Ther** 1986 May;237(2):445-9

Substitution of natural conditioned and unconditioned stimuli by artificial stimuli does not prevent acquisition of conditioned taste aversion in rats. Brožek G, et al. **Physiol Bohemoslov** 1985;34 Suppl:13-6

Repeated testing attenuates conditioned place preference with cocaine. Bardo MT, et al. **Psychopharmacology (Berlin)** 1986;89(2):239-43

CONDITIONING, CLASSICAL

Failure of hippocampectomy to facilitate classical conditioning at an optimal interstimulus interval is not due to a 'ceiling effect'. Port RL, et al. **Behav Neurosci** 1986 Apr;100(2):161-4

Congener characteristics influence aversion conditioning to alcoholic beverages in rats. Franchina JJ, et al. **Behav Res Ther** 1986; 24(3):299-306

Single unit activity of locus coeruleus neurons in the freely moving cat. II. Conditioning and pharmacologic studies. Rasmussen K, et al. **Brain Res** 1986 Apr 23;371(2):335-44

Conditioning of aversion to alcohol orosensory cues in 5- and 10-day rats: subsequent reduction in alcohol ingestion. Molina JC, et al. **Dev Psychobiol** 1986 May;19(3):175-83

Conditioned aversions and their memories in 5-day-old rats during suckling. Kehoe P, et al. **J Exp Psychol [Anim Behav]** 1986 Jan; 12(1):40-7

[Comparison of the effect of serotonin administered into the dorsal hippocampus on conditioned passive and active avoidance in rats] Gasanov GG, et al. **Biull Eksp Biol Med** 1986 May;101(5):517-9 (Eng.

Abstr.) **(Rus)**

CONDITIONING, OPERANT

Behavioral effects of CGS 8216 alone, and in combination with diazepam and pentobarbital in dogs. Risner ME, et al. **Pharmacol Biochem Behav** 1986 Apr;24(4):1071-6

The effects of prenatal morphine on the responsiveness to morphine and amphetamine. Wagner GC, et al. **Pharmacol Biochem Behav** 1986 Mar; 24(3):757-9

Interaction of buspirone and dopaminergic agents on punished behavior of pigeons. Witkin JM, et al. **Pharmacol Biochem Behav** 1986 Mar; 24(3):751-6

[Neuronal activity of the monkey amygdala during operant feeding behavior and the effects of drugs] Nakano Y. **Fukuoka Igaku Zasshi** 1986 Jan;77(1):55-73 (Eng. Abstr.) **(Jpn)**

CONFLICT (PSYCHOLOGY)

Differential effects of dorsal raphe lesions and intraraphe GABA and benzodiazepines on conflict behavior in rats. Green S, et al. **Behav Neural Biol** 1986 Jul;46(1):13-29

Low doses of muscimol produce anticonflict actions in the lateral septum of the rat. Drugan RC, et al. **Neuropharmacology** 1986 Feb; 25(2):203-5

Comparison of the effects of the benzodiazepine midazolam and three serotonin antagonists on a consummatory conflict paradigm. Becker HC. **Pharmacol Biochem Behav** 1986 Apr;24(4):1057-64

CONSCIOUSNESS

Enigma of drug-induced altered states of consciousness among the !Kung Bushmen of the Kalahari Desert. Dobkin De Rios M. **J Ethnopharmacol** 1986 Mar;15(3):297-304

CONSUMMATORY BEHAVIOR

Comparison of the effects of the benzodiazepine midazolam and three serotonin antagonists on a consummatory conflict paradigm. Becker HC. **Pharmacol Biochem Behav** 1986 Apr;24(4):1057-64

CONVERSION DISORDER

Globus hystericus syndrome responsive to antidepressants. Brown SR, et al. **Am J Psychiatry** 1986 Jul;143(7):917-8

Conversion without hysteria: a case report and review of the literature. Shalev A, et al. **Br J Psychiatry** 1986 Feb;148:198-203 (46 ref.)

CORTICOSTERONE

In vitro study of antral gastrin biosynthesis in response to weaning and corticosterone acetate in rats. Okahata H, et al. **Acta Endocrinol (Copenh)** 1986 Apr;111(4):539-45

Corticosterone secretion by rats after adrenalectomy. Damasco MC, et al. **Acta Physiol Pharmacol Latinoam** 1985;35(4):415-7

Seasonal changes in the plasma concentration of sexual steroids, corticosterone and thyroid hormone in the hen with special respect to the moulting period. Szelényi Z, et al. **Acta Vet Hung** 1985; 33(3-4):189-98

Stimulation of corticosterone secretion in vitro by brief ACTH exposure. Keith LD, et al. **Am J Physiol** 1986 Jun;250(6 Pt 1):E629-33

Hormones in perinatal rat and spiny mouse: relation to altricial and precocial timing of birth. Lamers WH, et al. **Am J Physiol** 1986 Jul; 251(1 Pt 1):E78-85

Does corticosterone affect gastric mucosal cell growth during development? Tseng CC, et al. **Am J Physiol** 1986 May; 250(5 Pt 1):G633-8

Suppression of corticosterone synthesis alters the behavior of hippocampally lesioned rats. Ryan JP, et al. **Behav Neural Biol** 1985 Jul;44(1):47-59

Neuroendocrine parameters in the rat exposed to 60-Hz electric fields. Quinlan WJ, et al. **Bioelectromagnetics** 1985;6(4):381-9

Circadian corticosterone rhythm did not develop in rats seven weeks after destruction with 5,7-dihydroxytryptamine of the serotoninergic nerve terminals in the suprachiasmatic nucleus at the age of 16 days. Bánky Z, et al. **Brain Res** 1986 Mar 26;369(1-2):119-24

In vivo release of corticosterone in discrete brain areas of rats. A push-pull perfusion study. Dietl H. **Brain Res** 1986 Mar 26;369(1-2):373-6

Impact of circulating corticosterone on alpha 1- and alpha 2-noradrenergic receptors in discrete brain areas. Jhanwar-Uniyal M, et al. **Brain Res** 1986 Mar 19;368(2):404-8

Loss of 3H-corticosterone binding capacity in hippocampal slices maintained in vitro. Halpain S, et al. **Brain Res Bull** 1986 Feb; 16(2):167-70

Relationship between endogenous cyclic AMP production and steroid hormone secretion in chick adrenal cells. Rosenberg J, et al. **Comp Biochem Physiol [B]** 1986;84(1):71-5

Effects of corticosterone infusion on the lipogenic activity and ultrastructure of the liver of laying hens. Pilo B, et al. **Cytobios** 1985; 44(179S):273-85

Effect of adrenalectomy and corticosterone on [3H]imipramine binding in rat blood platelets and brain. Arora RC, et al. **Eur J Pharmacol** 1986 Apr 29;123(3):415-9

Chronic corticosterone administration in rats: behavioral and biochemical evidence of increased central dopaminergic activity. Wolkowitz O, et al. **Eur J Pharmacol** 1986 Apr 2;122(3):329-38

Plasma ACTH and corticosterone responses to limbic kindling in the rat. Szafarczyk A, et al. **Exp Neurol** 1986 Jun;92(3):583-90

Further studies on the inhibitory effects of somatostatin on the growth and steroidogenic capacity of rat adrenal zona glomerulosa. Robba C, et al. **Exp Pathol** 1986;29(2):77-82

The influence of social cues on the reproductive endocrinology of male brown-headed cowbirds: field and laboratory studies. Dufty AM Jr, et al. **Horm Behav** 1986 Jun;20(2):222-34

Effects of stimulation on steroid output and perfusion medium flow rate in the isolated perfused rat adrenal gland in situ. Hinson JP, et al. **J Endocrinol** 1986 May;109(2):279-85

The actions of N-terminal fragments of corticotrophin on steroidogenesis in dispersed rat adrenal cells in vitro. Vinson GP, et al. **J Endocrinol** 1986 May;109(2):275-8

Influence of subcutaneous melatonin implantation on gonadal development and on plasma levels of luteinizing hormone, testosterone, estradiol, and corticosterone in the pigeon. John TM, et al. **J Pineal Res** 1986;3(2):169-79

Corticosteroid receptors in rat hippocampal sections: effect of adrenalectomy and corticosterone replacement. Sarrieau A, et al. **J Steroid Biochem** 1986 Mar;24(3):721-4

Bidirectional responsiveness of the pituitary-adrenal system in old and young male and female rats. Brett LP, et al. **Neurobiol Aging** 1986 May-Jun;7(3):153-9

Selective control by corticosterone of serotonin1 receptor capacity in raphe-hippocampal system. De Kloet ER, et al. **Neuroendocrinology** 1986;42(6):513-21

Aldosterone effects on salt appetite in adrenalectomized rats. McEwen BS, et al. **Neuroendocrinology** 1986;43(1):38-43

Effects of 6-hydroxydopamine-induced lesions of the paraventricular nucleus, and of prazosin, on the corticosterone response to restraint in rats. Gibson A, et al. **Neuropharmacology** 1986 Mar;25(3):257-60

Morphine-elicited feeding: diurnal rhythm, circulating corticosterone and macronutrient selection. Bhakthavatsalam P, et al. **Pharmacol Biochem Behav** 1986 Apr;24(4):911-7

Central norepinephrine and plasma corticosterone following acute and chronic stressors: influence of social isolation and handling. Irwin J, et al. **Pharmacol Biochem Behav** 1986 Apr;24(4):1151-4

Regioselective inhibition of benzo(a)pyrene metabolism by corticosterone in comparison with metyrapone and alpha-naphthoflavone. Bogdanffy MS, et al. **Toxicol Lett** 1986 Apr;31(1):57-64

[Stimulation of pituitary-adrenocortical system by cepharanthine] Yoshikawa N, et al. **Nippon Yakurigaku Zasshi** 1986 Feb; 87(2):99-104 (Eng. Abstr.) **(Jpn)**

[Effect of corticosterone on mitochondrial respiration of slices of rat liver] Leshchenko MV. **Probl Endokrinol (Mosk)** 1986 Mar-Apr;32(2):67-9 (Eng. Abstr.) **(Rus)**

CORTICOTROPIN

Ovine corticotrophin-releasing factor in dogs: dose-response relationships and effects of dexamethasone. Kemppainen RJ, et al. **Acta Endocrinol (Copenh)** 1986 May;112(1):12-9

Stimulation of corticosterone secretion in vitro by brief ACTH exposure. Keith LD, et al. **Am J Physiol** 1986 Jun;250(6 Pt 1):E629-33

The periaqueductal gray: a prerequisite for ACTH-induced excessive grooming. Spruijt BM, et al. **Behav Brain Res** 1986 Apr;20(1):19-25

Neonatal treatment with monosodium glutamate does not alter grooming behavior induced by novelty or adrenocorticotropic hormone. Dunn AJ, et al. **Behav Neural Biol** 1985 Jul;44(1):80-9

Corticotropin-releasing factor (CRF) and vasopressin concentration in major brain regions after adrenalectomy and their involvement in adrenalectomy-induced ACTH elevation. Hashimoto K, et al. **Endocrinol Jpn** 1986 Feb;33(1):95-103

Adrenocorticotropin-induced changes in ovine pituitary gonadotropin secretion in vitro. Matteri RL, et al. **Endocrinology** 1986 May; 118(5):2091-6

Antagonism of beta-endorphin-induced prolactin release by alpha-melanocyte-stimulating hormone and corticotropin-like intermediate lobe peptide. Wardlaw SL, et al. **Endocrinology** 1986 Jul; 119(1):112-8

Regulation of beta-endorphin, corticotropin-like intermediate lobe peptide, and alpha-melanotropin-stimulating hormone in the hypothalamus by testosterone. Wardlaw SL. **Endocrinology** 1986 Jul; 119(1):19-24

Beta-endorphin and ACTH levels in peripheral blood during and after aerobic and anaerobic exercise. de Meirleir K, et al. **Eur J Appl Physiol** 1986;55(1):5-8

Plasma ACTH and corticosterone responses to limbic kindling in the rat.

Szafarczyk A, et al. **Exp Neurol** 1986 Jun;92(3):583-90

Dissimilar responsiveness of cultured corticotrophs and melanotrophs to tripeptide aldehydes. Fazekas I, et al. **Histochemistry** 1986; 84(4-6):418-22

Discordances in the temporal pattern of the ACTH/beta-endorphin releasing effects of synthetic CRFs and partially purified bovine CRF in a superfusion system. Yasuda Y, et al. **Horm Metab Res** 1986 May; 18(5):313-7

Effects of stimulation on steroid output and perfusion medium flow rate in the isolated perfused rat adrenal gland in situ. Hinson JP, et al. **J Endocrinol** 1986 May;109(2):279-85

The actions of N-terminal fragments of corticotrophin on steroidogenesis in dispersed rat adrenal cells in vitro. Vinson GP, et al. **J Endocrinol** 1986 May;109(2):275-8

Effect of repeated restraint stress, desmethylimipramine or adrenocorticotropin on the alpha and beta adrenergic components of the cyclic AMP response to norepinephrine in rat brain slices. Stone EA, et al. **J Pharmacol Exp Ther** 1986 Jun;237(3):702-7

Compared effects of ACTH, angiotensin II and POMC peptides on isolated human adrenal cells. Pham-Huu-Trung MT, et al. **J Steroid Biochem** 1986 Jan;24(1):345-8

Action of partially purified ACTH-potentiating substance from rat serum on isolated rat adrenal cells. Morita Y. **Jpn J Pharmacol** 1986 Feb; 40(2):205-14

High concentrations of catecholamines selectively diminish the sensitivity of CRF-stimulated ACTH release by cultured rat pituitary cells to the suppressive effects of dexamethasone. Lamberts SW, et al. **Life Sci** 1986 Jul 14;39(2):97-102

Effect of various blockers of arachidonic acid metabolism on release of beta-endorphin- and adrenocorticotropin-like immunoreactivity induced by phospholipase A2 from rat adenohypophysis in vitro. Knepel W, et al. **Neuroendocrinology** 1986;43(1):44-8

Anatomical evidence for interactions between catecholamine- and adrenocorticotropin-containing neurons. Baker H, et al. **Neuroscience** 1986 Feb;17(2):469-84

Effects of corticotropin-releasing factor, corticotropin and cortisol on gastrointestinal motility in dogs. Bueno L, et al. **Peptides** 1986 Jan-Feb; 7(1):73-7

Opioid and other peptides as inhibitors of leumorphin (dynorphin B-29) converting activity. Devi L, et al. **Peptides** 1986 Jan-Feb;7(1):87-90

Immunohistochemical localization of follicle-stimulating hormone, luteinizing hormone, growth hormone, adrenocorticotrophic hormone and prolactin in the human placenta. Al-Timimi A, et al. **Placenta** 1986 Mar-Apr;7(2):163-72

Role of cholecystokinin in corticotropin release: coexistence with vasopressin and corticotropin-releasing factor in cells of the rat hypothalamic paraventricular nucleus. Mezey E, et al. **Proc Natl Acad Sci USA** 1986 May;83(10):3510-2

Positive inotropic effects of an ACTH analogue (ACTH 1-17) on myocardial performance. Levi G, et al. **Ric Clin Lab** 1985 Oct-Dec; 15(4):349-56

The role of calcium ions in the mechanism of ACTH stimulation of cortisol synthesis. Davies E, et al. **Steroids** 1985 Jun;45(6):551-60

[Plasma levels of beta-endorphin and ACTH during critical increase in arterial pressure in man] Giovannini C, et al. **Boll Soc Ital Biol Sper** 1986 Jan 31;62(1):7-13 (Eng. Abstr.) **(Ita)**

[Detection of the pro-opiomelanocortin peptide fragments--beta-endorphin and ACTH--in the adrenals of rats and mice by immunohistochemistry] Arefolov VA, et al. **Biull Eksp Biol Med** 1986 Apr;101(4):445-7 (Eng. Abstr.) **(Rus)**

[Beta-endorphin and corticotropin in the blood of patients during the acute period of severe craniocerebral injury] Marzoian RA, et al. **Vopr Med Khim** 1986 May-Jun;32(3):95-8 (Eng. Abstr.) **(Rus)**

[Selective effect of antiepileptics on the cortex and medulla of the adrenal glands] Nović M, et al. **Srp Arh Celok Lek** 1985 Nov-Dec; 113(11-12):983-90 (Eng. Abstr.) **(Scc)**

CORTICOTROPIN RELEASING HORMONE

Ovine corticotrophin-releasing factor in dogs: dose-response relationships and effects of dexamethasone. Kemppainen RJ, et al. **Acta Endocrinol (Copenh)** 1986 May;112(1):12-9

Intragranular colocalization of CRF and Met-Enk-8 in nerve terminals in the rat median eminence. Hisano S, et al. **Brain Res** 1986 Apr 9; 370(2):321-6

Sympatho-adrenal medullary functions in response to intracerebroventricularly injected corticotropin-releasing factor in anesthetized rats. Kurosawa M, et al. **Brain Res** 1986 Mar 5; 367(1-2):250-7

Adrenocortical responses to corticotropin-releasing factor in the rat. Normand M, et al. **Can J Physiol Pharmacol** 1986 Mar;64(3):269-72

Ultrastructural characterization of neurosecretory fibres immunoreactive for vasotocin, isotocin, somatostatin, LHRH and CRF in the pituitary of a teleost fish, Poecilia latipinna. Batten TF. **Cell Tissue Res** 1986; 244(3):661-72

Ontogenetic development of corticotropin-releasing factor (CRF)-containing neural elements in the brain of the chicken during incubation and after hatching. Józsa R, et al. **Cell Tissue Res** 1986; 244(3):681-5

Corticotropin-releasing factor (CRF) and vasopressin concentration in major brain regions after adrenalectomy and their involvement in adrenalectomy-induced ACTH elevation. Hashimoto K, et al. **Endocrinol Jpn** 1986 Feb;33(1):95-103

Release of corticotropin-releasing factor from rat brain regions in vitro. Smith MA, et al. **Endocrinology** 1986 May;118(5):1997-2001

Discordances in the temporal pattern of the ACTH/beta-endorphin releasing effects of synthetic CRFs and partially purified bovine CRF in a superfusion system. Yasuda Y, et al. **Horm Metab Res** 1986 May; 18(5):313-7

Corticotropin-releasing factor receptors in the pituitary gland and central nervous system: methods and overview. De Souza EB, et al. **Methods Enzymol** 1986;124:560-90

Autoradiographic localization of brain receptors for peptide hormones: angiotensin II, corticotropin-releasing factor, and gonadotropin-releasing hormone. Millan M, et al. **Methods Enzymol** 1986;124:590-606

Receptor-mediated actions of corticotropin-releasing factor in pituitary gland and nervous system. Aguilera G, et al. **Neuroendocrinology** 1986; 43(1):79-88 (37 ref.)

Effects of corticotropin-releasing factor and growth hormone-releasing factor on sleep and activity in rats. Ehlers CL, et al. **Neuroendocrinology** 1986;42(6):467-74

Predominant release of vasopressin vs. corticotropin-releasing factor from the isolated median eminence after adrenalectomy. Holmes MC, et al. **Neuroendocrinology** 1986;43(2):245-51

Effects of corticotropin-releasing factor, corticotropin and cortisol on gastrointestinal motility in dogs. Bueno L, et al. **Peptides** 1986 Jan-Feb; 7(1):73-7

Ultrastructural alterations of the paraventriculo-infundibular corticotropin releasing factor (CRF)-immunoreactive neuronal system in long term adrenalectomized rats. Liposits Z, et al. **Peptides** 1985 Nov-Dec;6(6):1021-36

Localization of urotensin I- and corticotropin-releasing factor-like immunoreactivity in the central nervous system of Catostomus commersoni. Yulis CR, et al. **Peptides** 1986 Jan-Feb;7(1):79-86

Role of cholecystokinin in corticotropin release: coexistence with vasopressin and corticotropin-releasing factor in cells of the rat hypothalamic paraventricular nucleus. Mezey E, et al. **Proc Natl Acad Sci USA** 1986 May;83(10):3510-2

Purification and characterization of peptides with corticotropin-releasing factor activity from porcine hypothalami. Patthy M, et al. **Proc Natl Acad Sci USA** 1986 May;83(9):2969-73

EEG stability following corticotropin releasing factor in rats. Ehlers CL. **Psychoneuroendocrinology** 1986;11(1):121-5

Comparison of a specific two-site immunoradiometric assay with radioimmunoassay for rat/human CRF-41. Linton EA, et al. **Regul Pept** 1986 Mar;14(1):69-84

Corticotropin-releasing factor receptors: autoradiographic identification. De Souza EB, et al. **Res Publ Assoc Res Nerv Ment Dis** 1986; 64:179-98

[The development of immunoreactive corticotropin-releasing factor (IR-CRF) in the hypothalamus, pancreas and gastrointestinal tract of immature rats] Ohtsuka K, et al. **Nippon Naibunpi Gakkai Zasshi** 1986 Jan 20;62(1):34-44 (Eng. Abstr.) **(Jpn)**

[Study on the development of the radioimmunoassay of the corticotropin releasing factor (CRF)] Ui K, et al. **Nippon Sanka Fujinka Gakkai Zasshi** 1986 May;38(5):657-62 (Eng. Abstr.) **(Jpn)**

CRITICAL PERIOD (PSYCHOLOGY)

Neonatal 6-hydroxydopamine lesion of forebrain norepinephrine does not eliminate critical period for behavioral effects of gonadal hormone manipulation. Pappas BA, et al. **Brain Res** 1986 May;391(2):310-4

DANSYL COMPOUNDS

Fitting fluorescence emission spectra of probes bound to biological membranes. Rooney EK, et al. **J Biochem Biophys Methods** 1986 Mar; 12(3):175-89

DELUSIONS

Delusional depression: phenomenology and response to treatment. A prospective study. Lykouras E, et al. **Acta Psychiatr Scand** 1986 Mar; 73(3):324-9

Course and outcome of the delusional misidentification syndromes. Christodoulou GN. **Bibl Psychiatr** 1986;(164):143-8

Treating delusional depressives with amitriptyline. Spiker DG, et al. **J Clin Psychiatry** 1986 May;47(5):243-6

DEPRESSION

A simplified radioimmunoassay of plasma nortriptyline in depressed patients compared with high-pressure liquid chromatography and gas-liquid chromatography. Sayegh JF. **Neurochem Res** 1986 Feb; 11(2):193-206

Diclofensine and imipramine. A double-blind comparative trial in depressive out-patients. Capponi R, et al. **Neuropsychobiology** 1985; 14(4):173-80

[Comparative evaluation of the therapeutic efficacy of the antidepressants adepren, linamiphen and emovit] Guliamov MG. **Zh Nevropatol Psikhiatr** 1986;86(4):582-7 (Eng. Abstr.) **(Rus)**

DEPRESSIVE DISORDER

Dysregulation of plasma pro-opiomelanocortin-related peptides in neurotic depression. Genazzani AR, et al. **Acta Endocrinol (Copenh)** 1986 May;112(1):1-6

The management of resistant depression. Levine S. **Acta Psychiatr Belg** 1986 Mar-Apr;86(2):141-51

Serum dopamine-beta-hydroxylase activity in patients with major depressive disorders. Kjellman BF, et al. **Acta Psychiatr Scand** 1986 Mar;73(3):266-70

Delusional depression: phenomenology and response to treatment. A prospective study. Lykouras E, et al. **Acta Psychiatr Scand** 1986 Mar; 73(3):324-9

Comparison between a serotonin and a noradrenaline reuptake blocker in the treatment of depressed outpatients. Biochemical aspects. Nyström C, et al. **Acta Psychiatr Scand** 1986 Feb;73(2):133-8

Imipramine in adolescent major depression: plasma level and clinical response. Ryan ND, et al. **Acta Psychiatr Scand** 1986 Mar; 73(3):275-88

Depressive relapses and incomplete recovery from index episode. Faravelli C, et al. **Am J Psychiatry** 1986 Jun;143(7):888-91

Lithium potentiation of tricyclic antidepressants following lack of T3 potentiation. Garbutt JC, et al. **Am J Psychiatry** 1986 Aug; 143(8):1038-9

Current antidepressants. Hollister LE. **Annu Rev Pharmacol Toxicol** 1986; 26:23-37 (30 ref.)

Current management of depression. Kerr K, et al. **Aust Fam Physician** 1986 Apr;15(4):500-2

Depression in childhood. Birleson P. **Aust Paediatr J** 1986 Feb; 22(1):7-10

Efficacy of phenelzine in geriatric depression. Lazarus LW, et al. **Biol Psychiatry** 1986 Jun;21(7):699-701

Pirbuterol trial as antidepressant [letter] Nurnberger JI Jr, et al. **Biol Psychiatry** 1986 May;21(5-6):565-6

Synergistic action of alprazolam with tranylcypromine in drug-resistant atypical depression with panic attacks. Ries RK, et al. **Biol Psychiatry** 1986 May;21(5-6):522-6

Depression in general practice [letter] Blacker CV, et al. **Br J Psychiatry** 1986 Mar;148:333-5

Affective disorders and circadian rhythms. Hallonquist JD, et al. **Can J Psychiatry** 1986 Apr;31(3):259-72 (143 ref.)

Alprazolam and desipramine in moderately severe depression [letter] McCormick WO. **Can J Psychiatry** 1986 May;31(4):378

Who responds to prophylactic lithium? Abou-Saleh MT, et al. **J Affective Disord** 1986 Mar-Apr;10(2):115-25

A two-year naturalistic follow-up of depressed patients treated with cognitive therapy, pharmacotherapy and a combination of both. Blackburn IM, et al. **J Affective Disord** 1986 Jan-Feb;10(1):67-75

Unipolar depression in the elderly. Reoccurrence on discontinuation of tricyclic antidepressants. Cook BL, et al. **J Affective Disord** 1986 Mar-Apr;10(2):91-4

Folic acid enhances lithium prophylaxis. Coppen A, et al. **J Affective Disord** 1986 Jan-Feb;10(1):9-13

Impairment of work and leisure in depressed outpatients. A preliminary communication. De Lisio G, et al. **J Affective Disord** 1986 Mar-Apr; 10(2):79-84

Hypochondriacal fears and beliefs in DSM-III melancholia. Changes with amitriptyline. Kellner R, et al. **J Affective Disord** 1986 Jan-Feb; 10(1):21-6

Depression in general practice attenders. 'Caseness', natural history and predictors of outcome. Parker G, et al. **J Affective Disord** 1986 Jan-Feb; 10(1):27-35

Lymphocyte beta-adrenergic receptor density of patients with recurrent affective illness. Wood K, et al. **J Affective Disord** 1986 Jan-Feb; 10(1):3-8

Effective low dose tricyclic antidepressant treatment for depressed geriatric rehabilitation patients. A double-blind study. Lakshmanan M, et al. **J Am Geriatr Soc** 1986 Jun;34(6):421-6

Tricyclic-resistant depression [letter] Berkowitz HL. **J Clin Psychiatry** 1986 Jul;47(7):393

Antidepressant treatment for posttraumatic stress disorder (PTSD) [letter] Harris SE. **J Clin Psychiatry** 1986 May;47(5):275

Phenelzine for chronic depression: a study of continuation treatment. Harrison W, et al. **J Clin Psychiatry** 1986 Jul;47(7):346-9

Effect of carbamazepine on body weight in affectively ill patients. Joffe RT, et al. **J Clin Psychiatry** 1986 Jun;47(6):313-4

Early placebo response in anxious and depressed patients. Loebel AD, et al. **J Clin Psychiatry** 1986 May;47(5):230-3

Treating delusional depressives with amitriptyline. Spiker DG, et al. **J Clin Psychiatry** 1986 May;47(5):243-6

Medication effects on one-carbon metabolism in schizophrenia, mania, and major depression. Morere DA, et al. **J Clin Psychopharmacol** 1986 Jun;6(3):155-61

Dissociation of depressive mood and vegetative symptoms during treatment with L-tryptophan [letter] Siddiqui AR, et al. **J Clin Psychopharmacol** 1986 Apr;6(2):118-9

Rapid antidepressant effect of addition of lithium to tranylcypromine. Tariot PN, et al. **J Clin Psychopharmacol** 1986 Jun;6(3):165-7

Dissociation between CSF and plasma B-endorphin in major depressive disorders: evidence for a different regulation. Facchinetti F, et al. **J Endocrinol Invest** 1986 Feb;9(1):11-4

Hostility and recovery from melancholia. Fava GA, et al. **J Nerv Ment Dis** 1986 Jul;174(7):414-7

Cognitive processes in anxiety and depression: discussion paper. Mathews A. **J R Soc Med** 1986 Mar;79(3):158-61

Symposium on trazodone. New clinical applications and safety considerations for a third generation antidepressant. IVth World Congress of Biological Psychiatry. Philadelphia, September 1985. **Neuropsychobiology** 1986;15 Suppl 1:1-52

Possible nonlinear pharmacokinetics of desipramine after once daily dosing. Amsterdam JD, et al. **Pharmacopsychiatry** 1986 Mar; 19(2):84-7

A double-blind comparative trial of zimelidine, amitriptyline, and placebo in patients with mixed anxiety and depression. Amsterdam JD, et al. **Pharmacopsychiatry** 1986 May;19(3):115-9

Double-blind comparison of diclofensine with nomifensine in outpatients with dysphoric mood. Funke HJ, et al. **Pharmacopsychiatry** 1986 May; 19(3):120-3

Age, therapeutic 'milieu' and clinical outcome in depressive patients treated with viloxazine: a study with plasma levels. Altamura AC, et al. **Prog Neuropsychopharmacol Biol Psychiatry** 1986;10(1):67-75

Chronic imipramine treatment and weight gain. Fernstrom MH, et al. **Psychiatry Res** 1986 Apr;17(4):269-73

Clinical studies on norepinephrine metabolism: how to interpret the numbers. Linnoila M, et al. **Psychiatry Res** 1986 Mar;17(3):229-39

Antidepressants and biochemical theories of depression. McNeal ET, et al. **Psychol Bull** 1986 May;99(3):361-74

Effects of carbamazepine on serum electrolytes in affectively ill patients. Joffe RT, et al. **Psychol Med** 1986 May;16(2):331-5

Use of a standardized documentation system (BLIPS/BDP) in the conduct of a multicenter international trial comparing fluvoxamine, imipramine, and placebo. Cassano GB, et al. **Psychopharmacol Bull** 1986; 22(1):52-8

A review of controlled studies of adinazolam mesylate in patients with major depressive disorder. Feighner JP. **Psychopharmacol Bull** 1986; 22(1):186-91

Problems with and promises of monoamine oxidase inhibitors. Klein DF, et al. **Psychopharmacol Bull** 1986;22(1):7-11

The relationship of antiobsessional and antidepressant effects of tricyclic antidepressants. Mavissakalian M, et al. **Psychopharmacol Bull** 1986; 22(1):161-6

Understanding the response lag to tricyclics. I. Application of pulse-loading regimens with intravenous clomipramine. Pollock BG, et al. **Psychopharmacol Bull** 1986;22(1):214-9

New perspectives on long-standing issues: the monoamine oxidase inhibitors. Robinson DS. **Psychopharmacol Bull** 1986;22(1):12-5

Discussion on the monoamine oxidase inhibitors. Schiele BC. **Psychopharmacol Bull** 1986;22(1):16-8

Open trial of buspirone in the treatment of major depressive disorder. Schweizer EE, et al. **Psychopharmacol Bull** 1986;22(1):183-5

Investigating opioid peptides in schizophrenia and depression. Berger PA, et al. **Res Publ Assoc Res Nerv Ment Dis** 1986;64:309-33 (91 ref.)

DESIPRAMINE

Characterization of desmethylimipramine 2-hydroxylation in human foetal and adult liver microsomes. Spina E, et al. **Acta Pharmacol Toxicol (Copenh)** 1986 Apr;58(4):277-81

Inhibitory effects of desmethylimipramine, metanephrine and normetanephrine on the neuronal and extraneuronal accumulation of catecholamines in fish spleen. Ungell AL. **Acta Physiol Scand** 1986 May; 127(1):27-31

Chronic exposure of human cells in culture to the tricyclic antidepressant desipramine reduces the number of beta-adrenoceptors. Honegger UE, et al. **Biochem Pharmacol** 1986 Jun 1;35(11):1899-902

Clorgyline and desipramine alter the sensitivity of [3H]noradrenaline release to calcium but not to clonidine. Campbell IC, et al. **Brain Res** 1986 May 7;372(2):253-9

Alprazolam and desipramine in moderately severe depression [letter] McCormick WO. **Can J Psychiatry** 1986 May;31(4):378

Quantitative homogeneous enzyme immunoassays for amitriptyline, nortriptyline, imipramine, and desipramine. Pankey S, et al. **Clin Chem** 1986 May;32(5):768-72

Differential effects of cimetidine and ranitidine on imipramine demethylation and desmethylimipramine hydroxylation by human liver microsomes. Spina E, et al. **Eur J Clin Pharmacol** 1986;30(2):239-42

The effects of desipramine, zimelidine, electroconvulsive treatment and lithium on rat brain biogenic amines: a comparison with peripheral changes. Karoum F, et al. **Eur J Pharmacol** 1986 Mar 4; 121(3):377-85

Acute effects of desipramine and clomipramine on pituitary-adrenal axis in man. Holl WR, et al. **Horm Metab Res** 1986 Feb;18(2):134-7

Symptom exacerbation in psychotically depressed adolescents due to high desipramine plasma concentrations. Conrad CD, et al. **J Clin Psychopharmacol** 1986 Jun;6(3):161-4

Studies on rat brain catecholamine synthesis and beta-adrenoceptor number following administration of electroconvulsive shock, desipramine and clenbuterol. Nimgaonkar VL, et al. **J Neural Transm** 1986;65(3-4):245-59

Effect of chronic desipramine treatment on dihydroalprenolol, imipramine, and desipramine binding sites: a quantitative autoradiographic study in the rat brain. Biegon A. **J Neurochem** 1986 Jul;47(1):77-80

Effect of repeated restraint stress, desmethylimipramine or adrenocorticotropin on the alpha and beta adrenergic components of the cyclic AMP response to norepinephrine in rat brain slices. Stone EA, et al. **J Pharmacol Exp Ther** 1986 Jun;237(3):702-7

Possible nonlinear pharmacokinetics of desipramine after once daily dosing. Amsterdam JD, et al. **Pharmacopsychiatry** 1986 Mar; 19(2):84-7

DESOXYCORTICOSTERONE

Effect of corticosteroids on the thymus of the fish Oryzias latipes. Ghoneum MH, et al. **Dev Comp Immunol** 1986 Winter;10(1):35-44

Immunoreactive atrial natriuretic hormone levels increase in deoxycorticosterone acetate-treated pigs. Grekin RJ, et al. **Hypertension** 1986 Jun;8(6 Pt 2):II16-20

Neurotoxicity of triorthotolyl phosphate in chickens of different genotypes in the presence and absence of deoxycorticosterone. Ehrich M, et al. **Poult Sci** 1986 Feb;65(2):375-9

Steroid hormone metabolites are barbiturate-like modulators of the GABA receptor. Majewska MD, et al. **Science** 1986 May 23; 232(4753):1004-7

[The receptor system for glucocorticoids in myocardial cells. New approaches to the studies of its regulation and function] Seleznev IuM. **Biull Vsesoiuznogo Kardiol Nauchn Tsentra AMN SSSR** 1986; 9(1):94-9 **(Rus)**

DEXTROAMPHETAMINE

Reinstatement of orienting behavior by d-amphetamine in rats with superior colliculus lesions. Midgley GC, et al. **Behav Neurosci** 1986 Apr; 100(2):246-55

Differential effects of dopamine agonists on acoustically and electrically elicited startle responses: comparison to effects of strychnine. Davis M, et al. **Brain Res** 1986 Apr 16;371(1):58-69

Release of endogenous dopamine and cholecystokinin from rat striatal slices: effects of amphetamine and dopamine antagonists. Hutchison JB, et al. **Brain Res** 1986 Apr 9;370(2):310-4

Glucose regulates [3H](+)-amphetamine binding and Na+K+ ATPase activity in the hypothalamus: a proposed mechanism for the glucostatic control of feeding and satiety. Hauger R, et al. **Brain Res Bull** 1986 Feb;16(2):281-8 (41 ref.)

The discriminative stimulus properties of cocaine and d-amphetamine: the effects of three routes of administration. de la Garza R, et al. **Pharmacol Biochem Behav** 1986 Mar;24(3):765-8

Amphetamine-induced anorexia: analysis with hypothalamic lesions and knife cuts. McCabe JT, et al. **Pharmacol Biochem Behav** 1986 Apr; 24(4):1047-56

Evidence that thioridazine enhances amphetamine-induced stereotypy via anticholinergic activity. Robertson A, et al. **Prog Neuropsychopharmacol Biol Psychiatry** 1986;10(1):33-40

The discriminative stimulus and subjective effects of d-amphetamine, phenmetrazine and fenfluramine in humans. Chait LD, et al. **Psychopharmacology (Berlin)** 1986;89(3):301-6

DIAZEPAM

Formulation and stability of diazepam suspension compounded from tablets. Strom JG Jr, et al. **Am J Hosp Pharm** 1986 Jun; 43(6):1489-91

Lack of preference for diazepam in anxious volunteers. de Wit H, et al. **Arch Gen Psychiatry** 1986 Jun;43(6):533-41

Effects of diazepam on pancreatic exocrine secretion in the dog. Yamagishi F, et al. **Arch Int Pharmacodyn Ther** 1986 Apr; 280(2):314-23

Peptide derivatives as prodrugs. Thomas WA. **Biochem Soc Trans** 1986 Apr;14(2):383-7

Serum protein binding of diazepam and propranolol in the feto-maternal unit from early to late pregnancy. Krauer B, et al. **Br J Obstet Gynaecol** 1986 Apr;93(4):322-8

Release of [3H]norepinephrine: alteration by early developmental exposure to diazepam. Kellogg CK, et al. **Brain Res** 1986 Feb 26; 366(1-2):137-44

Effects of diazepam on circadian phase advances and delays. Ralph MR, et al. **Brain Res** 1986 May 7;372(2):405-8

Single unit activity of locus coeruleus neurons in the freely moving cat. II. Conditioning and pharmacologic studies. Rasmussen K, et al. **Brain Res** 1986 Apr 23;371(2):335-44

Plasma concentration profile of diazepam after oral administration of the open-ring form of diazepam to man. Inotsume N, et al. **Chem Pharm Bull (Tokyo)** 1986 Feb;34(2):937-40

The behavior of 1,4-benzodiazepine drugs in acidic media. IV. Proton and carbon-13 nuclear magnetic resonance spectra of diazepam and fludiazepam in acidic aqueous solution. Kuwayama T, et al. **Chem Pharm Bull (Tokyo)** 1985 Dec;33(12):5503-10

Effects of the intraperitoneal administration of diazepam on rat serum lipoproteins separated by polyacrylamide gel electrophoresis. Cuparencu B, et al. **Clin Exp Pharmacol Physiol** 1985 Nov-Dec; 12(6):593-602

Acute tolerance to diazepam induced by benzodiazepines. Wong PT, et al. **Clin Exp Pharmacol Physiol** 1986 Jan;13(1):1-8

Acute tolerance to diazepam in mice: pharmacokinetic considerations. Yoong YL, et al. **Clin Exp Pharmacol Physiol** 1986 Feb;13(2):153-8

Comparison of two benzodiazepines with differing accumulation: behavioral changes during and after 3 weeks of dosing. Ghoneim MM, et al. **Clin Pharmacol Ther** 1986 May;39(5):491-500

Comparison of controlled-release diazepam capsules and placebo in patients in general practice. Montandon A, et al. **Curr Med Res Opin** 1986;10(1):10-6

Individual differences in the reinforcing and subjective effects of amphetamine and diazepam. de Wit H, et al. **Drug Alcohol Depend** 1986 Feb;16(4):341-60

Repeated administration of diazepam and triazolam to subjects with histories of drug abuse. Roache JD, et al. **Drug Alcohol Depend** 1986 May;17(1):15-29

The action of cisapride on gastric emptying and the pharmacodynamics and pharmacokinetics of oral diazepam. Bateman DN. **Eur J Clin Pharmacol** 1986;30(2):205-8

Calcium alters the properties of [3H]diazepam binding sites in rat brain membranes. Wu PH, et al. **Int J Biochem** 1986;18(4):345-50

Interaction of diazepam with famotidine and cimetidine, two H2-receptor antagonists. Locniskar A, et al. **J Clin Pharmacol** 1986 Apr; 26(4):299-303

Effect of the anticonvulsant denzimol on the disposition of diazepam in the rat. Caccia S, et al. **J Pharm Pharmacol** 1986 Jun;38(6):469–72

Solubility of diazepam and prazepam in aqueous non-ionic surfactants. Moro ME, et al. **J Pharm Pharmacol** 1986 Apr;38(4):294–6

Does alprazolam, in contrast to diazepam, activate alpha 2-adrenoceptors involved in the regulation of rat growth hormone secretion? Eriksson E, et al. **Life Sci** 1986 Apr 21;38(16):1491–8

The role of benzodiazepine receptors in the discriminative stimulus properties of delta-9-tetrahydrocannabinol. Mokler DJ, et al. **Life Sci** 1986 Apr 28;38(17):1581–9

Potencies of diazepam metabolites in rats trained to discriminate diazepam. Young R, et al. **Life Sci** 1986 Jul 7;39(1):17–20

Brain histamine regulation following chronic diazepam treatment and stress. Mazurkiewicz-Kwilecki IM, et al. **Pharmacol Biochem Behav** 1986 Mar;24(3):513–7

Behavioral effects of CGS 8216 alone, and in combination with diazepam and pentobarbital in dogs. Risner ME, et al. **Pharmacol Biochem Behav** 1986 Apr;24(4):1071–6

Differential antagonism of diazepam-induced loss of the righting response. Witkin JM, et al. **Pharmacol Biochem Behav** 1986 Apr;24(4):963–5

Correction. Study of an octadecaneuropeptide derived from diazepam binding inhibitor (DBI): biological activity and presence in rat brain. **Proc Natl Acad Sci USA** 1986 Apr;83(8):2776

Maternal diazepam exposure on brain ornithine decarboxylase and growth of offspring. Su MQ, et al. **Proc Natl Sci Counc Repub China [B]** 1986 Jan;10(1):70–4

[An in vitro study of the adsorption of diazepam on microcrystalline bismuth subnitrate] Liu CT, et al. **Yao Hsueh Hsueh Pao** 1986 Jan; 21(1):47–50 (Eng. Abstr.) **(Chi)**

[FSH, LH, estradiol and testosterone levels after Seda-Presomen in women following hysterectomy with bilateral adnexotomy] Stehlíková J, et al. **Acta Univ Palacki Olomuc Fac Med** 1981;101:139–45 **(Ger)**

[Comparison of the bioavailability of two diazepam preparations. Clinical comparison between a new commercial preparation and a standard preparation after oral and intramuscular administration] Resch F, et al. **Arzneimittelforschung** 1986 Apr;36(4):735–8 (Eng. Abstr.) **(Ger)**

DIBENZAZEPINES

In vitro metabolism of desmethyltrimipramine to yield hydroxylamino compound. Ozkirimli S, et al. **Acta Pharm Suec** 1986;23(1):57–9

A multicentre trial of lofepramine. Holden JM, et al. **Br J Clin Pract** 1986 Feb;40(2):59–67

Determination of metapramine, imipramine, trimipramine and their major metabolites in plasma by reversed-phase column liquid chromatography. Pok Phak R, et al. **J Chromatogr** 1986 Mar 7;375(2):339–47

Effect of chronic administration of the 6-aza analogue of mianserin (Org. 3770) and its enantiomers on behaviour and changes in noradrenaline metabolism of olfactory-bulbectomized rats in the 'open field' apparatus. O'Connor WT, et al. **Neuropharmacology** 1986 Mar;25(3):267–70

Comparison of circling induced by unilateral intrastriatal microinjections of haloperidol, clozapine and CCK-8 in rats. Weiss F, et al. **Pharmacol Biochem Behav** 1986 Apr;24(4):983–9

Fluperlapine vs haloperidol: a comparison of their neuroendocrinological profiles and the influence on serum lipids. Fleischhacker WW, et al. **Pharmacopsychiatry** 1986 May;19(3):111–4

The AMDP system in international clinical trials: a double-blind comparison of fluperlapine and haloperidol. Woggon B, et al. **Psychopharmacol Bull** 1986;22(1):47–51

Effects of repeated doses of fluvoxamine, mianserin and placebo on memory and measures of sedation. Curran HV, et al. **Psychopharmacology (Berlin)** 1986;89(3):360–3

Receptor binding of N-(methyl-11C) clozapine in the brain of rhesus monkey studied by positron emission tomography (PET). Hartvig P, et al. **Psychopharmacology (Berlin)** 1986;89(2):248–52

[The biochemical effects of a new antidepressive, metapramine (RP 19560) on activity of the dopaminergic and cholinergic systems of the rat striatum] Boireau A, et al. **J Pharmacol** 1986 Jan–Mar;17(1):75–84 (Eng. Abstr.) **(Fre)**

[Studies of the side effect profile of clozapine] Nitzsche M, et al. **Psychiatr Neurol Med Psychol (Leipz)** 1986 Mar;38(3):148–52 (Eng. Abstr.) **(Ger)**

[Comparative clinical study of imipramine and mianserin in depressions] Chiriţă V, et al. **Rev Med Chir Soc Med Nat Iasi** 1985 Oct–Dec; 89(4):651–6 (Eng. Abstr.) **(Rum)**

[Effect of haloperidol and clozapine on the bioelectric activity of the human cerebral cortex] Sviderskaia NE, et al. **Zh Nevropatol Psikhiatr** 1986;86(3):428–31 (Eng. Abstr.) **(Rus)**

DIBENZOTHIEPINS

Urinary excretion of conjugates of dothiepin and northiaden (mono-N-demethyl-dothiepin) after an oral dose of dothiepin to humans. Kawahara K, et al. **Eur J Drug Metab Pharmacokinet** 1986 Jan–Mar;11(1):29–32

Contractions of isolated canine coronary arteries resistant to S2-serotonergic blockade. Cohen RA. **J Pharmacol Exp Ther** 1986 May; 237(2):548–52

[Pharmacokinetic study of isofloxythepin in animals] Poláková L, et al. **Cesk Farm** 1986 Apr;35(3):97–101 (Eng. Abstr.) **(Cze)**

DIBENZOXEPINS

Stabilization of AD-1590, a non-steroidal antiinflammatory agent, in suppository bases by beta-cyclodextrin complexation. Takahashi T, et al. **Chem Pharm Bull (Tokyo)** 1986 Apr;34(4):1770–4

DIETHYLAMINES

Subchronic inhalation of diethylamine vapor in Fischer-344 rats: organ system toxicity. Lynch DW, et al. **Fundam Appl Toxicol** 1986 Apr; 6(3):559–65

DIIODOTYROSINE

Internalization and heterochromatic localization of 3H-di-iodothyrosine (T2) in the unicellular organism Tetrahymena and rat thymocytes. Csaba G, et al. **Acta Morphol Hung** 1985;33(1–2):61–8

In vivo formation of diiodotyrosine by extrathyroidal thyroxine ether-link cleavage and effects of mononitrotyrosine on this pathway in the rat. Meinhold H, et al. **Endocrinology** 1986 Jun;118(6):2305–11

DISCRIMINATION (PSYCHOLOGY)

The role of benzodiazepine receptors in the discriminative stimulus properties of delta-9-tetrahydrocannabinol. Mokler DJ, et al. **Life Sci** 1986 Apr 28;38(17):1581–9

Potencies of diazepam metabolites in rats trained to discriminate diazepam. Young R, et al. **Life Sci** 1986 Jul 7;39(1):17–20

Discriminative stimulus properties of PCP mimetics. Browne RG. **Natl Inst Drug Abuse Res Monogr Ser** 1986;64:134–47

Interactions between delta 9-tetrahydrocannabinol and cannabidiol as evaluated by drug discrimination procedures in rats and pigeons. Hiltunen AJ, et al. **Neuropharmacology** 1986 Feb;25(2):133–42

The discriminative stimulus properties of cocaine and d-amphetamine: the effects of three routes of administration. de la Garza R, et al. **Pharmacol Biochem Behav** 1986 Mar;24(3):765–8

Discriminative properties of l-cathinone compared to dl- and d-cathinone. Schechter MD. **Pharmacol Biochem Behav** 1986 May; 24(5):1161–5

Behavioural and pharmacological dissociation of chlordiazepoxide effects on discrimination and punished responding. Hodges H, et al. **Psychopharmacology (Berlin)** 1986;89(2):155–61

DISCRIMINATION LEARNING

Discriminative stimulus effects of atypical anxiolytics in baboons and rats. Ator NA, et al. **J Pharmacol Exp Ther** 1986 May;237(2):393–403

Differential interactions between chlordiazepoxide, pentobarbital and benzodiazepine antagonists Ro 15-1788 and CGS 8216 in a drug discrimination procedure. De Vry J, et al. **Pharmacol Biochem Behav** 1986 Apr;24(4):999–1005

The discriminative stimulus and subjective effects of d-amphetamine, phenmetrazine and fenfluramine in humans. Chait LD, et al. **Psychopharmacology (Berlin)** 1986;89(3):301–6

The discriminative stimulus properties of zolpidem, a novel imidazopyridine hypnotic. Sanger DJ, et al. **Psychopharmacology (Berlin)** 1986;89(3):317–22

Taste/tactile cue discriminations in taste-aversion learning following depletion of noradrenaline. Archer T, et al. **Scand J Psychol** 1986; 27(1):39–51

DOPA

Domperidone treatment in man inhibits the fall in plasma renin activity induced by intravenous gamma-L-glutamyl-L-dopa. Worth DP, et al. **Br J Clin Pharmacol** 1986 May;21(5):497–502

High yield synthesis of 6-[18F]fluoro-L-dopa. Chirakal R, et al. **J Nucl Med** 1986 Mar;27(3):417–21

Occurrence and distribution of 5-S-cysteinyl derivatives of dopamine, dopa and dopac in the brains of eight mammalian species. Fornstedt B, et al. **Neuropharmacology** 1986 Apr;25(4):451–4

[Inhibition by melanin of lipid photo-oxidation] Sakina NL, et al. **Biokhimiia** 1986 May;51(5):864–8 (Eng. Abstr.) **(Rus)**

DOPAMINE

The sensitivity of prolactin secretion to dopamine changes during pregnancy in mice. Swartz SR, et al. **Acta Endocrinol (Copenh)** 1986 Apr;111(4):567–71

Histochemistry of puberty. A multidisciplinary study in the rat. Rietveld WJ, et al. **Acta Histochem [Suppl] (Jena)** 1986;32:63–8

Effect on brain monoamines in the rat of substituted and protected analogues of the oxytocin fragment, prolyl-leucyl-glycinamide following N-terminal substitution by D- and L-pipecolic acid. Szabó

Ibopamine. **Arzneimittelforschung** 1986 Feb;36(2A):285-407

Synthesis and chemical properties of ibopamine and of related esters of N-substituted dopamines--synthesis of ibopamine metabolites. Casagrande C, et al. **Arzneimittelforschung** 1986 Feb;36(2A):291-303

Activity of ibopamine on central nervous system in mice and rats. Ferrini R, et al. **Arzneimittelforschung** 1986 Feb;36(2A):327-30

Humoral and renal effects of ibopamine in normal subjects. Incerti PL, et al. **Arzneimittelforschung** 1986 Feb;36(2A):405-7

Ibopamine kinetics after a single oral dose in healthy volunteers. Lodola E, et al. **Arzneimittelforschung** 1986 Feb;36(2A):345-8

Effect of ibopamine on diuresis in conscious rats in normal and experimentally altered conditions. Miragoli G, et al. **Arzneimittelforschung** 1986 Feb;36(2A):318-22

Ibopamine, an orally active dopamine-like drug: metabolism and pharmacokinetics in rats. Pocchiari F, et al. **Arzneimittelforschung** 1986 Feb;36(2A):334-40

Ibopamine, an orally active dopamine-like drug: metabolism and pharmacokinetics in dogs. Pocchiari F, et al. **Arzneimittelforschung** 1986 Feb;36(2A):341-4

6-Hydroxydopamine and excitotoxin lesions of medial prefrontal cortex fail to affect schedule-induced drinking in the rat. Christie MJ, et al. **Behav Brain Res** 1986 Feb;19(2):183-6

Reinstatement of orienting behavior by d-amphetamine in rats with superior colliculus lesions. Midgley GC, et al. **Behav Neurosci** 1986 Apr; 100(2):246-55

The propensity for nonregulatory ingestive behavior is related to differences in dopamine systems: behavioral and biochemical evidence. Mittleman G, et al. **Behav Neurosci** 1986 Apr;100(2):213-20

Regional turnover of norepinephrine and dopamine in rat brain following acute exposure to air ions. Charry JM, et al. **Bioelectromagnetics** 1985; 6(4):415-25

Protective and restitutive effects of antihypoxic drugs on posthypoxic dopamine release inhibition. Wustmann C, et al. **Biomed Biochim Acta** 1986;45(4):549-56

Action of dopamine on the exocrine pancreatic secretion of the intact dog. Delcenserie R, et al. **Br J Pharmacol** 1986 May;88(1):189-95

Modulation of [3H]-dopamine released by different frequencies of stimulation from rabbit retina. Dubocovich ML, et al. **Br J Pharmacol** 1986 May;88(1):51-61

Unilateral peri-substantia nigra catecholaminergic lesion and amygdala kindling. Albala BJ, et al. **Brain Res** 1986 Apr 9;370(2):388-92

Effect of aging on in vitro dopamine biosynthesis in the median eminence of rat hypothalamic slices. Arita J, et al. **Brain Res** 1986 Mar 26; 369(1-2):391-4

Adenosine 3',5'-cyclic monophosphate stimulates dopamine biosynthesis in the median eminence of rat hypothalamic slices. Arita J, et al. **Brain Res** 1986 May 21;374(1):37-44

Dopaminergic amacrine cells in the retina of Japanese dace. Chino YM, et al. **Brain Res** 1986 May 7;372(2):323-37

Interactions between dopamine and amino acid-induced excitation and inhibition in the striatum. Chiodo LA, et al. **Brain Res** 1986 Jun 4; 375(1):198-203

Dopaminergic control of male sex behavior in rats: effects of an intracerebrally-infused agonist. Hull EM, et al. **Brain Res** 1986 Apr 2;370(1):73-81

Release of endogenous dopamine and cholecystokinin from rat striatal slices: effects of amphetamine and dopamine antagonists. Hutchison JB, et al. **Brain Res** 1986 Apr 9;370(2):310-4

Stimulation by gastrin-releasing peptide, neurotensin and DN1417, a novel TRH analog, of dopamine and norepinephrine release from perifused rat hypothalamic fragments in vitro. Kabayama Y, et al. **Brain Res** 1986 May 7;372(2):394-9

Denervation-like postsynaptic supersensitivity to dopamine agonists induced by microinjection of colchicine into the substantia nigra pars compacta. Kamata K, et al. **Brain Res** 1986 Mar 5;367(1-2):1-7

Ultrastructural evidence of dopaminergic input to enkephalinergic neurons in rat neostriatum. Kubota Y, et al. **Brain Res** 1986 Mar 5; 367(1-2):374-8

Permanent alteration of peptide feedback on dopamine neurons after injection of alpha-melanotropin antiserum at a critical period of postnatal development. Lichtensteiger W, et al. **Brain Res** 1986 Mar 19;368(2):205-10

One perfusion mixture for immunocytochemical detection of noradrenaline, dopamine, serotonin and acetylcholine in the same rat brain. McRae-Degueurce A, et al. **Brain Res** 1986 Jun 18; 376(1):217-9

Effect of postnatal light deprivation on the ontogenesis of dopamine neurons in rat retina. Melamed E, et al. **Brain Res** 1986 May; 391(2):280-4

Excitatory effect of iontophoretically applied dopamine on identified neurons of the rat subthalamic nucleus. Mintz I, et al. **Brain Res** 1986 Jun 4:375(1):172-5

Decrease in rat striatal dopamine synthesis and metabolism in vivo by metabolically stable adenosine receptor agonists. Myers S, et al. **Brain Res** 1986 Jun 4;375(1):193-7

Evidence for, and nature of, the tonic inhibitory influence of habenulointerpeduncular pathways upon cerebral dopaminergic transmission in the rat. Nishikawa T, et al. **Brain Res** 1986 May 14; 373(1-2):324-36

Effects of intraventricular 6-hydroxydopamine on the dopaminergic innervation of striatum: histochemical and neurochemical analysis. Onn SP, et al. **Brain Res** 1986 Jun 18;376(1):8-19

Single unit response of noradrenergic, serotonergic and dopaminergic neurons in freely moving cats to simple sensory stimuli. Rasmussen K, et al. **Brain Res** 1986 Mar 26;369(1-2):336-40

Circadian rhythm in the light response of rat retinal disk-shedding and autophagy. Remé C, et al. **Brain Res** 1986 Mar 26;369(1-2):356-60

Dopamine modulates neuronal activities related to motor performance in the monkey prefrontal cortex. Sawaguchi T, et al. **Brain Res** 1986 Apr 23;371(2):404-8

Regulation of mating behaviour in the female rat by gonadotropin-releasing hormone in the ventral tegmental area: effects of selective destruction of the A10 dopamine neurones. Sirinathsinghji DJ, et al. **Brain Res** 1986 May 21;374(1):167-73

An in vivo voltammetric comparison of the effects of three psychomotor stimulants on electrically evoked neostriatal dopamine release. Stamford JA, et al. **Brain Res** 1986 Feb 26;366(1-2):350-3

In vivo voltammetric characterization of low affinity striatal dopamine uptake: drug inhibition profile and relation to dopaminergic innervation density. Stamford JA, et al. **Brain Res** 1986 May 14;373(1-2):85-91

Dendritic morphology of dopaminergic cells revealed by intracellular injection of Lucifer yellow in fixed carp retina. Teranishi T, et al. **Brain Res** 1986 Apr 2;370(1):196-9

Dopamine stimulates rat cortical somatostatin release. Thal LJ, et al. **Brain Res** 1986 May 7;372(2):205-9

Bay K 8644 stimulation of calcium entry and endogenous dopamine release in rat striatal synaptosomes antagonized by nimodipine. Woodward JJ, et al. **Brain Res** 1986 Apr 9;370(2):397-400

Mesolimbic dopamine projection modulates amygdala-evoked EPSP in nucleus accumbens neurons: an in vivo study. Yim CY, et al. **Brain Res** 1986 Mar 26;369(1-2):347-52

Dissociation of the effects of castration and testosterone replacement on sexual behavior and neural metabolism of dopamine in the male rat. Baum MJ, et al. **Brain Res Bull** 1986 Feb;16(2):145-8

Variation in the ability of neuroleptics to block the inhibitory influence of dopaminergic neurons on the activity of cells in the rat prefrontal cortex. Thierry AM, et al. **Brain Res Bull** 1986 Feb;16(2):155-60

Circling from unilateral VTA morphine: direction is controlled by environmental stimuli. Wise RA, et al. **Brain Res Bull** 1986 Feb; 16(2):267-9

Combined effects of n-hexane and toluene on norepinephrine and dopamine levels in rat brain tissues after long-term exposures. Ikeda M, et al. **Bull Environ Contam Toxicol** 1986 Apr;36(4):510-7

An opioid mechanism modulates central and not peripheral dopaminergic control of ciliary activity in the marine mussel Mytilus edulis. Aiello E, et al. **Cell Mol Neurobiol** 1986 Mar;6(1):17-30

The dopaminergic innervation of the goldfish pituitary. An immunocytochemical study at the electron-microscope level using antibodies against dopamine. Kah O, et al. **Cell Tissue Res** 1986; 244(3):577-82

In vitro studies on the maturation of mesencephalic dopaminergic neurons. Barbin G, et al. **Dev Neurosci** 1985;7(5-6):296-307 (52 ref.)

Subpopulations of lactotropes detected with the reverse hemolytic plaque

assay show differential responsiveness to dopamine. Luque EH, et al. **Endocrinology** 1986 May;118(5):2120-4

Reversal by thiols of dopamine-, stalk-median eminence-, and zinc-induced inhibition of prolactin transformation in adenohypophyses of lactating rats. Martinez-Escalera G, et al. **Endocrinology** 1986 May; 118(5):1803-7

Effects of epinephrine, norepinephrine, and dopamine on gonadotropin-releasing hormone-induced secretion of luteinizing hormone in vitro. Swartz SR, et al. **Endocrinology** 1986 Jun; 118(6):2425-31

Dopaminergic mechanisms and motor function: characterization of D-1 and D-2 dopamine receptor interactions. Barone P, et al. **Eur J Pharmacol** 1986 Apr 9;123(1):109-14

GBR 12783, a potent and selective inhibitor of dopamine uptake: biochemical studies in vivo and ex vivo. Bonnet JJ, et al. **Eur J Pharmacol** 1986 Feb 18;121(2):199-209

Evidence for a specific effect of BHT 920, an azepine derivative, on tyrosine hydroxylase in the dopaminergic system of the rat. Jennewein HM, et al. **Eur J Pharmacol** 1986 Apr 29;123(3):363-9

Alteration of striatal dopaminergic functions implicated in methamphetamine-induced reverse tolerance in rats. Kaneno S, et al. **Eur J Pharmacol** 1986 Apr 16;123(2):287-94

Apomorphine enantiomers' effects on dopamine metabolism: receptor and non-receptor related actions. Saller CF, et al. **Eur J Pharmacol** 1986 Feb 18;121(2):181-8

Effects of dopamine and amphetamine on mouse caudate neurons recorded in vitro. Trulson ME, et al. **Eur J Pharmacol** 1986 May 13; 124(1-2):161-5

In vivo evaluation by differential pulse voltammetry of the effect of thyrotropin-releasing hormone (TRH) on dopaminergic and serotoninergic synaptic activity in the striatum and nucleus accumbens of the rat. Crespi F, et al. **Exp Brain Res** 1986;62(2):329-34

Effects of somatostatin on dopamine sensitive adenylate cyclase activity in the caudate-putamen of the rat. Moser A, et al. **Exp Brain Res** 1986; 62(3):567-71

Determination of sulfated biogenic amines: emphasis on dopamine sulfate isomers. Elchisak MA. **Fed Proc** 1986 Jul;45(8):2241-6

Amine sulfate formation in the central nervous system. Tyce GM, et al. **Fed Proc** 1986 Jul;45(8):2247-53

The anti-oestrogen tamoxifen does not interfere with the dopaminergic control of prolactin and TSH release in normogonadotrophic oligozoospermic man. van Bergeijk L, et al. **Horm Metab Res** 1986 Apr;18(4):272-6

Dopamine selectively inhibits aldosterone responses to angiotensin II in humans. Carey RM, et al. **Hypertension** 1986 May;8(5):399-406

Neural regulation of adrenal chromaffin cell function in the mouse: fate and distribution of [3H]dopamine in denervated adrenal medulla. Hirano T. **J Auton Nerv Syst** 1986 Apr;15(4):285-95

Dopamine and L-dopa potentiation of pressor responses to norepinephrine in isolated perfused rat kidneys. Lam BK, et al. **J Cardiovasc Pharmacol** 1986 May-Jun;8(3):554-8

Dopamine inhibits the aldosterone response to upright posture. Malchoff CD, et al. **J Clin Endocrinol Metab** 1986 Jul;63(1):197-201

Dopamine selectively inhibits aldosterone responses to angiotensin II in man. Carey RM, et al. **J Hypertension [Suppl]** 1984 Dec;2(3):S267-9

Dopamine receptor blockade does not affect the natriuresis accompanying sodium chloride infusion in dogs. Bradley T, et al. **J Lab Clin Med** 1986 Jun;107(6):525-8

Histamine-induced prolactin release and activity of tuberoinfundibular dopaminergic neurons in male rats. Seltzer AM, et al. **J Neural Transm** 1986;65(2):115-23

Free and conjugated 3,4-dihydroxyphenylacetic acid and homovanillic acid in brain dopaminergic areas at basal state and after pipotiazine activation. Tavitian E, et al. **J Neural Transm** 1986;65(3-4):261-75

Effects of hypoxia on the activities of noradrenergic and dopaminergic neurons in the rat brain. Miwa S, et al. **J Neurochem** 1986 Jul; 47(1):63-9

An in vivo study of dopamine release and metabolism in rat brain regions using intracerebral dialysis. Sharp T, et al. **J Neurochem** 1986 Jul; 47(1):113-22

The effects of 1-methyl-4-phenyl-1,2,3,6-tetrahydropyridine on presynaptic dopamine uptake sites in the mouse striatum. Donnan GA, et al. **J Neurol Sci** 1986 Jun;74(1):111-9

DARPP-32, a dopamine- and adenosine 3':5'-monophosphate-regulated phosphoprotein: regional, tissue, and phylogenetic distribution. Hemmings HC Jr, et al. **J Neurosci** 1986 May;6(5):1469-81

In vivo comparison of the regulation of releasable dopamine in the caudate nucleus and the nucleus accumbens of the rat brain. Kuhr WG, et al. **J Neurosci** 1986 Apr;6(4):974-82

Chronic treatment with iprindole reduces immobility of rats in the behavioural 'despair' test by activating dopaminergic mechanisms in the brain. Berettera C, et al. **J Pharm Pharmacol** 1986 Apr; 38(4):313-5

Amineptine: its effect on the dopaminergic system of rats. Ponzio F, et al. **J Pharm Pharmacol** 1986 Apr;38(4):301-3

Desensitization of rat striatal dopamine-stimulated adenylate cyclase after acute amphetamine administration. Barnett JV, et al. **J Pharmacol Exp Ther** 1986 Jun;237(3):820-5

In vivo voltammetric study of dopamine release in the striatum following microinjection of apomorphine into the substantia nigra zona reticulata. Kamata K, et al. **Jpn J Pharmacol** 1986 Mar;40(3):472-7

Renal hemodynamics during separate and combined infusion of amino acids and dopamine. ter Wee PM, et al. **Kidney Int** 1986 Apr; 29(4):870-4

Dopamine inhibition of prolactin release but not synthesis in the male Syrian hamster: in vitro studies. Blask DE, et al. **Life Sci** 1986 May 26;38(21):1915-21

3H-xylamine binds to presynaptic rat striatal membranes. Cushing SD, et al. **Life Sci** 1986 May 12;38(19):1715-21

Effects of dopaminergic drugs on plasma levels of steroid hormones in conscious dogs. Goiny M, et al. **Life Sci** 1986 Jun 23; 38(25):2293-300

Prevention of 1-methyl-4-phenyl-1,2,3,6-tetrahydropyridine-induced dopaminergic toxicity in mice by MDL 72145, a selective inhibitor of MAO-B. Kindt MV, et al. **Life Sci** 1986 Apr 21;38(16):1459-62

Rat striatal dopamine and tetrahydrobiopterin content following an intrastriatal injection of manganese chloride. Lista A, et al. **Life Sci** 1986 Jun 9;38(23):2121-7

Selective dopamine D2 receptor reduction enhances a D1-mediated oral dyskinesia in rats. Rosengarten H, et al. **Life Sci** 1986 Jul 7; 39(1):29-35

Participation of angiotensin II in learning and memory. II. Interactions of angiotensin II with dopaminergic drugs. Yonkov DI, et al. **Methods Find Exp Clin Pharmacol** 1986 Apr;8(4):203-6

Effects of dopamine and vasopressin on histamine-induced increases in macromolecular permeability in the canine forelimb. Adamski SW, et al. **Microcirc Endothelium Lymphatics** 1985 Feb;2(1):27-39

Dopamine and somatostatin inhibit forskolin-stimulated prolactin and growth hormone secretion but not stimulated cyclic AMP levels in sheep anterior pituitary cell cultures. Ray KP, et al. **Mol Cell Endocrinol** 1986 May;45(2-3):175-82

Dopamine autoreceptor regulation of the kinetic state of striatal tyrosine hydroxylase. Strait KA, et al. **Mol Pharmacol** 1986 Jun;29(6):561-9

Involvement of dopaminergic, cholinergic, and glutamatergic mechanisms in the actions of phencyclidine-like drugs. Johnson KM, et al. **Natl Inst Drug Abuse Res Monogr Ser** 1986;64:52-66

Neurotensin effect on dopamine release and calcium transport in rat striatum: interactions with diphenylalkylamine calcium antagonists. Battaini F, et al. **Naunyn Schmiedebergs Arch Pharmacol** 1986 Mar; 332(3):267-70

Dopaminergic mediation of long-term behavioral effects of in utero drug exposure. Middaugh LD, et al. **Neurobehav Toxicol Teratol** 1985 Nov-Dec;7(6):685-9

The effect of raphé nuclei lesions on striatal tyramine concentration and dopamine turnover in the rat. Juorio AV, et al. **Neurochem Res** 1986 May;11(5):687-93

The increase of anterior pituitary dopamine in aging C57BL/6J female mice is caused by ovarian steroids, not intrinsic pituitary aging. Telford N, et al. **Neuroendocrinology** 1986;43(2):135-42

Antioxidants fail to inhibit depletion of striatal dopamine by MPTP [letter] Baldessarini RJ, et al. **Neurology** 1986 May;36(5):735

Dopamine D2 receptors and dopamine metabolism. Relationship between biochemical and behavioural effects of substituted benzamide drugs. Magnusson O, et al. **Neuropharmacology** 1986 Feb;25(2):187-97

Control of sensorimotor function by dopaminergic nigrostriatal neurons: influence on eating and drinking. White NM. **Neurosci Biobehav Rev** 1986 Spring;10(1):15-36 (189 ref.)

Preferential vulnerability of A8 dopamine neurons in the primate to the neurotoxin 1-methyl-4-phenyl-1,2,3,6-tetrahydropyridine. Deutch AY, et al. **Neurosci Lett** 1986 Jul 11;68(1):51-6

Light ON depresses and light OFF enhances the release of dopamine from the cat's retina. Hamasaki DI, et al. **Neurosci Lett** 1986 Jul 11; 68(1):112-6

Dopaminergic and noradrenergic sympathetic nerves of the dog have different DOPA decarboxylase activities. Harris T, et al. **Neurosci Lett** 1986 Apr 11;65(2):155-60

Striatal neuropeptide Y neurones are under the influence of the nigrostriatal dopaminergic pathway: immunohistochemical evidence. Kerkerian L, et al. **Neurosci Lett** 1986 May 6;66(1):106-12

Responsiveness to 'autoreceptor' doses of apomorphine inversely correlated with the firing rate of dopaminergic A9 neurons: action of baclofen. Mereu G, et al. **Neurosci Lett** 1986 Apr 11;65(2):161-6

Regional cerebral pharmacokinetics of the dopaminergic neurotoxin 1-methyl-4-phenyl-1,2,3,6-tetrahydropyridine as examined by positron emission tomography in a baboon is altered by tranylcypromine. Moerlein SM, et al. **Neurosci Lett** 1986 May 15;66(2):205-9

Strain differences in the density of dopaminergic cells of the retina in albino rats. Nguyen-Legros J, et al. **Neurosci Lett** 1986 May 6; 66(1):13-8

Distinct functions for dopamine and serotonin in locomotor behaviour: evidence using the 5-HT1 agonist RU 24969 in globus pallidus-lesioned rats. Oberlander C, et al. **Neurosci Lett** 1986 Jun 18;67(2):113-8

Catecholamine sensitivities of motor cortical neurons of the monkey. Sawaguchi T, et al. **Neurosci Lett** 1986 May 15;66(2):135-40

Reduced apomorphine sensitivity of dopamine metabolism in rat striatum after repeated administration of methamphetamine. Kashihara K, et al. **Neurosci Res** 1986 May;3(4):351-5

Effects of dopamine and its agonists and antagonists on the receptive field properties of ganglion cells in the rabbit retina. Jensen RJ, et al. **Neuroscience** 1986 Mar;17(3):837-55

Simultaneous monitoring of dopamine release in rat frontal cortex, nucleus accumbens and striatum: effect of drugs, circadian changes and correlations with motor activity. O'Neill RD, et al. **Neuroscience** 1985 Sep;16(1):49-55

Glutamate decarboxylase-immunoreactive boutons in synaptic contacts with hypothalamic dopaminergic cells: a light and electron microscopy study combining immunocytochemistry and radioautography. Tappaz ML, et al. **Neuroscience** 1985 Sep;16(1):111-22

Effect of DN-1417, a thyrotropin releasing hormone analog, on dopaminergic neurons in rat brain. Nakahara T, et al. **Peptides** 1985 Nov-Dec;6(6):1093-9

Behavioral and biochemical assessment of time-related changes in globus pallidus and striatal dopamine induced by intranigrally administered neurotensin. Napier TC, et al. **Peptides** 1985 Nov-Dec;6(6):1057-68

Involvement of extrapyramidal motor mechanisms in the suppression of locomotor activity by antipsychotic drugs: a comparison between the effects produced by pre- and post-synaptic inhibition of dopaminergic neurotransmission. Ahlenius S, et al. **Pharmacol Biochem Behav** 1986 May;24(5):1409-15

Effects of dopaminergic agents on eye tracking before and after repeated methamphetamine. Ando K, et al. **Pharmacol Biochem Behav** 1986 Mar;24(3):693-9

Selective involvement of dopamine in the nucleus accumbens in the feeding response elicited by muscimol injection in the nucleus raphe dorsalis of sated rats. Bendotti C, et al. **Pharmacol Biochem Behav** 1986 May;24(5):1189-93

Dopamine neurotransmission in the nucleus accumbens may be involved in oxytocin-enhanced grooming behavior of the rat. Drago F, et al. **Pharmacol Biochem Behav** 1986 May;24(5):1185-8

Synergistic effects of dopamine agonists and centrally administered neurotensin on feeding. Hawkins MF, et al. **Pharmacol Biochem Behav** 1986 May;24(5):1195-201

Effects of acute and chronic bupropion on locomotor activity and dopaminergic neurons. Nielsen JA, et al. **Pharmacol Biochem Behav** 1986 Apr;24(4):795-9

Grooming in the mouse is stimulated by the dopamine D1 agonist SKF 38393 and by low doses of the D1 antagonist SCH 23390, but is inhibited by dopamine D2 agonists, D2 antagonists and high doses of SCH 23390. Starr BS, et al. **Pharmacol Biochem Behav** 1986 Apr;24(4):837-9

The interaction of neurotensin with dopaminergic pathways in the central nervous system: basic neurobiology and implications for the pathogenesis and treatment of schizophrenia. Nemeroff CB. **Psychoneuroendocrinology** 1986;11(1):15-37

Lithium and bupropion antagonise the phasic changes in locomotor activity caused by dopamine infused into the rat nucleus accumbens. Barnes JC, et al. **Psychopharmacology (Berlin)** 1986;89(3):311-6

Mesolimbic dopamine and its control of locomotor activity in rats: differences in pharmacology and light/dark periodicity between the olfactory tubercle and the nucleus accumbens. Cools AR. **Psychopharmacology (Berlin)** 1986;88(4):451-9

Effect of in vitro inorganic lead on dopamine release from superfused rat striatal synaptosomes. Minnema DJ, et al. **Toxicol Appl Pharmacol** 1986 Jun 30;84(2):400-11

DOPAMINE BETA-HYDROXYLASE

Serum dopamine-beta-hydroxylase activity in patients with major depressive disorders. Kjellman BF, et al. **Acta Psychiatr Scand** 1986 Mar;73(3):266-70

A comprehensive study of chronic schizophrenic patients. II: Biological, neuropsychological, and clinical correlates of CT abnormality. Pandurangi AK, et al. **Acta Psychiatr Scand** 1986 Feb;73(2):161-71

Specific lysis of noradrenergic synaptosomes by an antiserum to dopamine-beta-hydroxylase. Docherty M, et al. **FEBS Lett** 1986 Jun 23;202(1):37-40

Electron microscopic analysis of tyrosine hydroxylase, dopamine-beta-hydroxylase and phenylethanolamine-N-methyltransferase immunoreactive innervation of the hypothalamic paraventricular nucleus in the rat. Liposits Z, et al. **Histochemistry** 1986;84(2):105-20

Adenosine 5'-diphosphate-dependent subunit dissociation of bovine dopamine beta-hydroxylase. Dhawan S, et al. **J Biol Chem** 1986 Jun 15;261(17):7680-4

Substituted 1-benzylimidazole-2-thiols as potent and orally active inhibitors of dopamine beta-hydroxylase. Kruse LI, et al. **J Med Chem** 1986 Jun;29(6):887-9

Peripheral and central short-term effects of fusaric acid, a DBH inhibitor, on tryptophan and serotonin metabolism in the rat. Chaouloff F, et al. **J Neural Transm** 1986;65(3-4):219-32

Inhibitory action of hydralazine on catecholamine-synthesizing enzymes prepared from bovine adrenal medulla. Morita K, et al. **Jpn J Pharmacol** 1986 Mar;40(3):445-53

Some catecholamine inhibitors do not cause accumulation of nuclear estrogen receptors in rat hypothalamus and anterior pituitary gland. Blaustein JD, et al. **Neuroendocrinology** 1986;43(2):143-9

Dopamine-beta-hydroxylase inhibitors modulate the concentration of functional estrogen receptors in female rat hypothalamus and pituitary gland. Blaustein JD, et al. **Neuroendocrinology** 1986;43(2):150-8

Sensation seeking, paired associate learning and brain catecholamines. Kulcsár Z, et al. **Neuropsychobiology** 1986;15(1):43-8

[The function of the sympathetic nervous system determined by humoral factors in the maintenance hemodialysis patients] Minami M, et al. **Hokkaido Igaku Zasshi** 1986 Mar;61(2):186-94 (Eng. Abstr.) **(Jpn)**

[Determination of dopamine-beta-hydroxylase (DBH) and monoamine oxidase (MAO) activities in platelets and plasma in schizophrenic, maniac-depressive and neurotic patients] Xavier Vieira R, et al. **Acta Med Port** 1986 Jan-Feb;7(1):45-8 (Eng. Abstr.) **(Por)**

DOXAPRAM

Doxapram: cardiopulmonary effects in the horse. Wernette KM, et al. **Am J Vet Res** 1986 Jun;47(6):1360-2

DOXEPIN

Pharmacokinetic evaluation of two doxepin products. Wecker MT, et al. **Clin Ther** 1986;8(3):342-7

A controlled comparison of clonidine and doxepin in the treatment of the opiate withdrawal syndrome. Täschner KL. **Pharmacopsychiatry** 1986 May;19(3):91-5

DRUG EVALUATION

The AMDP-system in clinical psychopharmacology. Bobon D, et al. **Pharmacopsychiatry** 1986 Mar;19(2):55-7

DRUG SCREENING

[Effects of central acting drugs on the mirror staircase test] Houri D. **Nippon Yakurigaku Zasshi** 1986 Feb;87(2):135-42 (Eng. Abstr.) **(Jpn)**

ELECTROCONVULSIVE THERAPY

Effect of electroconvulsive shock (ECS) treatment on the histaminergic system in rat brain: biochemical and behavioural studies. Zawilska J, et al. **Agents Actions** 1986 Apr;18(1-2):222-5

Biochemical and neuroendocrinological effects of electroconvulsive therapy. Discussion of Part II. Barkai AI. **Ann NY Acad Sci** 1986; 462:120-3

Interactions of drugs and electroshock treatment on cerebral monoaminergic systems. Barkai AI. **Ann NY Acad Sci** 1986; 462:147-62

Neuroendocrine responses as a probe into the mechanisms of action of electroconvulsive therapy. Cowen PJ. **Ann NY Acad Sci** 1986; 462:163-71 (32 ref.)

The biochemistry of electroconvulsive therapy. Discussion of Part III. Decina P. **Ann NY Acad Sci** 1986;462:172–3

Effect of electroconvulsive shock on serotonin activity. Essman WB. **Ann NY Acad Sci** 1986;462:99–104

Electroconvulsive therapy and lateralized affective systems. Flor-Henry P. **Ann NY Acad Sci** 1986;462:389–97 (43 ref.)

What have we learned ? Frankel FH. **Ann NY Acad Sci** 1986; 462:411–5

Changes in gamma-aminobutyric acid biochemistry and seizure threshold. Green AR. **Ann NY Acad Sci** 1986;462:105–19 (29 ref.)

Neurochemical mechanisms of mood stabilization. Focus on electroconvulsive therapy. Lerer B, et al. **Ann NY Acad Sci** 1986; 462:366–75 (74 ref.)

Electroconvulsive therapy in the treatment of manic episodes. Small JG, et al. **Ann NY Acad Sci** 1986;462:37–49

Carbamazepine and ECT: a paradoxical combination [letter] Cantor C. **J Clin Psychiatry** 1986 May;47(5):276–7

ELECTROENCEPHALOGRAPHY

A comprehensive study of chronic schizophrenic patients. II: Biological, neuropsychological, and clinical correlates of CT abnormality. Pandurangi AK, et al. **Acta Psychiatr Scand** 1986 Feb;73(2):161–71

EEG asymmetry in schizophrenic patients before and during neuroleptic treatment. Merrin EL, et al. **Biol Psychiatry** 1986 May; 21(5–6):455–64

Evidence that serotonin mediates non-cholinergic neocortical low voltage fast activity, non-cholinergic hippocampal rhythmical slow activity and contributes to intelligent behavior. Vanderwolf CH, et al. **Brain Res** 1986 May 28;374(2):342–56

Effects of methylphenidate on normal children's mood, event-related potentials, and performance in memory scanning and vigilance. Peloquin LJ, et al. **J Abnorm Psychol** 1986 Feb;95(1):88–98

Contribution to the search for vigilance-indicative EEG variables. Results of a controlled, double-blind study with pyritinol in elderly patients with symptoms of mental dysfunction. Herrmann WM, et al. **Pharmacopsychiatry** 1986 Mar;19(2):75–83

EEG stability following corticotropin releasing factor in rats. Ehlers CL. **Psychoneuroendocrinology** 1986;11(1):121–5

[Refinement of an EEG diurnal vigilance index. Application to drug trials] Goldenberg F. **Rev Electroencephalogr Neurophysiol Clin** 1986 Mar; 16(1):39–48 (Eng. Abstr.) **(Fre)**

[EEG studies in rats to determine the threshold levels of chlorpromazine with respect to the state of vigilance] Bergschicker R, et al. **Biomed Biochim Acta** 1986;45(3):401–12 (Eng. Abstr.) **(Ger)**

[Identification of neuroleptics by using the characteristics of the spatial organization of the EEG] Monakhov KK, et al. **Farmakol Toksikol** 1986 May–Jun;49(3):27–32 (Eng. Abstr.) **(Rus)**

[Effect of haloperidol and clozapine on the bioelectric activity of the human cerebral cortex] Sviderskaia NE, et al. **Zh Nevropatol Psikhiatr** 1986;86(3):428–31 (Eng. Abstr.) **(Rus)**

ELECTROLYTES

Substance P-induced intestinal secretion of water and electrolytes. McFadden D, et al. **Gut** 1986 Mar;27(3):267–72

Effects of carbamazepine on serum electrolytes in affectively ill patients. Joffe RT, et al. **Psychol Med** 1986 May;16(2):331–5

ELECTROSHOCK

Changes in the behavioural response to a TRH analogue following chronic amitriptyline treatment and repeated electroconvulsive shock in the rat. Bennett GW, et al. **Br J Pharmacol** 1986 May;88(1):129–39

The effects of desipramine, zimelidine, electroconvulsive treatment and lithium on rat brain biogenic amines: a comparison with peripheral changes. Karoum F, et al. **Eur J Pharmacol** 1986 Mar 4; 121(3):377–85

Correlation of indices of stress with intensity of electrical shock for cows. Lefcourt AM, et al. **J Dairy Sci** 1986 Mar;69(3):833–42

Studies on rat brain catecholamine synthesis and beta-adrenoceptor number following administration of electroconvulsive shock, desipramine and clenbuterol. Nimgaonkar VL, et al. **J Neural Transm** 1986;65(3–4):245–59

Electroconvulsive shock and cyclic AMP signal transduction: effects distal to the receptor. Newman ME, et al. **J Neurochem** 1986 Jun; 46(6):1667–9

Disruption of conditioned taste aversion by ECS: the role of lithium chloride. Shaw N. **Physiol Behav** 1986;36(6):1193–5

EMOTIONS

Antiemotional and anticonvulsant activity of brotizolam and its effects on motor performance in animals. Böke-Kuhn K, et al. **Arzneimittelforschung** 1986 Mar;36(3A):528–31

Food, mood and health: the Medieval outlook. Mauron J. **Int J Vitam Nutr Res [Suppl]** 1986;29:9–26

Central muscarinic effects of physostigmine on mood, cardiovascular function, pituitary and adrenal neuroendocrine release. Janowsky DS, et al. **Psychopharmacology (Berlin)** 1986;89(2):150–4

Steroids may influence changes in mood [news] Barnes DM. **Science** 1986 Jun 13;232(4756):1344–5

[Subjective findings in emotionally stable and labile subjects following oral application of flupenthixol in small doses] Stieglitz RD, et al. **Arzneimittelforschung** 1986 May;36(5):850–4 (Eng. Abstr.) **(Ger)**

ENDORPHINS

Dysregulation of plasma pro-opiomelanocortin-related peptides in neurotic depression. Genazzani AR, et al. **Acta Endocrinol (Copenh)** 1986 May;112(1):1–6

Plasma beta-endorphin-like immunoreactivity during pregnancy, parturition, puerperium and in newborn. Zivný J, et al. **Acta Obstet Gynecol Scand** 1986;65(2):129–31

Involvement of a serotonergic control in the regulation of plasma levels of immunoreactive beta-endorphin. Cancela LM, et al. **Acta Physiol Pharmacol Latinoam** 1985;35(4):409–13

Eating behavior and plasma beta-endorphin in bulimia. Waller DA, et al. **Am J Clin Nutr** 1986 Jul;44(1):20–3

Opioid peptide processing and receptor selectivity. Höllt V. **Annu Rev Pharmacol Toxicol** 1986;26:59–77 (127 ref.)

The periaqueductal gray: a prerequisite for ACTH-induced excessive grooming. Spruijt BM, et al. **Behav Brain Res** 1986 Apr;20(1):19–25

A putative met-enkephalin releaser, kyotorphin enhances intracellular Ca2+ in the synaptosomes. Ueda H, et al. **Biochem Biophys Res Commun** 1986 Jun 13;137(2):897–902

Degradation of beta-casomorphin in the rat brain in vivo. Stark H, et al. **Biomed Biochim Acta** 1986;45(4):557–63

gamma-Endorphin and schizophrenia: amino acid composition of gamma-endorphin and nucleotide sequence of gamma-endorphin cDNA from pituitary glands of schizophrenic patients. Bovenberg RA, et al. **Brain Res** 1986 Jun 18;376(1):29–37

Opioid-induced feeding: localization of sensitive brain sites. Gosnell BA, et al. **Brain Res** 1986 Mar 26;369(1–2):177–84

Central nervous system mediation of positive and negative reinforcement in neonatal albino rats. Kehoe P, et al. **Brain Res** 1986 Jun; 392(1–2):69–75

The course of the decrease of hypothalamic beta-endorphin induced by training, and the development of the effect of beta-endorphin on the retrieval of inhibitory avoidance in rats. Izquierdo I, et al. **Braz J Med Biol Res** 1985;18(3):391–5

Hormonal and metabolic responses to intracarotid and intrajugular infusion of beta-endorphin in normal dogs. el-Tayeb KM, et al. **Can J Physiol Pharmacol** 1986 Mar;64(3):306–10

An opioid mechanism modulates central and not peripheral dopaminergic control of ciliary activity in the marine mussel Mytilus edulis. Aiello E, et al. **Cell Mol Neurobiol** 1986 Mar;6(1):17–30

Cardiocirculatory effects of physiological doses of beta-endorphin. Tuggle DW, et al. **Circ Shock** 1986;18(3):215–25

Endorphins and amylase secretion [letter] Davison JS. **Dig Dis Sci** 1986 May;31(5):556–7

Acute hemorrhagic stress in conscious sheep elevates immunoreactive beta-endorphin in plasma but not in cerebrospinal fluid. Smith R, et al. **Endocrinology** 1986 Jun;118(6):2572–6

Antagonism of beta-endorphin-induced prolactin release by alpha-melanocyte-stimulating hormone and corticotropin-like intermediate lobe peptide. Wardlaw SL, et al. **Endocrinology** 1986 Jul; 119(1):112–8

Regulation of beta-endorphin, corticotropin-like intermediate lobe peptide, and alpha-melanotropin-stimulating hormone in the hypothalamus by testosterone. Wardlaw SL. **Endocrinology** 1986 Jul; 119(1):19–24

Beta-endorphin and ACTH levels in peripheral blood during and after aerobic and anaerobic exercise. de Meirleir K, et al. **Eur J Appl Physiol** 1986;55(1):5–8

Stress hormonal response to exercise after sleep loss. Martin BJ, et al. **Eur J Appl Physiol** 1986;55(2):210–4

Opioid peptides. Structure-activity relationships in [OGly4] dermorphin tetrapeptides. X. Salvadori S, et al. **Farmaco [Sci]** 1986 Feb; 41(2):103–10

Discordances in the temporal pattern of the ACTH/beta-endorphin releasing effects of synthetic CRFs and partially purified bovine CRF in a superfusion system. Yasuda Y, et al. **Horm Metab Res** 1986 May; 18(5):313–7

The interaction between gamma-type endorphins and HLA class I antigens. Claas FH, et al. **Hum Immunol** 1986 Apr;15(4):347–56

Influence of beta-endorphin, somatostatin, substance P and vasoactive intestinal peptide on the proliferative response of human peripheral blood T lymphocytes to mercuric chloride. Nordlind K, et al. **Int Arch Allergy Appl Immunol** 1986;80(3):326–8

beta-Endorphin-(1–27) inhibits the spinal beta-endorphin-induced release of Met-enkephalin. Tseng LF, et al. **Int J Pept Protein Res** 1986 Apr; 27(4):394–7

Relationships among concentrations of four opioid neuropeptides and luteinizing hormone-releasing hormone in neural tissues of beef cows following early weaning. Malven PV, et al. **J Anim Sci** 1986 Mar; 62(3):723-33

High-performance liquid chromatography of amino acids, peptides and proteins. LXVII. Evaluation of bandwidth relationships of peptides related to human beta-endorphin, separated by gradient-elution reversed-phase high-performance liquid chromatography. Hearn MT, et al. **J Chromatogr** 1986 Feb 21;352:35-66

Pro-opiomelanocortin messenger ribonucleic acid and posttranslational processing of beta endorphin in spleen macrophages. Lolait SJ, et al. **J Clin Invest** 1986 Jun;77(6):1776-9

Pregnancy-associated changes in ovarian immunoreactive beta-endorphin in rats. Autelitano DJ, et al. **J Endocrinol** 1986 Mar;108(3):343-50

Dissociation between CSF and plasma B-endorphin in major depressive disorders: evidence for a different regulation. Facchinetti F, et al. **J Endocrinol Invest** 1986 Feb;9(1):11-4

Conversion of leumorphin (dynorphin B-29) to dynorphin B and dynorphin B-14 by thiol protease activity. Devi L, et al. **J Neurochem** 1986 Jul;47(1):154-7

beta-Endorphin-induced stimulation of central sympathetic outflow: inhibitory modulation by central noradrenergic neurons. Appel NM, et al. **J Pharmacol Exp Ther** 1986 Jun;237(3):695-701

Structural modifications of pro-opiomelanocortin-derived peptides alter their behavioral effects markedly. Hirsch MD, et al. **J Pharmacol Exp Ther** 1986 May;237(2):378-85

Enzyme linked immunosorbent assay (ELISA) for beta-endorphin and its antibodies. Sarma JK, et al. **Life Sci** 1986 May 12;38(19):1723-32

Uptake and release of kyotorphin in rat brain synaptosomes. Ueda H, et al. **Life Sci** 1986 Jun 30;38(26):2405-11

Computationally directed biorational drug design of peptides. Momany FA, et al. **Methods Enzymol** 1986;124:3-18

Structure-activity studies of morphiceptin analogs: receptor binding and molecular determinants of mu-affinity and selectivity. Loew G, et al. **Mol Pharmacol** 1986 Jun;29(6):546-53

Plasma beta-endorphin and beta-lipotropin in patients with end-stage renal disease--effects of hemodialysis. Elias AN, et al. **Nephron** 1986; 43(3):173-6

Effect of various blockers of arachidonic acid metabolism on release of beta-endorphin- and adrenocorticotropin-like immunoreactivity induced by phospholipase A2 from rat adenohypophysis in vitro. Knepel W, et al. **Neuroendocrinology** 1986;43(1):44-8

Acetylation of melanocyte-stimulating hormone and beta-endorphin in the pars intermedia of the perinatal pituitary gland in the mouse. Leenders HJ, et al. **Neuroendocrinology** 1986;43(2):166-74

Suppression of receptive and proceptive behavior in ovariectomized, estrogen-progesterone-primed rats by intraventricular beta-endorphin: studies of behavioral specificity. Wiesner JB, et al. **Neuroendocrinology** 1986;43(1):57-62

The effects of aging on molecular forms of beta- and gamma-endorphins in rat hypothalamus. Wilkinson CW, et al. **Neuroendocrinology** 1986; 43(2):124-31

RIA/chromatographic evidence for novel opioid peptide(s) in Squilla mantis ganglia. Palmisano A, et al. **Neuropeptides** 1986 Apr; 7(3):281-9

Estradiol target sites immunoreactive for beta-endorphin in the arcuate nucleus of rat and mouse hypothalamus. Jirikowski GF, et al. **Neurosci Lett** 1986 Apr 11;65(2):121-6

alpha-N-acetylated beta-endorphin is differentially processed in the normal and hypothalamo-pituitary-disconnected (HPD) ewe. Smith AI, et al. **Neurosci Lett** 1986 Apr 11;65(2):229-33

Opioid and other peptides as inhibitors of leumorphin (dynorphin B-29) converting activity. Devi L, et al. **Peptides** 1986 Jan-Feb;7(1):87-90

Characterization of endorphins from the pituitary of the spiny dogfish Squalus acanthias. Lorenz RG, et al. **Peptides** 1986 Jan-Feb; 7(1):119-26

Does placebo response mediate runner's high? Hinton ER, et al. **Percept Mot Skills** 1986 Jun;62(3):789-90

Effect of beta-endorphin on sociosexual proclivity in a choice paradigm. Wiesner JB, et al. **Pharmacol Biochem Behav** 1986 Mar;24(3):507-11

The effect of altered 5-hydroxytryptamine levels on beta-endorphin content in rat brain. Soliman KF, et al. **Proc Soc Exp Biol Med** 1986 Jun;182(2):187-93

Diurnal rhythm of plasma beta endorphin, cortisol and growth hormone in schizophrenics as compared to control subjects. Gil-Ad I, et al. **Psychopharmacology (Berlin)** 1986;88(4):496-9

Selective potentiations in opioid analgesia following scopolamine pretreatment. Sperber ES, et al. **Psychopharmacology (Berlin)** 1986; 89(2):175-6

Release of immunoreactive met-enkephalin by intraventricular beta-endorphin in anesthetized rats. Tseng LF, et al. **Regul Pept** 1986 May;14(3):181-92

Des-enkephalin-gamma-endorphin: bioavailability in rats following the subcutaneous and intramuscular route of administration. Verhoef JC, et al. **Regul Pept** 1986 Apr;14(2):113-24

Investigating opioid peptides in schizophrenia and depression. Berger PA, et al. **Res Publ Assoc Res Nerv Ment Dis** 1986;64:309-33 (91 ref.)

[Beta-endorphin and dynorphin are involved in the central depressor action of clonidine or norepinephrine in rats] Xie CW, et al. **Sheng Li Hsueh Pao** 1985 Apr;37(2):172-9 (Eng. Abstr.) **(Chi)**

[A new group of hormones, endogenous ligands for drug receptors] Schreiber V. **Cesk Fysiol** 1986;35(3):219-23 **(Cze)**

[Development of a radioimmunoassay for beta-casomorphin (1-5)] Furkert J, et al. **Radiobiol Radiother (Berl)** 1986;27(2):205-13 (Eng. Abstr.) **(Ger)**

[Plasma levels of beta-endorphin and ACTH during critical increase in arterial pressure in man] Giovannini C, et al. **Boll Soc Ital Biol Sper** 1986 Jan 31;62(1):7-13 (Eng. Abstr.) **(Ita)**

[Effect of intrathecal beta-endorphin and electrical tooth pulp stimulation on endocrine and cardiovascular functions] Miyata A. **Masui** 1986 Feb; 35(2):250-9 (Eng. Abstr.) **(Jpn)**

[Maternal beta-endorphin secretion during pregnancy--measurement of immunoreactive beta-endorphin in urine] Sumioki H, et al. **Nippon Sanka Fujinka Gakkai Zasshi** 1986 Apr;38(4):499-504 (Eng. Abstr.) **(Jpn)**

[Detection of the pro-opiomelanocortin peptide fragments--beta-endorphin and ACTH--in the adrenals of rats and mice by immunohistochemistry] Arefolov VA, et al. **Biull Eksp Biol Med** 1986 Apr;101(4):445-7 (Eng. Abstr.) **(Rus)**

[Immunohistochemical identification of endogenous sources of cardiac glycoside biosynthesis] Kvetnoi IM, et al. **Biull Eksp Biol Med** 1986 Apr;101(4):392-3 (Eng. Abstr.) **(Rus)**

[Effect of beta-endorphin on catecholamine levels in the rat hypothalamus and cerebral cortex] Slavnov VN, et al. **Biull Eksp Biol Med** 1986 May; 101(5):562-4 (Eng. Abstr.) **(Rus)**

[Beta-endorphin and corticotropin in the blood of patients during the acute period of severe craniocerebral injury] Marzoian RA, et al. **Vopr Med Khim** 1986 May-Jun;32(3):95-8 (Eng. Abstr.) **(Rus)**

[Changes in the chemosensitive properties of the central neurons of the snail Helix pomatia and of the mouse as affected by opioid peptides] Zakharov ND, et al. **Zh Evol Biokhim Fiziol** 1986 Mar-Apr; 22(2):166-9 (Eng. Abstr.) **(Rus)**

ENKEPHALIN, LEUCINE

Simple synthesis of (leucine5)-enkephaline. Vičar J. **Acta Univ Palacki Olomuc Fac Med** 1982;103:139-46

Long-term effects of leucine-enkephalin on active avoidance responding in mice. Dana RC, et al. **Behav Neurosci** 1986 Apr;100(2):185-9

In vitro activity profiles of cyclic and linear enkephalin pseudopeptide analogs. Edwards JV, et al. **Biochem Biophys Res Commun** 1986 Apr 29;136(2):730-6

Cyclic AMP or forskolin rapidly attenuates the depressant effects of opioids on sensory-evoked dorsal-horn responses in mouse spinal cord-ganglion explants. Crain SM, et al. **Brain Res** 1986 Apr 2; 370(1):61-72

Opioid-induced feeding: localization of sensitive brain sites. Gosnell BA, et al. **Brain Res** 1986 Mar 26;369(1-2):177-84

Release of [Leu5]enkephalin immunoreactivity from the isolated perfused rat stomach. Nishimura E, et al. **Eur J Pharmacol** 1986 May 13; 124(1-2):43-9

Cystamine-enkephalin dimer. Syntheses and biological activities of enkephalin analogs containing cystamine and cysteamine. Kondo M, et al. **Int J Pept Protein Res** 1986 Feb;27(2):153-9

Enkephalin-like substance in aplysia nervous tissue and actions of leu-enkephalin on single neurons. Leung MK, et al. **Life Sci** 1986 Apr 21;38(16):1529-34

Production and characterization of a rat monoclonal antibody against leu5 enkephalin. Hérion P, et al. **Mol Immunol** 1986 Feb;23(2):209-15

Leu-enkephalin content in rat brain during prolonged treatment with imipramine or amitriptyline. Herman ZS, et al. **Neuropeptides** 1986 Feb-Mar;7(2):113-24

Maturation of opioid sensitivity of fetal mouse dorsal root ganglion neuron perikarya in organotypic cultures: regulation by spinal cord. Chalazonitis A, et al. **Neuroscience** 1986 Apr;17(4):1181-98

The glutamate decarboxylase-, leucine enkephalin-, methionine enkephalin- and substance P-immunoreactive neurons in the neostriatum of the rat and cat: evidence for partial population overlap. Penny GR, et al. **Neuroscience** 1986 Apr;17(4):1011-45

The crystal structures of [Met5]enkephalin and a third form of [Leu5]enkephalin: observations of a novel pleated beta-sheet. Griffin JF, et al. **Proc Natl Acad Sci USA** 1986 May;83(10):3272-6

Selective potentiations in opioid analgesia following scopolamine pretreatment. Sperber ES, et al. **Psychopharmacology (Berlin)** 1986; 89(2):175-6

Enkephalin contents reflect noradrenergic large dense cored vesicle populations in vasa deferentia. Douglas BH 2d, et al. **Regul Pept** 1986 May;14(3):193-210

[Enkephalin metabolism in human serum--the measurement of Leu-enkephalin-like substance in human serum] Machi T, et al. **Masui** 1985 Dec;34(12):1588-93 (Eng. Abstr.) **(Jpn)**

[Effect of enkephalins on various mechanisms regulating glycogen concentration in the liver] Zoloev GK. **Probl Endokrinol (Mosk)** 1986 Mar-Apr;32(2):58-60 (Eng. Abstr.) **(Rus)**

ENKEPHALIN, METHIONINE

A putative met-enkephalin releaser, kyotorphin enhances intracellular Ca2+ in the synaptosomes. Ueda H, et al. **Biochem Biophys Res Commun** 1986 Jun 13;137(2):897-902

Intragranular colocalization of CRF and Met-Enk-8 in nerve terminals in the rat median eminence. Hisano S, et al. **Brain Res** 1986 Apr 9; 370(2):321-6

Influence of nitrous oxide upon regional brain levels of methionine-enkephalin-like immunoreactivity in rats. Quock RM, et al. **Brain Res Bull** 1986 Mar;16(3):321-3

Quality control of azure B preparations by liquid chromatography and standardization with azure B tetrafluoroborate. Nelis HJ, et al. **Clin Chim Acta** 1986 May 15;156(3):247-57

Disturbance of a met-enkephalin-like hormone in the hepatopancreas of crabs contaminated by metals. Amiard-Triquet C, et al. **Ecotoxicol Environ Safety** 1986 Apr;11(2):198-209

beta-Endorphin-(1-27) inhibits the spinal beta-endorphin-induced release of Met-enkephalin. Tseng LF, et al. **Int J Pept Protein Res** 1986 Apr; 27(4):394-7

Immunohistochemical distribution of substance P, serotonin, and methionine enkephalin in sexually dimorphic nuclei of the rat lumbar spinal cord. Micevych PE, et al. **J Comp Neurol** 1986 Jun 8; 248(2):235-44

Effects of hypoxia on neuropeptide levels in the rabbit superior cervical ganglion. Hanson G, et al. **J Neurobiol** 1986 Jan;17(1):51-4

Effects of kelatorphan and other peptidase inhibitors on the in vitro and in vivo release of methionine-enkephalin-like material from the rat spinal cord. Bourgoin S, et al. **J Pharmacol Exp Ther** 1986 Jul; 238(1):360-6

Evidence that long-term methionine-enkephalin administration stimulates rat adrenal zona fasciculata. Robba C, et al. **J Steroid Biochem** 1986 Apr;24(4):917-9

The inactivation of [Met5]-enkephalin by bestatin-sensitive aminopeptidase, captopril-sensitive peptidyl dipeptidase A and thiorphan-sensitive endopeptidase-24.11 in mouse vas deferens. Aoki K, et al. **Jpn J Pharmacol** 1986 Feb;40(2):297-302

Stabilization of methionine-enkephalin in human and rat blood. Aloyo VJ, et al. **Life Sci** 1986 Jul 7;39(1):21-8

Localization of Met-enkephalin-Arg6-Gly7-Leu8 immunoreactivity in rat duodenum. Wolter HJ. **Neuropeptides** 1986 Apr;7(3):201-6

Met-enkephalin selectively increases the spontaneous release of amino acid neurotransmitters from rat striatal slices. Arneric SP, et al. **Neurosci Lett** 1986 May 6;66(1):73-8

Distribution of Met-enkephalin immunoreactive fibres in the thalamus of the cat. Conrath M, et al. **Neurosci Lett** 1986 Apr 24; 65(3):299-303

The glutamate decarboxylase-, leucine enkephalin-, methionine enkephalin- and substance P-immunoreactive neurons in the neostriatum of the rat and cat: evidence for partial population overlap. Penny GR, et al. **Neuroscience** 1986 Apr;17(4):1011-45

Age-dependent influence of hypoxia on methionine-enkephalin concentration within rabbit brainstem nuclei. Gingras-Leatherman JL, et al. **Pediatr Res** 1986 Jul;20(7):655-7

Episodic secretion of met-enkephalin immunoreactive material in human plasma and CSF. Govoni S, et al. **Pharmacol Res Commun** 1986 Feb; 18(2):155-9

The crystal structures of [Met5]enkephalin and a third form of [Leu5]enkephalin: observations of a novel pleated beta-sheet. Griffin JF, et al. **Proc Natl Acad Sci USA** 1986 May;83(10):3272-6

Enkephalin contents reflect noradrenergic large dense cored vesicle populations in vasa deferentia. Douglas BH 2d, et al. **Regul Pept** 1986 May;14(3):193-210

Release of immunoreactive met-enkephalin by intraventricular beta-endorphin in anesthetized rats. Tseng LF, et al. **Regul Pept** 1986 May;14(3):181-92

ENKEPHALINS

Light and electron microscope demonstration of VIP- and enkephalin-immunoreactive nerves in the human male genitourinary tract. Vaalasti A, et al. **Anat Rec** 1986 May;215(1):21-7

In vitro activity profiles of cyclic and linear enkephalin pseudopeptide analogs. Edwards JV, et al. **Biochem Biophys Res Commun** 1986 Apr 29;136(2):730-6

Tyr1-substituted and fluorescent Pya1-enkephalins bind strongly and selectively to mu and delta opiate receptors. Mihara H, et al. **Biochem Biophys Res Commun** 1986 May 14;136(3):1170-6

Ultrastructural evidence of dopaminergic input to enkephalinergic neurons in rat neostriatum. Kubota Y, et al. **Brain Res** 1986 Mar 5; 367(1-2):374-8

Enkephalin-containing polypeptides in human cerebrospinal fluid. Nyberg F, et al. **Brain Res** 1986 Apr 23;371(2):278-86

Changes in the immunoreactivities of an opioid peptide leumorphin in the hypothalamus and anterior pituitary during the estrous cycle of the rat and their relation to sexual behavior. Suda M, et al. **Brain Res** 1986 May 28;374(2):236-43

Control mechanisms of peripheral enkephalin hydrolysis in mammalian plasma. Venturelli F, et al. **Comp Biochem Physiol [C]** 1986; 83(2):307-11

Proenkephalin A gene expression in bovine adrenal chromaffin cells is regulated by changes in electrical activity. Kley N, et al. **EMBO J** 1986 May;5(5):967-70

The proenkephalin gene is widely expressed within the male and female reproductive systems of the rat and hamster. Kilpatrick DL, et al. **Endocrinology** 1986 Jul;119(1):370-4

Conversion of leumorphin (dynorphin B-29) to dynorphin B and dynorphin B-14 by thiol protease activity. Devi L, et al. **J Neurochem** 1986 Jul;47(1):154-7

Enkephalin hydrolysis in homogenates of various absorptive mucosae of the albino rabbit: similarities in rates and involvement of aminopeptidases. Kashi SD, et al. **Life Sci** 1986 Jun 2; 38(22):2019-28

Enkephalin-like substance in aplysia nervous tissue and actions of leu-enkephalin on single neurons. Leung MK, et al. **Life Sci** 1986 Apr 21;38(16):1529-34

Use of vaccinia virus as a neuropeptide expression vector. Hruby DE, et al. **Methods Enzymol** 1986;124:295-309

Computationally directed biorational drug design of peptides. Momany FA, et al. **Methods Enzymol** 1986;124:3-18

Methods for estimating the contribution of proenkephalin A and proenkephalin B input to neuronal areas. Sundberg [illegible], et al. **Methods Enzymol** 1986;124:617-26

RIA/chromatographic evidence for novel opioid peptide(s) in Squilla mantis ganglia. Palmisano A, et al. **Neuropeptides** 1986 Apr; 7(3):281-9

Immunocytochemical localization of proenkephalin-derived peptides in the central nervous system of the rat. Merchenthaler I, et al. **Neuroscience** 1986 Feb;17(2):325-48

Opioid and other peptides as inhibitors of leumorphin (dynorphin B-29) converting activity. Devi L, et al. **Peptides** 1986 Jan-Feb;7(1):87-90

Opioid mydriasis: cross-tolerance between morphine and enkephalins. Ben-Am M, et al. **Pharmacology** 1986;32(5):278-82

Expression of proenkephalin messenger RNA by mouse spermatogenic cells. Kilpatrick DL, et al. **Proc Natl Acad Sci USA** 1986 Jul; 83(14):5015-8

Expression and cell type--specific processing of human preproenkephalin with a vaccinia recombinant. Thomas G, et al. **Science** 1986 Jun 27; 232(4758):1641-3

[Enkephalin-forming enzymes (review)] Grigor'iants OO, et al. **Vopr Med Khim** 1986 May-Jun;32(3):15-20 (52 ref.) **(Rus)**

ENURESIS

[Enuresis nocturna in school children in Bodö. A therapeutic trial with a vasopressin analog: desmopressin and imipramine] Holt J, et al. **Tidsskr Nor Laegeforen** 1986 Mar 20;106(8):651-4 (Eng. Abstr.)**(Nor)**

EPHEDRINE

New liquid membrane electrode for the determination of ephedrine, epinephrine, and norepinephrine. Hassan SS, et al. **Anal Chem** 1986 May; 58(6):1052-4

Pharmacological studies of two novel polycyclic derivatives of ephedrine. van der Schyf CJ, et al. **Arch Pharm (Weinheim)** 1986 May; 319(5):409-15

Production of nitrosamines from ephedrine, pseudoephedrine and extracts of Ephedra foliata under physiological conditions. Alwan SM, et al. **Cancer Lett** 1986 May;31(2):221-6

Chiral recognition model for the resolution of ephedrine and related alpha,beta-aminoalcohols as enantiomeric oxazolidine derivatives. Wainer IW, et al. **J Chromatogr** 1986 Mar 14;355(1):149-56

EPINEPHRINE

Renal extraction of endogenous and radiolabelled catecholamines in the dog. Bradley T, et al. **Acta Physiol Scand** 1986 Apr;126(4):505-10

Catecholamines of endoneurial laryngeal paraganglia in the rat. Dahlqvist A, et al. **Acta Physiol Scand** 1986 Jun;127(2):257-61

Binding of catecholamines to phospholipids isolated from adrenal medullary granules. Lishajko F. **Acta Physiol Scand** 1986 Jun; 127(2):177-85

Altered cardiovascular responsiveness to adrenaline in endurance-trained subjects. Svedenhag J, et al. **Acta Physiol Scand** 1986 Apr; 126(4):539-50

Temperature effects on catecholamine accumulation in neuronal and extraneuronal compartments in the cod spleen. Ungell AL. **Acta Physiol Scand** 1986 Apr;126(4):589-92

Inhibitory effects of desmethylimipramine, metanephrine and normetanephrine on the neuronal and extraneuronal accumulation of catecholamines in fish spleen. Ungell AL. **Acta Physiol Scand** 1986 May; 127(1):27-31

Topical anesthesia for laceration repair: tetracaine versus TAC (tetracaine, adrenaline, and cocaine). White WB, et al. **Am J Emerg Med** 1986 Jul; 4(4):319–22

Interaction between epinephrine and renal nerves in control of renin secretion rate. Kopp UC, et al. **Am J Physiol** 1986 Jun; 250(6 Pt 2):F999–1007

Metabolic effects of chronic infusions of epinephrine and norepinephrine in rats. Racotta R, et al. **Am J Physiol** 1986 May; 250(5 Pt 1):E518–22

New liquid membrane electrode for the determination of ephedrine, epinephrine, and norepinephrine. Hassan SS, et al. **Anal Chem** 1986 May; 58(6):1052–4

Monitoring maternal heart rate during epidural injection of a test dose containing epinephrine [letter] Chestnut DH, et al. **Anesthesiology** 1986 Jun;64(6):839–40

On the acceleration of epinephrine absorption by lidocaine [letter] Sosis M, et al. **Anesthesiology** 1986 Jul;65(1):103–4

Induction of refractoriness of cyclic AMP responses to prostaglandin E1 and epinephrine by prior exposure of guinea pig macrophages to lipopolysaccharide. Hazeki K, et al. **Arch Biochem Biophys** 1986 May 1;246(2):772–82

Glucose modulation of memory storage processing. Gold PE. **Behav Neural Biol** 1986 May;45(3):342–9

Epinephrine modulates long-term retention of an aversively motivated discrimination. Introini-Collison IB, et al. **Behav Neural Biol** 1986 May; 45(3):358–65

Comparative responses of the central adrenaline- and noradrenaline-containing neurons after reserpine injections. Lambás-Señas L, et al. **Biochem Pharmacol** 1986 Jul 1; 35(13):2207–11

Homologous and heterologous desensitization of one of the pathways of the alpha 1-adrenergic action. Effects of epinephrine, vasopressin, angiotensin II and phorbol 12-myristate 13-acetate. Garcia-Sáinz JA, et al. **Biochim Biophys Acta** 1986 Jun 16;887(1):73–9

Phorbol esters, vasopressin and angiotensin II block alpha 1-adrenergic action in rat hepatocytes. Possible role of protein kinase C. Garcia-Sáinz JA, et al. **Biochim Biophys Acta** 1986 Jun 16;887(1):69–72

Oxygen tension changes in the outer vascular wall supplied by vasa vasorum following adenosine and epinephrine. Buerk DG, et al. **Blood Vessels** 1986;23(1):9–21

Extradural morphine: influence of adrenaline admixture. Nordberg G, et al. **Br J Anaesth** 1986 Jun;58(6):598–604

Effects of i.a. lignocaine on adrenaline-induced vasoconstriction. Pateromichelakis S, et al. **Br J Anaesth** 1986 Jun;58(6):649–52

Comparison of the effects of the ionophore salinomycin and adrenaline on the haemodynamics and work efficiency of the dog heart. Fahim M, et al. **Cardiovasc Res** 1986 Feb;20(2):145–52

Reduced imprecision of the radioenzymatic assay of plasma catecholamines by improving the stability of the internal standards. Hoffmann JJ, et al. **Clin Chim Acta** 1986 Apr 30;156(2):221–5

Effects of histamine receptor antagonism on adrenaline-induced changes in blood pressure in intact dogs. Johnson MD, et al. **Clin Exp Pharmacol Physiol** 1985 Nov–Dec;12(6):557–64

Comparison of the inhibitory effects of spermine, papaverine and adrenaline upon isolated segments of the rat small intestine. Martin JS, et al. **Clin Exp Pharmacol Physiol** 1986 Jan;13(1):87–90

Stimulus-induced release of endogenous catecholamines from human washed platelets. Smith CC, et al. **Clin Sci** 1986 May;70(5):495–500

Ventilatory effects of the stress hormones in normal man. Askanazi J, et al. **Crit Care Med** 1986 Jul;14(7):602–5

Responses to epinephrine in patients with anorexia nervosa. Nakagawa K, et al. **Endocrinol Jpn** 1985 Dec;32(6):845–9

Effects of epinephrine, norepinephrine, and dopamine on gonadotropin-releasing hormone-induced secretion of luteinizing hormone in vitro. Swartz SR, et al. **Endocrinology** 1986 Jun; 118(6):2425–31

Sex-related differences in free plasma catecholamines in individuals of similar performance ability during graded ergometric exercise. Lehmann M, et al. **Eur J Appl Physiol** 1986;55(1):54–8

Labelling of human platelet alpha 2-adrenoceptors with the full agonist [3H](-)adrenaline. Garcia-Sevilla JA, et al. **Eur J Pharmacol** 1986 May 13;124(1–2):31–41

Inactivation of basal glycogen synthase by glucagon and epinephrine in hepatocytes from fed rats. Bosch F, et al. **FEBS Lett** 1986 May 5; 200(1):47–50

A suppressive role of c-kinase for the stimulation of hepatic ketogenesis by glucagon and epinephrine. Kojima H, et al. **FEBS Lett** 1986 Jun 9;201(2):271–6

Effect of different beta-blocking drugs and adrenaline on the conversion of thyroxine to triiodothyronine in isolated rat hepatocytes. Aanderud S, et al. **Horm Metab Res** 1986 Feb;18(2):110–3

Relationship between sleep variables and urinary excretion of adrenaline in nocturnal sleep. Nishihara K, et al. **Ind Health** 1985;23(4):279–82

Butyltin compounds in vitro inhibition of human platelet epinephrine-induced aggregation and blockade of epinephrine binding to platelets. Yanagisawa H, et al. **Ind Health** 1985;23(4):255–68

Interaction of epinephrine and propranolol [letter] Spencer PS, et al. **J Am Acad Dermatol** 1986 Jun;14(6):1093–4

The effects of intrathecal administration of arginine-vasopressin and substance P on blood pressure and adrenal secretion of epinephrine in rats. Riphagen CL, et al. **J Auton Nerv Syst** 1986 Jun;16(2):91–9

Platelet ADP receptor and alpha 2-adrenoreceptor interaction. Evidence for an ADP requirement for epinephrine-induced platelet activation and an influence of epinephrine on ADP binding. Figures WR, et al. **J Biol Chem** 1986 May 5;261(13):5981–6

Catecholamines induce an increase in nerve growth factor content in the medium of mouse L-M cells. Furukawa Y, et al. **J Biol Chem** 1986 May 5;261(13):6039–47

Inhibitors of Na+/H+ exchange block epinephrine- and ADP-induced stimulation of human platelet phospholipase C by blockade of arachidonic acid release at a prior step. Sweatt JD, et al. **J Biol Chem** 1986 Jul 5;261(19):8660–6

Distribution of tyrosine hydroxylase and neuropeptide Y-like immunoreactive neurons in rabbit medulla oblongata, with attention to colocalization studies, presumptive adrenaline-synthesizing perikarya, and vagal preganglionic cells. Blessing WW, et al. **J Comp Neurol** 1986 Jun 8;248(2):285–300

Effect of chronic growth hormone treatment on responses to epinephrine and thyrotropin-releasing hormone in lactating cows. McCutcheon SN, et al. **J Dairy Sci** 1986 Jan;69(1):44–51

Mechanism of long-term potentiation of transmitter release induced by adrenaline in bullfrog sympathetic ganglia. Kumamoto E, et al. **J Gen Physiol** 1986 May;87(5):775–93

Effects of intravenous epinephrine on macaque platelets. Beatty CH, et al. **J Med Primatol** 1986;15(1):49–61

Low plasma concentrations of adrenaline and physiological tremor in man. Fellows IW, et al. **J Neurol Neurosurg Psychiatry** 1986 Apr; 49(4):396–9

Effects of epinephrine, isoproterenol and IPS-339 on sympathetic transmission to the dog heart: evidence against the facilitatory role of presynaptic beta adrenoceptors. Yorikane R, et al. **J Pharmacol Exp Ther** 1986 Jul;238(1):334–40

Administration of intratracheal epinephrine by cricothyroid needle puncture [letter] Ravenel SD. **JAMA** 1986 Jun 6;255(21):2898–9

Effect of epinephrine infusion and adrenergic blockade on glucose oxidation in conscious dogs. Wolfe RR, et al. **Metabolism** 1986 Jul; 35(7):673–8

Effects of epinephrine on electrical properties of Madin-Darby canine kidney cells. Paulmichl M, et al. **Pflugers Arch** 1986 Apr; 406(4):367–71

[Intra-chamber adrenaline infusion in the extracapsular surgery of the lens. Value and limitations of the method] Dupeyron G, et al. **Bull Soc Ophtalmol Fr** 1985 May;85(5):631–4 **(Fre)**

[The stability of commercial adrenaline solutions. 3. The stability of adrenaline solutions] Thoma K, et al. **Pharm Acta Helv** 1986; 61(3):66–8 (Eng. Abstr.) **(Ger)**

[Sexual dimorphism in the pressor response to l-adrenaline in rats] Tomori M, et al. **Nippon Yakurigaku Zasshi** 1986 Mar;87(3):323–9 (Eng. Abstr.) **(Jpn)**

[Effect of continuous, intermittent and impulse acoustic stimuli on plasma catecholamine levels in humans at rest and during physical exertion] Buczyński A, et al. **Pol Tyg Lek** 1986 Jan 27;41(4):110–3 (Eng. Abstr.) **(Pol)**

[Role of adrenergic receptors in the regulation of glycogen metabolism in the liver] Torlińska T, et al. **Postepy Hig Med Dosw** 1985 Sep–Oct; 39(5):561–77 (75 ref.) (Eng. Abstr.) **(Pol)**

[Changes in blood volume in the heart and lungs and its role in the regulation of left-ventricular blood output after administration of catecholamines] Osadchil LI, et al. **Fiziol Zh** 1986 Mar–Apr; 32(2):149–54 (Eng. Abstr.) **(Rus)**

[Activity of presynaptic alpha-adrenoreceptors during prolonged perfusion with adrenaline] Berdysheva LV, et al. **Fiziol Zh SSSR** 1986 May;72(5):590–4 (Eng. Abstr.) **(Rus)**

[Circadian curve of adrenaline excretion as an indicator of the functional status of the body] Kuindzhi NN, et al. **Gig Sanit** 1986 Mar; (3):60–3 **(Rus)**

[Effect of adrenaline, hydrocortisone and serum HDL lipoproteins on the activity of multiple forms of glucose-6-phosphate dehydrogenase in the rat liver] Panin LE, et al. **Vopr Med Khim** 1986 May–Jun; 32(3):61–5 (Eng. Abstr.) **(Rus)**

ESCAPE REACTION

5,7-Dihydroxytryptamine lesions of crayfish serotonin-containing neurons: effect on the lateral giant escape reaction. Glanzman DL, et al. **J Neurosci** 1986 Jun;6(6):1560–9

ESTRADIOL

The effect of oestriol and tamoxifen on oestradiol induced prolactin secretion in anaesthetised rats. Gilna P, et al. **Acta Endocrinol (Copenh)** 1986 May;112(1):71–8

Biochemical and radioautographic analysis of estrogen-inducible progestin receptors in female ferret brain and pituitary: correlations with effects of progesterone on sexual behavior and gonadotropin-releasing hormone-stimulated secretion of luteinizing hormone. Baum MJ, et al. **Brain Res** 1986 Mar 19;368(2):296-309

Analysis of temporal and dose-dependent effects of estrogen on monoamines in brain nuclei. Renner K, et al. **Brain Res** 1986 Feb 26; 366(1-2):64-71

Modulation of the estradiol-induced luteinizing hormone surge by progesterone or antiestrogens: effects on pituitary gonadotropin-releasing hormone receptors. Attardi B, et al. **Endocrinology** 1986 Jul;119(1):274-83

The effect of oestradiolum benzoicum and progesterone on the noradrenalin content in organs of the female reproductive system of sexually immature pigs. Lakomy M, et al. **Gegenbaurs Morphol Jahrb** 1986;132(1):129-43

Anterior pituitary concentrations of gonadotropins, GnRH-receptors and ovarian characteristics following early weaning in beef cows. Parfet JR, et al. **J Anim Sci** 1986 Mar;62(3):717-22

Pituitary self-priming actions of gonadotropin-releasing hormone. Kinetics of estradiol's potentiating effects on gonadotropin-releasing hormone-facilitated luteinizing hormone and follicle-stimulating hormone release in healthy postmenopausal women. Veldhuis JD, et al. **J Clin Invest** 1986 Jun;77(6):1849-56

Central adrenergic activity in the mediobasal hypothalamus is temporally related to surge outputs of gonadotrophins in oestrogen-stimulated infant female rats. Clement EM, et al. **J Endocrinol** 1986 Apr; 109(1):45-5

Influence of subcutaneous melatonin implantation on gonadal development and on plasma levels of luteinizing hormone, testosterone, estradiol, and corticosterone in the pigeon. John TM, et al. **J Pineal Res** 1986;3(2):169-79

Activation-inactivation of hormone binding sites of the oestradiol-17 beta receptor is a multiregulated process. Auricchio F, et al. **J Steroid Biochem** 1986 Jan;24(1):39-43

Effects of estradiol and progesterone on immunoreactive forms of hypothalamic luteinizing hormone-releasing hormone. Drouva SV, et al. **Neuroendocrinology** 1986;43(1):32-7

Activation of estradiol-positive feedback at puberty: estradiol sensitizes the LHRH-releasing system at two different biochemical steps. Ojeda SR, et al. **Neuroendocrinology** 1986;43(2):259-65

Estradiol target sites immunoreactive for beta-endorphin in the arcuate nucleus of rat and mouse hypothalamus. Jirikowski GF, et al. **Neurosci Lett** 1986 Apr 11;65(2):121-6

[Preliminary study in female rats of the immunoregulatory effect of estradiol, progesterone and pituitary prolactin on natural killer-like cell mediated cytotoxic activity] Mohammad M, et al. **Ann Endocrinol (Paris)** 1985;46(6):415-9 (Eng. Abstr.) **(Fre)**

EUPHORIA

Does placebo response mediate runner's high? Hinton ER, et al. **Percept Mot Skills** 1986 Jun;62(3):789-90

EXPLORATORY BEHAVIOR

The inhibition of the cage-leaving response—a model for studies of the serotonergic neurotransmission in the rat. Rényi L, et al. **J Neural Transm** 1986;65(3-4):193-210

Sensation seeking, paired associate learning and brain catecholamines. Kulcsár Z, et al. **Neuropsychobiology** 1986;15(1):43-8

EXTINCTION (PSYCHOLOGY)

Effects of pimozide on appetitive behavior and locomotor activity: dissimilarity of effects when compared to extinction. Spivak KJ, et al. **Physiol Behav** 1986;36(3):457-63

FEAR

How antipanic drugs might work [letter] Nesse RM, et al. **Am J Psychiatry** 1986 Jul;143(7):945

Synergistic action of alprazolam with tranylcypromine in drug-resistant atypical depression with panic attacks. Ries RK, et al. **Biol Psychiatry** 1986 May;21(5-6):522-6

Hypochondriacal fears and beliefs in DSM-III melancholia. Changes with amitriptyline. Kellner R, et al. **J Affective Disord** 1986 Jan-Feb; 10(1):21-6

Pharmacokinetics and clinical effects of alprazolam following single and multiple oral doses in patients with panic disorder. Ciraulo DA, et al. **J Clin Pharmacol** 1986 Apr;26(4):292-8

Alprazolam treatment for panic disorders. Alexander PE, et al. **J Clin Psychiatry** 1986 Jun;47(6):301-4

Pharmacotherapy of the panic disorders. Ballenger JC. **J Clin Psychiatry** 1986 Jun;47 Suppl:27-32 (55 ref.)

Nonsteroidal anti-inflammatory drugs and panic disorder [letter] Goldstein JA. **J Clin Psychiatry** 1986 May;47(5):277

Pharmacotherapeutic considerations in anxiety disorders. Hollister LE. **J Clin Psychiatry** 1986 Jun;47 Suppl:33-6 (21 ref.)

Current trends in clinical research on panic attacks, agoraphobia, and related anxiety disorders. Klerman GL. **J Clin Psychiatry** 1986 Jun; 47 Suppl:37-9 (10 ref.)

Treatment of panic disorder and agoraphobia with clonazepam. Spier SA, et al. **J Clin Psychiatry** 1986 May;47(5):238-42

Clonazepam in the treatment of panic disorder [letter] Judd FK, et al. **Med J Aust** 1986 Jul 7;145(1):59

The design and conduct of the Upjohn Cross-National Collaborative Panic Study. Klerman GL, et al. **Psychopharmacol Bull** 1986; 22(1):59-64

Taper withdrawal studies with alprazolam in patients with panic disorder and agoraphobia. Pecknold JC, et al. **Psychopharmacol Bull** 1986; 22(1):173-6

Benzodiazepines for treatment of panic attacks: a new look. Rickels K, et al. **Psychopharmacol Bull** 1986;22(1):93-9

A comparison of alprazolam and imipramine in the treatment of agoraphobia and panic disorder. Rizley R, et al. **Psychopharmacol Bull** 1986;22(1):167-72

[Psychopharmacology of panic attacks] Dugas M, et al. **Ann Med Interne (Paris)** 1986;137(2):152-4 (Eng. Abstr.) **(Fre)**

[Rapid response of a disorder to the addition of lithium carbonate: panic resistant to tricyclic antidepressants] Cournoyer J. **Can J Psychiatry** 1986 May;31(4):335-8 (Eng. Abstr.) **(Fre)**

FENFLURAMINE

Inhibition of gastric emptying and feeding by fenfluramine. Robinson PH, et al. **Am J Physiol** 1986 May;250(5 Pt 2):R764-9

Effects of fenfluramine on eight outpatients with the syndrome of autism. Stubbs EG, et al. **Dev Med Child Neurol** 1986 Apr;28(2):229-35

Side effects of fenfluramine in autistic children. Piggott LR, et al. **J Am Acad Child Psychiatry** 1986 Mar;25(2):287-9

Amphetamine-induced anorexia: analysis with hypothalamic lesions and knife cuts. McCabe JT, et al. **Pharmacol Biochem Behav** 1986 Apr; 24(4):1047-56

Short-term efficacy and safety of fenfluramine in hospitalized preschool-age autistic children: an open study. Campbell M, et al. **Psychopharmacol Bull** 1986;22(1):141-7

Fenfluramine treatment of childhood attention deficit disorder with hyperactivity: a preliminary report. Donnelly M, et al. **Psychopharmacol Bull** 1986;22(1):152-4

The effects of fenfluramine on suicidal behavior. Meyendorff E, et al. **Psychopharmacol Bull** 1986;22(1):155-9

Fenfluramine treatment of autism: UCLA collaborative study of 81 patients at nine medical centers. Ritvo ER, et al. **Psychopharmacol Bull** 1986;22(1):133-40

The discriminative stimulus and subjective effects of d-amphetamine, phenmetrazine and fenfluramine in humans. Chait LD, et al. **Psychopharmacology (Berlin)** 1986;89(3):301-6

Dissociation of the anorectic actions of 5-HTP and fenfluramine. Fletcher PJ, et al. **Psychopharmacology (Berlin)** 1986;89(2):216-20

[New indications for fenfluramine (letter)] De Villard R, et al. **Presse Med** 1986 Apr 5;15(14):668 **(Fre)**

FLUPHENAZINE

Longitudinal measurement of plasma homovanillic acid levels in schizophrenic patients. Correlation with psychosis and response to neuroleptic treatment. Pickar D, et al. **Arch Gen Psychiatry** 1986 Jul; 43(7):669-76

Relapse in chronic schizophrenics treated with fluphenazine decanoate is associated with low serum neuroleptic levels. Jayaram G, et al. **J Clin Psychiatry** 1986 May;47(5):247-8

Plasma fluphenazine levels in patients receiving two doses of fluphenazine decanoate. Marder SR, et al. **Psychopharmacol Bull** 1986;22(1):264-6

Fluphenazine plasma levels in patients receiving low and conventional doses of fluphenazine decanoate. Marder SR, et al. **Psychopharmacology (Berlin)** 1986;88(4):480-3

Flupenthixol decanoate and fluphenazine decanoate in chronic schizophrenia. Kong DS, et al. **Singapore Med J** 1985 Dec; 26(7):551-5

[Use of fluphenazine decanoate in psychiatric therapy. Multicenter study in 1095 patients preselected for long-acting neuroleptic treatment] Bogliolo C. **Minerva Psichiatr** 1986 Jan-Mar;27(1):1-18 **(Ita)**

[Children and travel to the South. Risk for drug intoxication (letter)] Haugen T, et al. **Tidsskr Nor Laegeforen** 1986 Apr 30;106(11):974 **(Nor)**

FLURAZEPAM

Peptide derivatives as prodrugs. Thomas WA. **Biochem Soc Trans** 1986 Apr;14(2):383-7

The inhibitory effect of endogenous convulsants quinolinic acid and kynurenine on the pentobarbital stimulation of [3H]flunitrazepam binding. Zarkovsky AM. **Pharmacol Biochem Behav** 1986 May; 24(5):1215-7

FOOD DEPRIVATION

6-Hydroxydopamine and excitotoxin lesions of medial prefrontal cortex fail to affect schedule-induced drinking in the rat. Christie MJ, et al. **Behav Brain Res** 1986 Feb;19(2):183-6

Food-restricted, prepubertal, female rats: rapid recovery of luteinizing hormone pulsing with excess food, and full recovery of pubertal development with gonadotropin-releasing hormone. Bronson FH. **Endocrinology** 1986 Jun;118(6):2483-7

FSH

Can neonatal treatment with a related hormone adapt the receptor for itself? Csaba G, et al. **Acta Physiol Hung** 1986;67(1):65-9

Selective reduction of elevated FSH levels in infertile men by pulsatile LHRH treatment. Hönigl W, et al. **Clin Endocrinol (Oxf)** 1986 Feb; 24(2):177-82

Episodic patterns of luteinizing hormone and follicle-stimulating hormone release: differential secretory dynamics and adrenergic control in ovariectomized rats. Condon TP, et al. **Endocrinology** 1986 Jun; 118(6):2525-33

Adrenocorticotropin-induced changes in ovine pituitary gonadotropin secretion in vitro. Matteri RL, et al. **Endocrinology** 1986 May; 118(5):2091-6

Luteinizing hormone and follicle-stimulating hormone responses to intranasal gonadotropin-releasing hormone. Rajfer J, et al. **Fertil Steril** 1986 Jun;45(6):794-9

Single dose responses to the gonadotropin-releasing hormone agonist analogue [(imBz 1)-D-His6,Pro9-NEt]GnRH. Doelle GC, et al. **Horm Metab Res** 1986 Mar;18(3):201-2

Anterior pituitary concentrations of gonadotropins, GnRH-receptors and ovarian characteristics following early weaning in beef cows. Parfet JR, et al. **J Anim Sci** 1986 Mar;62(3):717-22

Pulsatile or continuous infusion of luteinizing hormone-releasing hormone and hormonal concentrations in prepubertal beef heifers. Skaggs CL, et al. **J Anim Sci** 1986 Apr;62(4):1034-48

Effects of intermittent injections of LHRH on secretory patterns of LH and FSH and ovarian follicular growth during postpartum anovulation in suckled beef cows. Spicer LJ, et al. **J Anim Sci** 1986 May; 62(5):1317-23

Single subcutaneous doses of a luteinizing hormone-releasing hormone antagonist suppress serum gonadotropin and testosterone levels in normal men. Pavlou SN, et al. **J Clin Endocrinol Metab** 1986 Aug; 63(2):303-8

Pituitary self-priming actions of gonadotropin-releasing hormone. Kinetics of estradiol's potentiating effects on gonadotropin-releasing hormone-facilitated luteinizing hormone and follicle-stimulating hormone release in healthy postmenopausal women. Veldhuis JD, et al. **J Clin Invest** 1986 Jun;77(6):1849-56

Ontogeny of serum and pituitary gonadotrophins in male rats treated with low doses of 5 alpha-dihydrotestosterone. Karanth S, et al. **J Endocrinol** 1986 Mar;108(3):369-75

Varying the patterns and concentrations of gonadotrophin-releasing hormone stimulation does not alter the ratio of LH and FSH released from perifused sheep pituitary cells. McIntosh JE, et al. **J Endocrinol** 1986 May;109(2):155-61

Timing of multiple ovulations in the ewe after treatment with FSH or PMSG with and without GnRH. Walker SK, et al. **J Reprod Fertil** 1986 May;77(1):135-42

Steroid regulation of gonadotropins in genetically hypoprolactinemic females (IPL nude rats). Cohen H, et al. **J Steroid Biochem** 1986 Jan; 24(1):431-5

Immunohistochemical localization of follicle-stimulating hormone, luteinizing hormone, growth hormone, adrenocorticotrophic hormone and prolactin in the human placenta. Al-Timimi A, et al. **Placenta** 1986 Mar-Apr;7(2):163-72

Effect of atrial natriuretic peptide on gonadotropin release in superfused rat pituitary cells. Horvath J, et al. **Proc Natl Acad Sci USA** 1986 May; 83(10):3444-6

[Effect of tyrosine on serum concentrations of LH, FSH and testosterone in adult men] Ni J, et al. **Sheng Li Hsueh Pao** 1985 Jun;37(3):303-6 (Eng. Abstr.) **(Chi)**

[The effect of synthetic chicken LH-RH on the release of LH and FSH and ovulation in rats (a comparative study of synthetic mammalian LH-RH and chicken LH-RH)] Takahashi Y, et al. **Nippon Naibunpi Gakkai Zasshi** 1986 Feb 20;62(2):126-39 (Eng. Abstr.) **(Jpn)**

GABA

Lack of involvement of GABA in baroreceptor-mediated sympathoinhibition. McCall RB. **Am J Physiol** 1986 Jun; 250(6 Pt 2):R1065-73

Reversible depression of ventilation and cardiovascular function by ventriculocisternal perfusion with gamma-aminobutyric acid in dogs. Kneussl MP, et al. **Am Rev Respir Dis** 1986 Jun;133(6):1024-8

Changes in gamma-aminobutyric acid biochemistry and seizure threshold. Green AR. **Ann NY Acad Sci** 1986;462:105-19 (29 ref.)

Gamma aminobutyric acid mediates ventromedial hypothalamic mechanisms controlling the execution of lordotic responses in the female rat. Mascó D, et al. **Behav Brain Res** 1986 Feb;19(2):153-62

Differential effects of dorsal raphe lesions and intraraphe GABA and benzodiazepines on conflict behavior in rats. Green S, et al. **Behav Neural Biol** 1986 Jul;46(1):13-29

Anti-convulsant effects of manipulation of brain 4-aminobutyrate concentrations by selective enzyme inhibition. John RA, et al. **Biochem Soc Trans** 1986 Apr;14(2):408-10

A GABA-activated chloride-conductance not blocked by picrotoxin on spiny lobster neuromuscular preparations. Albert J, et al. **Br J Pharmacol** 1986 Apr;87(4):771-9

Loss of inhibition in the CA1 region of the kainic acid lesioned hippocampus is not associated with changes in postsynaptic responses to GABA. Ashwood TJ, et al. **Brain Res** 1986 Mar 5; 367(1-2):390-4

Effects of D-aspartate on excitatory amino acid-induced release of [3H]GABA from goldfish retina. Cha JH, et al. **Brain Res** 1986 Jun 18;376(1):140-8

Interactions between dopamine and amino acid-induced excitation and inhibition in the striatum. Chiodo LA, et al. **Brain Res** 1986 Jun 4; 375(1):198-203

gamma-Aminobutyric acid immunoreactivity in mouse barrel field: a light microscopical study. Chmielowska J, et al. **Brain Res** 1986 Mar 19; 368(2):371-4

Nipecotic acid, an uptake blocker, prevents fading of the gamma-aminobutyric acid effect. Dalkara T. **Brain Res** 1986 Feb 26; 366(1-2):314-9

Elicitation of intraspecific defensive behaviors in the rat by microinjection of picrotoxin, a gamma-aminobutyric acid antagonist, into the midbrain periaqueductal gray matter. Depaulis A, et al. **Brain Res** 1986 Mar 5; 367(1-2):87-95

GABA visualized by immunocytochemistry in the guinea pig cochlea in axons and endings of efferent neurons. Fex J, et al. **Brain Res** 1986 Feb 26;366(1-2):106-17

GABA and serotonin (5-HT) pattern in the supraependymal fibers of the rat epithalamus: combined radioautographic and immunocytochemical studies. Effect of 5-HT content on [3H]GABA accumulation. Harandi M, et al. **Brain Res** 1986 Apr 9;370(2):241-9

Inhibition of GABA uptake in the rat hippocampal slice. Korn SJ, et al. **Brain Res** 1986 Mar 19;368(2):247-55

Immunohistochemical demonstration of GABA containing neurons in the guinea pig ileum using purified GABA antiserum. Saito N, et al. **Brain Res** 1986 Jun 18;376(1):78-84

GABA imbalance in squirrel monkey after unilateral vestibular end-organ ablation. Thompson GC, et al. **Brain Res** 1986 Apr 2;370(1):182-5

GABA-like immunoreactivity in the squirrel monkey organ of Corti. Thompson GC, et al. **Brain Res** 1986 Apr 30;372(1):72-9

GABA in the PNS: demonstration in enteric neurons. Baetge G, et al. **Brain Res Bull** 1986 Mar;16(3):421-4

Optic nerve stimulation-induced increase of release of 3H-glutamate and 3H-aspartate but not 3H-GABA from the suprachiasmatic nucleus in slices of rat hypothalamus. Liou SY, et al. **Brain Res Bull** 1986 Apr; 16(4):527-31

Pharmacological evaluation of GABAergic and glutamatergic inputs to the nucleus basalis--cortical and the septal-hippocampal cholinergic projections. Wood PL. **Can J Physiol Pharmacol** 1986 Mar; 64(3):325-8

gamma-Aminobutyric acid (GABA) removal from the synaptic cleft: a postsynaptic event? Cupello A, et al. **Cell Mol Neurobiol** 1986 Mar; 6(1):1-16

The occurrence of gamma-aminobutyric acid (GABA)-containing cells in cultures of retinas from the human fetus. Osborne NN, et al. **Cell Mol Neurobiol** 1986 Mar;6(1):87-93

Light- and electron-microscopic visualization of gamma-aminobutyric acid and GABA-transaminase in the oviduct of rats. Predominant occurrence in epithelium. Erdö SL, et al. **Cell Tissue Res** 1986; 244(3):621-6

Immunocytochemistry of GABA in the antennal lobes of the sphinx moth Manduca sexta. Hoskins SG, et al. **Cell Tissue Res** 1986; 244(2):243-52

Cultured neurons as model systems for biochemical and pharmacological studies on receptors for neurotransmitter amino acids. Schousboe A, et al. **Dev Neurosci** 1985;7(5-6):252-62 (56 ref.)

Anisotropic inhibition in the receptive field surround of the frog retinal ganglion cells, evidenced by bicuculline and SR 95103, a new GABA antagonist. Bonaventure N, et al. **Eur J Pharmacol** 1986 Mar 4; 121(3):327-36

Effect of GABAergic drugs in the behavioral 'despair' test in rats. Borsini F, et al. **Eur J Pharmacol** 1986 Feb 18;121(2):265-8

Spontaneous paroxysmal activity induced by zero magnesium and bicuculline: suppression by NMDA antagonists and GABA mimetics. Horne AL, et al. **Eur J Pharmacol** 1986 Mar 18;122(2):231-8

Pharmacological evidence that at least two different non-adrenergic non-cholinergic inhibitory systems are present in the rat small intestine.

Manzini S, et al. **Eur J Pharmacol** 1986 Apr 16;123(2):229–36

The effect of apomorphine and pergolide on the potassium–evoked overflow of GABA in rat striatum studied by microdialysis. Tossman U, et al. **Eur J Pharmacol** 1986 Apr 16;123(2):295–8

Experimental neuropathy induced by methyl mercury compounds: autoradiographic study of GABA uptake by dorsal root ganglia. Kumamoto T, et al. **Eur Neurol** 1986;25(4):269–77

GABA–like immunoreactivity in the vertebrate retina: a species comparison. Mosinger JL, et al. **Exp Eye Res** 1986 Jun;42(6):631–44

GABA–induced hypothermia in rats: involvement of serotonergic and cholinergic mechanisms. Serrano JS, et al. **Gen Pharmacol** 1986; 17(3):327–32

Insect optic lobe neurons identifiable with monoclonal antibodies to GABA. Meyer EP, et al. **Histochemistry** 1986;84(3):207–16

Control of rat gastric somatostatin release by gamma–aminobutyric acid (GABA). Koop H, et al. **Horm Metab Res** 1986 Feb;18(2):94–7

GABA immunoreactivity in the retina. Agardh E, et al. **Invest Ophthalmol Vis Sci** 1986 May;27(5):674–8

Distribution of gamma–aminobutyric acid–immunoreactive neurons in the septal region of the rat brain. Onteniente B, et al. **J Comp Neurol** 1986 Jun 15;248(3):422–30

Distribution of GABA–like immunoreactivity in the brain of the honeybee. Schäfer S, et al. **J Comp Neurol** 1986 Apr 15; 246(3):287–300

Presence of gamma–aminobutyric acid in embryonic palates of AJ and SWV mouse strains. Wee EL, et al. **J Craniofac Genet Dev Biol** 1986; 6(1):53–61

Inter– and intracellular relationship of substance P–containing neurons with serotonin and GABA in the dorsal raphe nucleus: combination of autoradiographic and immunocytochemical techniques. Mâgoul R, et al. **J Histochem Cytochem** 1986 Jun;34(6):735–42

4–Amino–2–(substituted methyl)–2–butenoic acids: substrates and potent inhibitors of gamma–aminobutyric acid aminotransferase. Silverman RB, et al. **J Med Chem** 1986 May;29(5):764–70

Studies on analogues of succinic semialdehyde as substrates for succinate semialdehyde dehydrogenase from rat brain. Manzocchi A, et al. **J Neurochem** 1986 Jun;46(6):1895–8

Spontaneous release of gamma–aminobutyric acid formed from putrescine and its enhanced Ca2+–dependent release by high K+ stimulation in the brains of freely moving rats. Noto T, et al. **J Neurochem** 1986 Jun; 46(6):1877–80

Effect of early iron deficiency in rat on the gamma–aminobutyric acid shunt in brain. Taneja V, et al. **J Neurochem** 1986 Jun;46(6):1670–4

Immunohistochemical demonstration of GABAergic neurons in the enteric nervous system. Jessen KR, et al. **J Neurosci** 1986 Jun; 6(6):1628–34

The rat ventromedial thalamic nucleus and motor control: role of N–methyl–D–aspartate–mediated excitation, GABAergic inhibition, and muscarinic transmission. Klockgether T, et al. **J Neurosci** 1986 Jun; 6(6):1702–11

In–vitro release of [14C]glutamate from dentate gyrus is modulated by GABA. Spencer P, et al. **J Pharm Pharmacol** 1986 May;38(5):393–5

Effects of insecticides on GABA–induced chloride influx into rat brain microsacs. Abalis IM, et al. **J Toxicol Environ Health** 1986; 18(1):13–23

Synthesis of radioactive (–)–carnitine from gamma–aminobutyrate. Pande SV. **Methods Enzymol** 1986;123:297–302

Reduction in number of immunostained GABAergic neurones in deprived–eye dominance columns of monkey area 17. Hendry SH, et al. **Nature** 1986 Apr 24–30;320(6064):750–3

GABA and GAD immunoreactivity of photoreceptor terminals in primate retina. Nishimura Y, et al. **Nature** 1986 Apr 24–30;320(6064):753–6

Neurochemistry. Is GABA the neurotransmitter for some photoreceptors? [news] Yazulla S. **Nature** 1986 Apr 24–30;320(6064):685–6

Acute and chronic effects of lithium chloride on GABA–ergic function in the rat corpus striatum and frontal cerebral cortex. Otero Losada ME, et al. **Naunyn Schmiedebergs Arch Pharmacol** 1986 Feb; 332(2):169–72

Asymmetric diffusion into the postsynaptic neuron: an extremely efficient mechanism for removing excess GABA from synaptic clefts on the Deiters' neurone plasma membrane. Hyden H, et al. **Neurochem Res** 1986 May;11(5):695–706

Changes in gamma–aminobutyric acid high affinity binding to cerebral cortex membranes after pinealectomy or melatonin administration to rats. Castroviejo DA, et al. **Neuroendocrinology** 1986;43(1):24–31

Evidence for estrogen–receptive GABAergic neurons in the preoptic/anterior hypothalamic area of the rat brain. Flügge G, et al. **Neuroendocrinology** 1986;43(1):1–5

Pipecolic acid enhancement of GABA response in single neurons of rat brain. Takahama K, et al. **Neuropharmacology** 1986 Mar;25(3):339–42

Pharmacological modulation of GABAergic transmission in cultured cerebellar neurons. Vicini S, et al. **Neuropharmacology** 1986 Feb; 25(2):207–11

GABA receptor binding in rat cerebral cortex and superior cervical ganglion in the absence of GABAergic synapses. Balcar VJ, et al. **Neurosci Lett** 1986 May 23;66(3):269–74

Ion channels activated by acetylcholine and gamma–aminobutyric acid in freshly dissociated sympathetic neurones of the rat. Cull–Candy SG, et al. **Neurosci Lett** 1986 May 23;66(3):275–80

Synapses between GABA–immunoreactive axonal and dendritic elements in monkey substantia nigra. Holstein GR, et al. **Neurosci Lett** 1986 May 23;66(3):316–22

gamma–Aminobutyric acid–dependent motility induced by avermectin B1a in the isolated intestine of the guinea pig. Kerr DI, et al. **Neurosci Lett** 1986 Mar 28;65(1):7–10

GABAergic neurons in the cerebral cortex of the brain of a lizard (Podarcis hispanica). Schwerdtfeger WK, et al. **Neurosci Lett** 1986 Jul 11;68(1):117–21

Calcium–independent release of gamma–aminobutyrate from nerve processes in the developing rabbit retina. Jönsson U, et al. **Neuroscience** 1986 Apr;17(4):1235–41

Gamma–aminobutyrate, gastrin releasing peptide, serotonin, somatostatin, and vasopressin: ultrastructural immunocytochemical localization in presynaptic axons in the suprachiasmatic nucleus. van den Pol AN. **Neuroscience** 1986 Mar;17(3):643–59

Lordosis behavior and GABAergic neurotransmission. Fernández–Guasti A, et al. **Pharmacol Biochem Behav** 1986 Mar;24(3):673–6

GABAergic control of masculine sexual behavior. Fernández–Guasti A, et al. **Pharmacol Biochem Behav** 1986 Apr;24(4):1065–70

Effects of the potentiation of the GABAergic neurotransmission in the olfactory bulbs on mouse–killing behavior. Molina V, et al. **Pharmacol Biochem Behav** 1986 Mar;24(3):657–64

Activity of biotin–dependent and GABA metabolizing enzymes in chorionic villus samples: potential for 1st trimester prenatal diagnosis. Sweetman FR, et al. **Prenat Diagn** 1986 May–Jun;6(3):187–94

L–glutamic acid, a neurotrophic factor for maintenance of acetylcholinesterase and butyrylcholinesterase in the preganglionically denervated superior cervical ganglion of the cat. Koelle GB, et al. **Proc Natl Acad Sci USA** 1986 Apr;83(8):2751–4

Possible involvement of low and high affinity GABA receptors in the chloride influx into synaptosomes. Sánchez C, et al. **Rev Esp Fisiol** 1986 Mar;42(1):1–5

Brain glutamate decarboxylase cloned in lambda gt–11: fusion protein produces gamma–aminobutyric acid. Kaufman DL, et al. **Science** 1986 May 30;232(4754):1138–40

The role of chloride transport in postsynaptic inhibition of hippocampal neurons. Misgeld U, et al. **Science** 1986 Jun 13;232(4756):1413–5

[Role of gamma–aminobutyric acid in the process of catecholamine secretion from the adrenal medulla] Kitayama S. **Hiroshima Daigaku Shigaku Zasshi** 1985 Jun;17(1):21–34 **(Jpn)**

[Monoamine oxidase activity and gamma–aminobutyric acid levels in hyperoxia. The effect of clorgyline] Goroshinskaia IA, et al. **Vopr Med Khim** 1986 Mar–Apr;32(2):76–9 (Eng. Abstr.) **(Rus)**

GALVANIC SKIN RESPONSE

Skin conductance habituation and cerebrospinal fluid 5–hydroxyindoleacetic acid in suicidal patients. Edman G, et al. **Arch Gen Psychiatry** 1986 Jun;43(6):586–92

Periaqueductal gray inhibition of viscerointercostal and galvanic skin reflexes. Sonoda H, et al. **Brain Res** 1986 Mar 26;369(1–2):91–102

GENERALIZATION (PSYCHOLOGY)

[Neuropharmacological analysis of the compensatory–recovery processes in deficiency of the generalization function in lobectomized cats] Mukhin EI. **Zh Vyssh Nerv Deiat** 1986 Jan–Feb;36(1):52–7 (Eng. Abstr.) **(Rus)**

GLUCURONIDASE

Identity of esterase–22 and egasyn, the protein which complexes with microsomal beta–glucuronidase. Medda S, et al. **Biochem Genet** 1986 Apr;24(3–4):229–43

Effect of the cholangiographic agent, ioglycamide, on the beta–glucuronidase activity in rat liver and bile: relevance with regard to bilirubin deconjugation. Mesa VA, et al. **Biochem Pharmacol** 1986 May 15;35(10):1755–7

Steroid content of beta–glucuronidase and sulfatase preparations. Graef V, et al. **Clin Chem** 1986 Jul;32(7):1416

Impaired biliary elimination of beta–glucuronidase–resistant 'glucuronides' of valproic acid after intravenous administration in the rat. Evidence for oxidative metabolism of the resistant isomers. Dickinson RG, et al. **Drug Metab Dispos** 1986 Mar–Apr;14(2):255–62

Age–dependent variations of intralysosomal enzyme release from human PMN leukocytes under various stimuli. Fülöp T Jr, et al. **Immunobiology** 1986 Apr;171(3):302–10

Acid phosphatase and beta–glucuronidase activities in mast cells, macrophages, plasma cells and lymphocytes in gingival fibromatosis. Tanaka A, et al. **J Osaka Dent Univ** 1985 Apr;19(1):33–41

Breast milk beta–glucuronidase and neonatal jaundice [letter] Gaffney PT, et al. **Lancet** 1986 May 17;1(8490):1161–2

GONADOTROPINS, PITUITARY

Serotonin stimulates gonadotrophin release by acting directly on the median eminence. Vitale ML, et al. **Acta Physiol Pharmacol Latinoam** 1985;35(4):473–9

The effects of the cholecystokinin antagonist, proglumide, on gonadotropin release in the rat. Vijayan E, et al. **Brain Res Bull** 1986 Apr;16(4):533–6

Evidence for activation of the central nervous system–pituitary mechanism for gonadotropin secretion at the time of puberty in the male rat. Matsumoto AM, et al. **Endocrinology** 1986 Jul;119(1):362–9

The effect of hypothalamic catecholamine synthesis inhibition by alpha-methyltyrosine on gonadotropin secretion during sexual maturation in the male Wistar rat. Raum WJ, et al. **Endocrinology** 1986 Jul;119(1):168–75

Central adrenergic activity in the mediobasal hypothalamus is temporally related to surge outputs of gonadotrophins in oestrogen–stimulated infant female rats. Clement EM, et al. **J Endocrinol** 1986 Apr; 109(1):45–51

Regulation of ovarian function in the post partum cow: an endocrine model. Peters AR, et al. **Vet Rec** 1986 Mar 1;118(9):236–9

[FSH, LH, estradiol and testosterone levels after Seda–Presomen in women following hysterectomy with bilateral adnexotomy] Stehlíková J, et al. **Acta Univ Palacki Olomuc Fac Med** 1981;101:139–45 **(Ger)**

[Participation of catecholamines in the regulation of an induced wave of gonadotropins in ovariectomized rats] Bukiia NG, et al. **Probl Endokrinol (Mosk)** 1986 Mar–Apr;32(2):47–51 (Eng. Abstr.) **(Rus)**

GUANETHIDINE

Liquid chromatographic determination of guanethidine salts and hydrochlorothiazide using electrochemical detection and ion–pair techniques. Stewart JT, et al. **J Pharm Sci** 1986 Apr;75(4):413–5

HABITUATION (PSYCHOPHYSIOLOGY)

Skin conductance habituation and cerebrospinal fluid 5–hydroxyindoleacetic acid in suicidal patients. Edman G, et al. **Arch Gen Psychiatry** 1986 Jun;43(6):586–92

HALOPERIDOL

Interactions of drugs and electroshock treatment on cerebral monoaminergic systems. Barkai AI. **Ann NY Acad Sci** 1986; 462:147–62

Progress in pharmacotherapy of borderline disorders. A double–blind study of amitriptyline, haloperidol, and placebo. Soloff PH, et al. **Arch Gen Psychiatry** 1986 Jul;43(7):691–7

Bromocriptine in the treatment of neuroleptic–resistant schizophrenia. Gattaz WF, et al. **Biol Psychiatry** 1986 May;21(5–6):519–21

Effects of intermittent and continuous haloperidol administration on the dopaminergic system in the rat brain. Kashihara K, et al. **Biol Psychiatry** 1986 Jun;21(7):650–6

Lithium and haloperidol [letter] Nemes ZC, et al. **Biol Psychiatry** 1986 May;21(5–6):568–9

Dopamine antagonist haloperidol decreases substance P, substance K, and preprotachykinin mRNAs in rat striatonigral neurons. Bannon MJ, et al. **J Biol Chem** 1986 May 25;261(15):6640–2

Drug holidays and serum haloperidol levels in schizophrenic patients. McMillan DE, et al. **J Clin Psychiatry** 1986 Jul;47(7):373–4

Differential effects of apomorphine on spinal reflex activity following 6–hydroxydopamine or long–term haloperidol pretreatment. Jensen TS, et al. **J Neural Transm** 1986;65(2):125–34

Effects of apomorphine on morphine analgesia during the state of dopaminergic supersensitivity after chronic treatment with haloperidol. Kamata K, et al. **J Pharmacobiodyn** 1986 Jan;9(1):88–94

The effect of thioridazine on haloperidol induced behavioral hypersensitivity. Klawans HL, et al. **Life Sci** 1986 May 12; 38(19):1707–14

Haloperidol binding to monoclonal antibodies: conformational analysis and relationships to D–2 receptor binding. Sherman MA, et al. **Mol Pharmacol** 1986 Jun;29(6):589–98

Neuroleptic treatment induces region–specific changes in levels of neurokinin A and substance P in rat brain. Lindefors N, et al. **Neuropeptides** 1986 Apr;7(3):265–80

Comparison of circling induced by unilateral intrastriatal microinjections of haloperidol, clozapine and CCK–8 in rats. Weiss F, et al. **Pharmacol Biochem Behav** 1986 Apr;24(4):983–9

Fluperlapine vs haloperidol: a comparison of their neuroendocrinological profiles and the influence on serum lipids. Fleischhacker WW, et al. **Pharmacopsychiatry** 1986 May;19(3):111–4

Amitriptyline and haloperidol in unstable and schizotypal borderline disorders. Soloff PH, et al. **Psychopharmacol Bull** 1986;22(1):177–82

The AMDP system in international clinical trials: a double–blind comparison of fluperlapine and haloperidol. Woggon B, et al. **Psychopharmacol Bull** 1986;22(1):47–51

Effects of haloperidol and nomifensine on the visual aftereffects of tilt and movement. Harris JP, et al. **Psychopharmacology (Berlin)** 1986; 89(2):177–82

Haloperidol facilitates memory retrieval in the rat. Sara SJ. **Psychopharmacology (Berlin)** 1986;89(3):307–10

[Plasma monitoring of haloperidol. Correlation with clinical efficacy and plasma prolactin levels] Giraud–Serio J, et al. **Ann Med Psychol (Paris)** 1985 Nov;143(9):900–11 **(Fre)**

[Studies on the diuretic effect of haloperidol in adult rats] Shirakura Y. **Nippon Yakurigaku Zasshi** 1986 Feb;87(2):189–97 (Eng. Abstr.) **(Jpn)**

[Nonuniform effect of prolonged haloperidol administration on the GABA(A) and benzodiazepine receptors in different parts of the brain] Vasar EE, et al. **Biull Eksp Biol Med** 1986 Apr;101(4):433–6 (Eng. Abstr.) **(Rus)**

[Effect of haloperidol and clozapine on the bioelectric activity of the human cerebral cortex] Sviderskaia NE, et al. **Zh Nevropatol Psikhiatr** 1986;86(3):428–31 (Eng. Abstr.) **(Rus)**

[Aberrations of cortical and subcortical integration during chronic administration of haloperidol to the dog] Kachalova LM, et al. **Zh Vyssh Nerv Deiat** 1986 Mar–Apr;36(2):375–84 (Eng. Abstr.) **(Rus)**

[Bethanechol as treatment for urinary retention induced by a combination of neuroleptics and anticholinergics] Seguí Montesinos J, et al. **Actas Luso Esp Neurol Psiquiatr Cienc Afines** 1985 Nov–Dec; 13(6):402–5 (Eng. Abstr.) **(Spa)**

[Increasing the neuronal population of the nucleus accumbens in the rat using haloperidol] Rueda J, et al. **Arch Neurobiol (Madr)** 1986 Mar–Apr; 49(2):90–4 (Eng. Abstr.) **(Spa)**

HANDLING (PSYCHOLOGY)

Central norepinephrine and plasma corticosterone following acute and chronic stressors: influence of social isolation and handling. Irwin J, et al. **Pharmacol Biochem Behav** 1986 Apr;24(4):1151–4

HEXOBARBITAL

Pipecolic acid antagonizes barbiturate–enhanced GABA binding to bovine brain membranes. Feigenbaum P, et al. **Brain Res** 1986 Apr 30; 372(1):176–9

Stereospecific analysis of racemic hexobarbital in rat blood by enantioselective capillary gas chromatography. van der Graaff M, et al. **J Chromatogr** 1986 Mar 7;375(2):411–5

Intra–arterial administration of hexobarbital enantiomers to the rat: disposition and estimation of apparent extraction ratio. Van der Graaff M, et al. **Pharm Weekbl [Sci]** 1986 Apr 25;8(2):139–44

Effects of methylmercury on hypnotic action of hexobarbital, liver hydroxylase and cytochrome P–450 in mice. Su MQ, et al. **Toxicology** 1986 Jun;39(3):233–45

HISTAMINE

Biochemical and pharmacological characterization of histamine–mediated up–regulation of human platelet serotonin uptake. Evidence for a subclass of histamine H2 receptors (H2h) highly sensitive to H2 receptor antagonists. Gespach C, et al. **Agents Actions** 1986 Apr; 18(1–2):115–9

Effect of electroconvulsive shock (ECS) treatment on the histaminergic system in rat brain: biochemical and behavioural studies. Zawilska J, et al. **Agents Actions** 1986 Apr;18(1–2):222–5

H1 action of histamine on aldosterone and cortisol secretion by perfused dog adrenal. Aikawa T, et al. **Am J Physiol** 1986 May; 250(5 Pt 1):E523–9

Histamine as a neuroregulator. Prell GD, et al. **Annu Rev Neurosci** 1986; 9:209–54 (260 ref.)

Histamine–induced constriction and dilatation of rabbit middle cerebral arteries in vitro: role of the endothelium. Sercombe R, et al. **Blood Vessels** 1986;23(3):137–53

Allometric growth of the rat peritoneal mast cell mass and of the granular constituents: heparin, histamine and 5–hydroxytryptamine. Aldenborg F, et al. **Growth** 1985 Winter;49(4):510–8

Response of isolated uterus of rat, hamster and guinea pig to different uterine stimulants. Mehrotra PK, et al. **Indian J Exp Biol** 1985 Oct; 23(10):572–3

Studies on vascular permeability increasing factors involved in 48–hour homologous PCA in the mouse ear. Inagaki N, et al. **Int Arch Allergy Appl Immunol** 1986;80(3):285–90

Histamine–induced prolactin release and activity of tuberoinfundibular dopaminergic neurons in male rats. Seltzer AM, et al. **J Neural Transm** 1986;65(2):115–23

Effects of dopamine and vasopressin on histamine–induced increases in macromolecular permeability in the canine forelimb. Adamski SW, et al. **Microcirc Endothelium Lymphatics** 1985 Feb;2(1):27–39

Histamine–induced fluid efflux in the canine forelimb as affected by carotid occlusion or hemorrhage. Dabney JM, et al. **Microcirc Endothelium Lymphatics** 1984 Jun;1(3):247–71

Comparison of effects of phencyclidine and methamphetamine on body temperature in mice: a possible role for histamine neurons in thermoregulation. Itoh Y, et al. **Naunyn Schmiedebergs Arch Pharmacol** 1986 Mar;332(3):293-6

Variations of brain histamine levels in germ-free and nephrectomized rats. Hegstrand LR, et al. **Neurochem Res** 1986 Feb;11(2):185-91

Brain histamine regulation following chronic diazepam treatment and stress. Mazurkiewicz-Kwilecki IM, et al. **Pharmacol Biochem Behav** 1986 Mar;24(3):513-7

[The role of endogenous amines in anaphylactic shock in rats] Oyama M. **Kanagawa Shigaku** 1985 Dec;20(3):307-19 (Eng. Abstr.) **(Jpn)**

[The role of serotonin, histamine and prostaglandins on potentiation of hypoxic pulmonary vasoconstriction by repeated intermittent hypoxic challenges in dogs] Nakanishi S, et al. **Nippon Kyobu Shikkan Gakkai Zasshi** 1986 Jan;24(1):42-8 (Eng. Abstr.) **(Jpn)**

[Basophil histamine and peripheral blood serotonin in metal and toxic gas poisoning] Fal W, et al. **Med Pr** 1985;36(6):377-81 (Eng. Abstr.) **(Pol)**

HOMOVANILLIC ACID

Longitudinal measurement of plasma homovanillic acid levels in schizophrenic patients. Correlation with psychosis and response to neuroleptic treatment. Pickar D, et al. **Arch Gen Psychiatry** 1986 Jul; 43(7):669-76

Developmental variations in CSF monoamine metabolites during childhood. Hedner J, et al. **Biol Neonate** 1986;49(4):190-7

Regional brain homovanillic acid following delta 9-tetrahydrocannabinol and cocaine. Bowers MB Jr, et al. **Brain Res** 1986 Feb 26; 366(1-2):405-7

Early neuroleptic response in psychotic men and women: correlation with plasma HVA and MHPG. Bowers MB Jr, et al. **Compr Psychiatry** 1986 May-Jun;27(3):181-5

Free and conjugated 3,4-dihydroxyphenylacetic acid and homovanillic acid in brain dopaminergic areas at basal state and after pipotiazine activation. Tavitian E, et al. **J Neural Transm** 1986;65(3-4):261-75

HOSTILITY

Hostility and recovery from melancholia. Fava GA, et al. **J Nerv Ment Dis** 1986 Jul;174(7):414-7

HUNGER

Hunger perceptions and satiety responses among normal-weight bulimics and normals to a high-calorie, carbohydrate-rich food. Chiodo J, et al. **Psychol Med** 1986 May;16(2):343-9

[Regulation of food intake by the central nervous system and the gastrointestinal tract (II)] Schusdziarra V. **Leber Magen Darm** 1986 Mar; 16(2):104, 107-10, 113 **(Ger)**

HYDANTOINS

Family studies of mephenytoin hydroxylation deficiency. Inaba T, et al. **Am J Hum Genet** 1986 May;38(5):768-72

Separation of amino acid phenylthiohydantoin derivatives by high-pressure liquid chromatography. Meuth JL, et al. **Anal Biochem** 1986 May 1;154(2):478-84

Polymorphic metabolism of mephenytoin in man: pharmacokinetic interaction with a co-regulated substrate, mephobarbital. Jacqz E, et al. **Clin Pharmacol Ther** 1986 Jun;39(6):646-53

5,5-Diaryl-2-thiohydantoins and 5,5-diaryl-N3-substituted-2-thiohydantoins as potential hypolipidemic agents. Tompkins JE. **J Med Chem** 1986 May;29(5):855-9

Genetic polymorphism of mephenytoin metabolism. Inaba T. **Prog Clin Biol Res** 1986;214:139-56 (40 ref.)

HYDRAZINES

Synthesis of cell-impermeable inhibitor of phospholipase A2. Yedgar S, et al. **FEBS Lett** 1986 May 5;200(1):165-8

2,2'-Phthaloyl-,2,2'-isophthaloyl-, and 2,2'-terephthaloylbis[1,1,1-trimethylhydrazinium] dihydroxide, bis(inner salts): synthesis, partition coefficients, toxicity and effect on ganglionic transmission. Cates LA, et al. **J Pharm Sci** 1986 Apr; 75(4):407-9

Antagonism of thromboxane actions in the isolated perfused rat heart. Stahl GL, et al. **Life Sci** 1986 Jun 2;38(22):2037-41

Relationship between oxidative metabolites of hydrazine and hydrazine-induced mutagenicity. Noda A, et al. **Toxicol Lett** 1986 May; 31(2):131-7

[Hydrazine in drinking water] Bodenschatz W. **Off Gesundheitswes** 1986 Apr;48(4):205-8 (Eng. Abstr.) **(Ger)**

[Synthesis and anticoccidial activity of 3-(substituted benzylidenehydrazino)-6-(4-chlorophenyl)-1,2,4-triazines] Shibamoto S, et al. **Yakugaku Zasshi** 1986 Mar;106(3):233-9 (Eng. Abstr.) **(Jpn)**

[Hydrazine sulfate as a stabilizer of cell membranes] Filov VA, et al. **Biull Eksp Biol Med** 1986 May;101(5):610-1 **(Rus)**

HYDRAZONES

Determination of copper in biological tissue by means of photochemically generated (Z)-2-thiophenaldehyde 2-pyridylhydrazone. García Sánchez F, et al. **Analyst** 1986 Apr;111(4):445-8

Spectrophotometric determination of palladium in catalysts and carbenicillin with 1-(2-pyridylmethylidene)-5-(salicylidene)-thiocarbohydr azone. Rosales D, et al. **Analyst** 1986 Apr;111(4):449-53

Synthesis of some new hydrazone derivatives as biologically active agents. Sen Gupta AK, et al. **Arzneimittelforschung** 1986 May;36(5):790-3

[Antiviral and antibacterial activities of substituted benzalacetone amidinohydrazones] Yoshii S, et al. **Yakugaku Zasshi** 1986 Feb; 106(2):158-63 (Eng. Abstr.) **(Jpn)**

HYDROXYBUTYRATES

The effect of the dissolved oxygen concentration and anabolic limitations on the behaviour of Rhizobium ORS571 in chemostat cultures. de Vries W, et al. **Antonie Van Leeuwenhoek** 1986;52(1):85-96

Perchloric acid interference in enzymatic-fluorimetric-continuous-flow assay methods for measuring glucose, lactate, pyruvate, alanine, glycerol, and 3-hydroxybutyrate in blood. Stappenbeck R, et al. **Clin Chem** 1986 Jun;32(6):1023-6

Determination of human ketone body kinetics using stable-isotope labelled tracers. Beylot M, et al. **Diabetologia** 1986 Feb;29(2):90-6

Is there Ca2+(Sr2+)-3-hydroxybutyrate symport in rat-liver mitochondria? A reappraisal. Moody AJ, et al. **Eur J Biochem** 1986 Jun 2;157(2):243-9

[Effect of lithium oxybutyrate on the viability of preserved donor kidney] Sholokhov VM, et al. **Farmakol Toksikol** 1986 May-Jun;49(3):69-70 (Eng. Abstr.) **(Rus)**

[The effect of gamma-hydroxybutyric acid on the biosynthesis of macromolecules and metabolic paramagnetic centers in hepatocytes in acute radiation injury] Sharygin VL, et al. **Radiobiologiia** 1986 Mar-Apr; 26(2):189-94 (Eng. Abstr.) **(Rus)**

[Use of lithium oxybutyrate in the combined therapy of burn injury patients] Iurasov II, et al. **Voen Med Zh** 1986 Apr;(4):20-1 **(Rus)**

[Use of sodium hydroxybutyrate electrophoresis in the complex treatment of lumbar osteochondrosis] Matesha AM, et al. **Vopr Kurortol Fizioter Lech Fiz Kult** 1986 Jan-Feb;(1):60-1 **(Rus)**

HYDROXYDOPAMINES

Studies on cyproheptadine-amphetamine interaction after pretreatment with 6-hydroxydopamine. Chodera A, et al. **Acta Physiol Pol** 1984 Sep-Dec;35(5-6):426-31

Effect of 6-hydroxydopamine on polymerization of tubulin. Protection by superoxide dismutase, catalase, or anaerobic conditions. Davison AJ, et al. **Biochem Pharmacol** 1986 May 1;35(9):1411-7

Effects of bilateral lesion of the locus coeruleus and of neonatal administration of 6-hydroxydopamine on the concentration of individual proteins in rat brain. Heydorn WE, et al. **Brain Res** 1986 Mar 5; 367(1-2):31-8

Plasticity of catecholaminergic terminals in rat paraventricular hypothalamic nucleus after 6-hydroxydopamine lesion: an emphasis on bouton sizes and synaptic frequency. Hwang BH, et al. **Brain Res** 1986 Mar 26;369(1-2):267-74

Effects of intraventricular 6-hydroxydopamine on the dopaminergic innervation of striatum: histochemical and neurochemical analysis. Onn SP, et al. **Brain Res** 1986 Jun 18;376(1):8-19

Neonatal 6-hydroxydopamine lesion of forebrain norepinephrine does not eliminate critical period for behavioral effects of gonadal hormone manipulation. Pappas BA, et al. **Brain Res** 1986 May;391(2):310-4

The acute effects of 6-hydroxydopamine treatment on noradrenergic function in the rat hippocampus in vitro. Yasuda RP, et al. **Brain Res** 1986 Mar 5;367(1-2):121-7

Differential effects of apomorphine on spinal reflex activity following 6-hydroxydopamine or long-term haloperidol pretreatment. Jensen TS, et al. **J Neural Transm** 1986;65(2):125-34

Sinus node function after selective elimination of sympathetic influences on the sinus node area of the dog. Yano K, et al. **Jpn Heart J** 1986 Jan;27(1):71-81

Effects of 6-hydroxydopamine-induced lesions of the paraventricular nucleus, and of prazosin, on the corticosterone response to restraint in rats. Gibson A, et al. **Neuropharmacology** 1986 Mar;25(3):257-60

Destruction of meningeal cells over the newborn hamster cerebellum with 6-hydroxydopamine prevents foliation and lamination in the rostral cerebellum. von Knebel Doeberitz C, et al. **Neuroscience** 1986 Feb; 17(2):409-26

Effect of 6-hydroxydopamine on neuropeptides in the rat female genitourinary tract. Allen JM, et al. **Peptides** 1985 Nov-Dec; 6(6):1213-7

Changes in nociception after 6-hydroxydopamine lesions of descending catecholaminergic pathways in mice. Fasmer OB, et al. **Pharmacol Biochem Behav** 1986 May;24(5):1441-4

Effect of 6-OHDA injected into the locus coeruleus on apomorphine-induced aggression. Pucilowski O, et al. **Pharmacol Biochem Behav** 1986 Mar;24(3):773-5

HYDROXYINDOLEACETIC ACID

Effects of pentagastrin and oxyphenonium on the levels of serotonin and 5-hydroxyindoleacetic acid in different parts of the digestive tract, blood and brain of rats. Pokora J, et al. **Acta Physiol Pol** 1984 Jul-Aug; 35(4):317-23

Skin conductance habituation and cerebrospinal fluid 5-hydroxyindoleacetic acid in suicidal patients. Edman G, et al. **Arch Gen Psychiatry** 1986 Jun;43(6):586-92

Serotonin and 5-hydroxyindoleacetic acid in brains of suicide victims. Comparison in chronic schizophrenic patients with suicide as cause of death. Korpi ER, et al. **Arch Gen Psychiatry** 1986 Jun;43(6):594-600

Developmental variations in CSF monoamine metabolites during childhood. Hedner J, et al. **Biol Neonate** 1986;49(4):190-7

Time-related response of central serotonergic function to lithium administration. Otero Losada ME, et al. **Gen Pharmacol** 1986; 17(3):333-7

Peripheral and central short-term effects of fusaric acid, a DBH inhibitor, on tryptophan and serotonin metabolism in the rat. Chaouloff F, et al. **J Neural Transm** 1986;65(3-4):219-32

Regional distribution of immunoreactive-thyrotrophin-releasing hormone and substance P, and indoleamines in human spinal cord. Bennett GW, et al. **J Neurochem** 1986 Jun;46(6):1718-24

HYDROXYTRYPTOPHAN

Correction and amplification: cortisol response to 5-HTP [letter] Meltzer HY, et al. **Arch Gen Psychiatry** 1986 Aug;43(8):815

[Critical study of the clinical actions of 5-HTP] Teixeira M. **Actas Luso Esp Neurol Psiquiatr Cienc Afines** 1986 Mar-Apr; 14(2):104-12 **(Por)**

HYPOCHONDRIASIS

Hypochondriacal fears and beliefs in DSM-III melancholia. Changes with amitriptyline. Kellner R, et al. **J Affective Disord** 1986 Jan-Feb; 10(1):21-6

IMIPRAMINE

Imipramine in adolescent major depression: plasma level and clinical response. Ryan ND, et al. **Acta Psychiatr Scand** 1986 Mar; 73(3):275-88

How antipanic drugs might work [letter] Nesse RM, et al. **Am J Psychiatry** 1986 Jul;143(7):945

Interactions of drugs and electroshock treatment on cerebral monoaminergic systems. Barkai AI. **Ann NY Acad Sci** 1986; 462:147-62

Clinically significant improvement in agoraphobia research. Mavissakalian M. **Behav Res Ther** 1986;24(3):369-70

Imipramine-flupenthixol decanoate interaction. Cook PE, et al. **Can J Psychiatry** 1986 Apr;31(3):235-7

Regional distribution and elimination kinetics of imipramine in rat brain after multiple dosages. Masada M, et al. **Chem Pharm Bull (Tokyo)** 1986 Feb;34(2):927-30

Quantitative homogeneous enzyme immunoassays for amitriptyline, nortriptyline, imipramine, and desipramine. Pankey S, et al. **Clin Chem** 1986 May;32(5):768-72

Targeting imipramine dose in children with depression. Sallee F, et al. **Clin Pharmacol Ther** 1986 Jul;40(1):8-13

Steady-state levels of imipramine and its metabolites: significance of dose-dependent kinetics. Brøsen K, et al. **Eur J Clin Pharmacol** 1986; 30(1):43-9

Differential effects of cimetidine and ranitidine on imipramine demethylation and desmethylimipramine hydroxylation by human liver microsomes. Spina E, et al. **Eur J Clin Pharmacol** 1986;30(2):239-42

Effect of adrenalectomy and corticosterone on [3H]imipramine binding in rat blood platelets and brain. Arora RC, et al. **Eur J Pharmacol** 1986 Apr 29;123(3):415-9

[3H]imipramine displacement and 5HT uptake inhibition by tryptoline derivatives: in rat brain 5-methoxytryptoline is not the autacoid for [3H]imipramine recognition sites. Barbaccia ML, et al. **Eur J Pharmacol** 1986 Apr 9;123(1):45-52

Determination of metapramine, imipramine, trimipramine and their major metabolites in plasma by reversed-phase column liquid chromatography. Pok Phak R, et al. **J Chromatogr** 1986 Mar 7;375(2):339-47

Effects of tranylcypromine enantiomers on monoamine uptake and release and imipramine binding. Tuomisto J, et al. **J Neural Transm** 1986; 65(2):135-45

Effect of chronic desipramine treatment on dihydroalprenolol, imipramine, and desipramine binding sites: a quantitative autoradiographic study in the rat brain. Biegon A. **J Neurochem** 1986 Jul;47(1):77-80

Subdivision of mouse brain [3H]imipramine binding based on ion dependence and serotonin sensitivity. Severson JA, et al. **J Neurochem** 1986 Jun;46(6):1743-54

The effect of antidepressants on ethylmorphine and imipramine N-demethylation in rat liver microsomes. Daniel W, et al. **J Pharm Pharmacol** 1986 May;38(5):396-8

Leu-enkephalin content in rat brain during prolonged treatment with imipramine or amitriptyline. Herman ZS, et al. **Neuropeptides** 1986 Feb-Mar;7(2):113-24

Diclofensine and imipramine. A double-blind comparative trial in depressive out-patients. Capponi R, et al. **Neuropsychobiology** 1985; 14(4):173-80

Effect of serotonin on the dissociation of high-affinity binding of [3H]imipramine in mouse cerebral cortex. Kim SS, et al. **Neurosci Lett** 1986 Jun 18;67(2):123-8

Accidental poisoning. Maroncelli RD. **Nursing** 1986 Jul;16(7):25

Escalating imipramine dosage requirements. Hudson CJ, et al. **Psychiatr J Univ Ottawa** 1986 Mar;11(1):26-7

Imipramine binding in agoraphobia [letter] Ambrosini P. **Psychiatry Res** 1986 Jun;18(2):189-92

Chronic imipramine treatment and weight gain. Fernstrom MH, et al. **Psychiatry Res** 1986 Apr;17(4):269-73

Use of a standardized documentation system (BLIPS/BDP) in the conduct of a multicenter international trial comparing fluvoxamine, imipramine, and placebo. Cassano GB, et al. **Psychopharmacol Bull** 1986; 22(1):52-8

A comparison of alprazolam and imipramine in the treatment of agoraphobia and panic disorder. Rizley R, et al. **Psychopharmacol Bull** 1986;22(1):167-72

Human cognitive function following binedaline (50 mg and 100 mg) and imipramine (75 mg): results with a new battery on tests. Jones DM, et al. **Psychopharmacology (Berlin)** 1986;89(2):198-202

Comparison of the metabolism of the three antidepressants amitriptyline, imipramine, and chlorimipramine in vitro in rat liver microsomes. Krüger R, et al. **Psychopharmacology (Berlin)** 1986;88(4):505-13

[Binding of tritiated imipramine to human platelets. 1 or several binding sites?] Scotto di Tella AM, et al. **Encephale** 1986 Jan-Feb;12(1):13-7 (Eng. Abstr.) **(Fre)**

[Tofranil] Peutillot JF, et al. **Soins Psychiatr** 1986 Mar;(65):I-II **(Fre)**

[Enuresis nocturna in school children in Bodö. A therapeutic trial with a vasopressin analog: desmopressin and imipramine] Holt J, et al. **Tidsskr Nor Laegeforen** 1986 Mar 20;106(8):651-4 (Eng. Abstr.)**(Nor)**

[Comparative clinical study of imipramine and mianserin in depressions] Chiriţă V, et al. **Rev Med Chir Soc Med Nat Iasi** 1985 Oct-Dec; 89(4):651-6 (Eng. Abstr.) **(Rum)**

[Effect of clomipramine and imipramine in vivo on genetic material in the mouse] Theodorescu R. **Rev Med Interna [Neurol Psihiatr]** 1985 Oct-Dec;30(4):309-14 **(Rum)**

[Prediction of the effect of antidepressants in patients with endogenous depression] Litvinova NM, et al. **Zh Nevropatol Psikhiatr** 1986; 86(4):577-82 (Eng. Abstr.) **(Rus)**

ISOCARBOXAZID

The effects of isocarboxazid on blood pressure and pulse. Davidson J, et al. **J Clin Psychopharmacol** 1986 Jun;6(3):139-43

LACTATES

Lactate utilization by the neonatal rat brain in vitro. Competition with glucose and 3-hydroxybutyrate. Fernández E, et al. **Biochem J** 1986 Mar 1;234(2):489-92

Long-term effects of combined vitamin B6-magnesium administration in an autistic child. Martineau J, et al. **Biol Psychiatry** 1986 May; 21(5-6):511-8

Perchloric acid interference in enzymatic-fluorimetric-continuous-flow assay methods for measuring glucose, lactate, pyruvate, alanine, glycerol, and 3-hydroxybutyrate in blood. Stappenbeck R, et al. **Clin Chem** 1986 Jun;32(6):1023-6

Synthesis and identification of 3-(4-hydroxy-1-naphthoxy)lactic acid as a metabolite of propranolol in the rat, in man, and in the rat liver 9000 g supernatant fraction. Talaat RE, et al. **Drug Metab Dispos** 1986 Mar-Apr;14(2):202-7

Hormone and metabolite response to weight-lifting training sessions. Guezennec Y, et al. **Int J Sports Med** 1986 Apr;7(2):100-5

[Changes in cardiovascular, sympathoadrenal and metabolic responses during exercise corresponding to the lactate threshold in middle-aged and elderly women] Yoshitake Y. **Nippon Eiseigaku Zasshi** 1986 Feb; 40(6):867-75 (Eng. Abstr.) **(Jpn)**

LEARNING

Attenuation of sensory preconditioning by noradrenaline depletion in the rat. Archer T, et al. **Behav Brain Res** 1986 Apr;20(1):47-56

Central nervous system mediation of positive and negative reinforcement in neonatal albino rats. Kehoe P, et al. **Brain Res** 1986 Jun; 392(1-2):69-75

Learning impairment following lesion of the basal nucleus of Meynert in the marmoset: modification by cholinergic drugs. Ridley RM, et al. **Brain Res** 1986 Jun 18;376(1):108-16

Sedative effects and impaired learning and recall after single oral doses of lorazepam. Shader RI, et al. **Clin Pharmacol Ther** 1986 May; 39(5):526-9

Benzodiazepine impairs and beta-carboline enhances performance in learning and memory tasks. Venault P, et al. **Nature** 1986 Jun 26-Jul 2;321(6073):864-6

Cholinergic suppression: a postsynaptic mechanism of long-term associative learning. Morielli AD, et al. **Proc Natl Acad Sci USA** 1986 Jun;83(12):4556-60

[Chief trends in research into the neurochemical mechanisms of learning and memory] Kruglikov RI. **Zh Vyssh Nerv Deiat** 1986 Mar-Apr; 36(2):226-31 (24 ref.) **(Rus)**

LEARNING DISORDERS

Disruption of conditioned taste aversion by ECS: the role of lithium chloride. Shaw N. **Physiol Behav** 1986;36(6):1193-5

LEVODOPA

The effects of domperidone on the absorption of levodopa in normal subjects. Bradbrook ID, et al. **Eur J Clin Pharmacol** 1986; 29(6):721-3

Dopamine and L-dopa potentiation of pressor responses to norepinephrine in isolated perfused rat kidneys. Lam BK, et al. **J Cardiovasc Pharmacol** 1986 May-Jun;8(3):554-8

A lymphotropic prodrug of L-dopa: synthesis, pharmacological properties, and pharmacokinetic behavior of 1,3-dihexadecanoyl-2-[(S)-2-amino-3-(3,4-dihydroxyphenyl)propanoyl] propane-1,2,3-triol. Garzon-Aburbeh A, et al. **J Med Chem** 1986 May;29(5):687-91

Differential effect of repeated treatment with L-dopa on dopamine-D1 or -D2 receptors. Parenti M, et al. **Neuropharmacology** 1986 Mar; 25(3):331-4

[L-dopa extracted from seeds of Mucuna sempervirens Hemsl as a promoter of fracture healing] Yang HY. **Chung Hsi I Chieh Ho Tsa Chih** 1985 Jul;5(7):398-401, 386 (Eng. Abstr.) **(Chi)**

[Stimulation of ovulation with analogs of luliberin, androstenol and their combination with L-DOPA] Lupanova GE. **Farmakol Toksikol** 1986 Mar-Apr;49(2):35-7 (Eng. Abstr.) **(Rus)**

LH

Can neonatal treatment with a related hormone adapt the receptor for itself? Csaba G, et al. **Acta Physiol Hung** 1986;67(1):65-9

Colocalization of luteinizing hormone and serotonin in secretory granules of mammalian gonadotrophs. Payette RF, et al. **Anat Rec** 1986 May; 215(1):51-8

Secretion of the beta-subunit of luteinizing hormone in dispersed rat anterior pituitary cells. Seki T, et al. **Asia Oceania J Obstet Gynaecol** 1986 Mar;12(1):113-8

Copper induces luteinizing hormone release and desensitization of pituitary gonadotropes. Schvartz I, et al. **Biochem Biophys Res Commun** 1986 Apr 14;136(1):417-25

Changes in the dynamics of luteinizing hormone-releasing hormone-stimulated secretion of luteinizing hormone during sexual maturation of female rats. Nash SJ, et al. **Biol Reprod** 1986 Apr; 34(3):549-57

Effect of luteinising hormone releasing hormone and its analogues on plasma luteinising hormone concentrations in incubating bantam hens. Sharp PJ, et al. **Br Poult Sci** 1986 Mar;27(1):129-35

Biochemical and radioautographic analysis of estrogen-inducible progestin receptors in female ferret brain and pituitary: correlations with effects of progesterone on sexual behavior and gonadotropin-releasing hormone-stimulated secretion of luteinizing hormone. Baum MJ, et al. **Brain Res** 1986 Mar 19;368(2):296-309

Modulation of the estradiol-induced luteinizing hormone surge by progesterone or antiestrogens: effects on pituitary gonadotropin-releasing hormone receptors. Attardi B, et al. **Endocrinology** 1986 Jul;119(1):274-83

Food-restricted, prepubertal, female rats: rapid recovery of luteinizing hormone pulsing with excess food, and full recovery of pubertal development with gonadotropin-releasing hormone. Bronson FH. **Endocrinology** 1986 Jun;118(6):2483-7

Episodic patterns of luteinizing hormone and follicle-stimulating hormone release: differential secretory dynamics and adrenergic control in ovariectomized rats. Condon TP, et al. **Endocrinology** 1986 Jun; 118(6):2525-33

Gonadotropin-releasing hormone-mediated desensitization of cultured rat anterior pituitary cells can be uncoupled from luteinizing hormone release. Jinnah HA, et al. **Endocrinology** 1986 Jun;118(6):2599-604

Synthesis and release of luteinizing hormone by rat anterior pituitary cells: effects of cytochalasins B and D. Liu TC, et al. **Endocrinology** 1986 Jul;119(1):236-43

Adrenocorticotropin-induced changes in ovine pituitary gonadotropin secretion in vitro. Matteri RL, et al. **Endocrinology** 1986 May; 118(5):2091-6

Receptor binding and gonadotropin-releasing activity of a novel chicken gonadotropin-releasing hormone ([His5, Trp7, Tyr8]GnRH) and a D-Arg6 analog. Millar RP, et al. **Endocrinology** 1986 Jul; 119(1):224-31

Effects of epinephrine, norepinephrine, and dopamine on gonadotropin-releasing hormone-induced secretion of luteinizing hormone in vitro. Swartz SR, et al. **Endocrinology** 1986 Jun; 118(6):2425-31

Modification of luteinizing hormone secretion by activators of Ca2+/phospholipid-dependent protein kinase. Turgeon JL, et al. **Endocrinology** 1986 May;118(5):2053-8

Biosynthesis, glycosylation, and secretion of rat luteinizing hormone alpha- and beta-subunits: differential effects of orchiectomy and gonadotropin-releasing hormone. Vogel DL, et al. **Endocrinology** 1986 Jul;119(1):202-13

Luteinizing hormone and follicle-stimulating hormone responses to intransal gonadotropin-releasing hormone. Rajfer J, et al. **Fertil Steril** 1986 Jun;45(6):794-9

Single dose responses to the gonadotropin-releasing hormone agonist analogue [(imBz 1)-D-His6,Pro9-NEt]GnRH. Doelle GC, et al. **Horm Metab Res** 1986 Mar;18(3):201-2

Effects of pulsatile injection of GnRH into 6- to 14-wk-old Holstein bulls. Miller CJ, et al. **J Anim Sci** 1986 May;62(5):1332-9

Anterior pituitary concentrations of gonadotropins, GnRH-receptors and ovarian characteristics following early weaning in beef cows. Parfet JR, et al. **J Anim Sci** 1986 Mar;62(3):717-22

Pulsatile or continuous infusion of luteinizing hormone-releasing hormone and hormonal concentrations in prepubertal beef heifers. Skaggs CL, et al. **J Anim Sci** 1986 Apr;62(4):1034-48

Effects of intermittent injections of LHRH on secretory patterns of LH and FSH and ovarian follicular growth during postpartum anovulation in suckled beef cows. Spicer LJ, et al. **J Anim Sci** 1986 May; 62(5):1317-23

Participation of voltage-dependent calcium channels in the action of gonadotropin-releasing hormone. Chang JP, et al. **J Biol Chem** 1986 Jul 15;261(20):9105-8

Single subcutaneous doses of a luteinizing hormone-releasing hormone antagonist suppress serum gonadotropin and testosterone levels in normal men. Pavlou SN, et al. **J Clin Endocrinol Metab** 1986 Aug; 63(2):303-8

Pituitary self-priming actions of gonadotropin-releasing hormone. Kinetics of estradiol's potentiating effects on gonadotropin-releasing hormone-facilitated luteinizing hormone and follicle-stimulating hormone release in healthy postmenopausal women. Veldhuis JD, et al. **J Clin Invest** 1986 Jun;77(6):1849-56

Ontogeny of serum and pituitary gonadotrophins in male rats treated with low doses of 5 alpha-dihydrotestosterone. Karanth S, et al. **J Endocrinol** 1986 Mar;108(3):369-75

Seasonal changes in concentrations of plasma hormones in the male ring dove (Streptopelia risoria). Lea RW, et al. **J Endocrinol** 1986 Mar; 108(3):385-91

Varying the patterns and concentrations of gonadotrophin-releasing hormone stimulation does not alter the ratio of LH and FSH released from perifused sheep pituitary cells. McIntosh JE, et al. **J Endocrinol** 1986 May;109(2):155-61

Effects of LH and an LH-releasing hormone agonist on different second messenger systems in the regulation of steroidogenesis in isolated rat Leydig cells. Themmen AP, et al. **J Endocrinol** 1986 Mar; 108(3):431-40

Influence of subcutaneous melatonin implantation on gonadal development and on plasma levels of luteinizing hormone, testosterone, estradiol, and corticosterone in the pigeon. John TM, et al. **J Pineal Res** 1986;3(2):169-79

Steroid regulation of gonadotropins in genetically hypoprolactinemic females (IPL nude rats). Cohen H, et al. **J Steroid Biochem** 1986 Jan; 24(1):431-5

Top concentrations of dynorphin-like immunoreactivity in fractions of rat anterior pituitary cells enriched in gonadotrophs. Knepel W, et al. **Life Sci** 1986 Jun 23;38(25):2363-7

Modulation and role of Ca2+ in LH and LHRH agonist action in rat Leydig cells. Cooke BA, et al. **Med Biol** 1986;63(5-6):259-63

The different mechanisms for suppression of pituitary and testicular function. Sandow J, et al. **Med Biol** 1986;63(5-6):192-200

Perifusion of anterior pituitary cells: release of gonadotropins and somatotropins. Badger TM. **Methods Enzymol** 1986;124:79-90

Immunohistochemical localization of follicle-stimulating hormone, luteinizing hormone, growth hormone, adrenocorticotrophic hormone and prolactin in the human placenta. Al-Timimi A, et al. **Placenta** 1986 Mar-Apr;7(2):163-72

Effect of atrial natriuretic peptide on gonadotropin release in superfused rat pituitary cells. Horvath J, et al. **Proc Natl Acad Sci USA** 1986 May; 83(10):3444-6

Gonadotropin-releasing hormone differentially regulates expression of the genes for luteinizing hormone alpha and beta subunits in male rats. Papavasiliou SS, et al. **Proc Natl Acad Sci USA** 1986 Jun; 83(11):4026-9

[Effect of tyrosine on serum concentrations of LH, FSH and testosterone in adult men] Ni J, et al. **Sheng Li Hsueh Pao** 1985 Jun;37(3):303-6 (Eng. Abstr.) **(Chi)**

[The effect of synthetic chicken LH-RH on the release of LH and FSH and ovulation in rats (a comparative study of synthetic mammalian LH-RH and chicken LH-RH)] Takahashi Y, et al. **Nippon Naibunpi Gakkai Zasshi** 1986 Feb 20;62(2):126-39 (Eng. Abstr.) **(Jpn)**

[Role of various types of serotonin reception in the hypothalamic modulation of the release of luteinizing hormone] Ignatkov VIa, et al. **Fiziol Zh SSSR** 1986 Mar;72(3):316-22 (Eng. Abstr.) **(Rus)**

LH-FSH RELEASING HORMONE

Serotonin stimulates gonadotrophin release by acting directly on the median eminence. Vitale ML, et al. **Acta Physiol Pharmacol Latinoam** 1985;35(4):473-9

Pulsatile administration of gonadotropin releasing hormone (Gn-RH) to lactating sows using a portable automatic pump ('Zyklomat'). Rojanasthien S, et al. **Acta Vet Scand** 1985;26(4):442-8

Induction of ovulation in anestrous mares with pulsatile administration of gonadotropin-releasing hormone. Johnson AL. **Am J Vet Res** 1986 May;47(5):983-6

Demonstration of immunoreactive LHRH in the human ovaries by peroxidase immunocytochemistry. Huang HJ, et al. **Asia Oceania J Obstet Gynaecol** 1986 Mar;12(1):149-54

Autoradiographical localization of luteinizing hormone releasing hormone (LHRH) receptors on rat testicular intertubular cells fractionated on Percoll density gradients. Hedger MP, et al. **Aust J Biol Sci** 1985; 38(4):435-44

Increased potency of antagonists of the luteinizing hormone releasing hormone which have D-3-Pal in position 6. Folkers K, et al. **Biochem Biophys Res Commun** 1986 Jun 13;137(2):709-15

Changes in the dynamics of luteinizing hormone-releasing hormone-stimulated secretion of luteinizing hormone during sexual maturation of female rats. Nash SJ, et al. **Biol Reprod** 1986 Apr; 34(3):549-57

Effect of luteinising hormone releasing hormone and its analogues on plasma luteinising hormone concentrations in incubating bantam hens. Sharp PJ, et al. **Br Poult Sci** 1986 Mar;27(1):129-35

Attempts to immunoprecipitate the LHRH precursor synthesized in cell free systems. Cohen S, et al. **Brain Res Bull** 1986 Mar;16(3):309-14

Ultrastructural characterization of neurosecretory fibres immunoreactive for vasotocin, isotocin, somatostatin, LHRH and CRF in the pituitary of a teleost fish, Poecilia latipinna. Batten TF. **Cell Tissue Res** 1986; 244(3):661-72

A reinvestigation of the Gn-RH (gonadotrophin-releasing hormone) systems in the goldfish brain using antibodies to salmon Gn-RH. Kah O, et al. **Cell Tissue Res** 1986;244(2):327-37

Induction of ovarian activity by pulsatile infusion of LHRH in women with lactational amenorrhoea. Glasier A, et al. **Clin Endocrinol (Oxf)** 1986 Mar;24(3):243-52

Selective reduction of elevated FSH levels in infertile men by pulsatile LHRH treatment. Hönigl W, et al. **Clin Endocrinol (Oxf)** 1986 Feb; 24(2):177-82

Modulation of the estradiol-induced luteinizing hormone surge by progesterone or antiestrogens: effects on pituitary gonadotropin-releasing hormone receptors. Attardi B, et al. **Endocrinology** 1986 Jul;119(1):274-83

Food-restricted, prepubertal, female rats: rapid recovery of luteinizing hormone pulsing with excess food, and full recovery of pubertal development with gonadotropin-releasing hormone. Bronson FH. **Endocrinology** 1986 Jun;118(6):2483-7

Gonadotropin-releasing hormone (GnRH) rapidly stimulates the formation of inositol phosphates and diacyglycerol in rat granulosa cells: further evidence for the involvement of Ca2+ and protein kinase C in the action of GnRH. Davis JS, et al. **Endocrinology** 1986 Jun; 118(6):2561-71

Cytodifferentiation of granulosa cells induced by gonadotropin-releasing hormone promotes fibronectin secretion. Dorrington JH, et al. **Endocrinology** 1986 May;118(5):2065-71

Gonadotropin-releasing hormone-mediated desensitization of cultured rat anterior pituitary cells can be uncoupled from luteinizing hormone release. Jinnah HA, et al. **Endocrinology** 1986 Jun;118(6):2599-604

Receptor binding and gonadotropin-releasing activity of a novel chicken gonadotropin-releasing hormone ([His5, Trp7, Tyr8]GnRH) and a D-Arg6 analog. Millar RP, et al. **Endocrinology** 1986 Jul; 119(1):224-31

Functional characteristics of the luteinizing hormone-releasing hormone pulse generator in conscious unrestrained female rabbits: activation by norepinephrine. Ramirez VD, et al. **Endocrinology** 1986 Jun; 118(6):2331-9

Baseline and luteinizing hormone-releasing hormone-perturbed patterns of estrogen receptor distribution in anterior pituitary cell nuclei. Singh P, et al. **Endocrinology** 1986 Jun;118(6):2355-61

Effects of epinephrine, norepinephrine, and dopamine on gonadotropin-releasing hormone-induced secretion of luteinizing hormone in vitro. Swartz SR, et al. **Endocrinology** 1986 Jun; 118(6):2425-31

Biosynthesis, glycosylation, and secretion of rat luteinizing hormone alpha- and beta-subunits: differential effects of orchiectomy and gonadotropin-releasing hormone. Vogel DL, et al. **Endocrinology** 1986 Jul;119(1):202-13

Regulation of human prolactin secretion by gonadotropin-releasing hormone in vitro. Blackwell RE, et al. **Fertil Steril** 1986 Jul; 46(1):26-31

Intranasal peptide contraception by inhibition of ovulation with the gonadotropin-releasing hormone superagonist nafarelin: six months' clinical results. Gudmundsson JA, et al. **Fertil Steril** 1986 May; 45(5):617-23

GnRH ovulation induction [letter] Leyendecker G. **Fertil Steril** 1986 May; 45(5):737-8

Stimulation of multiple follicular growth for in vitro fertilization by administration of pulsatile luteinizing hormone-releasing hormone during the midfollicular phase. Shaw RW, et al. **Fertil Steril** 1986 Jul; 46(1):135-7

Single dose responses to the gonadotropin-releasing hormone agonist analogue [(imBz 1)-D-His6,Pro9-NEt]GnRH. Doelle GC, et al. **Horm Metab Res** 1986 Mar;18(3):201-2

Active immunization of female dogs against luteinizing hormone releasing hormone (LHRH) and its effects on ovarian steroids and estrus suppression. Singh V. **Indian J Exp Biol** 1985 Dec;23(12):667-72

Specificity and affinity characteristics of dog luteinizing hormone releasing hormone (LHRH) antibodies. Singh V. **Indian J Exp Biol** 1985 Dec;23(12):673-5

Lack of correlation between fertility and sperm numbers in male rats treated with histrelin, a potent LHRH agonist. Foldesy RG, et al. **J Androl** 1986 May-Jun;7(3):140-6

Relationships among concentrations of four opioid neuropeptides and luteinizing hormone-releasing hormone in neural tissues of beef cows following early weaning. Malven PV, et al. **J Anim Sci** 1986 Mar; 62(3):723-33

Effects of pulsatile injection of GnRH into 6- to 14-wk-old Holstein bulls. Miller CJ, et al. **J Anim Sci** 1986 May;62(5):1332-9

Anterior pituitary concentrations of gonadotropins, GnRH-receptors and ovarian characteristics following early weaning in beef cows. Parfet JR, et al. **J Anim Sci** 1986 Mar;62(3):717-22

Pulsatile or continuous infusion of luteinizing hormone-releasing hormone and hormonal concentrations in prepubertal beef heifers. Skaggs CL, et al. **J Anim Sci** 1986 Apr;62(4):1034-48

Effects of intermittent injections of LHRH on secretory patterns of LH and FSH and ovarian follicular growth during postpartum anovulation in suckled beef cows. Spicer LJ, et al. **J Anim Sci** 1986 May; 62(5):1317-23

Effects of intermittent injections of LHRH on specific binding of 125I-labeled gonadotropins to granulosa and theca, and concentrations of steroids in serum and ovarian follicles during postpartum anovulation in suckled beef cows. Spicer LJ, et al. **J Anim Sci** 1986 May; 62(5):1324-31

Participation of voltage-dependent calcium channels in the action of gonadotropin-releasing hormone. Chang JP, et al. **J Biol Chem** 1986 Jul 15;261(20):9105-8

Single subcutaneous doses of a luteinizing hormone-releasing hormone antagonist suppress serum gonadotropin and testosterone levels in normal men. Pavlou SN, et al. **J Clin Endocrinol Metab** 1986 Aug; 63(2):303-8

Pituitary self-priming actions of gonadotropin-releasing hormone. Kinetics of estradiol's potentiating effects on gonadotropin-releasing hormone-facilitated luteinizing hormone and follicle-stimulating hormone release in healthy postmenopausal women. Veldhuis JD, et al. **J Clin Invest** 1986 Jun;77(6):1849-56

Varying the patterns and concentrations of gonadotrophin-releasing hormone stimulation does not alter the ratio of LH and FSH released from perifused sheep pituitary cells. McIntosh JE, et al. **J Endocrinol** 1986 May;109(2):155-61

Testosterone metabolites do not participate in the control of hypothalamic LH-releasing hormone. Zanisi M, et al. **J Endocrinol** 1986 May; 109(2):291-6

Isolation and characterization of a new peptide from hypothalamus and pituitary using a monoclonal antibody to LHRH. Knapp RJ, et al. **J Neuroimmunol** 1986 Jun;11(4):335-51

Prolonged controlled-release of nafarelin, a luteinizing hormone-releasing hormone analogue, from biodegradable polymeric implants: influence of composition and molecular weight of polymer. Sanders LM, et al. **J Pharm Sci** 1986 Apr;75(4):356-60

Absence of LHRH effect on testosterone production by Leydig cells from fetal mouse testis. Pointis G, et al. **J Steroid Biochem** 1986 Jan; 24(1):307-10

Effects of chronic administration of LH releasing hormone on age-dependent activities of testicular 4-ene-5 alpha-reductase and 17 beta-ol-dehydrogenase in mice. Takeyama M, et al. **J Steroid Biochem** 1986 May;24(5):1095-6

The undescended testis: is there a role for LHRH? [editorial] **Lancet** 1986 May 17;1(8490):1133-4

Luteinising-hormone-releasing hormone and cryptorchidism [letter] Chilvers C, et al. **Lancet** 1986 Jul 12;2(8498):101

Prolonged pulsatile release of gonadotropin-releasing hormone from the guinea pig hypothalamus in vitro. McKibbin PE, et al. **Life Sci** 1986 Jun 9;38(23):2145-50

Modulation and role of Ca2+ in LH and LHRH agonist action in rat Leydig cells. Cooke BA, et al. **Med Biol** 1986;63(5-6):259-63

Peptidergic secretory granules isolated from the brain: a model system for study of intracellular aspects of the process of peptide secretion. Barnea A. **Methods Enzymol** 1986;124:254-65

Detection of a high-molecular-weight LHRH precursor by cell-free translation of mRNA from human, rat, and mouse hypothalamus. Curtis A, et al. **Methods Enzymol** 1986;124:318-35

Measurement of neuropeptide release: in vitro and in vivo procedures. Levine JE, et al. **Methods Enzymol** 1986;124:466-94

Autoradiographic localization of brain receptors for peptide hormones: angiotensin II, corticotropin-releasing factor, and gonadotropin-releasing hormone. Millan M, et al. **Methods Enzymol** 1986;124:590-606

Computer-controlled perifusion system for neuroendocrine tissues: development and applications. Negro-Vilar A, et al. **Methods Enzymol** 1986;124:67-79

Luciferin derivatization of ligands for development of nonisotopic binding assays. Schaeffer JM. **Methods Enzymol** 1986;124:29-35

LHRH promotes the synthesis and release of a 87,000 Da protein (GP-87) by enriched gonadotrophs. Chanat E, et al. **Mol Cell Endocrinol** 1986 Jul;46(2):109-19

Degradation of luteinizing hormone-releasing hormone (LHRH) and an LHRH agonist by the rat testis. Hedger MP, et al. **Mol Cell Endocrinol** 1986 Jun;46(1):59-70

Hormone-stimulated redistribution of gonadotrope protein kinase C in vivo: dependence on Ca2+ influx. McArdle CA, et al. **Mol Pharmacol** 1986 Jun;29(6):570-6

Effects of estradiol and progesterone on immunoreactive forms of hypothalamic luteinizing hormone-releasing hormone. Drouva SV, et al. **Neuroendocrinology** 1986;43(1):32-7

Gonadotropin-releasing hormone neuronal system of the white-footed mouse, Peromyscus leucopus. Glass JD. **Neuroendocrinology** 1986; 43(2):220-9

In vitro LHRH release from superfused hypothalamus as a function of the rat estrous cycle: effect of progesterone. Kim K, et al. **Neuroendocrinology** 1986;42(5):392-8

Hypothalamic and pituitary enzymatic degradation of luteinizing hormone-releasing hormone during the 4-day estrous cycle of the rat. Assessment by high-performance liquid chromatography. Lapp CA, et al. **Neuroendocrinology** 1986;43(2):230-8

Removal of the vomeronasal organ impairs lordosis in female hamsters: effect is reversed by luteinising hormone-releasing hormone. Mackay-Sim A, et al. **Neuroendocrinology** 1986;42(6):489-93

Patch clamp recordings of single ion channel activation by gonadotrophin-releasing hormone in ovine pituitary gonadotrophs. Mason WT, et al. **Neuroendocrinology** 1986;43(2):205-19

Activation of estradiol-positive feedback at puberty: estradiol sensitizes the LHRH-releasing system at two different biochemical steps. Ojeda SR, et al. **Neuroendocrinology** 1986;43(2):259-65

Effects of cupric acetate on hypothalamic gonadotropin-releasing hormone release in intact and ovariectomized rabbits. Pau KY, et al. **Neuroendocrinology** 1986;43(2):197-204

Postnatal morphological changes in rat LHRH neurons correlated with sexual maturation. Wray S, et al. **Neuroendocrinology** 1986; 43(2):93-7

Use of cryoprotectant to maintain long-term peptide immunoreactivity and tissue morphology. Watson RE Jr, et al. **Peptides** 1986 Jan-Feb; 7(1):155-9

Pharmacological evidence of catecholaminergic involvement in the behavioral effects of luteinizing hormone releasing hormone in rats. Mora S, et al. **Pharmacol Biochem Behav** 1986 Mar;24(3):433-8

Activation of two different but complementary biochemical pathways stimulates release of hypothalamic luteinizing hormone-releasing hormone. Ojeda SR, et al. **Proc Natl Acad Sci USA** 1986 Jul; 83(13):4932-6

Gonadotropin-releasing hormone differentially regulates expression of the genes for luteinizing hormone alpha and beta subunits in male rats. Papavasiliou SS, et al. **Proc Natl Acad Sci USA** 1986 Jun; 83(11):4026-9

The neural control of luteinizing hormone release. Summerlee AJ. **Prog Neurobiol** 1986;26(2):147-78

Radioimmunoassay of [D-Trp6]-luteinizing hormone-releasing hormone: its application to animal pharmacokinetic studies after single injection and long-acting formulation administration. Ezan E, et al. **Regul Pept** 1986 Apr;14(2):155-67

[Luteinized unruptured follicle syndrome after induction of ovulation by pulsatile administration of gonadorelin (letter)] Pfister P, et al. **Presse Med** 1986 May 10;15(19):887-8 **(Fre)**

[The effect of synthetic chicken LH-RH on the release of LH and FSH and ovulation in rats (a comparative study of synthetic mammalian LH-RH and chicken LH-RH)] Takahashi Y, et al. **Nippon Naibunpi Gakkai Zasshi** 1986 Feb 20;62(2):126-39 (Eng. Abstr.) **(Jpn)**

[Stimulation of ovulation with analogs of luliberin, androstenol and their combination with L-DOPA] Lupanova GE. **Farmakol Toksikol** 1986 Mar-Apr;49(2):35-7 (Eng. Abstr.) **(Rus)**

LIPOTROPIN

Dysregulation of plasma pro-opiomelanocortin-related peptides in neurotic depression. Genazzani AR, et al. **Acta Endocrinol (Copenh)** 1986 May;112(1):1-6

Plasma beta-endorphin and beta-lipotropin in patients with end-stage renal disease--effects of hemodialysis. Elias AN, et al. **Nephron** 1986; 43(3):173-6

LITHIUM

Effect of renal nerve activity on tubular sodium and water reabsorption in dog kidneys as determined by the lithium clearance method. Abildgaard U, et al. **Acta Physiol Scand** 1986 Feb;126(2):251-7

Renal function and lithium: a longitudinal study. DePaulo JR Jr, et al. **Am J Psychiatry** 1986 Jul;143(7):892-5

Lithium potentiation of tricyclic antidepressants following lack of T3 potentiation. Garbutt JC, et al. **Am J Psychiatry** 1986 Aug; 143(8):1038-9

Safety of the combination of lithium and neuroleptic drugs. Goldney RD, et al. **Am J Psychiatry** 1986 Jul;143(7):882-4

Identifying lithium-responsive bipolar depressed patients using nuclear magnetic resonance. Rosenthal J, et al. **Am J Psychiatry** 1986 Jun; 143(6):779-80

Interactions of drugs and electroshock treatment on cerebral monoaminergic systems. Barkai AI. **Ann NY Acad Sci** 1986; 462:147-62

Lithium-induced reduction in intracellular inositol supply in cholinergically stimulated parotid gland. Downes CP, et al. **Biochem J** 1986 Feb 15;234(1):199-204

Mechanism of inhibition by lithium of sodium transport in the toad bladder. Herrera FC, et al. **Biol Cell** 1985;55(3):257-63

Lithium counteracts carbamazepine-induced leukopenia while increasing its therapeutic effect. Brewerton TD. **Biol Psychiatry** 1986 Jun; 21(7):677-85

Lithium mechanisms in bipolar illness and altered intracellular calcium functions. Meltzer HL. **Biol Psychiatry** 1986 May;21(5-6):492-510

Lithium and haloperidol [letter] Nemes ZC, et al. **Biol Psychiatry** 1986 May;21(5-6):568-9

Regular 48-hour cycling of sleep duration and mood in a 35-year-old woman: use of lithium in time isolation. Welsh DK, et al. **Biol Psychiatry** 1986 May;21(5-6):527-37

Lithium and piroxicam [letter] Shelley RK. **Br J Psychiatry** 1986 Mar; 148:343

The uptake of lithium ions by synthetic carbonated hydroxyapatite. Mayer I, et al. **Calcif Tissue Int** 1986 May;38(5):293-5

The complexation of 'crowned' 4-(2,4-dinitrophenylazo)phenol with alkali and alkaline earth metal ions, and its application to the determination of Li(I) in a pharmaceutical preparation. Nakashima K, et al. **Chem Pharm Bull (Tokyo)** 1986 Jan;34(1):168-73

Erythrocyte cation transport activities as a function of cell age. Hentschel WM, et al. **Clin Chim Acta** 1986 May 30;157(1):33-43

The renal lithium clearance and its correlations with other biological variables: observations in a large group of physically healthy persons. Schou M, et al. **Clin Nephrol** 1986 Apr;25(4):207-11

Lithium chloride as an enhancing agent for metaphase preparations from rodent lymphocytes. Dowling PK, et al. **Cytogenet Cell Genet** 1986; 42(1-2):33-5

Nephrotoxicity of cyclosporin A. A lithium clearance and micropuncture study in rats. Dieperink H, et al. **Eur J Clin Invest** 1986 Feb; 16(1):69-77

myo-Inositol reverses Li+-induced inhibition of phosphoinositide turnover and ornithine decarboxylase induction during early lymphocyte activation. Mustelin T, et al. **Eur J Immunol** 1986 Jul; 16(7):859-61

The effects of desipramine, zimelidine, electroconvulsive treatment and lithium on rat brain biogenic amines: a comparison with peripheral changes. Karoum F, et al. **Eur J Pharmacol** 1986 Mar 4; 121(3):377-85

Lithium and hematopoietic toxicity. I. Recovery in vivo of murine hematopoietic stem cells (CFU-S and CFU-Mix) after single-dose administration of cyclophosphamide. Gallicchio VS. **Exp Hematol** 1986 Jun;14(5):395-400

Evidence for an intestinal lithium excretion in rats. Kersten L, et al.

Exp Pathol 1986;29(1):55-63
Influence of the incubation of cells with zinc and lithium ions on GVH reactivity of cells and on their ability to form haemopoietic colonies. Hrubá A, et al. **Folia Biol (Praha)** 1986;32(2):81-90
Time-related response of central serotonergic function to lithium administration. Otero Losada ME, et al. **Gen Pharmacol** 1986; 17(3):333-7
Thermoluminescence response of LiF to alpha radiation. Barber DE, et al. **Health Phys** 1986 Jun;50(6):805-8
Uses of lithium in patients without major affective illness. van der Kolk BA. **Hosp Community Psychiatry** 1986 Jul;37(7):675, 684
In vitro study of local solubility of uric acid stones with lithium carbonate. Jávor A, et al. **Int Urol Nephrol** 1985;17(4):315-8
Who responds to prophylactic lithium? Abou-Saleh MT, et al. **J Affective Disord** 1986 Mar-Apr;10(2):115-25
Folic acid enhances lithium prophylaxis. Coppen A, et al. **J Affective Disord** 1986 Jan-Feb;10(1):9-13
Lithium-resistant adolescent mania. Hsu LK. **J Am Acad Child Psychiatry** 1986 Mar;25(2):280-3
Inhibition by lithium of the hydroosmotic action of vasopressin in the isolated perfused cortical collecting tubule of the rabbit. Cogan E, et al. **J Clin Invest** 1986 May;77(5):1507-14
Lithium interaction with sulindac and naproxen. Ragheb M, et al. **J Clin Psychopharmacol** 1986 Jun;6(3):150-4
Rapid antidepressant effect of addition of lithium to tranylcypromine. Tariot PN, et al. **J Clin Psychopharmacol** 1986 Jun;6(3):165-7
Use of carbamazepine in acute psychosis: a controlled study. Lenzi A, et al. **J Int Med Res** 1986;14(2):78-84
The in situ perfused spinal cord of the rat. Applicability of drugs and chemicals, sodium-lithium exchange, and calcium reduction to functional intact central nervous system tissue. Deutschmann W, et al. **J Pharmacol Methods** 1986 Apr;15(2):143-55
Effects of bipolar affective disorder and lithium administration on the cholinergic system in human blood. Jope RS, et al. **J Psychiatr Res** 1986;20(1):9-18
Spontaneous toxicokinetics of lithium during a therapeutic overdose with renal failure. Bismuth C, et al. **J Toxicol Clin Toxicol** 1986; 24(3):261-8
Pharmacokinetics of lithium in the dog. Rosenthal RC, et al. **J Vet Pharmacol Ther** 1986 Mar;9(1):81-7
Angiotensin converting enzyme inhibitors and lithium treatment [letter] Douste-Blazy P, et al. **Lancet** 1986 Jun 21;1(8495):1448
Symptomatic reactive hypoglycemia during glucose tolerance test in lithium-treated patients. Shah JH, et al. **Metabolism** 1986 Jul; 35(7):634-9
Acute and chronic effects of lithium chloride on GABA-ergic function in the rat corpus striatum and frontal cerebral cortex. Otero Losada ME, et al. **Naunyn Schmiedebergs Arch Pharmacol** 1986 Feb; 332(2):169-72
Effects of lithium on visual perception in manic-depressive patients without acute symptomatology. Kropf D, et al. **Neuropsychobiology** 1986;15(1):34-42
Lithium treatment and blood pressure. Vestergaard P, et al. **Pharmacopsychiatry** 1986 Mar;19(2):73-4
Erythrocyte lithium transport during lithium treatment in patients with affective disorders. Zaremba D, et al. **Pharmacopsychiatry** 1986 Mar; 19(2):63-7
Cholecystokinin octapeptide and lithium produce different effects on feeding and taste aversion learning. Ervin GN, et al. **Physiol Behav** 1986;36(3):507-12
Lithium treatment of mania: clinical characteristics, specificity of symptom change, and outcome. Swann AC, et al. **Psychiatry Res** 1986 Jun; 18(2):127-41
[Schizophrenic excitement and the role of lithium in its therapy (apropos of 2 recent cases)] Skurnik N, et al. **Ann Med Psychol (Paris)** 1985 Dec;143(10):960-2 **(Fre)**
[Rapid response of a disorder to the addition of lithium carbonate: panic resistant to tricyclic antidepressants] Cournoyer J. **Can J Psychiatry** 1986 May;31(4):335-8 (Eng. Abstr.) **(Fre)**
[Determination of micro-quantities of serum lithium by atomic absorption spectrophotometry. Significance and applications] Moynier I, et al. **Pathol Biol (Paris)** 1986 Jan;34(1):51-6 (Eng. Abstr.) **(Fre)**
[Effect of lithium on the immune system] Skotnicki AB, et al. **Przegl Lek** 1985;42(12):805-10 **(Pol)**
[Effect of lithium oxybutyrate on the viability of preserved donor kidney] Sholokhov VM, et al. **Farmakol Toksikol** 1986 May-Jun;49(3):69-70 (Eng. Abstr.) **(Rus)**
[Use of lithium oxybutyrate in the combined therapy of burn injury patients] Iurasov II, et al. **Voen Med Zh** 1986 Apr;(4):20-1 **(Rus)**
[Granulocytosis induced by lithium. Possible clinical applications] Alvarez E, et al. **Med Clin (Barc)** 1986 Feb 15;86(6):233-5 (Eng. Abstr.) **(Spa)**

LORAZEPAM

Lorazepam dependence and chronic psychosis [letter] Carr AC. **Br J Psychiatry** 1986 Mar;148:344
Sedative effects and impaired learning and recall after single oral doses of lorazepam. Shader RI, et al. **Clin Pharmacol Ther** 1986 May; 39(5):526-9
Alprazolam and lorazepam single and multiple-dose effects on psychomotor skills and sleep. Subhan Z, et al. **Eur J Clin Pharmacol** 1986;29(6):709-12
Determination of lormetazepam in plasma by gas chromatography and electron-capture detection. Zecca L, et al. **J Chromatogr** 1986 Apr 25; 377:368-72
Lorazepam-associated drug dependence [letter] Ross M. **J R Coll Gen Pract** 1986 Feb;36(283):86
A late-appearing benzodiazepine-induced hypoactivity that is not reversed by a receptor antagonist. Lister RG, et al. **Psychopharmacology (Berlin)** 1986;88(4):520-4

MANIC DISORDER

Open multicentre trial of zuclopenthixol in mania and schizophrenia based on the AMDP scales. Bobon D, et al. **Acta Psychiatr Belg** 1986 Mar-Apr;86(2):152-76
Rapid reduction of mania by means of reserpine therapy [letter] Telner JI, et al. **Am J Psychiatry** 1986 Aug;143(8):1058
Lithium-resistant adolescent mania. Hsu LK. **J Am Acad Child Psychiatry** 1986 Mar;25(2):280-3
Elevated blood neutrophil concentration in mania [letter] Wolf JM. **J Clin Psychiatry** 1986 Jun;47(6):331
Medication effects on one-carbon metabolism in schizophrenia, mania, and major depression. Morere DA, et al. **J Clin Psychopharmacol** 1986 Jun;6(3):155-61
Lithium treatment of mania: clinical characteristics, specificity of symptom change, and outcome. Swann AC, et al. **Psychiatry Res** 1986 Jun; 18(2):127-41
[Studies of the side effect profile of clozapine] Nitzsche M, et al. **Psychiatr Neurol Med Psychol (Leipz)** 1986 Mar;38(3):148-52 (Eng. Abstr.) **(Ger)**

MEMORY

Glucose modulation of memory storage processing. Gold PE. **Behav Neural Biol** 1986 May;45(3):342-9
The use of avoidance training in studies of modulation of memory storage. Gold PE. **Behav Neural Biol** 1986 Jul;46(1):87-98
Epinephrine modulates long-term retention of an aversively motivated discrimination. Introini-Collison IB, et al. **Behav Neural Biol** 1986 May; 45(3):358-65
The course of the decrease of hypothalamic beta-endorphin induced by training, and the development of the effect of beta-endorphin on the retrieval of inhibitory avoidance in rats. Izquierdo I, et al. **Braz J Med Biol Res** 1985;18(3):391-5
Sedative effects and impaired learning and recall after single oral doses of lorazepam. Shader RI, et al. **Clin Pharmacol Ther** 1986 May; 39(5):526-9
Effects of methylphenidate on normal children's mood, event-related potentials, and performance in memory scanning and vigilance. Peloquin LJ, et al. **J Abnorm Psychol** 1986 Feb;95(1):88-98
Conditioned aversions and their memories in 5-day-old rats during suckling. Kehoe P, et al. **J Exp Psychol [Anim Behav]** 1986 Jan; 12(1):40-7
Participation of angiotensin II in learning and memory. II. Interactions of angiotensin II with dopaminergic drugs. Yonkov DI, et al. **Methods Find Exp Clin Pharmacol** 1986 Apr;8(4):203-6
Benzodiazepine impairs and beta-carboline enhances performance in learning and memory tasks. Venault P, et al. **Nature** 1986 Jun 26-Jul 2;321(6073):864-6
Effects of repeated doses of fluvoxamine, mianserin and placebo on memory and measures of sedation. Curran HV, et al. **Psychopharmacology (Berlin)** 1986;89(3):360-3
Effects of chlordiazepoxide on cued radial maze performance in rats. Hodges H, et al. **Psychopharmacology (Berlin)** 1986;88(4):460-6
Haloperidol facilitates memory retrieval in the rat. Sara SJ. **Psychopharmacology (Berlin)** 1986;89(3):307-10
[Chief trends in research into the neurochemical mechanisms of learning and memory] Kruglikov RI. **Zh Vyssh Nerv Deiat** 1986 Mar-Apr; 36(2):226-31 (24 ref.) **(Rus)**

MENTAL DISORDERS

27th Annual Psychopharmacology Meeting. Jeseník Spa, January 1985. Abstracts. **Act Nerv Super (Praha)** 1986 Mar;28(1):27-49
The closing of the organic versus functional dichotomy [letter] Fox HA. **Am J Psychiatry** 1986 Aug;143(8):1059-60
Placebo problems in psychotherapy research. Social-psychological alternatives to chemotherapy concepts. Wilkins W. **Am Psychol** 1986 May;41(5):551-6
Skin conductance habituation and cerebrospinal fluid 5-hydroxyindoleacetic acid in suicidal patients. Edman G, et al. **Arch Gen Psychiatry** 1986 Jun;43(6):586-92

Hospital doctors' management of psychological problems. Mayou R, et al. **Br J Psychiatry** 1986 Feb;148:194–7

Neuroleptic blood levels and clinical response. Rockland LH. **Can J Psychiatry** 1986 May;31(4):299–303

Ethnicity and psychopharmacology. Lin KM, et al. **Cult Med Psychiatry** 1986 Jun;10(2):151–65

Institutional therapy for adolescents. Uribe VM, et al. **Curr Psychiatr Ther** 1986;23:45–9

Biologic therapy in a rehabilitation system for mental patients. Vovin RY. **Curr Psychiatr Ther** 1986;23:269–74

New psychoactive drugs. Murray JB. **Genet Soc Gen Psychol Monogr** 1985 Nov;111(4):429–53

Patients' competency to give informed consent to medication. Beck JC, et al. **Hosp Community Psychiatry** 1986 Apr;37(4):400–2

In again, out again: preliminary evaluation of a state hospital's worst recidivists. Geller JL. **Hosp Community Psychiatry** 1986 Apr;37(4):386–90

Psychotropic prescribing patterns of nonpsychiatric residents in a general hospital in 1973 and 1982. Haggerty JJ Jr, et al. **Hosp Community Psychiatry** 1986 Apr;37(4):357–61

Uses of lithium in patients without major affective illness. van der Kolk BA. **Hosp Community Psychiatry** 1986 Jul;37(7):675, 684

A consumer survey of an adolescent unit. Pyne N, et al. **J Adolesc** 1986 Mar;9(1):63–72

Treatment of uncooperative psychiatric patients in the community [letter] Spencer S. **Lancet** 1986 May 10;1(8489):1095

The limits of liability for psychiatric malpractice. Taub S. **Leg Med** 1985;:258–70

Diagnostic and therapeutic problems in the psychopharmacological treatment of the elderly patient. Ravizza L. **Neuropsychobiology** 1986;15 Suppl 1:15–8

The use of psychotropic drugs in elderly patients with chronic mental illness. Howell T, et al. **New Dir Ment Health Serv** 1986 Mar;(29):47–58

The AMDP-system in clinical psychopharmacology. Bobon D, et al. **Pharmacopsychiatry** 1986 Mar;19(2):55–7

Annual NCDEU meeting (1985): New Clinical Drug Evaulation Unit. Abridged proceedings. **Psychopharmacol Bull** 1986;22(1):1–337

Use of placebo in clinical trials. Rickels K. **Psychopharmacol Bull** 1986;22(1):19–24

[Use of fluphenazine decanoate in psychiatric therapy. Multicenter study in 1095 patients preselected for long-acting neuroleptic treatment] Bogliolo C. **Minerva Psichiatr** 1986 Jan–Mar;27(1):1–18 **(Ita)**

[Basic principles of the rehabilitation process of the mental patient] Grecu G. **Rev Med Interna [Neurol Psihiatr]** 1985 Oct–Dec;30(4):241–53 **(Rum)**

[Clinical aspects and significance of measuring concentrations of neuroleptics and antidepressants in the blood] Cheshkova E, et al. **Zh Nevropatol Psikhiatr** 1986;86(4):573–6 (Eng. Abstr.) **(Rus)**

[Clinico-pharmacokinetic aspects of the optimization of psychopharmacotherapy] Gor'kov VA, et al. **Zh Nevropatol Psikhiatr** 1986;86(4):567–73 (Eng. Abstr.) **(Rus)**

[Clinico-biochemical approach to the problem of psychogenic disorders and background] Pelipas VE, et al. **Zh Nevropatol Psikhiatr** 1986;86(3):409–12 (Eng. Abstr.) **(Rus)**

[Experimental modeling of the cellular mechanisms of various psychopathological syndromes] Rabinovich MIa. **Zh Vyssh Nerv Deiat** 1986 Mar–Apr;36(2):242–51 (22 ref.) **(Rus)**

MENTAL PROCESSES

Mental and physical components of sawmill operatives' workload. Fibiger W, et al. **Ergonomics** 1986 Mar;29(3):363–75

[Physical work capacity under different levels of measured stress in relation to type-A personality in intellectual workers] Mincheva L, et al. **Probl Khig** 1985;10:20–32 (Eng. Abstr.) **(Bul)**

MESORIDAZINE

Mesoridazine and thioridazine: clinical effects and blood levels in refractory schizophrenics. Vital-Herne J, et al. **J Clin Psychiatry** 1986 Jul;47(7):375–9

METHOTRIMEPRAZINE

Immobilon [letter] **Vet Rec** 1986 Apr 19;118(16):466

METHYLPHENIDATE

Vicissitudes of follow-up studies: differential effects of parent training and stimulant medication with hyperactives. Firestone P, et al. **Am J Orthopsychiatry** 1986 Apr;56(2):184–94

Determination of methylphenidate and its main metabolite in plasma by gas chromatography-chemical ionization mass spectrometry. Nakajima K, et al. **Chem Pharm Bull (Tokyo)** 1986 Apr;34(4):1701–8

A neuropathic substrate for stimulant drug effects in hyperactive children. Evans RW, et al. **Clin Neuropharmacol** 1986;9(3):264–81

Effects of methylphenidate on normal children's mood, event-related potentials, and performance in memory scanning and vigilance. Peloquin LJ, et al. **J Abnorm Psychol** 1986 Feb;95(1):88–98

A thin layer chromatographic method for high volume screening of urine for methylphenidate abuse. Manno BR, et al. **J Anal Toxicol** 1986 May–Jun;10(3):116–9

Comparing classroom and clinic measures of attention deficit disorder: differential, idiosyncratic, and dose-response effects of methylphenidate. Rapport MD, et al. **J Consult Clin Psychol** 1986 Jun;54(3):334–41

Methylphenidate and cognitive therapy in children with attention deficit disorder: a double-blind trial. Brown RT, et al. **J Dev Behav Pediatr** 1986 Jun;7(3):163–74

The therapeutic effect of clonidine in attention deficit disorder with hyperactivity: a comparison with placebo and methylphenidate. Hunt RD, et al. **Psychopharmacol Bull** 1986;22(1):229–36

Methylphenidate: rate-dependent effects on hyperactivity. Rapport MD, et al. **Psychopharmacol Bull** 1986;22(1):223–8

[Effect of tsentedrin on the work capacity of operator specialists] Bakharev VD, et al. **Voen Med Zh** 1986 Mar;(3):44–5 **(Rus)**

METHYSERGIDE

Antimigraine drug interactions with 5-hydroxytryptamine1A receptors. Hiner BC, et al. **Ann Neurol** 1986 May;19(5):511–3

Methylergometrine, an active metabolite of methysergide. Müller-Schweinitzer E, et al. **Cephalalgia** 1986 Mar;6(1):35–41

Pharmacokinetics of methysergide and its metabolite methylergometrine in man. Bredberg U, et al. **Eur J Clin Pharmacol** 1986;30(1):75–7

Regional serotonin receptor studies: chronic methysergide treatment induces a selective and dose-dependent decrease in serotonin-2 receptors in mouse cerebral cortex. May PC, et al. **Life Sci** 1986 May 12;38(19):1741–7

MOTIVATION

Individual differences in the reinforcing and subjective effects of amphetamine and diazepam. de Wit H, et al. **Drug Alcohol Depend** 1986 Feb;16(4):341–60

MOTOR ACTIVITY

Pituitary-adrenal correlates of schedule-induced polydipsia and wheel running in rats. Tazi A, et al. **Behav Brain Res** 1986 Mar;19(3):249–56

Within-session data [letter] Lynch MR, et al. **Biol Psychiatry** 1986 May;21(5–6):573–4

Inhibition of amphetamine-induced locomotor activity by injection of carbachol into the anterior hypothalamic/preoptic area: pharmacological and electrophysiological studies in the rat. Brudzynski SM, et al. **Brain Res** 1986 Jun 18;376(1):47–56

Denervation-like postsynaptic supersensitivity to dopamine agonists induced by microinjection of colchicine into the substantia nigra pars compacta. Kamata K, et al. **Brain Res** 1986 Mar 5;367(1–2):1–7

Effects of diazepam on circadian phase advances and delays. Ralph MR, et al. **Brain Res** 1986 May 7;372(2):405–8

Dopamine modulates neuronal activities related to motor performance in the monkey prefrontal cortex. Sawaguchi T, et al. **Brain Res** 1986 Apr 23;371(2):404–8

Involvement of neuronal cell bodies of the mesencephalic locomotor region in the initiation of locomotor activity of freely behaving rats. Brudzynski SM, et al. **Brain Res Bull** 1986 Mar;16(3):377–81

Circling from unilateral VTA morphine: direction is controlled by environmental stimuli. Wise RA, et al. **Brain Res Bull** 1986 Feb;16(2):267–9

Dissociation of the toxic and behavioral effects of lithium on rats. Teixeira NA, et al. **Braz J Med Biol Res** 1985;18(3):349–54

Dopaminergic mechanisms and motor function: characterization of D-1 and D-2 dopamine receptor interactions. Barone P, et al. **Eur J Pharmacol** 1986 Apr 9;123(1):109–14

Chronic corticosterone administration in rats: behavioral and biochemical evidence of increased central dopaminergic activity. Wolkowitz O, et al. **Eur J Pharmacol** 1986 Apr 2;122(3):329–38

Sensorimotor changes following lesion of mid-dorsal caudate nucleus in rats. Mulgaonker VK, et al. **Indian J Physiol Pharmacol** 1985 Jul–Sep;29(3):153–8

Chronic treatment with iprindole reduces immobility of rats in the behavioural 'despair' test by activating dopaminergic mechanisms in the brain. Berettera C, et al. **J Pharm Pharmacol** 1986 Apr;38(4):313–5

Dose related sequence of effects induced by the DA agonist 2-(N,N-dipropyl)-amino-5,6-dihydroxytetralin. Doaré L, et al. **J Pharmacol** 1986 Jan–Mar;17(1):60–4

Effect of glucose on amphetamine-induced motor behavior. White NM, et al. **Life Sci** 1986 Jun 16;38(24):2255–62

Involvement of dopaminergic, cholinergic, and glutamatergic mechanisms in the actions of phencyclidine-like drugs. Johnson KM, et al. **Natl Inst Drug Abuse Res Monogr Ser** 1986;64:52–66

Psychopharmacology of phencyclidine. Marwah J, et al. **Natl Inst Drug Abuse Res Monogr Ser** 1986;64:127-33

Effects of corticotropin-releasing factor and growth hormone-releasing factor on sleep and activity in rats. Ehlers CL, et al. **Neuroendocrinology** 1986;42(6):467-74

Infusion of adrenergic receptor agonists and antagonists into the locus coeruleus and ventricular system of the brain. Effects on swim-motivated and spontaneous motor activity. Weiss JM, et al. **Neuropharmacology** 1986 Apr;25(4):367-84

Distinct functions for dopamine and serotonin in locomotor behaviour: evidence using the 5-HT1 agonist RU 24969 in globus pallidus-lesioned rats. Oberlander C, et al. **Neurosci Lett** 1986 Jun 18;67(2):113-8

Simultaneous monitoring of dopamine release in rat frontal cortex, nucleus accumbens and striatum: effect of drugs, circadian changes and correlations with motor activity. O'Neill RD, et al. **Neuroscience** 1985 Sep;16(1):49-55

Effect of DN-1417, a thyrotropin releasing hormone analog, on dopaminergic neurons in rat brain. Nakahara T, et al. **Peptides** 1985 Nov-Dec;6(6):1093-9

Behavioral and biochemical assessment of time-related changes in globus pallidus and striatal dopamine induced by intranigrally administered neurotensin. Napier TC, et al. **Peptides** 1985 Nov-Dec;6(6):1057-68

Involvement of extrapyramidal motor mechanisms in the suppression of locomotor activity by antipsychotic drugs: a comparison between the effects produced by pre- and post-synaptic inhibition of dopaminergic neurotransmission. Ahlenius S, et al. **Pharmacol Biochem Behav** 1986 May;24(5):1409-15

Lack of evidence for the involvement of catecholaminergic mechanisms in the behavioral anti-methamphetamine effect of L-histidine in the mouse. Itoh Y, et al. **Pharmacol Biochem Behav** 1986 Mar; 24(3):571-4

Effects of serotonergic agonists and antagonists on the locomotor activity of neonatal rats. Lucot JB, et al. **Pharmacol Biochem Behav** 1986 Mar; 24(3):537-41

Dissociation of locomotor depression and ChE activity after DFP, soman and sarin. Lynch MR, et al. **Pharmacol Biochem Behav** 1986 Apr; 24(4):941-7

Pharmacological evidence of catecholaminergic involvement in the behavioral effects of luteinizing hormone releasing hormone in rats. Mora S, et al. **Pharmacol Biochem Behav** 1986 Mar;24(3):433-8

Effects of acute and chronic bupropion on locomotor activity and dopaminergic neurons. Nielsen JA, et al. **Pharmacol Biochem Behav** 1986 Apr;24(4):795-9

Biochemical and behavioral correlates of chronic stress: effects of tricyclic antidepressants. Soblosky JS, et al. **Pharmacol Biochem Behav** 1986 May; 24(5):1361-8

Antagonistic behavioral effects of calcitonin and amphetamine in the rat. Twery MJ, et al. **Pharmacol Biochem Behav** 1986 May;24(5):1203-7

Effects of acute and long-term treatments with thyrotropin-releasing hormone on locomotor activity and jumping behavior in mice. Ushijima I, et al. **Pharmacol Biochem Behav** 1986 May;24(5):1423-8

Comparison of motor depressant effects of caerulein and N-propylnorapomorphine in mice. Vasar E, et al. **Pharmacol Biochem Behav** 1986 Mar;24(3):469-78

Comparison of circling induced by unilateral intrastriatal microinjections of haloperidol, clozapine and CCK-8 in rats. Weiss F, et al. **Pharmacol Biochem Behav** 1986 Apr;24(4):983-9

Wheel-running activity after kainic acid injection into lateral hypothalamus of rats. Blake DJ, et al. **Physiol Behav** 1986; 36(6):1009-16

Effects of pimozide on appetitive behavior and locomotor activity: dissimilarity of effects when compared to extinction. Spivak KJ, et al. **Physiol Behav** 1986;36(3):457-63

Effects of Suanzaorentang on behavior changes and central monoamines. Hsieh MT, et al. **Proc Natl Sci Counc Repub China [B]** 1986 Jan; 10(1):43-8

Lithium and bupropion antagonise the phasic changes in locomotor activity caused by dopamine infused into the rat nucleus accumbens. Barnes JC, et al. **Psychopharmacology (Berlin)** 1986;89(3):311-6

Mesolimbic dopamine and its control of locomotor activity in rats: differences in pharmacology and light/dark periodicity between the olfactory tubercle and the nucleus accumbens. Cools AR. **Psychopharmacology (Berlin)** 1986;88(4):451-9

A late-appearing benzodiazepine-induced hypoactivity that is not reversed by a receptor antagonist. Lister RG, et al. **Psychopharmacology (Berlin)** 1986;88(4):520-4

Behavioural and pharmacological characterization of the mouth movements induced by muscarinic agonists in the rat. Salamone JD, et al. **Psychopharmacology (Berlin)** 1986;88(4):467-71

Involvement of different dopamine receptors in rat diphasic motility response to apomorphine. Vaccheri A, et al. **Psychopharmacology (Berlin)** 1986;89(3):265-8

N,N'-diallylbarbital potentiation of drug-induced sleep and motor incoordination. Tateoka Y, et al. **Res Commun Chem Pathol Pharmacol** 1986 Apr;52(1):17-28

[The central inhibitory action of hexoprenaline] Zhang SS. **Yao Hsueh Hsueh Pao** 1985 Sep;20(9):699-701 (Eng. Abstr.) (Chi)

[Synthesis and pharmacological studies of derivatives of 5- and 7-(O-hydroxyphenyl)-2,3-dihydro-1,4-diazepins] Kostka K, et al. **Acta Pol Pharm** 1985;42(5):442-7 (Eng. Abstr.) (Pol)

MSH

Permanent alteration of peptide feedback on dopamine neurons after injection of alpha-melanotropin antiserum at a critical period of postnatal development. Lichtensteiger W, et al. **Brain Res** 1986 Mar 19;368(2):205-10

Antagonism of beta-endorphin-induced prolactin release by alpha-melanocyte-stimulating hormone and corticotropin-like intermediate lobe peptide. Wardlaw SL, et al. **Endocrinology** 1986 Jul; 119(1):112-8

Regulation of beta-endorphin, corticotropin-like intermediate lobe peptide, and alpha-melanotropin-stimulating hormone in the hypothalamus by testosterone. Wardlaw SL. **Endocrinology** 1986 Jul; 119(1):19-24

Dissimilar responsiveness of cultured corticotrophs and melanotrophs to tripeptide aldehydes. Fazekas I, et al. **Histochemistry** 1986; 84(4-6):418-22

Melanocyte-stimulating hormone, tyrosinase activity and the regulation of eumelanogenesis and phaeomelanogenesis in the hair follicular melanocytes of the mouse. Burchill SA, et al. **J Endocrinol** 1986 Apr; 109(1):15-21

Structural modifications of pro-opiomelanocortin-derived peptides alter their behavioral effects markedly. Hirsch MD, et al. **J Pharmacol Exp Ther** 1986 May;237(2):378-85

Acetylation of melanocyte-stimulating hormone and beta-endorphin in the pars intermedia of the perinatal pituitary gland in the mouse. Leenders HJ, et al. **Neuroendocrinology** 1986;43(2):166-74

Coexpression of human growth hormone-releasing factor 1-37-like and alpha-melanotropin-like immunoreactivities in neurones of the rat lateral dorsal hypothalamus. Fellmann D, et al. **Neurosci Lett** 1986 Jul 11;68(1):122-6

GABAA and GABAB receptors on porcine pars intermedia cells in primary culture: functional role in modulating peptide release. Demeneix BA, et al. **Neuroscience** 1986 Apr;17(4):1275-85

NEUROPSYCHOLOGICAL TESTS

A comprehensive study of chronic schizophrenic patients. II. Biological, neuropsychological, and clinical correlates of CT abnormality. Pandurangi AK, et al. **Acta Psychiatr Scand** 1986 Feb;73(2):161-71

NEUROREGULATORS

Feulgen lecture: phenotypic plasticity in the nervous system (summary). Black IB. **Acta Histochem [Suppl] (Jena)** 1986;32:9-10

Different neurotransmitter metabolite concentrations in CSF samples from inpatient and outpatient normal volunteers. Guthrie SK, et al. **Acta Psychiatr Scand** 1986 Mar;73(3):315-21

Neuroendocrine aspects of bulimia. Friedman EJ. **Adolesc Psychiatry** 1986;13:422-7

Interactions of drugs and electroshock treatment on cerebral monoaminergic systems. Barkai AI. **Ann NY Acad Sci** 1986; 462:147-62

Neurotransmitter receptor mapping by autoradiography and other methods. Kuhar MJ, et al. **Annu Rev Neurosci** 1986;9:27-59

Histamine as a neuroregulator. Prell GD, et al. **Annu Rev Neurosci** 1986; 9:209-54 (260 ref.)

Neurotransmitters in temperature control. Lipton JM, et al. **Annu Rev Physiol** 1986;48:613-23 (66 ref.)

Proceedings of a workshop on the non-adrenergic non-cholinergic nervous system in the gastrointestinal and respiratory tracts. Ghent, September 19-20, 1985. **Arch Int Pharmacodyn Ther** 1986 Apr; 280(2 Suppl):1-252

The action of thallium acetate on phasic transmitter release in the mouse neuromuscular junction. Wiegand H, et al. **Arch Toxicol** 1986 Apr; 58(4):265-70

Chemical lesions of the nucleus accumbens septi in rats: effects on muricide and apomorphine-induced aggression. Pucilowski O, et al. **Behav Brain Res** 1986 Feb;19(2):171-8

Behavior and brain neurotransmitters: correlations in different strains of mice. Krehbiel D, et al. **Behav Neural Biol** 1986 Jul;46(1):30-45

N-methyl D-aspartate acts as an antagonist of the photoreceptor transmitter in the carp retina. Ariel M, et al. **Brain Res** 1986 Apr 30; 372(1):143-8

Polyamines contribute to calcium-stimulated release of aspartate from brain particulate fractions. Bondy SC, et al. **Brain Res** 1986 Apr 16; 371(1):96-100

On the transmitter at the A-to-B cell in Aplysia californica. Gaillard WD, et al. **Brain Res** 1986 May 14;373(1-2):311-5

Spectra of neurotransmitter receptors and ionic responses on cerebral A and B neurons in Aplysia californica. Gaillard WD, et al. **Brain Res** 1986 May 14;373(1-2):303-10

Selective uptake of neuroactive amino acids by both oligodendrocytes and astrocytes in primary dissociated culture: a possible role for oligodendrocytes in neurotransmitter metabolism. Reynolds R, et al. **Brain Res** 1986 Apr 23;371(2):253–66

Histophotometric evaluation of glutamate dehydrogenase activity of the rat hippocampal formation during postnatal development, with special reference to the glutamate transmitter metabolism. Schünzel G, et al. **Cell Mol Neurobiol** 1986 Mar;6(1):31–42

Influence of dopaminergic, adrenergic and cholinergic blockade and TRH administration on GH responses to GRF 1–29. Jordan V, et al. **Clin Endocrinol (Oxf)** 1986 Mar;24(3):291–8

No effect of atrial natriuretic factor on cardiac rate, force and transmitter release. Hiwatari M, et al. **Clin Exp Pharmacol Physiol** 1986 Feb; 13(2):163–8

Non–adrenergic neurotransmitters in relation to sympathetic nervous control of the lower urinary tract. Burnstock G. **Clin Sci** 1986; 70 Suppl 14:15s–20s (61 ref.)

A microiontophoretic study on the nature of the putative synaptic neurotransmitter involved in the pedunculopontine–substantia nigra pars compacta excitatory pathway of the rat. Scarnati E, et al. **Exp Brain Res** 1986;62(3):470–8

Neuromodulators and transmitters in respiratory control. Moss IR, et al. **Fed Proc** 1986 Jun;45(7):2133–47

Sulfate conjugation of neurotransmitters and drugs. Introduction. Weinshilboum RM. **Fed Proc** 1986 Jul;45(8):2220–2

Nutrition. Neurotransmitter function and behavior. **Int J Vitam Nutr Res [Suppl]** 1986;29:1–109

Neurotransmitter precursor therapies in affective disorders. von Lerber–Good WF. **Int J Vitam Nutr Res [Suppl]** 1986;29:69–82 (39 ref.)

Intramural neurons of the guinea–pig urinary bladder: histochemical localization of putative neurotransmitters in cultures and newborn animals. Crowe R, et al. **J Auton Nerv Syst** 1986 Apr;15(4):319–39

Targeted immobilization of neurotransmitters and neuropeptides on agarose and on Acrylex polymers. Penke B, et al. **J Chromatogr** 1986 Apr 11;376:307–14

Neurotransmitter specificity of cells and fibers in the medial preoptic nucleus: an immunohistochemical study in the rat. Simerly RB, et al. **J Comp Neurol** 1986 Apr 15;246(3):343–63

Mechanism of long–term potentiation of transmitter release induced by adrenaline in bullfrog sympathetic ganglia. Kumamoto E, et al. **J Gen Physiol** 1986 May;87(5):775–93

Stimulation–produced spinal inhibition from the midbrain in the rat is mediated by an excitatory amino acid neurotransmitter in the medial medulla. Aimone LD, et al. **J Neurosci** 1986 Jun;6(6):1803–13

Expression and regulation of catecholaminergic traits in primary sensory neurons: relationship to target innervation in vivo. Katz DM, et al. **J Neurosci** 1986 Apr;6(4):983–9

Yohimbine affects the evoked overflow of neurotransmitters from rat brain slices by more than one mechanism. Hagan RM, et al. **J Pharm Pharmacol** 1986 Mar;38(3):195–200

Differential pharmacology and function of two 5–HT1 receptors modulating transmitter release in rat cerebellum. Raiteri M, et al. **J Pharmacol Exp Ther** 1986 May;237(2):644–8

Factors influencing an increase in spontaneous transmitter release by hypoxia at the mouse neuromuscular junction. Nishimura M. **J Physiol (Lond)** 1986 Mar;372:303–13

Factors affecting in vivo electrochemistry: electrode–tissue interaction and the ascorbate amplification effect. Echizen H, et al. **Life Sci** 1986 Jul 7;39(1):77–89

Neurochemical changes in brains of mice infected with Pichinde virus. Barrett AD, et al. **Med Microbiol Immunol (Berl)** 1986; 175(2–3):213–5

Tetrahydrobiopterin administration to rhesus macaques. Its appearance in CSF and effect on neurotransmitter synthesis. Miller L, et al. **Neurochem Res** 1986 Feb;11(2):291–8

Single–unit activity of hypothalamic arcuate neurons in brain tissue slices. Effects of anterior pituitary hormones, cholecystokinin–octapeptide, and neurotransmitters. Pan JT, et al. **Neuroendocrinology** 1986; 43(2):189–96

Met–enkephalin selectively increases the spontaneous release of amino acid neurotransmitters from rat striatal slices. Arnerić SP, et al. **Neurosci Lett** 1986 May 6;66(1):73–8

Transmitter secretion varies between visualized release sites at amphibian neuromuscular junctions. Bennett M, et al. **Neurosci Lett** 1986 Apr 24; 65(3):311–5

Chemical modulation of ephaptic activation of CA3 hippocampal pyramids. Dalkara T, et al. **Neuroscience** 1986 Feb;17(2):361–70

Neurons dissociated from rat myenteric plexus retain differentiated properties when grown in cell culture. I. Morphological properties and immunocytochemical localization of transmitter candidates. Nishi R, et al. **Neuroscience** 1985 Sep;16(1):187–99

Cytochemical study of developing neurotransmitter properties of dissociated sympathetic neurons grown in co–culture with dissociated pineal cells. Phillips CE, et al. **Neuroscience** 1986 Apr;17(4):1139–46

Neurons dissociated from rat myenteric plexus retain differentiated properties when grown in cell culture. II. Electrophysiological properties and responses to neurotransmitter candidates. Willard AL, et al. **Neuroscience** 1985 Sep;16(1):201–11

Somatostatin and CCK–8 modulate release of striatal amino acids: role of dopamine receptors. Arnerić SP, et al. **Peptides** 1986 Jan–Feb; 7(1):97–103

Identification and immunocytochemical localization of proctolin in pericardial organs of the shore crab, Carcinus maenas. Stangier J, et al. **Peptides** 1986 Jan–Feb;7(1):67–72

Facilitation, augmentation and potentiation of transmitter release at frog neuromuscular junctions poisoned with botulinum toxin. Lupa MT, et al. **Pflugers Arch** 1986 Jun;406(6):636–40

Human peripheral monocytes express putative receptors for neuroexcitatory amino acids. Malone JD, et al. **Proc Natl Acad Sci USA** 1986 May;83(10):3307–10

Relationship between transmitter release and presynaptic calcium influx when calcium enters through discrete channels. Zucker RS, et al. **Proc Natl Acad Sci USA** 1986 May;83(9):3032–6

Neurochemical and neuroendocrine dysregulation in affective disorders. Golden RN, et al. **Psychiatr Clin North Am** 1986 Jun;9(2):313–27

Antidepressants and biochemical theories of depression. McNeal ET, et al. **Psychol Bull** 1986 May;99(3):361–74

Neurotransmitters and differentiation antigens in subsets of sensory neurons projecting to the spinal dorsal horn. Jessell TM, et al. **Res Publ Assoc Res Nerv Ment Dis** 1986;64:111–33 (111 ref.)

Nerve activity alters neurotransmitter synthesis [news] Marx JL. **Science** 1986 Jun 20;232(4757):1500–1

[Influence of praziquantel on monoamine transmitters in the rat brain] Liu GQ, et al. **Yao Hsueh Hsueh Pao** 1985 Nov;20(11):807–10 (Eng. Abstr.) **(Chi)**

[Effect of intrathecal morphine on plasma levels of neurohumoral substances] Kotani N. **Masui** 1986 Feb;35(2):208–16 (Eng. Abstr.) **(Jpn)**

[Effects of inhibitors of some mediators on the paw–edema induced by acetyl glyceryl ether phosphorylcholine in rats] Tajima M, et al. **Nippon Yakurigaku Zasshi** 1986 Apr;87(4):487–95 (Eng. Abstr.) **(Jpn)**

[Regulatory peptides. A functional continuum] Ashmarin IP, et al. **Biokhimiia** 1986 Apr;51(4):531–45 (149 ref.) (Eng. Abstr.) **(Rus)**

[Neurohumoral regulation of the processes of bile formation and bile excretion] Ivanichenkova RA. **Klin Med (Mosk)** 1986 Apr; 64(4):24–32 (59 ref.) **(Rus)**

NEUROTENSIN

Substance P and neurotensin: their roles in the regulation of anterior pituitary function. Aronin N, et al. **Annu Rev Physiol** 1986; 48:537–49 (57 ref.)

The amino acid sequence of kinetensin, a novel peptide isolated from pepsin–treated human plasma: homology with human serum albumin, neurotensin and angiotensin. Mogard MH, et al. **Biochem Biophys Res Commun** 1986 May 14;136(3):983–8

Stimulation by gastrin–releasing peptide, neurotensin and DN1417, a novel TRH analog, of dopamine and norepinephrine release from perifused rat hypothalamic fragments in vitro. Kabayama Y, et al. **Brain Res** 1986 May 7;372(2):394–9

Colocalization of immunoreactive substance P and neurotensin in amacrine cells of the goldfish retina. Li HB, et al. **Brain Res** 1986 Feb 26;366(1–2):307–13

Adaptation to cold antagonizes neurotensin–induced hypothermia in mice. Merritt WD, et al. **Brain Res** 1986 Mar 26;369(1–2):136–42

Neurotensin actions in the retina: mechanisms and variability. Zalutsky RA, et al. **Brain Res** 1986 Apr 23;371(2):360–3

[Ser7]neurotensin: isolation from guinea pig intestine. Shaw C, et al. **FEBS Lett** 1986 Jul 7;202(2):187–92

Neurotensin stimulates histamine release in in vivo skin 'blisters' in rats: an effect inhibited by cromolyn or somatostatin. Cochrane DE, et al. **Int Arch Allergy Appl Immunol** 1986;80(3):225–30

Neurotensin in the rat parabrachial region: ultrastructural localization and extrinsic sources of immunoreactivity. Milner TA, et al. **J Comp Neurol** 1986 May 15;247(3):326–43

Neurotensin effect on dopamine release and calcium transport in rat striatum: interactions with diphenylalkylamine calcium antagonists. Battaini F, et al. **Naunyn Schmiedebergs Arch Pharmacol** 1986 Mar; 332(3):267–70

Neurotensin–like immunoreactivities in human plasma: feeding responses and metabolism. Holst Pedersen J, et al. **Peptides** 1986 Jan–Feb; 7(1):15–20

Covalent labeling of neurotensin receptors in rat gastric fundus plasma membranes. Mazella J, et al. **Peptides** 1985 Nov–Dec;6(6):1137–41

Behavioral and biochemical assessment of time–related changes in globus pallidus and striatal dopamine induced by intranigrally administered neurotensin. Napier TC, et al. **Peptides** 1985 Nov–Dec;6(6):1057–68

Synergistic effects of dopamine agonists and centrally administered neurotensin on feeding. Hawkins MF, et al. **Pharmacol Biochem Behav** 1986 May;24(5):1195-201

Molecular forms of somatostatin, substance P and neurotensin in fresh human cerebral cortex. Bateman DE, et al. **Regul Pept** 1986 May; 14(3):211-6

Catabolism of substance P and neurotensin in the rat stomach wall is susceptible to inhibitors of angiotensin converting enzyme. Orloff MS, et al. **Regul Pept** 1986 Mar;14(1):21-31

Computer analysis of intestinal motility: effects of cholecystokinin and neurotensin on jejunal contraction patterns. Schemann M, et al. **Z Gastroenterol** 1986 May;24(5):262-8

[Role of alpha-adrenoreceptors of the hypothalamus and amygdala in the response of the secretory glands of the stomach to neurotensin and somatostatin] Barashkova GM, et al. **Fiziol Zh SSSR** 1986 Apr; 72(4):498-502 (Eng. Abstr.) **(Rus)**

NEUROTIC DISORDERS

[Determination of dopamine-beta-hydroxylase (DBH) and monoamine oxidase (MAO) activities in platelets and plasma in schizophrenic, maniac-depressive and neurotic patients] Xavier Vieira R, et al. **Acta Med Port** 1986 Jan-Feb;7(1):45-8 (Eng. Abstr.) **(Por)**

[Antistress and antineurotic action of psychotropic preparations in experiments on monkeys] Startsev VG, et al **Vestn Akad Med Nauk SSSR** 1986;(3):30-3 (Eng. Abstr.) **(Rus)**

NITRAZEPAM

The carry-over effects of triazolam compared with nitrazepam and placebo in acute emergency driving situations and in monotonous simulated driving. Laurell H, et al. **Acta Pharmacol Toxicol (Copenh)** 1986 Mar;58(3):182-6

Development of tolerance to benzodiazepines. II. Baclofen effect on the activity of rats during tolerance to the sedative action of nitrazepam and oxazepam. Chodera A, et al. **Acta Physiol Pol** 1984 Jul-Aug; 35(4):301-9

Peptide derivatives as prodrugs. Thomas WA. **Biochem Soc Trans** 1986 Apr;14(2):383-7

Influence of some dopaminoceptor agents on nitrazepam-induced sleep in the domestic fowl (Gallus domesticus) and rats. Wambebe C. **Jpn J Pharmacol** 1986 Mar;40(3):357-65

NOMIFENSINE

Merital withdrawn by manufacturer [letter] Hendra N. **Am J Nurs** 1986 May;86(5):533

Protein binding of nomifensine and its three main metabolites. Lindberg RL. **Biochem Pharmacol** 1986 Jun 15;35(12):2044-6

Nomifensine--a farewell and future concerns [editorial] Shader RI, et al. **J Clin Psychopharmacol** 1986 Jun;6(3):A21

Double-blind comparison of diclofensine with nomifensine in outpatients with dysphoric mood. Funke HJ, et al. **Pharmacopsychiatry** 1986 May; 19(3):120-3

Effects of haloperidol and nomifensine on the visual aftereffects of tilt and movement. Harris JP, et al. **Psychopharmacology (Berlin)** 1986; 89(2):177-82

[Hemolytic anemia with kidney failure after nomifensine (letter)] Oberhofer R, et al. **Dtsch Med Wochenschr** 1986 Jun 13; 111(24):960-2 **(Ger)**

[Comparative evaluation of the therapeutic efficacy of the antidepressants adepren, linamiphen and emovit] Guliamov MG. **Zh Nevropatol Psikhiatr** 1986;86(4):582-7 (Eng. Abstr.) **(Rus)**

NOREPINEPHRINE

Effect on brain monoamines in the rat of substituted and protected analogues of the oxytocin fragment, prolyl-leucyl-glycinamide following N-terminal substitution by D- and L-pipecolic acid. Szabó G, et al. **Acta Physiol Hung** 1986;67(1):155-61

Benzodiazepines decrease norepinephrine release from rat pineal nerves by acting on peripheral type binding sites. Lowenstein PR, et al. **Acta Physiol Pharmacol Latinoam** 1985;35(4):441-9

Renal extraction of endogenous and radiolabelled catecholamines in the dog. Bradley T, et al. **Acta Physiol Scand** 1986 Apr;126(4):505-10

Catecholamines of endoneurial laryngeal paraganglia in the rat. Dahlqvist A, et al. **Acta Physiol Scand** 1986 Jun;127(2):257-61

Possible involvement of the Ni-protein in the prejunctional inhibitory effect of a stable adenosine analogue (R-PIA) on noradrenaline release in the rat hippocampus. Fredholm BB, et al. **Acta Physiol Scand** 1986 Feb;126(2):307-9

Temperature effects on catecholamine accumulation in neuronal and extraneuronal compartments in the cod spleen. Ungell AL. **Acta Physiol Scand** 1986 Apr;126(4):589-92

Inhibitory effects of desmethylimipramine, metanephrine and normetanephrine on the neuronal and extraneuronal accumulation of catecholamines in fish spleen. Ungell AL. **Acta Physiol Scand** 1986 May; 127(1):27-31

Comparison between a serotonin and a noradrenaline reuptake blocker in the treatment of depressed outpatients. Biochemical aspects. Nyström C, et al. **Acta Psychiatr Scand** 1986 Feb;73(2):133-8

Synergistic action of angiotensin II on norepinephrine-induced prostaglandin release from rat glomeruli. Matsumura Y, et al. **Am J Physiol** 1986 May;250(5 Pt 2):F811-6

Metabolic effects of chronic infusions of epinephrine and norepinephrine in rats. Racotta R, et al. **Am J Physiol** 1986 May; 250(5 Pt 1):E518-22

Plasma cortisol and norepinephrine concentrations in castrated male pigs maintained in pairs in outdoor pens and in a confinement finishing house: assessment of stress. Benson GJ, et al. **Am J Vet Res** 1986 May; 47(5):1071-4

New liquid membrane electrode for the determination of ephedrine, epinephrine, and norepinephrine. Hassan SS, et al. **Anal Chem** 1986 May; 58(6):1052-4

Behavioral and neurochemical consequences associated with stressors. Anisman H, et al. **Ann NY Acad Sci** 1986;467:205-25 (67 ref.)

Neurochemical mechanisms of mood stabilization. Focus on electroconvulsive therapy. Lerer B, et al. **Ann NY Acad Sci** 1986; 462:366-75 (74 ref.)

Comparative alpha- and beta-adrenoceptor activity of 2- and 6-ring-chlorinated noradrenaline analogues. Squier GJ, et al. **Arzneimittelforschung** 1986 Mar;36(3):457-60

Attenuation of sensory preconditioning by noradrenaline depletion in the rat. Archer T, et al. **Behav Brain Res** 1986 Apr;20(1):47-56

Depletion of brain norepinephrine with DSP-4 does not alter acquisition or performance of a radial-arm maze task. Chrobak JJ, et al. **Behav Neural Biol** 1985 Jul;44(1):144-50

Lipolysis in rat adipocytes during recovery from lactation. Response to noradrenaline and adenosine. Vernon RG, et al. **Biochem J** 1986 Feb 15;234(1):229-31

Comparative responses of the central adrenaline- and noradrenaline-containing neurons after reserpine injections. Lambás-Señas L, et al. **Biochem Pharmacol** 1986 Jul 1; 35(13):2207-11

Effects of short-chain alcohols and norepinephrine on brain (Na+,K+)ATPase activity. Nhamburo PT, et al. **Biochem Pharmacol** 1986 Jun 15;35(12):1987-92

Effect of catecholamines on the hepatic rate-limiting enzymes of cholesterol metabolism in normally fed and cholesterol-fed rabbits. Deverey R, et al. **Biochim Biophys Acta** 1986 Jul 11;887(2):173-81

Regional turnover of norepinephrine and dopamine in rat brain following acute exposure to air ions. Charry JM, et al. **Bioelectromagnetics** 1985; 6(4):415-25

Adrenergic modulation of the delayed rectifier potassium channel in calf cardiac Purkinje fibers. Bennett P, et al. **Biophys J** 1986 Apr; 49(4):839-48

Noradrenergic innervation of gerbil large cerebral arteries. Alafaci C, et al. **Blood Vessels** 1986;23(3):154-9

Unilateral peri-substantia nigra catecholaminergic lesion and amygdala kindling. Albala BJ, et al. **Brain Res** 1986 Apr 9;370(2):388-92

Clorgyline and desipramine alter the sensitivity of [3H]noradrenaline release to calcium but not to clonidine. Campbell IC, et al. **Brain Res** 1986 May 7;372(2):253-9

Intracellular recordings from pineal cells in tissue culture: membrane properties and response to norepinephrine. Freschi JE, et al. **Brain Res** 1986 Mar 19;368(2):366-70

Changes in the noradrenergic innervation of the area dentata after axotomy of coeruleohippocampal projections or unilateral lesion of the locus coeruleus. Haring JH, et al. **Brain Res** 1986 Mar 19; 368(2):233-8

Effects of bilateral lesion of the locus coeruleus and of neonatal administration of 6-hydroxydopamine on the concentration of individual proteins in rat brain. Heydorn WE, et al. **Brain Res** 1986 Mar 5; 367(1-2):31-8

Characterization of hypothalamic noradrenaline receptors in the supraoptic nucleus and periventricular region of the paraventricular nucleus of mice in vitro. Inenaga K, et al. **Brain Res** 1986 Mar 26; 369(1-2):37-47

Impact of circulating corticosterone on alpha 1- and alpha 2-noradrenergic receptors in discrete brain areas. Jhanwar-Uniyal M, et al. **Brain Res** 1986 Mar 19;368(2):404-8

Pharmacological characterization of the receptor mediating the adrenergic inhibition of responses to substance P in the cingulate cortex. Jones RS, et al. **Brain Res** 1986 Mar 5;367(1-2):151-61

Stimulation by gastrin-releasing peptide, neurotensin and DN1417, a novel TRH analog, of dopamine and norepinephrine release from perifused rat hypothalamic fragments in vitro. Kabayama Y, et al. **Brain Res** 1986 May 7;372(2):394-9

Release of [3H]norepinephrine: alteration by early developmental exposure to diazepam. Kellogg CK, et al. **Brain Res** 1986 Feb 26; 366(1-2):137-44

Noradrenaline-stimulated inositol phospholipid breakdown in rat dorsal lateral geniculate nucleus neurones. Kemp JA, et al. **Brain Res** 1986

Apr 23;371(2):314-8

One perfusion mixture for immunocytochemical detection of noradrenaline, dopamine, serotonin and acetylcholine in the same rat brain. McRae-Degueurce A, et al. **Brain Res** 1986 Jun 18; 376(1):217-9

Neonatal 6-hydroxydopamine lesion of forebrain norepinephrine does not eliminate critical period for behavioral effects of gonadal hormone manipulation. Pappas BA, et al. **Brain Res** 1986 May;391(2):310-4

Peripheral sympathectomy and adrenal medullectomy do not alter cerebrospinal fluid norepinephrine. Peskind ER, et al. **Brain Res** 1986 Mar 5;367(1-2):258-64

Single unit response of noradrenergic, serotonergic and dopaminergic neurons in freely moving cats to simple sensory stimuli. Rasmussen K, et al. **Brain Res** 1986 Mar 26;369(1-2):336-40

The acute effects of 6-hydroxydopamine treatment on noradrenergic function in the rat hippocampus in vitro. Yasuda RP, et al. **Brain Res** 1986 Mar 5;367(1-2):121-7

Combined effects of n-hexane and toluene on norepinephrine and dopamine levels in rat brain tissues after long-term exposures. Ikeda M, et al. **Bull Environ Contam Toxicol** 1986 Apr;36(4):510-7

Haemodynamic reactions to succinylcholine--an alternative hypothesis [letter] Baraka A. **Can Anaesth Soc J** 1986 Mar;33(2):252-4

Distribution of subgroups of noradrenaline neurons in the coeliac ganglion of the guinea-pig. Macrae IM, et al. **Cell Tissue Res** 1986; 244(1):173-80

Decreased basal cardiac interstitial norepinephrine release after neuronal uptake inhibition in dogs. Cousineau D, et al. **Circ Res** 1986 Jun; 58(6):859-66

Reduced imprecision of the radioenzymatic assay of plasma catecholamines by improving the stability of the internal standards. Hoffmann JJ, et al. **Clin Chim Acta** 1986 Apr 30;156(2):221-5

The effect of aging on alpha-adrenoceptors and their responses in rabbits. Hamilton CA, et al. **Clin Exp Pharmacol Physiol** 1985 Nov-Dec; 12(6):535-47

Effect of pregnancy in the rabbit on the pressor response to angiotensin and noradrenaline. Joels N, et al. **Clin Exp Pharmacol Physiol** 1985 Nov-Dec;12(6):577-86

Effect of noradrenaline, vasopressin and angiotensin II on renal prostaglandins in man. Loup R, et al. **Clin Sci** 1986 Apr;70(4):371-7

Stimulus-induced release of endogenous catecholamines from human washed platelets. Smith CC, et al. **Clin Sci** 1986 May;70(5):495-500

The effect of insulin and catecholamines on the activities of 3-hydroxy-3-methyl glutaryl coenzyme A reductase and acyl-coenzyme A: cholesterol-o-acyltransferase in isolated rat hepatocytes. Devery R, et al. **Diabetologia** 1986 Feb;29(2):122-4

Functional characteristics of the luteinizing hormone-releasing hormone pulse generator in conscious unrestrained female rabbits: activation by norepinephrine. Ramirez VD, et al. **Endocrinology** 1986 Jun; 118(6):2331-9

Effects of epinephrine, norepinephrine, and dopamine on gonadotropin-releasing hormone-induced secretion of luteinizing hormone in vitro. Swartz SR, et al. **Endocrinology** 1986 Jun; 118(6):2425-31

Sex-related differences in free plasma catecholamines in individuals of similar performance ability during graded ergometric exercise. Lehmann M, et al. **Eur J Appl Physiol** 1986;55(1):54-8

The effect of selective noradrenergic lesions upon the stimulation by noradrenaline of inositol phospholipid breakdown in rat hippocampal miniprisms. Fowler CJ, et al. **Eur J Pharmacol** 1986 Apr 29; 123(3):401-7

Morphine increases locus coeruleus noradrenergic neuronal activity in vitro. Trulson ME, et al. **Eur J Pharmacol** 1986 May 13; 124(1-2):189-92

Intracavernous injection of noradrenaline to interrupt erections during surgical interventions. de Meyer JM, et al. **Eur Urol** 1986; 12(3):169-70

'Neuropeptide tyrosine' (NPY) is co-stored with noradrenaline in vascular but not in parenchymal sympathetic nerves of brown adipose tissue. Cannon B, et al. **Exp Cell Res** 1986 Jun;164(2):546-50

Specific lysis of noradrenergic synaptosomes by an antiserum to dopamine-beta-hydroxylase. Docherty M, et al. **FEBS Lett** 1986 Jun 23;202(1):37-40

Thyrotropin and norepinephrine stimulate the metabolism of phosphoinositides in FRTL-5 thyroid cells. Philp NJ, et al. **FEBS Lett** 1986 Jul 7;202(2):193-6

Amine sulfate formation in the central nervous system. Tyce GM, et al. **Fed Proc** 1986 Jul;45(8):2247-53

The effect of oestradiolum benzoicum and progesterone on the noradrenalin content in organs of the female reproductive system of sexually immature pigs. Lakomy M, et al. **Gegenbaurs Morphol Jahrb** 1986;132(1):129-43

Thyroid status and noradrenaline-induced regulatory thermogenesis in heat acclimated rats. Arieli A, et al. **Horm Metab Res** 1986 Feb; 18(2):103-6

Origin of the increased plasma concentration of noradrenaline after feeding. Sharman DF, et al. **Horm Metab Res** 1986 Feb;18(2):145

Diurnal variations of brain noradrenaline metabolism of the methylmercury chloride-administered rat with reference to an altered circadian rhythm of paradoxical sleep. Arito H, et al. **Ind Health** 1985; 23(4):245-53

Perivascular noradrenergic and peptide-containing nerves show different patterns of changes during development and ageing in the guinea-pig. Dhall U, et al. **J Auton Nerv Syst** 1986 Jun;16(2):109-26

Characterization of hormone and protein release from alpha-toxin-permeabilized chromaffin cells in primary culture. Bader MF, et al. **J Biol Chem** 1986 May 5;261(13):5777-83

Catecholamines induce an increase in nerve growth factor content in the medium of mouse L-M cells. Furukawa Y, et al. **J Biol Chem** 1986 May 5;261(13):6039-47

Noradrenaline release in the human pulmonary artery is modulated by presynaptic alpha 2-adrenoceptors. Hentrich F, et al. **J Cardiovasc Pharmacol** 1986 May-Jun;8(3):539-44

Dopamine and L-dopa potentiation of pressor responses to norepinephrine in isolated perfused rat kidneys. Lam BK, et al. **J Cardiovasc Pharmacol** 1986 May-Jun;8(3):554-8

Angiotensin facilitation of 3H-norepinephrine release in central tissue of spontaneously hypertensive rats but not in Wistar-Kyoto rats: effects of sodium depletion. Meldrum MJ, et al. **J Cardiovasc Pharmacol** 1986 May-Jun;8(3):582-7

Alterations in plasma noradrenaline in response to reflex modulation of sympathetic vasoconstrictor tone to skeletal muscles. Grassi G, et al. **J Hypertension [Suppl]** 1984 Dec;2(3):S131-3

Alteration of presynaptic alpha 2-mediated inhibition of norepinephrine release in perfused mesenteric arteries of young and adult spontaneously hypertensive rats. Tsuda K, et al. **J Hypertension [Suppl]** 1984 Dec; 2(3):S95-7

Vascular responsiveness of simian digital artery to various vasoactive substances. Ito T, et al. **J Invest Dermatol** 1986 Jun;86(6):678-82

Measurement of endogenous noradrenaline release in the rat cerebral cortex in vivo by transcortical dialysis: effects of drugs affecting noradrenergic transmission. L'Heureux R, et al. **J Neurochem** 1986 Jun; 46(6):1794-801

Effects of hypoxia on the activities of noradrenergic and dopaminergic neurons in the rat brain. Miwa S, et al. **J Neurochem** 1986 Jul; 47(1):63-9

Role of adenylate cyclase in presynaptic alpha 2-adrenoceptor- and mu-opioid receptor-mediated inhibition of [3H]noradrenaline release from rat brain cortex slices. Schoffelmeer AN, et al. **J Neurochem** 1986 Jun;46(6):1711-7

Effect of dietary saturated fatty acids on hormone-sensitive lipolysis in rat adipocytes. Awad AB, et al. **J Nutr** 1986 Jun;116(6):1088-94

Stimulation by noradrenaline of inositol phospholipid breakdown in the rat hippocampus: effect of the ambient potassium concentration. Fowler CJ, et al. **J Pharm Pharmacol** 1986 Mar;38(3):201-8

Alpha 1-adrenoceptor function in the rat hippocampus as assessed by noradrenaline-stimulated inositol phospholipid breakdown after destruction of noradrenergic neurons by neonatal 6-hydroxydopamine treatment. Fowler CJ, et al. **J Pharm Pharmacol** 1986 May; 38(5):385-8

beta-Endorphin-induced stimulation of central sympathetic outflow: inhibitory modulation by central noradrenergic neurons. Appel NM, et al. **J Pharmacol Exp Ther** 1986 Jun;237(3):695-701

Modification of serotonergic and noradrenergic neurotransmissions by repeated administration of monoamine oxidase inhibitors: electrophysiological studies in the rat central nervous system. Blier P, et al. **J Pharmacol Exp Ther** 1986 Jun;237(3):987-94

Effect of repeated restraint stress, desmethylimipramine or adrenocorticotropin on the alpha and beta adrenergic components of the cyclic AMP response to norepinephrine in rat brain slices. Stone EA, et al. **J Pharmacol Exp Ther** 1986 Jun;237(3):702-7

Presence of a noradrenaline uptake system on a ligated cat sympathetic nerve. Ceña V, et al. **J Physiol (Lond)** 1986 Mar;372:351-62

Cyclic adenosine 3',5'-monophosphate mediates beta-receptor actions of noradrenaline in rat hippocampal pyramidal cells. Madison DV, et al. **J Physiol (Lond)** 1986 Mar;372:245-59

Actions of noradrenaline recorded intracellularly in rat hippocampal CA1 pyramidal neurones, in vitro. Madison DV, et al. **J Physiol (Lond)** 1986 Mar;372:221-44

An improved radioenzymatic assay for plasma norepinephrine using purified phenylethanolamine N-methyltransferase. Henry DP, et al. **Life Sci** 1986 Apr 21;38(16):1473-83

Sodium-dependence of the saturability of carrier-mediated noradrenaline efflux from noradrenergic neurones in the rat vas deferens. Bönisch H, et al. **Naunyn Schmiedebergs Arch Pharmacol** 1986 Feb; 332(2):131-4

Vasoconstriction induced by noradrenaline and angiotensin II is antagonized by eicosapentaenoic acid independent of formation of trienoic eicosanoids. Juan H, et al. **Naunyn Schmiedebergs Arch Pharmacol** 1986 Mar;332(3):288-92

Clonidine reverses baclofen-induced increases in noradrenaline turnover in rat brain. Sawynok J, et al. **Neurochem Res** 1986 May; 11(5):723-31

Morphine inhibits electrically stimulated noradrenaline release from slices of rat medial preoptic area. Diez-Guerra FJ, et al. **Neuroendocrinology** 1986;43(1):89–91

Lesion of noradrenergic neurones with DSP4 does not modify benzodiazepine receptor binding in cortex and hippocampus of rat. Marcel D, et al. **Neuropharmacology** 1986 Mar;25(3):283–6

Effect of chronic administration of the 6-aza analogue of mianserin (Org. 3770) and its enantiomers on behaviour and changes in noradrenaline metabolism of olfactory-bulbectomized rats in the 'open field' apparatus. O'Connor WT, et al. **Neuropharmacology** 1986 Mar;25(3):267–70

Effect of plasma from patients containing bupropion and its metabolites on the uptake of norepinephrine. Perumal AS, et al. **Neuropharmacology** 1986 Feb;25(2):199–202

Dopaminergic and noradrenergic sympathetic nerves of the dog have different DOPA decarboxylase activities. Harris T, et al. **Neurosci Lett** 1986 Apr 11;65(2):155–60

Inhibitory influence of monoamines and brainstem monoaminergic regions on the medullary swallowing reflex. Kessler JP, et al. **Neurosci Lett** 1986 Mar 28;65(1):41–6

Dissociated cells of foetal rat pallium growa in culture medium supplemented with noradrenaline: effects on the expression of neuron-specific enolase and cell adhesion molecule L1. König N, et al. **Neurosci Lett** 1986 May 6;66(1):67–72

Glutamate-induced activation of rat locus coeruleus increases CA1 pyramidal cell excitability. Olpe HR, et al. **Neurosci Lett** 1986 Mar 28;65(1):11–6

Catecholamine sensitivities of motor cortical neurons of the monkey. Sawaguchi T, et al. **Neurosci Lett** 1986 May 15;66(2):135–40

Monoamine innervation of the oculomotor nucleus in the rat. A radioautographic study. Soghomonian JJ, et al. **Neuroscience** 1986 Apr; 17(4):1147–57

Norepinephrine infusions into the medial preoptic area inhibit lordosis behavior. Caldwell JD, et al. **Pharmacol Biochem Behav** 1986 Apr; 24(4):1015–23

Central norepinephrine and plasma corticosterone following acute and chronic stressors: influence of social isolation and handling. Irwin J, et al. **Pharmacol Biochem Behav** 1986 Apr;24(4):1151–4

Hemodynamics and vascular sensitivity to circulating norepinephrine in normal skin and delayed and acute random skin flaps in the pig. Pang CY, et al. **Plast Reconstr Surg** 1986 Jul;78(1):75–84

Blood--brain barrier sodium/potassium pump: modulation by central noradrenergic innervation. Harik SI. **Proc Natl Acad Sci USA** 1986 Jun; 83(11):4067–70

Norepinephrine alters PGE2/PGE1 output ratio in isolated uterus from ovariectomized rats. Chaud MA, et al. **Prostaglandins Leukotrienes Med** 1986 May;22(2):201–10

Clinical studies on norepinephrine metabolism: how to interpret the numbers. Linnoila M, et al. **Psychiatry Res** 1986 Mar;17(3):229–39

The interaction of neurotensin with dopaminergic pathways in the central nervous system: basic neurobiology and implications for the pathogenesis and treatment of schizophrenia. Nemeroff CB. **Psychoneuroendocrinology** 1986;11(1):15–37

Norepinephrine alterations under stress conditions following the regular practice of meditation. Morrell EM, et al. **Psychosom Med** 1986 Mar–Apr;48(3–4):270–7

Enkephalin contents reflect noradrenergic large dense cored vesicle populations in vasa deferentia. Douglas BH 2d, et al. **Regul Pept** 1986 May;14(3):193–210

Noradrenaline as a possible mediator of angiotensin II induced fluid transport in rat ileum in vitro. Souviron A, et al. **Rev Esp Fisiol** 1986 Mar;42(1):51–5

Taste/tactile cue discriminations in taste-aversion learning following depletion of noradrenaline. Archer T, et al. **Scand J Psychol** 1986; 27(1):39–51

[Beta-endorphin and dynorphin are involved in the central depressor action of clonidine or norepinephrine in rats] Xie CW, et al. **Sheng Li Hsueh Pao** 1985 Apr;37(2):172–9 (Eng. Abstr.) **(Chi)**

[Effects of OKY 046 on responses to norepinephrine in rat mesenteric arterioles] Kato T, et al. **Masui** 1986 Mar;35(3):393–8 (Eng. Abstr.) **(Jpn)**

[Effect of continuous, intermittent and impulse acoustic stimuli on plasma catecholamine levels in humans at rest and during physical exertion] Buczyński A, et al. **Pol Tyg Lek** 1986 Jan 27;41(4):110–3 (Eng. Abstr.) **(Pol)**

[Role of adrenergic receptors in the regulation of glycogen metabolism in the liver] Torlińska T, et al. **Postepy Hig Med Dosw** 1985 Sep–Oct; 39(5):561–77 (75 ref.) (Eng. Abstr.) **(Pol)**

[Effect of phentolamine and noradrenaline on cardiac output and the viability of animals recovering after clinical death] Evtushenko AIa, et al. **Anesteziol Reanimatol** 1986 Mar–Apr;(2):31–4 (Eng. Abstr.) **(Rus)**

[Noradrenaline suppression of the spinal efferent component of the pressor reflexes] Karagulova GO, et al. **Biull Eksp Biol Med** 1986 Apr; 101(4):387–9 (Eng. Abstr.) **(Rus)**

[Cholinesterase and noradrenaline activity in response to exposure of acupuncture points to a laser] Lupyr' VM, et al. **Fiziol Zh** 1986 May–Jun;32(3):297–303 (Eng. Abstr.) **(Rus)**

[Changes in blood volume in the heart and lungs and its role in the regulation of left-ventricular blood output after administration of catecholamines] Osadchil LI, et al. **Fiziol Zh** 1986 Mar–Apr; 32(2):149–54 (Eng. Abstr.) **(Rus)**

[Development of various responses to noradrenaline administration in the control and cold-adapted rat] Kozyreva TV, et al. **Fiziol Zh SSSR** 1986 Mar;72(3):377–81 **(Rus)**

[Binding of noradrenaline with chromatin proteins from cell nuclei of the rat brain] Bozhko GKh, et al. **Ukr Biokhim Zh** 1986 Mar–Apr; 58(2):50–4 (Eng. Abstr.) **(Rus)**

NORMETANEPHRINE

Inhibitory effects of desmethylimipramine, metanephrine and normetanephrine on the neuronal and extraneuronal accumulation of catecholamines in fish spleen. Ungell AL. **Acta Physiol Scand** 1986 May; 127(1):27–31

NORTRIPTYLINE

Quantitative homogeneous enzyme immunoassays for amitriptyline, nortriptyline, imipramine, and desipramine. Pankey S, et al. **Clin Chem** 1986 May;32(5):768–72

A simplified radioimmunoassay of plasma nortriptyline in depressed patients compared with high-pressure liquid chromatography and gas-liquid chromatography. Sayegh JF. **Neurochem Res** 1986 Feb; 11(2):193–206

OBSESSIVE-COMPULSIVE DISORDER

Antiandrogenic treatment of obsessive-compulsive neurosis. Casas M, et al. **Acta Psychiatr Scand** 1986 Feb;73(2):221–2

Clomipramine: an antiobsessive drug. Ananth J. **Can J Psychiatry** 1986 Apr;31(3):253–8 (34 ref.)

Obsessive compulsive disorder [letter] Hardy JL. **Can J Psychiatry** 1986 Apr;31(3):290

An open clinical trial of fluoxetine in the treatment of obsessive-compulsive disorder. Fontaine R, et al. **J Clin Psychopharmacol** 1986 Apr;6(2):98–101

An inverse relationship between mania and obsessive-compulsive disorder: a case report [letter] Keck PE Jr, et al. **J Clin Psychopharmacol** 1986 Apr;6(2):123–4

Efficacy of trazodone as an anti-obsessional agent. Prasad A. **Neuropsychobiology** 1986;15 Suppl 1:19–21

The relationship of antiobsessional and antidepressant effects of tricyclic antidepressants. Mavissakalian M, et al. **Psychopharmacol Bull** 1986; 22(1):161–6

ORGANIC MENTAL DISORDERS

Propranolol treatment of assaultive patients with organic brain disease. A double-blind crossover, placebo-controlled study. Greendyke RM, et al. **J Nerv Ment Dis** 1986 May;174(5):290–4

Contribution to the search for vigilance-indicative EEG variables. Results of a controlled, double-blind study with pyritinol in elderly patients with symptoms of mental dysfunction. Herrmann WM, et al. **Pharmacopsychiatry** 1986 Mar;19(2):75–83

Neurochemical and neuroendocrine dysregulation in affective disorders. Golden RN, et al. **Psychiatr Clin North Am** 1986 Jun;9(2):313–27

[Current problems of organic brain syndrome in children] Măgureanu S, et al. **Rev Med Interna [Neurol Psihiatr]** 1986 Jan–Mar;31(1):53–8 (11 ref.) (Eng. Abstr.) **(Rum)**

ORGANIC MENTAL DISORDERS, PSYCHOTIC

A comprehensive study of chronic schizophrenic patients. II: Biological, neuropsychological, and clinical correlates of CT abnormality. Pandurangi AK, et al. **Acta Psychiatr Scand** 1986 Feb;73(2):161–71

OXAZEPAM

Development of tolerance to benzodiazepines. II. Baclofen effect on the activity of rats during tolerance to the sedative action of nitrazepam and oxazepam. Chodera A, et al. **Acta Physiol Pol** 1984 Jul–Aug; 35(4):301–9

Comparison of two benzodiazepines with differing accumulation: behavioral changes during and after 3 weeks of dosing. Ghoneim MM, et al. **Clin Pharmacol Ther** 1986 May;39(5):491–500

Single dose oxazepam has no effect on acetaminophen clearance or metabolism. Sonne J, et al. **Eur J Clin Pharmacol** 1986;30(1):127–9

PAIRED-ASSOCIATE LEARNING

Sensation seeking, paired associate learning and brain catecholamines. Kulcsár Z, et al. **Neuropsychobiology** 1986;15(1):43–8

PARANOID DISORDERS

Paranoid disorder: the Soviet viewpoint. Swanson DW, et al. **Am J Psychiatry** 1986 Jul;143(7):825-30 (40 ref.)

PARASYMPATHOMIMETICS

Mechanisms of release of atrial natriuretic factor. II. Effect of chronic administration of alpha- and beta-adrenergic and cholinergic agonists on plasma and atrial ANF in the rat. Garcia R, et al. **Biochem Biophys Res Commun** 1986 Apr 29;136(2):510-20

Learning impairment following lesion of the basal nucleus of Meynert in the marmoset: modification by cholinergic drugs. Ridley RM, et al. **Brain Res** 1986 Jun 18;376(1):108-16

Rotifer neuropharmacology--I. Cholinergic drug effects on oviposition of Philodina acuticornis (Rotifera, Aschelminthes). Nogrady T, et al. **Comp Biochem Physiol [C]** 1986;83(2):335-8

Cholinergic stimulation of human pancreatic secretion. Valenzuela JE, et al. **Dig Dis Sci** 1986 Jun;31(6):615-9

Mechanism of cholinergic stimulation of aldosterone secretion in bovine adrenal glomerulosa cells. Kojima I, et al. **Endocrinology** 1986 Jul; 119(1):284-91

Muscarinic stimulation of prostacyclin synthesis by the rat penis. Jeremy JY, et al. **Eur J Pharmacol** 1986 Apr 9;123(1):67-71

QSAR in a series of muscarinic agents. Note VI. Five-membered cyclic ligands. Pratesi P, et al. **Farmaco [Sci]** 1986 May;41(5):336-45

Changes in the interaction between CNS cholinergic and dopaminergic neurons induced by L-alpha-glycerylphosphorylcholine, a cholinomimetic drug. Trabucchi M, et al. **Farmaco [Sci]** 1986 Apr; 41(4):325-34

Effects of slaframine on ruminant digestive function: resting salivary flow and composition in cattle. Froetschel MA, et al. **J Anim Sci** 1986 May; 62(5):1404-11

Cholinergic modulation of an acetylcholine receptor-like antigen on the surface of chick ciliary ganglion neurons in cell culture. Smith MA, et al. **J Neurosci** 1986 Apr;6(4):946-53

Nicotinic and muscarinic agonists, phorbol esters, and agents which raise cyclic AMP levels phosphorylate distinct groups of proteins in the superior cervical ganglion. Cahill AL, et al. **Neurochem Res** 1986 Mar; 11(3):327-38

Drugs as research tools in psychology: cholinergic drugs and aggression. Bell R, et al. **Neuropsychobiology** 1985;14(4):181-92 (84 ref.)

Cholinergic agonists suppress play fighting in juvenile rats. Wilson LI, et al. **Pharmacol Biochem Behav** 1986 May;24(5):1157-9

Behavioural and pharmacological characterization of the mouth movements induced by muscarinic agonists in the rat. Salamone JD, et al. **Psychopharmacology (Berlin)** 1986;88(4):467-71

PARGYLINE

Role of propiolaldehyde and other metabolites in the pargyline inhibition of rat liver aldehyde dehydrogenase. DeMaster EG, et al. **Biochem Pharmacol** 1986 May 1;35(9):1481-9

Peroxidative N-oxidation and N-dealkylation reactions of pargyline. Weli AM, et al. **Xenobiotica** 1986 Mar;16(3):281-8

PEMOLINE

Measurement of whole blood serotonin as a guide in prescribing psychostimulant medication for children with attentional deficits. Saul RC, et al. **Clin Neuropharmacol** 1986;9(2):189-95

PENTOBARBITAL

Pipecolic acid antagonizes barbiturate-enhanced GABA binding to bovine brain membranes. Feigenbaum P, et al. **Brain Res** 1986 Apr 30; 372(1):176-9

Correlation between pentobarbital suppressed cerebellar cyclic GMP and performance of a swimming task. McCaslin PP, et al. **Brain Res** 1986 May 28;374(2):367-70

Blood pentobarbital concentrations during thiopental therapy. Watson WA, et al. **Drug Intell Clin Pharm** 1986 Apr;20(4):283-7

Oral pentobarbital intoxication in a bitch. Fucci V, et al. **J Am Vet Med Assoc** 1986 Jan 15;188(2):191-2

Stereoselective behavioral effects of the isomers of pentobarbital and secobarbital in the pigeon. Wenger GR, et al. **J Pharmacol Exp Ther** 1986 May;237(2):445-9

Variation in pentobarbitone sleeping time in mice. 1. Strain and sex differences. Lovell DP. **Lab Anim** 1986 Apr;20(2):85-90

Variation in pentobarbitone sleeping time in mice. 2. Variables affecting test results. Lovell DP. **Lab Anim** 1986 Apr;20(2):91-6

Inhibition of capillary transport reserve by sodium pentobarbital anesthesia in isometrically contracting dog heart. Durán WN, et al. **Microcirc Endothelium Lymphatics** 1984 Aug;1(4):453-63

Differential interactions between chlordiazepoxide, pentobarbital and benzodiazepine antagonists Ro 15-1788 and CGS 8216 in a drug discrimination procedure. De Vry J, et al. **Pharmacol Biochem Behav** 1986 Apr;24(4):999-1005

Behavioral effects of CGS 8216 alone, and in combination with diazepam and pentobarbital in dogs. Risner ME, et al. **Pharmacol Biochem Behav** 1986 Apr;24(4):1071-6

Effect of sodium pentobarbital on behavioral thermoregulation in rats and mice. Strek KS, et al. **Pharmacol Biochem Behav** 1986 Apr; 24(4):1147-50

The inhibitory effect of endogenous convulsants quinolinic acid and kynurenine on the pentobarbital stimulation of [3H]flunitrazepam binding. Zarkovsky AM. **Pharmacol Biochem Behav** 1986 May; 24(5):1215-7

Monitoring of pentobarbital plasma levels in critical care patients suffering from increased intracranial pressure. Heinemeyer G, et al. **Ther Drug Monit** 1986;8(2):145-50

[Duration of the narcotic action of nembutal under hyperbarism] Sledkov AIu, et al. **Farmakol Toksikol** 1986 May-Jun;49(3):32-5 (Eng. Abstr.) **(Rus)**

PEPTIDES

Peptide sequence analysis using exopeptidases with molecular analysis of the truncated polypeptides by mass spectrometry. Caprioli RM, et al. **Anal Biochem** 1986 May 1;154(2):596-603

Modulation by basic polypeptides of ATP-induced activation of tyrosine hydroxylase prepared from bovine adrenal medulla. Morita K, et al. **Arch Biochem Biophys** 1986 May 15;247(1):84-90

Regulatory peptides of the gastrointestinal and respiratory tracts. Polak JM, et al. **Arch Int Pharmacodyn Ther** 1986 Apr;280(2 Suppl):16-49 (82 ref.)

Elevation of plasma CCK concentration after intestinal administration of a pancreatic enzyme secretion-stimulating peptide purified from rat bile-pancreatic juice: analysis with N-terminal region specific radioimmunoassay. Iwai K, et al. **Biochem Biophys Res Commun** 1986 Apr 29;136(2):701-6

Stimulation by gastrin-releasing peptide, neurotensin and DN1417, a novel TRH analog, of dopamine and norepinephrine release from perifused rat hypothalamic fragments in vitro. Kabayama Y, et al. **Brain Res** 1986 May 7;372(2):394-9

Enkephalin-containing polypeptides in human cerebrospinal fluid. Nyberg F, et al. **Brain Res** 1986 Apr 23;371(2):278-86

Immunohistochemical localization of urotensin I and other neuropeptides in the caudal neurosecretory system of three species of teleosts and two species of elasmobranchs. Yamada C, et al. **Cell Tissue Res** 1986; 244(3):687-90

Separation of tryptophan pyrrolooxygenase into three molecular forms. A study of their substrate specificities using tryptophyl-containing peptides and proteins. Camoretti-Mercado B, et al. **Eur J Biochem** 1986 Apr 15;156(2):317-25

Scyliorhinin I and II: two novel tachykinins from dogfish gut. Conlon JM, et al. **FEBS Lett** 1986 May 5;200(1):111-6

Structure of asparagine-linked sugar chains in the major polypeptide of hepatitis B surface antigen. Hanaoka K, et al. **J Biochem (Tokyo)** 1986 Apr;99(4):1273-6

High-performance liquid chromatography of amino acids, peptides and proteins. LXVII. Evaluation of bandwidth relationships of peptides related to human beta-endorphin, separated by gradient-elution reversed-phase high-performance liquid chromatography. Hearn MT, et al. **J Chromatogr** 1986 Feb 21;352:35-66

High-performance liquid chromatography of tyrosine-containing peptides by pre-column derivatization involving formylation followed by fluorescence reaction with 1,2-diamino-4,5-dimethoxybenzene. Ishida J, et al. **J Chromatogr** 1986 Mar 28;356(1):171-7

Immunohistochemical study on the distribution of neuron-specific enolase-and peptide-containing nerves in the reticulorumen and the reticular groove of cattle. Kitamura N, et al. **J Comp Neurol** 1986 Jun 8;248(2):223-34

Neuropeptide-like immunoreactive cells in the retina of the larval tiger salamander: attention to the symmetry of dendritic projections. Yang CY, et al. **J Comp Neurol** 1986 Jun 1;248(1):105-18

Ultrastructural localization of serotonin and polypeptide YY (PYY) in endocrine cells of the human rectum. Lukinius AI, et al. **J Histochem Cytochem** 1986 Jun;34(6):719-26

Somatostatin immunoreactive neurons in rat visual cortex: a light and electron microscopic study. Meinecke DL, et al. **J Neurocytol** 1986 Feb;15(1):121-36

Peptidergic secretory granules isolated from the brain: a model system for study of intracellular aspects of the process of peptide secretion. Barnea A. **Methods Enzymol** 1986;124:254-65

Computationally directed biorational drug design of peptides. Momany FA, et al. **Methods Enzymol** 1986;124:3-18

A tissue culture model for the study of peptide synthesis and secretion from microdissected hypothalamic explants. Morris M, et al. **Methods Enzymol** 1986;124:359-71

Striatal neurons expressing somatostatin-like immunoreactivity: evidence for a peptidergic interneuronal system in the cat. Chesselet MF, et al. **Neuroscience** 1986 Mar;17(3):547-71

Somatostatin-immunoreactive amacrine cells of chicken retina: retinal mosaic, ultrastructural features, and light-driven variations in peptide metabolism. Ishimoto I, et al. **Neuroscience** 1986 Apr;17(4):1217-33

Use of cryoprotectant to maintain long-term peptide immunoreactivity and tissue morphology. Watson RE Jr, et al. **Peptides** 1986 Jan-Feb; 7(1):155-9

Localization of urotensin I- and corticotropin-releasing factor-like immunoreactivity in the central nervous system of Catostomus commersoni. Yulis CR, et al. **Peptides** 1986 Jan-Feb;7(1):79-86

Correction. Study of an octadecaneuropeptide derived from diazepam binding inhibitor (DBI): biological activity and presence in rat brain. **Proc Natl Acad Sci USA** 1986 Apr;83(8):2776

[Regulation of acinar cell receptors of the pancreas by peptides] Mössner J, et al. **Klin Wochenschr** 1986 Jun 2;64(11):489-98 (Eng. Abstr.) **(Ger)**

PERCEPTION

Single unit response of noradrenergic, serotonergic and dopaminergic neurons in freely moving cats to simple sensory stimuli. Rasmussen K, et al. **Brain Res** 1986 Mar 26;369(1-2):336-40

PERPHENAZINE

Prolactin and blood pressure responses to perphenazine in human subjects: comparison of the oral and intramuscular routes. Musey VC, et al. **Am J Med Sci** 1986 Jun;291(6):380-5

PERSONALITY DISORDERS

Borderline and schizotypal personality disorders treated with low-dose thiothixene vs placebo. Goldberg SC, et al. **Arch Gen Psychiatry** 1986 Jul;43(7):680-6

Pharmacotherapy for patients with borderline personality disorder. Gunderson JG. **Arch Gen Psychiatry** 1986 Jul;43(7):698-700

Progress in pharmacotherapy of borderline disorders. A double-blind study of amitriptyline, haloperidol, and placebo. Soloff PH, et al. **Arch Gen Psychiatry** 1986 Jul;43(7):691-7

A case of social phobia with avoidant personality disorder treated with MAOI. Deltito JA, et al. **Compr Psychiatry** 1986 May-Jun; 27(3):255-8

Etiology and treatment of borderline personality disorder in adolescents. Egan J. **Hosp Community Psychiatry** 1986 Jun;37(6):613-8

PERSONALITY INVENTORY

The effect of state anxiety on personality measurement. Reich J, et al. **Am J Psychiatry** 1986 Jun;143(6):760-3

PHENCYCLIDINE

The convulsant and anticonvulsant effects of phencyclidine (PCP) and PCP analogues in the rat. Leccese AP, et al. **Behav Brain Res** 1986 Feb;19(2):163-9

Cocaine, phencyclidine, and procaine inhibition of the acetylcholine receptor: characterization of the binding site by stopped-flow measurements of receptor-controlled ion flux in membrane vesicles. Karpen JW, et al. **Biochemistry** 1986 Apr 8;25(7):1777-85

Measurement of the amino acid metabolite of phencyclidine by selected ion monitoring. Syracuse CD, et al. **Biomed Environ Mass Spectrom** 1986 Mar;13(3):113-5

A comparison of the binding of sigma opioids and phencyclidine, and the interaction with antipsychotic drugs in rat brain membranes. Downes CP, et al. **Br J Pharmacol** 1986 May;88(1):231-7

Effects of sigma agonist compounds on local cerebral glucose utilization: relationship to psychotomimetic properties. Kozlowski MR. **Brain Res** 1986 Jun 18;376(1):190-3

Biotransformation of phencyclidine. Holsztynska EJ, et al. **Drug Metab Rev** 1985-86;16(3):285-320 (104 ref.)

Radioligand binding to central phencyclidine recognition sites is dependent on excitatory amino acid receptor agonists. Loo P, et al. **Eur J Pharmacol** 1986 Apr 29;123(3):467-8

High correlation between the localization of [3H]TCP binding and NMDA receptors. Maragos WF, et al. **Eur J Pharmacol** 1986 Apr 9; 123(1):173-4

Quantitation of phencyclidine, its metabolites, and derivatives by gas chromatography with nitrogen-phosphorus detection: application for in vivo and in vitro biotransformation studies. Holsztynska EJ, et al. **J Anal Toxicol** 1986 May-Jun;10(3):107-15

Management of acute PCP intoxication with verapamil. Price WA, et al. **J Toxicol Clin Toxicol** 1986;24(1):85-7

Is Metaphit a phencyclidine antagonist? Studies with ketamine, phencyclidine and N-methylaspartate. Davies SN, et al. **Life Sci** 1986 Jun 30;38(26):2441-5

Phencyclidine: an update. **Natl Inst Drug Abuse Res Monogr Ser** 1986; 64:1-260

Clinical implications of behavioral pharmacology research on phencyclidine. Balster RL. **Natl Inst Drug Abuse Res Monogr Ser** 1986; 64:148-62

Phencyclidine (PCP) selectively blocks certain presynaptic potassium channels. Blaustein MP, et al. **Natl Inst Drug Abuse Res Monogr Ser** 1986;64:37-51

Discriminative stimulus properties of PCP mimetics. Browne RG. **Natl Inst Drug Abuse Res Monogr Ser** 1986;64:134-47

Isolation and identification of an endogenous ligand for the phencyclidine receptor. DiMaggio DA, et al. **Natl Inst Drug Abuse Res Monogr Ser** 1986;64:24-36

Characterization of phencyclidine and sigma receptor-binding sites in brain. Gundlach AL, et al. **Natl Inst Drug Abuse Res Monogr Ser** 1986; 64:1-13

Involvement of dopaminergic, cholinergic, and glutamatergic mechanisms in the actions of phencyclidine-like drugs. Johnson KM, et al. **Natl Inst Drug Abuse Res Monogr Ser** 1986;64:52-66

Psychopharmacology of phencyclidine. Marwah J, et al. **Natl Inst Drug Abuse Res Monogr Ser** 1986;64:127-33

Modulation of phencyclidine (PCP) pharmacokinetics with PCP-specific Fab fragments. Owens SM, et al. **Natl Inst Drug Abuse Res Monogr Ser** 1986;64:112-26

Further evidence of phencyclidine/sigma opioid receptor commonality. Sircar R, et al. **Natl Inst Drug Abuse Res Monogr Ser** 1986; 64:14-23

Comparison of effects of phencyclidine and methamphetamine on body temperature in mice: a possible role for histamine neurons in thermoregulation. Itoh Y, et al. **Naunyn Schmiedebergs Arch Pharmacol** 1986 Mar;332(3):293-6

Chronic iminodipropionitrile (IDPN) causes no changes in the rat brain phencyclidine (PCP) receptor. Rothman RB, et al. **Neuropeptides** 1986 Apr;7(3):259-63

Effects of phencyclidine on ventral tegmental A10 dopamine neurons in the rat. French ED. **Neuropharmacology** 1986 Mar;25(3):241-8

Phencyclidine selectively blocks a spinal action of N-methyl-D-aspartate in mice. Aanonsen LM, et al. **Neurosci Lett** 1986 Jun 18;67(2):191-7

Actions of phencyclidine on rat locus coeruleus neurones in vitro. Lacey MG, et al. **Neuroscience** 1986 Feb;17(2):485-94

Enhancement of brain calcium antagonist binding by phencyclidine and related compounds. Bolger GT, et al. **Pharmacol Biochem Behav** 1986 Mar;24(3):417-23

Phencyclidine-induced wet-dog shakes observed in rats after withdrawal from reserpine treatment. Nabeshima T, et al. **Pharmacol Biochem Behav** 1986 May;24(5):1275-9

Interactions of phencyclidine with hippocampal circuitry: evidence for neuronal heterogeneity. Wang Y, et al. **Pharmacol Biochem Behav** 1986 May;24(5):1403-7

Voltage- and time-dependent effects of phencyclidines on the endplate current arise from open and closed channel blockade. Aguayo LG, et al. **Proc Natl Acad Sci USA** 1986 May;83(10):3523-7

Antagonism of phencyclidine action by metaphit in rat cerebellar Purkinje neurons: an electrophysiological study. Wang Y, et al. **Proc Natl Acad Sci USA** 1986 Apr;83(8):2724-7

PHENCYCLIDINE ABUSE

Phencyclidine: an update. **Natl Inst Drug Abuse Res Monogr Ser** 1986; 64:1-260

PHENELZINE

Efficacy of phenelzine in geriatric depression. Lazarus LW, et al. **Biol Psychiatry** 1986 Jun;21(7):699-701

A case of social phobia with avoidant personality disorder treated with MAOI. Deltito JA, et al. **Compr Psychiatry** 1986 May-Jun; 27(3):255-8

Phenelzine for chronic depression: a study of continuation treatment. Harrison W, et al. **J Clin Psychiatry** 1986 Jul;47(7):346-9

Phenelzine in social phobia. Liebowitz MR, et al. **J Clin Psychopharmacol** 1986 Apr;6(2):93-8

Inhibition of aromatic L-amino acid decarboxylase and tyrosine aminotransferase by the monoamine oxidase inhibitor phenelzine. Dyck LE, et al. **J Neurochem** 1986 Jun;46(6):1899-903

PHENETHYLAMINES

An in vivo voltammetric comparison of the effects of three psychomotor stimulants on electrically evoked neostriatal dopamine release. Stamford JA, et al. **Brain Res** 1986 Feb 26;366(1-2):350-3

Tolerance and pilot pharmacokinetics of amiflamine after increasing single oral doses in healthy subjects. Alván G, et al. **Clin Pharmacol Ther** 1986 Jul;40(1):81-5

Development of a standardized analysis strategy for basic drugs using ion-pair extraction and high-performance liquid chromatography. VIII. Method construction for the determination of mebeverine in tablets and biological fluids. Hoogewijs G, et al. **J Chromatogr** 1986 Apr 25; 377:391-8

The concentration in brain of octopamine and tyramine after portal-systemic bypass in rats: neuroamine concentrations determined simultaneously by methane chemical ionization gas chromatography mass spectrometry. Meredith CG, et al. **Life Sci** 1986 May 5; 38(18):1701-5

beta-phenylethylamine effect on brain and blood catechol-O-methyltransferase activity. Hannan CJ Jr. **Pharmacol Biochem Behav** 1986 Apr;24(4):1141-6

[The central inhibitory action of hexoprenaline] Zhang SS. **Yao Hsueh Hsueh Pao** 1985 Sep;20(9):699-701 (Eng. Abstr.) **(Chi)**

[Effective vasodilation. The calmodulin key molecule] Busse R. **Fortschr Med** 1986;104 Suppl 3:12-3 **(Ger)**

PHENMETRAZINE

An in vivo voltammetric comparison of the effects of three psychomotor stimulants on electrically evoked neostriatal dopamine release. Stamford JA, et al. **Brain Res** 1986 Feb 26;366(1-2):350-3

The discriminative stimulus and subjective effects of d-amphetamine, phenmetrazine and fenfluramine in humans. Chait LD, et al. **Psychopharmacology (Berlin)** 1986;89(3):301-6

PHENOBARBITAL

Effects of phenobarbitone and short-term exposure to heat on microsomal cytochrome P-450 and associated monooxygenases in rat liver. Pachecka J, et al. **Acta Physiol Pol** 1984 Sep-Dec;35(5-6):546-50

Physiologic changes induced by endotracheal instillation and suctioning in critically ill preterm infants with and without sedation. Ninan A, et al. **Am J Perinatol** 1986 Apr;3(2):94-7

Subcellular fractionation of liver organelles from phenobarbital-treated rats by counter-current partition and sucrose gradient centrifugation. Morris WB, et al. **Biochem Pharmacol** 1986 Jul 1;35(13):2187-91

Sexually dimorphic response of rat hepatic monooxygenases to low-dose phenobarbital. Shapiro BH. **Biochem Pharmacol** 1986 May 15; 35(10):1766-8

Regulation of cytochrome P-450p by phenobarbital and phenobarbital-like inducers in adult rat hepatocytes in primary monolayer culture and in vivo. Schuetz EG, et al. **Biochemistry** 1986 Mar 11;25(5):1124-33

Interaction between cyclosporin A and phenobarbitone [letter] Carstensen H, et al. **Br J Clin Pharmacol** 1986 May;21(5):550-1

cDNA clones for liver cytochrome P-450s from individual aroclor-treated rats: constitutive expression of a new P-450 gene related to phenobarbital-inducible forms. Affolter M, et al. **DNA** 1986 Jun; 5(3):209-18

Comparative kinetics of phenobarbital after administration of the acid and the propylhexedrine salt (barbexaclone). Perucca E, et al. **Eur J Clin Pharmacol** 1986;29(6):729-30

NADPH-dependent and -independent loss of cytochrome P-450 in control and phenobarbital-induced rat hepatic microsomes incubated with carbon tetrachloride. Moody DE, et al. **Exp Mol Pathol** 1986 Jun; 44(3):318-28

ADP-ribosylation of nuclear proteins is increased by phenobarbital. Identification of the ADP-ribosylated histone fractions in rat liver nuclei. Bràz J, et al. **FEBS Lett** 1986 Apr 21;199(2):164-8

Valproic acid teratogenicity in mice after various administration and phenobarbital-pretreatment regimens: the parent drug and not one of the metabolites assayed is implicated as teratogen. Nau H. **Fundam Appl Toxicol** 1986 May;6(4):662-8

Effects of phenobarbital, 3-methylcholanthrene and polychlorinated biphenyls on sex-specific forms of cytochrome P-450 in liver microsomes of rats. Kamataki T, et al. **J Biochem (Tokyo)** 1986 Mar; 99(3):841-5

The cDNA and protein sequence of a phenobarbital-induced chicken cytochrome P-450. Hobbs AA, et al. **J Biol Chem** 1986 Jul 15; 261(20):9444-9

Rat liver UDP-glucuronosyltransferase. Sequence and expression of a cDNA encoding a phenobarbital-inducible form. Mackenzie PI. **J Biol Chem** 1986 May 5;261(13):6119-25

Isolation and characterization of genomic clones for two chicken phenobarbital-inducible cytochrome P-450 genes. Mattschoss LA, et al. **J Biol Chem** 1986 Jul 15;261(20):9438-43

Increased bile acid level in preterm infants treated with phenobarbital [letter] Schimmel MS, et al. **J Pediatr Gastroenterol Nutr** 1986 May-Jun; 5(3):508

Transport of phenobarbitone into the intestinal lumen and the biliary tract following i.v. administration to rats. Arimori K, et al. **J Pharm Pharmacol** 1986 May;38(5):391-3

Inhibition of high-affinity choline uptake in the rat hippocampus by in vivo injection of phenobarbital in the medial septum. Richter JA, et al. **J Pharmacol Exp Ther** 1986 May;237(2):563-8

Lipid composition of liver microsomes from rats treated with acetone. Hayes EP, et al. **Toxicol Lett** 1986 May;31(2):139-45

[The polymorphism of drugs in powders and tablets. 2. X-ray diffraction studies of polymorphic modifications of phenobarbital] Traue J, et al. **Pharmazie** 1986 Apr;41(4):291-2 **(Ger)**

[Cytochrome P-450 isoforms in the liver of rats treated with phenobarbital, 3-methylcholanthrene and Aroclor 1254 studied by monoclonal antibodies] Koliada AIu. **Biull Eksp Biol Med** 1986 Apr; 101(4):422-5 (Eng. Abstr.) **(Rus)**

[Selective effect of antiepileptics on the cortex and medulla of the adrenal glands] Nović M, et al. **Srp Arh Celok Lek** 1985 Nov-Dec; 113(11-12):983-90 (Eng. Abstr.) **(Sec)**

PHENOTHIAZINE TRANQUILIZERS

Automated flow injection spectrophotometric determination of some phenothiazines using iron perchlorate: applications in drug assays, content uniformity and dissolution studies. Koupparis MA, et al. **Analyst** 1986 Mar;111(3):313-8

Photo-decomposition and metabolism of the phenothiazine drug perazine. Schley J. **Arzneimittelforschung** 1986 Apr;36(4):635-7

Effects of phenothiazines on phosphate incorporation and chloride uptake in isolated intestinal epithelial cells. Wahawisan R, et al. **Gen Pharmacol** 1986;17(3):275-80

Colorimetric determination of certain phenothiazine drugs by using morpholine and iodine-potassium iodide reagents. Youssef AF, et al. **J Assoc Off Anal Chem** 1986 May-Jun;69(3):513-8

A comparative trial of depot pipothiazine. Steinert J, et al. **J Int Med Res** 1986;14(2):72-7

Free and conjugated 3,4-dihydroxyphenylacetic acid and homovanillic acid in brain dopaminergic areas at basal state and after pipotiazine activation. Tavitian E, et al. **J Neural Transm** 1986;65(3-4):261-75

Biotransformation of amitriptyline in man: interaction with phenothiazines. Vandel S, et al. **Neuropsychobiology** 1986;15(1):15-9

[Pharmacokinetics of pipothiazine palmitate, after intramuscular administration in schizophrenic patients] Blanc M, et al. **Therapie** 1986 Jan-Feb;41(1):27-30 (Eng. Abstr.) **(Fre)**

PHENOTHIAZINES

Interaction between calmodulin and five different spin-labelled chlorophenothiazines. Olivier JL, et al. **Biochem J** 1986 Feb 1; 233(3):853-7

Quality control of azure B preparations by liquid chromatography and standardization with azure B tetrafluoroborate. Nelis HJ, et al. **Clin Chim Acta** 1986 May 15;156(3):247-57

Use of ethopropazine and BW 284C51 as selective inhibitors for cholinesterases from various species. Mikalsen A, et al. **Comp Biochem Physiol [C]** 1986;83(2):447-9

Increased acidophilia of eosinophil granules after EDTA treatment. Gomez-Perretta C, et al. **Histochem J** 1986 Jan;18(1):1-4

Differential modulation of autonomic activity by ethmozin and ethacizin (analog of ethmozin) on the canine sinus node and atrioventricular junction. Urthaler F, et al. **J Am Coll Cardiol** 1986 Jul; 8(1 Suppl A):86A-94A

Chromatographic assay of 10-[3-(3-hydroxypyrrolidinyl)propyl]-2-trifluoromethyl phenothiazine using electrochemical detection. Shibanoki S, et al. **J Chromatogr** 1986 Apr 25;377:436-40

A theoretical study of the binding of phenothiazine derivatives to residues 82-93 of calmodulin. Gresh N, et al. **Mol Pharmacol** 1986 Apr; 29(4):355-62

[Effect of ethacizin (diethylamine analog of ethmozine) on the efferent activity of the sympathetic and parasympathetic nerves of the heart] Khageman GR, et al. **Kardiologiia** 1986 Apr;26(4):54-60 (Eng. Abstr.) **(Rus)**

PHENOXYBENZAMINE

Effect of an alpha-blocking agent (phenoxybenzamine) in the management of premature ejaculation. Beretta G, et al. **Acta Eur Fertil** 1986 Jan-Feb; 17(1):43-5

The effect of alpha-adrenergic stimulation and blockade on perfusion of myocutaneous flaps. Moore GK, et al. **Otolaryngol Head Neck Surg** 1986 Apr;94(4):489-96

PHENYLALANINE

Quantification of the importance of individual steps in the control of aromatic amino acid metabolism. Salter M, et al. **Biochem J** 1986 Mar 15;234(3):635-47

Molecular basis for the anti-sickling activity of aromatic amino acids and related compounds: a proton nuclear magnetic resonance investigation. Russu IM, et al. **Biochemistry** 1986 Feb 25;25(4):808-15

In vivo studies on the formation of m-tyrosine and o-tyrosine from L-phenylalanine in rats. Ishimitsu S, et al. **Chem Pharm Bull (Tokyo)** 1986 Feb;34(2):768-74

Tryptophan requirement of growing swine as determined by the oxidation of an indicator amino acid. Lin FD, et al. **J Anim Sci** 1986 Mar; 62(3):660-4

Mutagenesis by normal metabolites in Escherichia coli: phenylalanine mutagenesis is dependent on error-prone DNA repair. Sargentini NJ, et al. **Mutat Res** 1986 Jul;161(2):113-8

PHENYLPROPANOLAMINE

Metabolism of cathinone to (-)-norephedrine and (-)-norpseudoephedrine. Brenneisen R, et al. **J Pharm Pharmacol** 1986 Apr;38(4):298-300

Behavioral and neurochemical evaluation of phenylpropanolamine. Woolverton WL, et al. **J Pharmacol Exp Ther** 1986 Jun; 237(3):926-30

Weight loss induced by chronic phenylpropanolamine: anorexia and brown adipose tissue thermogenesis. Wellman PJ, et al. **Pharmacol Biochem Behav** 1986 Mar;24(3):605-11

PHENYTOIN

In vitro evaluation of nasogastric administration methods for phenytoin. Cacek AT, et al. **Am J Hosp Pharm** 1986 Mar;43(3):689-92

Recovery of phenytoin from an enteral nutrient formula. Hooks MA, et al. **Am J Hosp Pharm** 1986 Mar;43(3):685-8

Effect of phenytoin on rat bone resorption in vitro. Somerman MJ, et al. **Arch Oral Biol** 1986;31(4):267-8

Comparison of four single-point phenytoin dosage prediction techniques using computer-simulated pharmacokinetic values. Toscano JP, et al. **Clin Pharm** 1986 May;5(5):396-402

Characterization of collagens in phenytoin-enlarged human gingiva. Narayanan AS, et al. **Coll Relat Res** 1985 Dec;5(6):513-8

Single dose comparison of the relative bioavailability of phenytoin suspension and extended capsules. Fitzsimmons WE, et al. **Epilepsia** 1986 Jul-Aug;27(4):464-8

Postrotatory nystagmus during phenytoin treatment. Mameli O, et al. **Epilepsia** 1986 Jul-Aug;27(4):385-90

Competition between valproate & phenytoin for plasma protein binding. Jaffery NF, et al. **Indian J Med Res** 1986 Apr;83:426-8

5,5-Diaryl-2-thiohydantoins and 5,5-diaryl-N3-substituted-2-thiohydantoins as potential hypolipidemic agents. Tompkins JE. **J Med Chem** 1986 May;29(5):855-9

The laser gingivectomy. The use of the CO2 laser for the removal of phenytoin hyperplasia. Pick RM, et al. **J Periodontol** 1985 Aug; 56(8):492-6

Persistent defects in the hepatic monooxygenase system of adult rats exposed, perinatally, to maternally administered phenytoin. Shapiro BH, et al. **J Pharmacol Exp Ther** 1986 Jul;238(1):68-75

Adjunctive therapy of phenytoin overdose--a case report using plasmaphoresis. Larsen LS, et al. **J Toxicol Clin Toxicol** 1986; 24(1):37-49

Interaction of oral phenytoin with enteral feedings. Saklad JJ, et al. **JPEN J Parenter Enteral Nutr** 1986 May-Jun;10(3):322-3

Activity-dependent depression of nerve action potential by phenytoin. David G, et al. **Neurosci Lett** 1986 May 15;66(2):163-8

Check concentrations of medications ordered for children. Cohen MR. **Nursing** 1986 May;16(5):8

A unilateral gingival overgrowth (hyperplasia) in a Dilantin treated patient. Khatiblou FA. **Periodont Case Rep** 1985;7(2):46-7

Interaction of furosemide and phenytoin in the rat. Williamson HE. **Proc Soc Exp Biol Med** 1986 Jul;182(3):322-4

Ethnic differences in phenytoin kinetics. Hvidberg EF. **Prog Clin Biol Res** 1986;214:279-87

Review of alterations in oral phenytoin bioavailability associated with formulation, antacids, and food. Cacek AT. **Ther Drug Monit** 1986; 8(2):166-71

Protection by phenytoin and calcium channel blocking agents against the toxicity of diisopropylfluorophosphate. Dretchen KL, et al. **Toxicol Appl Pharmacol** 1986 May;83(3):584-9

[Gingival hyperplasia due to Dihydan. A semi-quantitative and ultrastrctural study] Boudat MA, et al. **J Parodontol** 1985 Oct; 4(4):301-10 (Eng. Abstr.) **(Fre)**

[Diphenylhydantoin in the prevention and therapy of AIDS? (letter)] Lehr HA, et al. **Dtsch Med Wochenschr** 1986 Jun 20;111(25):1001-2 **(Ger)**

[Inhibitory effect of phenytoin on nerve hyperexcitability induced by low calcium in frogs] Takagi T, et al. **Kanagawa Shigaku** 1985 Dec; 20(3):394-401 (Eng. Abstr.) **(Jpn)**

[Gingival hyperplasia induced by diphenylhydantoin. Effect of diphenylhydantoin on DNA, RNA, and protein synthesis in cultured bovine gingival explants] Nagata T, et al. **Nippon Shishubyo Gakkai Kaishi** 1986 Mar;28(1):161-7 (Eng. Abstr.) **(Jpn)**

[Application of drug monitoring with saliva--the influence of phenytoin upon the salivary inorganic constituents] Watanabe S, et al. **Rinsho Byori** 1986 Mar;34(3):254-61 **(Jpn)**

PHOBIC DISORDERS

Clinically significant improvement in agoraphobia research. Mavissakalian M. **Behav Res Ther** 1986;24(3):369-70

A case of social phobia with avoidant personality disorder treated with MAOI. Deltito JA, et al. **Compr Psychiatry** 1986 May-Jun; 27(3):255-8

Pharmacokinetics and clinical effects of alprazolam following single and multiple oral doses in patients with panic disorder. Ciraulo DA, et al. **J Clin Pharmacol** 1986 Apr;26(4):292-8

Treatment of panic disorder and agoraphobia with clonazepam. Spier SA, et al. **J Clin Psychiatry** 1986 May;47(5):238-42

Phenelzine in social phobia. Liebowitz MR, et al. **J Clin Psychopharmacol** 1986 Apr;6(2):93-8

Imipramine binding in agoraphobia [letter] Ambrosini P. **Psychiatry Res** 1986 Jun;18(2):189-92

Taper withdrawal studies with alprazolam in patients with panic disorder and agoraphobia. Pecknold JC, et al. **Psychopharmacol Bull** 1986; 22(1):173-6

A comparison of alprazolam and imipramine in the treatment of agoraphobia and panic disorder. Rizley R, et al. **Psychopharmacol Bull** 1986;22(1):167-72

PHYSOSTIGMINE

Inhibition of acetylcholinesterase from electric eel by (-)-and (+)-physostigmine and related compounds. Brossi A, et al. **FEBS Lett** 1986 Jun 9;201(2):190-2

Distribution and pharmacokinetics of physostigmine in rat after intramuscular administration. Somani SM, et al. **Fundam Appl Toxicol** 1986 Feb;6(2):327-34

In vitro inhibition of brain acetylcholinesterase by phosphamidon & physostigmine sulphate in adult chick. Chattopadhyay R, et al. **Indian J Med Res** 1986 Apr;83:435-40

In-vitro study of physostigmine salicylate and pilocarpine hydrochloride release from different gel formulations. Habib FS, et al. **Pharmazie** 1986 Feb;41(2):124-5

Central muscarinic effects of physostigmine on mood, cardiovascular function, pituitary and adrenal neuroendocrine release. Janowsky DS, et al. **Psychopharmacology (Berlin)** 1986;89(2):150-4

The effect of hemicholinium-3 and physostigmine on choline in rat brain. Slone HT, et al. **Res Commun Chem Pathol Pharmacol** 1986 Apr; 52(1):133-6

PILOCARPINE

Corneal changes during pilocarpine gel therapy [letter] Hook SR. **Am J Ophthalmol** 1986 May 15;101(5):623

Stirring device for direct microtitration of pilocarpine hydrochloride in individual single-dose containers. Johansson PA. **Anal Chem** 1986 Jun; 58(7):1587-9

Pilocarpine for the treatment of xerostomia associated with salivary gland dysfunction. Fox PC, et al. **Oral Surg Oral Med Oral Pathol** 1986 Mar; 61(3):243-8

In-vitro study of physostigmine salicylate and pilocarpine hydrochloride release from different gel formulations. Habib FS, et al. **Pharmazie** 1986 Feb;41(2):124-5

[Rapid semiquantitative evaluation by thin-layer chromatography of pilo- and isopilocarpic acids in eyedrops with a pilocarpine base] Durif C, et al. **Pharm Acta Helv** 1986;61(5-6):135-8 **(Fre)**

PITUITARY HORMONE RELEASING HORMONES

The effects of orchidectomy and replacement therapy on the ultrastructure and gonadotropin-releasing hormone content of the median eminence of the rat. Beckman WC Jr. **Am J Anat** 1986 May;176(1):33-52

Relationship of gonadotropin-releasing hormone, danazol, and prostaglandin blockade to ovarian enlargement and ascites formation of the ovarian hyperstimulation syndrome in the rabbit. Pride SM, et al. **Am J Obstet Gynecol** 1986 May;154(5):1155-60

Mechanism of action of gonadotropin releasing hormone. Conn PM, et al. **Annu Rev Physiol** 1986;48:495-513 (81 ref.)

Regulation of mating behaviour in the female rat by gonadotropin-releasing hormone in the ventral tegmental area: effects of selective destruction of the A10 dopamine neurones. Sirinathsinghji DJ, et al. **Brain Res** 1986 May 21;374(1):167-73

The interaction of growth hormone releasing hormone with other hypothalamic hormones on the release of anterior pituitary hormones. Looij BJ Jr, et al. **Clin Endocrinol (Oxf)** 1986 Feb;24(2):149-56

The effect of physiological changes in ovarian steroids on the prolactin response to gonadotrophin releasing factor. Tan YM, et al. **Clin Endocrinol (Oxf)** 1986 Jan;24(1):71-8

Luteinizing hormone and follicle-stimulating hormone responses to intransal gonadotropin-releasing hormone. Rajfer J, et al. **Fertil Steril** 1986 Jun;45(6):794-9

Gonadotropin-releasing hormone and prostaglandin F2 alpha for postpartum dairy cows: estrous, ovulation, and fertility traits. Benmrad M, et al. **J Dairy Sci** 1986 Mar;69(3):800-11

Timing of multiple ovulations in the ewe after treatment with FSH or PMSG with and without GnRH. Walker SK, et al. **J Reprod Fertil** 1986 May;77(1):135-42

Medical treatment for undescended testis [letter] de Muinck Keizer-Schrama S. **Lancet** 1986 Jul 26;2(8500):220-1

Physiological role of putative testicular gonadotrophin releasing hormone

(GnRH). Clayton RN, et al. **Med Biol** 1986;63(5-6):201-9

Gonadotropin releasing hormone (GnRH) agonists in male contraception. Swerdloff RS, et al. **Med Biol** 1986;63(5-6):218-24

Regulation of primate testicular function by GnRH analogues. Weinbauer GF, et al. **Med Biol** 1986;63(5-6):210-7

Hormonal treatment of cryptorchidism [letter] Hadziselimovic F. **N Engl J Med** 1986 Jul 31;315(5):322

Clinical studies in black women with isolated gonadotrophin-releasing hormone deficiency. Norman RJ, et al. **S Afr Med J** 1986 Apr 26; 69(9):546-8

PITUITARY HORMONES

Neuroendocrine parameters in the rat exposed to 60-Hz electric fields. Quinlan WJ, et al. **Bioelectromagnetics** 1985;6(4):381-9

PITUITARY HORMONES, ANTERIOR

The interaction of growth hormone releasing hormone with other hypothalamic hormones on the release of anterior pituitary hormones. Looij BJ Jr, et al. **Clin Endocrinol (Oxf)** 1986 Feb;24(2):149-56

Single-unit activity of hypothalamic arcuate neurons in brain tissue slices. Effects of anterior pituitary hormones, cholecystokinin-octapeptide, and neurotransmitters. Pan JT, et al. **Neuroendocrinology** 1986; 43(2):189-96

Effects of neuropeptide Y (NPY) on the release of anterior pituitary hormones in the rat. Kerkerian L, et al. **Peptides** 1985 Nov-Dec; 6(6):1201-4

PRAZEPAM

Solubility of diazepam and prazepam in aqueous non-ionic surfactants. Moro ME, et al. **J Pharm Pharmacol** 1986 Apr;38(4):294-6

PROGESTERONE

Hormonal effects on the activities of glycosidases in the endometrium of rabbit uterus. Munakata H, et al. **Biochem Med Metab Biol** 1986 Apr;35(2):179-83

Biochemical and radioautographic analysis of estrogen-inducible progestin receptors in female ferret brain and pituitary: correlations with effects of progesterone on sexual behavior and gonadotropin-releasing hormone-stimulated secretion of luteinizing hormone. Baum MJ, et al. **Brain Res** 1986 Mar 19;368(2):296-309

The effect of physiological changes in ovarian steroids on the prolactin response to gonadotrophin releasing factor. Tan YM, et al. **Clin Endocrinol (Oxf)** 1986 Jan;24(1):71-8

Modulation of the estradiol-induced luteinizing hormone surge by progesterone or antiestrogens: effects on pituitary gonadotropin-releasing hormone receptors. Attardi B, et al. **Endocrinology** 1986 Jul;119(1):274-83

The effect of oestradiolum benzoicum and progesterone on the noradrenalin content in organs of the female reproductive system of sexually immature pigs. Lakomy M, et al. **Gegenbaurs Morphol Jahrb** 1986;132(1):129-43

Anterior pituitary concentrations of gonadotropins, GnRH-receptors and ovarian characteristics following early weaning in beef cows. Parfet JR, et al. **J Anim Sci** 1986 Mar;62(3):717-22

Activation of protein kinase C potentiates cyclic AMP production and stimulates steroidogenesis in differentiated ovarian granulosa cells. Shinohara O, et al. **J Steroid Biochem** 1986 Jan;24(1):161-8

Effects of dopaminergic drugs on plasma levels of steroid hormones in conscious dogs. Goiny M, et al. **Life Sci** 1986 Jun 23; 38(25):2293-300

Anxiolytic effects of progesterone are sexually dimorphic. Rodriguez-Sierra JF, et al. **Life Sci** 1986 May 19;38(20):1841-5

Effects of estradiol and progesterone on immunoreactive forms of hypothalamic luteinizing hormone-releasing hormone. Drouva SV, et al. **Neuroendocrinology** 1986;43(1):32-7

In vitro LHRH release from superfused hypothalamus as a function of the rat estrous cycle: effect of progesterone. Kim K, et al. **Neuroendocrinology** 1986;42(5):392-8

Suppression of receptive and proceptive behavior in ovariectomized, estrogen-progesterone-primed rats by intraventricular beta-endorphin: studies of behavioral specificity. Wiesner JB, et al. **Neuroendocrinology** 1986;43(1):57-62

Steroid hormone metabolites are barbiturate-like modulators of the GABA receptor. Majewska MD, et al. **Science** 1986 May 23; 232(4753):1004-7

[Preliminary study in female rats of the immunoregulatory effect of estradiol, progesterone and pituitary prolactin on natural killer-like cell mediated cytotoxic activity] Mohammad M, et al. **Ann Endocrinol (Paris)** 1985;46(6):415-9 (Eng. Abstr.) **(Fre)**

PROLACTIN

The effect of oestriol and tamoxifen on oestradiol induced prolactin secretion in anaesthetised rats. Gilna P, et al. **Acta Endocrinol (Copenh)** 1986 May;112(1):71-8

Human foetal prolactin but not thyrotropin secretion is decreased by bromocriptine. Roti E, et al. **Acta Endocrinol (Copenh)** 1986 May; 112(1):35-42

The sensitivity of prolactin secretion to dopamine changes during pregnancy in mice. Swartz SR, et al. **Acta Endocrinol (Copenh)** 1986 Apr;111(4):567-71

The phorbol ester TPA induces hormone release and electrical activity in clonal rat pituitary cells. Ostberg BC, et al. **Acta Physiol Scand** 1986 Apr;126(4):517-24

Therapeutic effect of bromocriptine in anovulatory women with normal prolactin levels. Waroński W, et al. **Acta Univ Palacki Olomuc Fac Med** 1981;101:125-32

Prolactin and blood pressure responses to perphenazine in human subjects: comparison of the oral and intramuscular routes. Musey VC, et al. **Am J Med Sci** 1986 Jun;291(6):380-5

Dopamine inhibits maitotoxin-stimulated pituitary 45Ca2+ efflux and prolactin release. Login IS, et al. **Am J Physiol** 1986 Jun; 250(6 Pt 1):E731-5

Effect of clonidine, quipazine, and LY 53857 on the prolactin-suppressant action of bromocriptine in rats. Lipham LB, et al. **Am J Vet Res** 1986 May;47(5):1089-91

The pituitary gland in primate mammary development: evidence that prolactin is not essential. Kleinberg DL, et al. **Ann NY Acad Sci** 1986; 464:37-43

Intracerebroventricular injection of anti-prolactin serum suppresses excessive grooming of pituitary homografted rats. Drago F, et al. **Behav Neural Biol** 1986 Jul;46(1):99-105

Benzodiazepine- and barbiturate-interactions with GABAA receptor responses on lactotrophs. Anderson RA, et al. **Brain Res** 1986 Apr 23; 371(2):287-92

Activation of GABA receptors in the hypothalamus stimulates secretion of growth hormone and prolactin. Willoughby JO, et al. **Brain Res** 1986 May 21;374(1):119-25

The effect of physiological changes in ovarian steroids on the prolactin response to gonadotrophin releasing factor. Tan YM, et al. **Clin Endocrinol (Oxf)** 1986 Jan;24(1):71-8

Plasma concentration of prolactin during four-day osmotic pump infusion of thyrotropin-releasing hormone and vasoactive intestinal polypeptide in rats. Niimi M, et al. **Endocrinol Jpn** 1985 Dec;32(6):929-32

Subpopulations of lactotropes detected with the reverse hemolytic plaque assay show differential responsiveness to dopamine. Luque EH, et al. **Endocrinology** 1986 May;118(5):2120-4

Reversal by thiols of dopamine-, stalk-median eminence-, and zinc-induced inhibition of prolactin transformation in adenohypophyses of lactating rats. Martinez-Escalera G, et al. **Endocrinology** 1986 May; 118(5):1803-7

Inhibition of the preovulatory prolactin surge in the rat by catechol estrogens: functional and temporal specificity. Okatani Y, et al. **Endocrinology** 1986 Jul;119(1):261-7

Antagonism of beta-endorphin-induced prolactin release by alpha-melanocyte-stimulating hormone and corticotropin-like intermediate lobe peptide. Wardlaw SL, et al. **Endocrinology** 1986 Jul; 119(1):112-8

Biphasic effect of GABAA receptor agonists on prolactin secretion: evidence for two types of GABAA receptor complex on lactotrophes. Anderson R, et al. **Eur J Pharmacol** 1986 May 13;124(1-2):1-9

Regulation of human prolactin secretion by gonadotropin-releasing hormone in vitro. Blackwell RE, et al. **Fertil Steril** 1986 Jul; 46(1):26-31

Immunoperoxidase localization of prolactin in endometrium during normal menstrual, luteal phase defect, and corrected luteal phase defect cycles. Kauma S, et al. **Fertil Steril** 1986 Jul;46(1):37-41

The anti-oestrogen tamoxifen does not interfere with the dopaminergic control of prolactin and TSH release in normogonadotrophic oligozoospermic man. van Bergeijk L, et al. **Horm Metab Res** 1986 Apr;18(4):272-6

Serum concentrations of prolactin, thyroxine and triiodothyronine relative to season and the estrous cycle in the mare. Johnson AL. **J Anim Sci** 1986 Apr;62(4):1012-20

Plasma levels of arginine vasotocin, prolactin, aldosterone and corticosterone during prolonged dehydration in the domestic fowl: effect of dietary NaCl. Arnason SS, et al. **J Comp Physiol [B]** 1986; 156(3):383-97

Prolactin release, oestrogens and proliferation of prolactin-secreting cells in the anterior pituitary gland of adult male rats. Pérez RL, et al. **J Endocrinol** 1986 Mar;108(3):399-403

Prolactin lowering effect of dihydroergokryptine in rat and in man. Poli M, et al. **J Endocrinol Invest** 1986 Feb;9(1):31-6

Histamine-induced prolactin release and activity of tuberoinfundibular dopaminergic neurons in male rats. Seltzer AM, et al. **J Neural Transm** 1986;65(2):115-23

Steroid regulation of gonadotropins in genetically hypoprolactinemic females (IPL nude rats). Cohen H, et al. **J Steroid Biochem** 1986 Jan; 24(1):431-5

Age-related differences in the pituitary prolactin response to thyrotropin-releasing hormone. Arnetz BB, et al. **Life Sci** 1986 Jul 14; 39(2):135-9

Dopamine inhibition of prolactin release but not synthesis in the male Syrian hamster: in vitro studies. Blask DE, et al. **Life Sci** 1986 May 26;38(21):1915-21

Dopamine and somatostatin inhibit forskolin-stimulated prolactin and growth hormone secretion but not stimulated cyclic AMP levels in sheep anterior pituitary cell cultures. Ray KP, et al. **Mol Cell Endocrinol** 1986 May;45(2-3):175-82

Immunohistochemical localization of follicle-stimulating hormone, luteinizing hormone, growth hormone, adrenocorticotrophic hormone and prolactin in the human placenta. Al-Timimi A, et al. **Placenta** 1986 Mar-Apr;7(2):163-72

Effect of mammalian growth hormone and prolactin on the growth of hypophysectomized chickens. King DB, et al. **Proc Soc Exp Biol Med** 1986 Jun;182(2):201-7

[Changes in plasma prolactin and magnesium in male rats treated with thioproperazine and/or bromocriptine] Marois G, et al. **Ann Endocrinol (Paris)** 1985;46(6):399-405 (Eng. Abstr.) **(Fre)**

[Preliminary study in female rats of the immunoregulatory effect of estradiol, progesterone and pituitary prolactin on natural killer-like cell mediated cytotoxic activity] Mohammad M, et al. **Ann Endocrinol (Paris)** 1985;46(6):415-9 (Eng. Abstr.) **(Fre)**

[Plasma monitoring of haloperidol. Correlation with clinical efficacy and plasma prolactin levels] Giraud-Serio J, et al. **Ann Med Psychol (Paris)** 1985 Nov;143(9):900-11 **(Fre)**

[Evaluation of the dopaminergic neuroendocrine control of prolactin release during labor in humans] Nishii O, et al. **Nippon Naibunpi Gakkai Zasshi** 1986 Feb 20;62(2):108-16 (Eng. Abstr.) **(Jpn)**

[The effect of prolactin on the production of surfactant in rat fetal lung] Sch E. **Nippon Sanka Fujinka Gakkai Zasshi** 1986 Mar;38(3):337-45 (Eng. Abstr.) **(Jpn)**

[Nocturnal prolactin (PRL) levels and PRL release by metoclopramide in normoprolactinemic anovulation, and effects of bromocriptine in induction of ovulation] Suginami H, et al. **Nippon Sanka Fujinka Gakkai Zasshi** 1986 Apr;38(4):603-4 **(Jpn)**

[Serum prolactin levels during sleep and in metoclopramide stimulation in normoprolactinemic anovulation and ovulation induction with bromocriptine] Suginami H, et al. **Nippon Sanka Fujinka Gakkai Zasshi** 1986 May;38(5):728-34 (Eng. Abstr.) **(Jpn)**

PROMAZINE

Promazine. A major plasma metabolite of chlorpromazine in a population of chronic schizophrenics. Sgaragli G, et al. **Drug Metab Dispos** 1986 Mar-Apr;14(2):263-6

Analysis of promazine in pharmaceutical preparations by high-performance liquid chromatography. Tebbett IR. **J Chromatogr** 1986 Mar 28;356(1):227-9

PROMETHAZINE

Oral paediatric premedication. Paul AK, et al. **J Indian Med Assoc** 1984 Jul;82(7):233-5

Effect on bone ash weights of long-term treatment of mice with oral promethazine HCl. Tyan ML. **Mech Ageing Dev** 1986 May; 34(3):305-12

PROPANEDIOLS

Regulatory changes in the fucose system associated with the evolution of a catabolic pathway for propanediol in Escherichia coli. Hacking AJ, et al. **J Bacteriol** 1977 May;130(2):832-8

Pulpal response to an experimental adhesion promoter. Plant CG, et al. **J Oral Pathol** 1986 Apr;15(4):196-200

[Application of fatty alcohols to pharmaceutical dosage form. III. Percutaneous absorption of indomethacin from fatty alcohol and propylene glycol (FAPG) bases consisting of a mixture of fatty alcohol and propylene glycol] Kaiho F, et al. **Yakugaku Zasshi** 1986 Jan; 106(1):47-53 (Eng. Abstr.) **(Jpn)**

[Effect of 1,2-propandiol and glycerin on erythrocyte survival in hypothermia] Vorotilin AM, et al. **Gematol Transfuziol** 1986 May; 31(5):49-51 **(Rus)**

PROPRANOLOL

Effect of alpha and beta adrenoreceptor antagonists on glucagon-induced inhibition of gastric acid secretion in cats. Dzierżkowska J, et al. **Acta Physiol Pol** 1984 Sep-Dec;35(5-6):475-84

Stability of propranolol hydrochloride suspension compounded from tablets. Henry DW, et al. **Am J Hosp Pharm** 1986 Jun;43(6):1492-5

Antimigraine drug interactions with 5-hydroxytryptamine1A receptors. Hiner BC, et al. **Ann Neurol** 1986 May;19(5):511-3

Association and partitioning of propranolol in model and biological membranes. Rogers JA, et al. **Biochem Pharmacol** 1986 Jul 1; 35(13):2259-61

Phorbol esters, vasopressin and angiotensin II block alpha 1-adrenergic action in rat hepatocytes. Possible role of protein kinase C. García-Sáinz JA, et al. **Biochim Biophys Acta** 1986 Jun 16;887(1):69-72

Relationship between plasma propranolol concentration and dose in young, healthy volunteers. Dey M, et al. **Biopharm Drug Dispos** 1986 Mar-Apr;7(2):103-11

The pharmacokinetics of exaprolol and propranolol in rats with interrupted enterohepatic circulation. Motheová O, et al. **Biopharm Drug Dispos** 1986 Mar-Apr;7(2):151-62

Serum protein binding of diazepam and propranolol in the feto-maternal unit from early to late pregnancy. Krauer B, et al. **Br J Obstet Gynaecol** 1986 Apr;93(4):322-8

Concomitant food intake can increase the bioavailability of propranolol by transient inhibition of its presystemic primary conjugation. Liedholm H, et al. **Clin Pharmacol Ther** 1986 Jul;40(1):29-36

Enprostil, in contrast to cimetidine, does not inhibit propranolol metabolism. Reilly CS, et al. **Clin Pharmacol Ther** 1986 Jul; 40(1):37-41

Synthesis and identification of 3-(4-hydroxy-1-naphthoxy)lactic acid as a metabolite of propranolol in the rat, in man, and in the rat liver 9000 g supernatant fraction. Talaat RE, et al. **Drug Metab Dispos** 1986 Mar-Apr;14(2):202-7

Cardiorespiratory response to exercise before and after acute beta-adrenoreceptor blockade in nonsmokers and chronic smokers. Penny WJ, et al. **Int J Cardiol** 1986 Jun;11(3):293-304

Pharmacokinetic and pharmacodynamic interactions between nifedipine and propranolol or betaxolol. Vinceneux P, et al. **Int J Clin Pharmacol Ther Toxicol** 1986 Mar;24(3):153-8

Interaction of epinephrine and propranolol [letter] Spencer PS, et al. **J Am Acad Dermatol** 1986 Jun;14(6):1093-4

Effects of beta-adrenergic stimulation on 1-O-hexadecyl-2-acetyl-sn-glycero-3-phosphocholine-mediated vasoconstriction and glycogenolysis in the perfused rat liver. Fisher RA, et al. **J Biol Chem** 1986 Jul 5;261(19):8817-23

Propranolol binding to human serum proteins studied by high-performance liquid chromatography. Bree F, et al. **J Chromatogr** 1986 Mar 7;375(2):416-22

Acute hypotensive effects of oral and intravenous propranolol: early alterations in peripheral resistance. Fagan TC, et al. **J Clin Hypertens** 1986 Mar;2(1):21-9

The serotonin syndrome: case responsive to propranolol [letter] Guzé BH, et al. **J Clin Psychopharmacol** 1986 Apr;6(2):119-20

Propranolol treatment of assaultive patients with organic brain disease. A double-blind crossover, placebo-controlled study. Greendyke RM, et al. **J Nerv Ment Dis** 1986 May;174(5):290-4

Effects of propranolol on catecholamine synthesis and uptake in the central nervous system of the rat. Tuross N, et al. **J Pharmacol Exp Ther** 1986 Jun;237(3):739-45

On the assessment of the beta-adrenoceptor blocking activity of propranolol using the rat isolated right ventricle. Doggrell SA, et al. **J Pharmacol Methods** 1986 Apr;15(2):119-31

Increased dependency of cardiac pacemaker activity on extracellular Ca after adrenergic blockade in the frog heart. Fukuda Y. **Jpn J Physiol** 1986;36(1):209-13

Branded or generic propranolol? [letter] Garcia-Buñuel L. **Lancet** 1986 Jun 21;1(8495):1443

Differences in side-effect incidence in patients on proprietary and generic propranolol [letter] Sanderson JH, et al. **Lancet** 1986 Apr 26; 1(8487):967-8

Daily propranolol administration reduces pineal concretion formation in the Mongolian gerbil. Vaughan MK, et al. **Proc Soc Exp Biol Med** 1986 Jul;182(3):372-4

[Propranolol poisoning] Bouwels LH. **Ned Tijdschr Geneeskd** 1986 Mar 29;130(13):596-9 (Eng. Abstr.) **(Dut)**

[Effect of forskolin, isoprenaline and propranolol on spontaneous contractions of the isolated atrium of guinea pigs] Varagic VM, et al. **C R Soc Biol (Paris)** 1985;179(6):777-81 (Eng. Abstr.) **(Fre)**

[The influence of central monoaminergic systems on the anticonvulsive action of propranolol] Lasek R, et al. **Pharmazie** 1986 Feb; 41(2):128-30 (Eng. Abstr.) **(Ger)**

PROSTAGLANDINS

Are prostaglandins involved in somatostatin mediated inhibition of gastric secretion in the cat? Albinus M, et al. **Agents Actions** 1986 Apr; 18(1-2):205-9

NaCl transport stimulates prostaglandin release in cultured renal epithelial (MDCK) cells. Kurtz A, et al. **Am J Physiol** 1986 May; 250(5 Pt 1):C676-81

Synergistic action of angiotensin II on norepinephrine-induced prostaglandin release from rat glomeruli. Matsumura Y, et al. **Am J Physiol** 1986 May;250(5 Pt 2):F811-6

Prostaglandin interaction with histamine release and parietal cell activity in isolated gastric glands. Nylander O, et al. **Am J Physiol** 1986 May; 250(5 Pt 1):G607-16

Effect of noradrenaline, vasopressin and angiotensin II on renal prostaglandins in man. Loup R, et al. **Clin Sci** 1986 Apr;70(4):371-7

Effects of prostaglandin synthesis inhibition on sympathetic-and parasympathetic-mediated coronary hemodynamic responses. Trimarco B, et al. **J Pharmacol Exp Ther** 1986 May;237(2):589-99

Regulation of renal cellular cAMP levels by prostaglandins and alpha 2-adrenoceptors: microdissection studies. Umemura S, et al. **Kidney Int** 1986 Mar;29(3):703-7

Prostaglandin synthesis by enterocyte microsomes of rabbit small intestine. Balaa MA, et al. **Prostaglandins** 1986 Apr;31(4):609-24

Prostacyclin and thromboxane formation in human umbilical arteries following stimulation with vasoactive autacoids. Bjøro K. **Prostaglandins** 1986 Apr;31(4):699-714

Indomethacin inhibits thrombin-, but not thyroxin-stimulated resorption of fetal rat limb bones. Hoffmann O, et al. **Prostaglandins** 1986 Apr; 31(4):601-8

[The role of serotonin, histamine and prostaglandins on potentiation of hypoxic pulmonary vasoconstriction by repeated intermittent hypoxic challenges in dogs] Nakanishi S, et al. **Nippon Kyobu Shikkan Gakkai Zasshi** 1986 Jan;24(1):42-8 (Eng. Abstr.) **(Jpn)**

PSYCHIATRIC STATUS RATING SCALES

The AMDP-system in clinical psychopharmacology. Bobon D, et al. **Pharmacopsychiatry** 1986 Mar;19(2):55-7

Predictors of outcome in schizophrenia: the process-reactive dimension. Harrow M, et al. **Schizophr Bull** 1986;12(2):195-207

PSYCHIATRY

Regulation of psychiatric practice [editorial] Baldessarini RJ, et al. **Am J Psychiatry** 1986 Jun;143(6):750-1

The policies and practices of American psychiatry are oppressive. Frank LR. **Hosp Community Psychiatry** 1986 May;37(5):497-501

American psychiatry's fundamental policy is to foster the patient's good. Ruben HL. **Hosp Community Psychiatry** 1986 May;37(5):501-4

PSYCHOLOGICAL TESTS

Clinically significant improvement in agoraphobia research. Mavissakalian M. **Behav Res Ther** 1986;24(3):369-70

Comparing classroom and clinic measures of attention deficit disorder: differential, idiosyncratic, and dose-response effects of methylphenidate. Rapport MD, et al. **J Consult Clin Psychol** 1986 Jun;54(3):334-41

PSYCHOLOGY

Increasing the societal contribution of organized psychology. DeLeon PH. **Am Psychol** 1986 Apr;41(4):466-74

PSYCHOMOTOR AGITATION

[Schizophrenic excitement and the role of lithium in its therapy (apropos of 2 recent cases)] Skurnik N, et al. **Ann Med Psychol (Paris)** 1985 Dec;143(10):960-2 **(Fre)**

PSYCHOMOTOR PERFORMANCE

Antiemotional and anticonvulsant activity of brotizolam and its effects on motor performance in animals. Böke-Kuhn K, et al. **Arzneimittelforschung** 1986 Mar;36(3A):528-31

Comparison of two benzodiazepines with differing accumulation: behavioral changes during and after 3 weeks of dosing. Ghoneim MM, et al. **Clin Pharmacol Ther** 1986 May;39(5):491-500

Repeated administration of diazepam and triazolam to subjects with histories of drug abuse. Roache JD, et al. **Drug Alcohol Depend** 1986 May;17(1):15-29

Residual effects of zopiclone and benzodiazepine hypnotics on psychomotor performance related to car driving. Harrison C, et al. **Drugs Exp Clin Res** 1985;11(12):823-9

Effect of carbamazepine on psychomotor performance in näive subjects. MacPhee GJ, et al. **Eur J Clin Pharmacol** 1986;30(1):37-42

Alprazolam and lorazepam single and multiple-dose effects on psychomotor skills and sleep. Subhan Z, et al. **Eur J Clin Pharmacol** 1986;29(6):709-12

Effect of sulpiride on vigilance in healthy subjects. Bartfai A, et al. **Int J Psychophysiol** 1986 May;4(1):1-5

A comparison of the effects of trazodone and amitriptyline on skills performance by geriatric subjects. Burns M, et al. **J Clin Psychiatry** 1986 May;47(5):252-4

Effects of drugs, age and illumination on response speed of squirrel monkeys. Steiner NO, et al. **Pharmacol Biochem Behav** 1986 Mar; 24(3):503-6

PSYCHOPHARMACOLOGY

An inhalational behavioral chamber. Pradhan SN, et al. **J Pharmacol Methods** 1986 Jun;15(3):189-99

The AMDP-system in clinical psychopharmacology. Bobon D, et al. **Pharmacopsychiatry** 1986 Mar;19(2):55-7

Why a statistical package on a micro? Hill M. **Psychopharmacol Bull** 1986; 22(1):65-72

A brain function diagnostic and study unit for psychotropic drug development and psychopharmacology research. Itil TM, et al. **Psychopharmacol Bull** 1986;22(1):297-300

Scientific and ethical considerations in the use of placebo controls in clinical trials in psychopharmacology. Klerman GL. **Psychopharmacol Bull** 1986;22(1):25-9

Stereoselective analysis of racemic psychotropic compounds by HPLC on chiral stationary phase. Smith DF, et al. **Psychopharmacology (Berlin)** 1986;89(3):392-3

[Refinement of an EEG diurnal vigilance index. Application to drug trials] Goldenberg F. **Rev Electroencephalogr Neurophysiol Clin** 1986 Mar; 16(1):39-48 (Eng. Abstr.) **(Fre)**

[Proceedings of 15th annual meeting of the Japanese Society of Neuropsychopharmacology. Abstracts] **Yakubutsu Seishin Kodo** 1986 Mar;6(1):1-225 **(Jpn)**

PSYCHOPHYSIOLOGIC DISORDERS

[Steps in the recovery from severe depression. On the psychosomatic aspects of a convalescent process] Böker W. **Psychiatr Prax** 1986 Mar; 13(2):41-8 (Eng. Abstr.) **(Ger)**

[Psychogenic urinary retention--pathogenesis, pathophysiology, diagnosis and treatment] Yamanishi T, et al. **Nippon Hinyokika Gakkai Zasshi** 1985 Oct;76(10):1567-72 (Eng. Abstr.) **(Jpn)**

PSYCHOSES, SUBSTANCE-INDUCED

Lorazepam dependence and chronic psychosis [letter] Carr AC. **Br J Psychiatry** 1986 Mar;148:344

Management of acute PCP intoxication with verapamil. Price WA, et al. **J Toxicol Clin Toxicol** 1986;24(1):85-7

Prolonged psychosis with first-rank symptoms following metrizamide myelography. Davis RJ, et al. **Psychosomatics** 1986 May;27(5):373-5

PSYCHOSEXUAL DISORDERS

Family environment: implications for sexual dysfunction and methaqualone dependence. TenHouten S. **J Psychoactive Drugs** 1986 Jan-Mar;18(1):73-5

PSYCHOTHERAPY

The closing of the organic versus functional dichotomy [letter] Fox HA. **Am J Psychiatry** 1986 Aug;143(8):1059-60

Placebo problems in psychotherapy research. Social-psychological alternatives to chemotherapy concepts. Wilkins W. **Am Psychol** 1986 May;41(5):551-6

Psychopharmacology and psychotherapy in the treatment of anxiety. Freedman AM. **Curr Psychiatr Ther** 1986;23:101-18 (47 ref.)

Methylphenidate and cognitive therapy in children with attention deficit disorder: a double-blind trial. Brown RT, et al. **J Dev Behav Pediatr** 1986 Jun;7(3):163-74

[Cognitive therapy in the treatment of psychotic and postpsychotic states--an overview] Perris C. **Lakartidningen** 1986 Apr 16; 83(16):1488-91 (61 ref.) **(Swe)**

PSYCHOTIC DISORDERS

Lithium and haloperidol [letter] Nemes ZC, et al. **Biol Psychiatry** 1986 May;21(5-6):568-9

Limbic system dysfunction as a factor in some schizophreniform psychoses: case report and overview. MacCrimmon DJ, et al. **Can J Psychiatry** 1986 May;31(4):344-6

Two cases of 'pure' or 'primary' erotomania successfully treated with pimozide [letter] Stein MB. **Can J Psychiatry** 1986 Apr;31(3):289-90

Early neuroleptic response in psychotic men and women: correlation with plasma HVA and MHPG. Bowers MB Jr, et al. **Compr Psychiatry** 1986 May-Jun;27(3):181-5

Marfan's syndrome and neuropsychiatric symptoms: case report and literature review. Leone JC, et al. **Compr Psychiatry** 1986 May-Jun; 27(3):247-50

Low dose therapy: the future of neuroleptic psychopharmacology. A symposium held during the annual meeting of the American Psychiatric Association. May 1986, Washington, D.C. **J Clin Psychiatry** 1986 May; 47 Suppl:1-36

Depot neuroleptics: a comparative review of standard, intermediate, and low-dose regimens. Kane JM, et al. **J Clin Psychiatry** 1986 May; 47 Suppl:30-3 (18 ref.)

The future of neuroleptic psychopharmacology. Ortiz A, et al. **J Clin Psychiatry** 1986 May;47 Suppl:3-11 (122 ref.)

Low-dose treatment strategies. Van Putten T, et al. **J Clin Psychiatry** 1986 May;47 Suppl:12-6 (21 ref.)

Neuroleptics and reserpine in refractory psychoses. Berlant JL. **J Clin Psychopharmacol** 1986 Jun;6(3):180-4

The prescription of discretionary antipsychotic medication by state mental hospital psychiatrists. Benson PR. **J Health Soc Behav** 1986 Mar; 27(1):28–43

Use of carbamazepine in acute psychosis: a controlled study. Lenzi A, et al. **J Int Med Res** 1986;14(2):78–84

Increased blink rate in adolescent patients with psychosis. Karson CN, et al. **Psychiatry Res** 1986 Mar;17(3):195–8

Drug effects on serine metabolism in psychiatric patients. Waziri R, et al. **Psychiatry Res** 1986 Jun;18(2):119–26

The use of benzodiazepines for psychotic disorders: a literature review and preliminary clinical findings. Arana GW, et al. **Psychopharmacol Bull** 1986;22(1):77–87

[Determination of plasma concentrations in the drug treatment of psychoses] Knudsen P, et al. **Ugeskr Laeger** 1986 Mar 31; 148(14):849–52 **(Dan)**

QUINIDINE

Renal handling and effects of [3H]digoxin and interactions with quinidine in the avian kidney. Milton A, et al. **Acta Physiol Scand** 1986 May; 127(1):9–16

Inhibition of ATP levels by quinidine in a human colonic epithelial cell line. Dharmsathaphorn K, et al. **Am J Physiol** 1986 Jun; 250(6 Pt 1):G806–13

Single potassium channels blocked by lidocaine and quinidine in isolated turtle colon epithelial cells. Richards NW, et al. **Am J Physiol** 1986 Jul;251(1 Pt 1):C85–9

Quinidine purpura: evidence that glycoprotein V is a target platelet antigen. Stricker RB, et al. **Blood** 1986 May;67(5):1377–81

Single-dose quinidine treatment inhibits metoprolol oxidation in extensive metabolizers. Leemann T, et al. **Eur J Clin Pharmacol** 1986; 29(6):739–41

Prediction of serum concentration time course of quinidine in human using a physiologically based pharmacokinetic model developed from the rat. Harashima H, et al. **J Pharmacobiodyn** 1986 Feb;9(2):132–8

Effects of quinidine and quinine on the excitability of pyramidal neurons in guinea-pig hippocampal slices. Yoshida S, et al. **Pflugers Arch** 1986 May;406(5):544–6

[TLC separation and fluorodensitometric determination of quinidine in human serum] He LY. **Yao Hsueh Hsueh Pao** 1985 Sep;20(9):702–5 (Eng. Abstr.) **(Chi)**

REACTION TIME

[Dynamics of the latent periods of the avoidance response and its correlation with adaptive behavior in the rat] Arushanian EB, et al. **Zh Vyssh Nerv Deiat** 1986 Mar–Apr;36(2):343–50 (Eng. Abstr.) **(Rus)**

[Participation of the cortical dopaminergic mechanism in latent inhibition in cats] Il'iuchenok RIu, et al. **Zh Vyssh Nerv Deiat** 1986 Jan–Feb; 36(1):176–8 **(Rus)**

RECEPTORS, ADRENERGIC

beta-Endorphin-induced stimulation of central sympathetic outflow: inhibitory modulation by central noradrenergic neurons. Appel NM, et al. **J Pharmacol Exp Ther** 1986 Jun;237(3):695–701

Central adrenergic control of vasopressin release. Brooks DP, et al. **Neuroendocrinology** 1986;42(5):416–20

RECEPTORS, ADRENERGIC, ALPHA

Comparative alpha- and beta-adrenoceptor activity of 2- and 6-ring-chlorinated noradrenaline analogues. Squier GJ, et al. **Arzneimittelforschung** 1986 Mar;36(3):457–60

Phorbol esters, vasopressin and angiotensin II block alpha 1-adrenergic action in rat hepatocytes. Possible role of protein kinase C. García-Sáinz JA, et al. **Biochim Biophys Acta** 1986 Jun 16;887(1):69–72

Homologous and heterologous desensitization of one of the pathways of the alpha 1-adrenergic action. Effects of epinephrine, vasopressin, angiotensin II and phorbol 12-myristate 13-acetate. García-Sáinz JA, et al. **Biochim Biophys Acta** 1986 Jun 16;887(1):73–9

Impact of circulating corticosterone on alpha 1- and alpha 2-noradrenergic receptors in discrete brain areas. Jhanwar-Uniyal M, et al. **Brain Res** 1986 Mar 19;368(2):404–8

Alpha adrenergic system in medial preoptic area involved in sleep-wakefulness in rats. Mohan Kumar V, et al. **Brain Res Bull** 1986 Apr;16(4):463–8

The effect of aging on alpha-adrenoceptors and their responses in rabbits. Hamilton CA, et al. **Clin Exp Pharmacol Physiol** 1985 Nov–Dec; 12(6):535–47

Labelling of human platelet alpha 2-adrenoceptors with the full agonist [3H](-)adrenaline. Garcia-Sevilla JA, et al. **Eur J Pharmacol** 1986 May 13;124(1-2):31–41

Receptor-mediated inositol phospholipid hydrolysis in astrocytes. Pearce B, et al. **Eur J Pharmacol** 1986 Feb 18;121(2):231–43

Noradrenaline release in the human pulmonary artery is modulated by presynaptic alpha 2-adrenoceptors. Hentrich F, et al. **J Cardiovasc Pharmacol** 1986 May–Jun;8(3):539–44

Alteration of presynaptic alpha 2-mediated inhibition of norepinephrine release in perfused mesenteric arteries of young and adult spontaneously hypertensive rats. Tsuda K, et al. **J Hypertension [Suppl]** 1984 Dec; 2(3):S95–7

Role of adenylate cyclase in presynaptic alpha 2-adrenoceptor- and mu-opioid receptor-mediated inhibition of [3H]noradrenaline release from rat brain cortex slices. Schoffelmeer AN, et al. **J Neurochem** 1986 Jun;46(6):1711–7

Alpha 1-adrenoceptor function in the rat hippocampus as assessed by noradrenaline-stimulated inositol phospholipid breakdown after destruction of noradrenergic neurons by neonatal 6-hydroxydopamine treatment. Fowler CJ, et al. **J Pharm Pharmacol** 1986 May; 38(5):385–8

Effect of repeated restraint stress, desmethylimipramine or adrenocorticotropin on the alpha and beta adrenergic components of the cyclic AMP response to norepinephrine in rat brain slices. Stone EA, et al. **J Pharmacol Exp Ther** 1986 Jun;237(3):702–7

Regulation of renal cellular cAMP levels by prostaglandins and alpha 2-adrenoceptors: microdissection studies. Umemura S, et al. **Kidney Int** 1986 Mar;29(3):703–7

Does alprazolam, in contrast to diazepam, activate alpha 2-adrenoceptors involved in the regulation of rat growth hormone secretion? Eriksson E, et al. **Life Sci** 1986 Apr 21;38(16):1491–8

Long-term amitriptyline treatment alters the affinity state of alpha 2 adrenoceptors in rabbit hindbrain. Hamilton CA, et al. **Life Sci** 1986 Jun 30;38(26):2429–36

The effect of alpha-adrenergic stimulation and blockade on perfusion of myocutaneous flaps. Moore GK, et al. **Otolaryngol Head Neck Surg** 1986 Apr;94(4):489–96

[Role of adrenergic receptors in the regulation of glycogen metabolism in the liver] Torlińska T, et al. **Postepy Hig Med Dosw** 1985 Sep–Oct; 39(5):561–77 (75 ref.) (Eng. Abstr.) **(Pol)**

[Role of alpha-adrenoreceptors of the hypothalamus and amygdala in the response of the secretory glands of the stomach to neurotensin and somatostatin] Barashkova GM, et al. **Fiziol Zh SSSR** 1986 Apr; 72(4):498–502 (Eng. Abstr.) **(Rus)**

[Activity of presynaptic alpha-adrenoreceptors during prolonged perfusion with adrenaline] Berdysheva LV, et al. **Fiziol Zh SSSR** 1986 May;72(5):590–4 (Eng. Abstr.) **(Rus)**

RECEPTORS, ADRENERGIC, BETA

Comparative alpha- and beta-adrenoceptor activity of 2- and 6-ring-chlorinated noradrenaline analogues. Squier GJ, et al. **Arzneimittelforschung** 1986 Mar;36(3):457–60

Chronic exposure of human cells in culture to the tricyclic antidepressant desipramine reduces the number of beta-adrenoceptors. Honegger UE, et al. **Biochem Pharmacol** 1986 Jun 1;35(11):1899–902

Pharmacological characterization of the receptor mediating the adrenergic inhibition of responses to substance P in the cingulate cortex. Jones RS, et al. **Brain Res** 1986 Mar 5;367(1-2):151–61

Differential effects of antidepressant drugs on [3H]dihydroalprenolol and [3H]imipramine ligand recognition sites in olfactory bulbectomized and sham-lesioned rats. Jesberger JA, et al. **Gen Pharmacol** 1986; 17(3):293–307

Lymphocyte beta-adrenergic receptor density of patients with recurrent affective illness. Wood K, et al. **J Affective Disord** 1986 Jan–Feb; 10(1):3–8

Platelet ADP receptor and alpha 2-adrenoreceptor interaction. Evidence for an ADP requirement for epinephrine-induced platelet activation and an influence of epinephrine on ADP binding. Figures WR, et al. **J Biol Chem** 1986 May 5;261(13):5981–6

Effects of beta-adrenergic stimulation on 1-O-hexadecyl-2-acetyl-sn-glycero-3-phosphocholine-mediated vasoconstriction and glycogenolysis in the perfused rat liver. Fisher RA, et al. **J Biol Chem** 1986 Jul 5;261(19):8817–23

Studies on rat brain catecholamine synthesis and beta-adrenoceptor number following administration of electroconvulsive shock, desipramine and clenbuterol. Nimgaonkar VL, et al. **J Neural Transm** 1985;65(3–4):245–59

Responses mediated via beta-1 adrenoceptors but not beta-2 adrenoceptors exhibit supersensitivity after chronic reserpine pretreatment. Grassby PF, et al. **J Pharmacol Exp Ther** 1986 Jun; 237(3):950–8

Effect of repeated restraint stress, desmethylimipramine or adrenocorticotropin on the alpha and beta adrenergic components of the cyclic AMP response to norepinephrine in rat brain slices. Stone EA, et al. **J Pharmacol Exp Ther** 1986 Jun;237(3):702–7

Effects of epinephrine, isoproterenol and IPS-339 on sympathetic transmission to the dog heart: evidence against the facilitatory role of presynaptic beta adrenoceptors. Yorikane R, et al. **J Pharmacol Exp Ther** 1986 Jul;238(1):334–40

RECEPTORS, CHOLINERGIC

Contrasting cholinergic dependence of pancreatic and gallbladder responses to cholecystokinin. Strah KM, et al. **Am J Physiol** 1986 May; 250(5 Pt 1):G665–9

Evidence that the acetylcholine binding site is not formed by the sequence alpha 127–143 of the acetylcholine receptor. Criado M, et al. **Biochemistry** 1986 May 20;25(10):2839–46

Cocaine, phencyclidine, and procaine inhibition of the acetylcholine receptor: characterization of the binding site by stopped–flow measurements of receptor–controlled ion flux in membrane vesicles. Karpen JW, et al. **Biochemistry** 1986 Apr 8;25(7):1777–85

Acetylcholine receptor: characterization of the voltage–dependent regulatory (inhibitory) site for acetylcholine in membrane vesicles from Torpedo californica electroplax. Takeyasu K, et al. **Biochemistry** 1986 Apr 8;25(7):1770–6

Haemodynamic reactions to succinylcholine––an alternative hypothesis [letter] Baraka A. **Can Anaesth Soc J** 1986 Mar;33(2):252–4

Cholinergic modulation of an acetylcholine receptor–like antigen on the surface of chick ciliary ganglion neurons in cell culture. Smith MA, et al. **J Neurosci** 1986 Apr;6(4):946–53

Channel properties of an insect neuronal acetylcholine receptor protein reconstituted in planar lipid bilayers. Hanke W, et al. **Nature** 1986 May 8–14;321(6066):171–4

Influence of estrogen levels on anticholinergic activity of tricyclic antidepressives. Kok EC, et al. **Prog Neuropsychopharmacol Biol Psychiatry** 1986;10(1):49–55

RECEPTORS, DOPAMINE

Human foetal prolactin but not thyrotropin secretion is decreased by bromocriptine. Roti E, et al. **Acta Endocrinol (Copenh)** 1986 May; 112(1):35–42

The diuretic effect of atrial natriuretic peptide (ANP) is dependent on dopaminergic activation. Pettersson A, et al. **Acta Physiol Scand** 1986 Apr;126(4):619–21

3H–spiperone binding in platelet membranes: a possible biological marker for schizophrenia. Sethi BB, et al. **Acta Psychiatr Scand** 1986 Feb; 73(2):186–90

A dopamine–dependent restitutive system for the maintenance of mental normalcy. Friedhoff AJ. **Ann NY Acad Sci** 1986;463:47–52

Affinity chromatography of the anterior pituitary D2–dopamine receptor. Senogles SE, et al. **Biochemistry** 1986 Feb 25;25(4):749–53

Effects of intermittent and continuous haloperidol administration on the dopaminergic system in the rat brain. Kashihara K, et al. **Biol Psychiatry** 1986 Jun;21(7):650–6

Somatostatin and cholecystokinin octapeptide differentially modulate the release of [3H]acetylcholine from caudate nucleus but not cerebral cortex: role of dopamine receptor activation. Arnerić SP, et al. **Brain Res** 1986 May 21;374(1):153–61

Dopamine receptor–mediated inhibition of serotonin N–acetyltransferase activity in retina. Iuvone PM, et al. **Brain Res** 1986 Mar 26; 369(1–2):168–76

Pharmacological effects of 1–methyl–4–phenyl–1,2,3,6–tetrahydropyridine (MPTP) on striatal dopamine receptor system. Lau YS, et al. **Brain Res** 1986 Mar 26; 369(1–2):311–5

Typical and atypical antipsychotic occupancy of D2 and S2 receptors: an autoradiographic analysis in rat brain. Altar CA, et al. **Brain Res Bull** 1986 Apr;16(4):517–25

Dopamine receptor stimulation induces a potassium dependent hyperpolarizing response in growth hormone producing neuroendocrine cells of the gastropod mollusc Lymnaea stagnalis. de Vlieger TA, et al. **Comp Biochem Physiol [C]** 1986;83(2):429–33

Dopaminergic mechanisms and motor function: characterization of D–1 and D–2 dopamine receptor interactions. Barone P, et al. **Eur J Pharmacol** 1986 Apr 9;123(1):109–14

Neurophysiological evidence that D–1 dopamine receptor blockade attenuates postsynaptic but not autoreceptor–mediated effects of dopamine agonists. Carlson JH, et al. **Eur J Pharmacol** 1986 Apr 16; 123(2):237–51 (59 ref.)

Neuropharmacological profile of a new series of dopamine agonists: N–n–propyl–hexahydronaphthoxazines. Hazelhoff B, et al. **Eur J Pharmacol** 1986 May 13;124(1–2):93–106

Apomorphine enantiomers' effects on dopamine metabolism: receptor and non–receptor related actions. Saller CF, et al. **Eur J Pharmacol** 1986 Feb 18;121(2):181–8

Dopamine receptors in pancreatic acinar cells from dog. Vayssette J, et al. **Eur J Pharmacol** 1986 Apr 2;122(3):321–8

Chronic corticosterone administration in rats: behavioral and biochemical evidence of increased central dopaminergic activity. Wolkowitz O, et al. **Eur J Pharmacol** 1986 Apr 2;122(3):329–38

Evidence for dopaminomimetic effect of intrastriatally injected cholecystokinin octapeptide in mice. Worms P, et al. **Eur J Pharmacol** 1986 Mar 4;121(3):395–401

Changes in the interaction between CNS cholinergic and dopaminergic neurons induced by L–alpha–glycerylphosphorylcholine, a cholinomimetic drug. Trabucchi M, et al. **Farmaco [Sci]** 1986 Apr; 41(4):325–34

Dopamine D1 receptors characterized with [3H]SCH 23390. Solubilization of a guanine nucleotide–sensitive form of the receptor. Niznik HB, et al. **J Biol Chem** 1986 Jun 25;261(18):8397–406

Purification of bovine striatal dopamine D–2 receptor by affinity chromatography. Ramwani J, et al. **J Biol Chem** 1986 Jul 5; 261(19):8894–8

Dopamine receptor blockade does not affect the natriuresis accompanying sodium chloride infusion in dogs. Bradley T, et al. **J Lab Clin Med** 1986 Jun;107(6):525–8

Dopamine receptor agonists: 3–allyl–6–chloro–2,3,4,5–tetrahydro–1–(4–hydroxyphenyl)–1H–3–benzazepine–7,8–diol and a series of related 3–benzazepines. Ross ST, et al. **J Med Chem** 1986 May;29(5):733–40

Pharmacological activity of amantadine: effect of N–alkyl substitution. Dunn JP, et al. **J Pharm Pharmacol** 1986 May;38(5):353–6

Effects of apomorphine on morphine analgesia during the state of dopaminergic supersensitivity after chronic treatment with haloperidol. Kamata K, et al. **J Pharmacobiodyn** 1986 Jan;9(1):88–94

Dose related sequence of effects induced by the DA agonist 2–(N,N–dipropyl)–amino–5,6–dihydroxytetralin. Doaré L, et al. **J Pharmacol** 1986 Jan–Mar;17(1):60–4

Influence of some dopaminoceptor agents on nitrazepam–induced sleep in the domestic fowl (Gallus domesticus) and rats. Wambebe C. **Jpn J Pharmacol** 1986 Mar;40(3):357–65

Specific binding of 3H–SCH 23390 to dopamine D1 receptors in vivo. Andersen PH, et al. **Life Sci** 1986 Apr 21;38(16):1507–14

Regulation of agonist and antagonist binding to striatal D–1 dopamine receptors: studies using the selective D–1 antagonist [3H]SK&F R–83566. Flaim KE, et al. **Life Sci** 1986 Jun 9;38(23):2087–96

Pharmacologic evidence for direct dopaminergic regulation of striatal acetylcholine release. Gorell JM, et al. **Life Sci** 1986 Jun 16; 38(24):2239–46

Functional antagonism of D–1 and D–2 dopaminergic mechanisms affecting striatal acetylcholine release. Gorell JM, et al. **Life Sci** 1986 Jun 16;38(24):2247–54

Excitation by dopamine D–2 receptor agonists, bromocriptine and LY 171555, in caudate nucleus neurons activated by nigral stimulation. Ohno Y, et al. **Life Sci** 1986 May 19;38(20):1867–73

Selective dopamine D2 receptor reduction enhances a D1–mediated oral dyskinesia in rats. Rosengarten H, et al. **Life Sci** 1986 Jul 7; 39(1):29–35

Tracer and maximal specific binding of tritiated spiperone or N–n–propylnorapomorphine to quantify dopamine receptors in rat brain regions in vivo. Van der Werf JF, et al. **Life Sci** 1986 Jul 14; 39(2):155–60

Haloperidol binding to monoclonal antibodies: conformational analysis and relationships to D–2 receptor binding. Sherman MA, et al. **Mol Pharmacol** 1986 Jun;29(6):589–98

Dopamine autoreceptor regulation of the kinetic state of striatal tyrosine hydroxylase. Strait KA, et al. **Mol Pharmacol** 1986 Jun;29(6):561–9

Effects of phencyclidine on ventral tegmental A10 dopamine neurons in the rat. French ED. **Neuropharmacology** 1986 Mar;25(3):241–8

Dopamine D2 receptors and dopamine metabolism. Relationship between biochemical and behavioural effects of substituted benzamide drugs. Magnusson O, et al. **Neuropharmacology** 1986 Feb;25(2):187–97

Differential effect of repeated treatment with L–dopa on dopamine–D1 or –D2 receptors. Parenti M, et al. **Neuropharmacology** 1986 Mar; 25(3):331–4

Effects of dopamine and its agonists and antagonists on the receptive field properties of ganglion cells in the rabbit retina. Jensen RJ, et al. **Neuroscience** 1986 Mar;17(3):837–55

Electrophysiological study of the effects of D1 and D2 dopamine antagonists on the interaction of converging inputs from the sensory–motor cortex and substantia nigra neurons in the rat. Vives F, et al. **Neuroscience** 1986 Feb;17(2):349–59

Somatostatin and CCK–8 modulate release of striatal amino acids: role of dopamine receptors. Arnerić SP, et al. **Peptides** 1986 Jan–Feb; 7(1):97–103

Reduction of the rewarding effect of brain stimulation by a blockade of dopamine D1 receptor with SCH 23390. Nakajima S, et al. **Pharmacol Biochem Behav** 1986 Apr;24(4):919–23

Grooming in the mouse is stimulated by the dopamine D1 agonist SKF 38393 and by low doses of the D1 antagonist SCH 23390, but is inhibited by dopamine D2 agonists, D2 antagonists and high doses of SCH 23390. Starr BS, et al. **Pharmacol Biochem Behav** 1986 Apr;24(4):837–9

Interaction of buspirone and dopaminergic agents on punished behavior of pigeons. Witkin JM, et al. **Pharmacol Biochem Behav** 1986 Mar; 24(3):751–6

Effects of a D1 and a D2 dopamine antagonist on the self–administration of cocaine and piribedil by rhesus monkeys. Woolverton WL. **Pharmacol Biochem Behav** 1986 Mar;24(3):531–5

The effects of REM sleep deprivation on striatal dopamine receptor sites.

Zwicker AP, et al. **Pharmacol Biochem Behav** 1986 Apr; 24(4):809–12

The effects of a 5-HT1 receptor ligand isapirone (TVX Q 7821) on 5-HT synthesis and the behavioural effects of 5-HT agonists in mice and rats. Goodwin GM, et al. **Psychopharmacology (Berlin)** 1986;89(3):382–7

Involvement of different dopamine receptors in rat diphasic motility response to apomorphine. Vaccheri A, et al. **Psychopharmacology (Berlin)** 1986;89(3):265–8

Behavioral and biochemical studies of dopamine receptor sensitivity in differentially housed mice. Wilmot CA, et al. **Psychopharmacology (Berlin)** 1986;89(3):364–9

Prenatal reserpine exposure in rats decreases caudate nucleus dopamine receptor binding in female offspring. Ali SF, et al. **Toxicol Lett** 1986 Jun;31(3):195–201

[The biochemical effects of a new antidepressive, metapramine (RP 19560) on activity of the dopaminergic and cholinergic systems of the rat striatum] Boireau A, et al. **J Pharmacol** 1986 Jan–Mar;17(1):75–84 (Eng. Abstr.) **(Fre)**

[Participation of the cortical dopaminergic mechanism in latent inhibition in cats] Il'iuchenok RIu, et al. **Zh Vyssh Nerv Deiat** 1986 Jan–Feb; 36(1):176–8 **(Rus)**

[Role of the presynaptic receptors in the control of dopamine synthesis in the striate complex and nucleus accumbens] Palarea MD, et al. **Rev Esp Fisiol** 1986 Mar;42(1):71–5 (Eng. Abstr.) **(Spa)**

RECEPTORS, DRUG

The role of phosphoinositides in signal transduction. Sekar MC, et al. **J Membr Biol** 1986;89(3):193–210 (328 ref.)

Binding of psychoactive drugs to rat brain amine receptors, measured ex vivo, and their effects on the metabolism of biogenic amines. Burki HR. **Naunyn Schmiedebergs Arch Pharmacol** 1986 Mar;332(3):258–66

[A new group of hormones, endogenous ligands for drug receptors] Schreiber V. **Cesk Fysiol** 1986;35(3):219–23 **(Cze)**

RECEPTORS, ENDOGENOUS SUBSTANCES

Can neonatal treatment with a related hormone adapt the receptor for itself? Csaba G, et al. **Acta Physiol Hung** 1986;67(1):65–9

Autoradiographical localization of luteinizing hormone releasing hormone (LHRH) receptors on rat testicular intertubular cells fractionated on Percoll density gradients. Hedger MP, et al. **Aust J Biol Sci** 1985; 38(4):435–44

Occurrence of two cholecystokinin binding sites in guinea-pig brain cortex. Durieux C, et al. **Biochem Biophys Res Commun** 1986 Jun 30; 137(3):1167–73

Evidence for opiate action at the brain receptors for thyrotropin-releasing hormone. Bhargava HN, et al. **Brain Res** 1986 Mar 19;368(2):262–7

A comparison of 2-amino-4-phosphonobutyric acid (AP4) receptors and [3H]AP4 binding sites in the rat brain. Bridges RJ, et al. **Brain Res** 1986 Jun 4;375(1):204–9

Modifications in the cortical regional distribution of choline acetyltransferase, somatostatin and somatostatin binding sites in the normal rat and following lesion of the nucleus basalis. Epelbaum J, et al. **Brain Res** 1986 Apr 23;371(2):376–9

Decrease in rat striatal dopamine synthesis and metabolism in vivo by metabolically stable adenosine receptor agonists. Myers S, et al. **Brain Res** 1986 Jun 4;375(1):193–7

Modulation of the estradiol-induced luteinizing hormone surge by progesterone or antiestrogens: effects on pituitary gonadotropin-releasing hormone receptors. Attardi B, et al. **Endocrinology** 1986 Jul;119(1):274–83

Desensitization to growth hormone-releasing factor (GRF) is associated with down-regulation of GRF-binding sites. Bilezikjian LM, et al. **Endocrinology** 1986 May;118(5):2045–52

Receptor binding and gonadotropin-releasing activity of a novel chicken gonadotropin-releasing hormone ([His5, Trp7, Tyr8]GnRH) and a D-Arg6 analog. Millar RP, et al. **Endocrinology** 1986 Jul; 119(1):224–31

Characterization of the hepatic prolactin receptors induced by chronic iron deficiency and neuroleptics. Barkey RJ, et al. **Eur J Pharmacol** 1986 Mar 18;122(2):259–67

Radioligand binding to central phencyclidine recognition sites is dependent on excitatory amino acid receptor agonists. Loo P, et al. **Eur J Pharmacol** 1986 Apr 29;123(3):467–8

Anterior pituitary concentrations of gonadotropins, GnRH-receptors and ovarian characteristics following early weaning in beef cows. Parfet JR, et al. **J Anim Sci** 1986 Mar;62(3):717–22

Platelet ADP receptor and alpha 2-adrenoreceptor interaction. Evidence for an ADP requirement for epinephrine-induced platelet activation and an influence of epinephrine on ADP binding. Figures WR, et al. **J Biol Chem** 1986 May 5;261(13):5981–6

Benzodiazepine interactions with central thyroid-releasing hormone binding sites: characterization and physiological significance. Rinehart RK, et al. **J Pharmacol Exp Ther** 1986 Jul;238(1):178–85

Physiological role of putative testicular gonadotrophin releasing hormone (GnRH). Clayton RN, et al. **Med Biol** 1986;63(5–6):201–9

The different mechanisms for suppression of pituitary and testicular function. Sandow J, et al. **Med Biol** 1986;63(5–6):192–200

Corticotropin-releasing factor receptors in the pituitary gland and central nervous system: methods and overview. De Souza EB, et al. **Methods Enzymol** 1986;124:560–90

Autoradiographic localization of brain receptors for peptide hormones: angiotensin II, corticotropin-releasing factor, and gonadotropin-releasing hormone. Millan M, et al. **Methods Enzymol** 1986;124:590–606

Localization of somatostatin receptors. Pelletier G, et al. **Methods Enzymol** 1986;124:607–17

Effect of oxidizing agents on rabbit mammary prolactin receptors. Mahajan PB, et al. **Mol Cell Endocrinol** 1986 Jun;46(1):37–42

Receptor-mediated actions of corticotropin-releasing factor in pituitary gland and nervous system. Aguilera G, et al. **Neuroendocrinology** 1986; 43(1):79–88 (37 ref.)

Down-regulation of growth hormone releasing factor receptors following continuous infusion of growth hormone releasing factor in vivo. Wehrenberg WB, et al. **Neuroendocrinology** 1986;43(2):266–8

Influence of excitatory amino acid receptor antagonists and of baclofen on synaptic transmission in the optic nerve to the suprachiasmatic nucleus in slices of rat hypothalamus. Shibata S, et al. **Neuropharmacology** 1986 Apr;25(4):403–9

Biochemical and pharmacological characterization of an extremely potent and selective nonpeptide cholecystokinin antagonist. Chang RS, et al. **Proc Natl Acad Sci USA** 1986 Jul;83(13):4923–6

Human peripheral monocytes express putative receptors for neuroexcitatory amino acids. Malone JD, et al. **Proc Natl Acad Sci USA** 1986 May;83(10):3307–10

Evidence for somatostatin binding sites in rabbit kidney. Roca B, et al. **Regul Pept** 1986 Feb;13(3–4):273–81

Corticotropin-releasing factor receptors: autoradiographic identification. De Souza EB, et al. **Res Publ Assoc Res Nerv Ment Dis** 1986; 64:179–98

[Regulation of acinar cell receptors of the pancreas by peptides] Mössner J, et al. **Klin Wochenschr** 1986 Jun 2;64(11):489–98 (Eng. Abstr.) **(Ger)**

[Effect of thyroid hormones on the nuclear-cytoplasmic transport of RNA] Adylova AT, et al. **Probl Endokrinol (Mosk)** 1986 Mar–Apr; 32(2):74–6 (Eng. Abstr.) **(Rus)**

RECEPTORS, ENDORPHIN

Opioid peptide processing and receptor selectivity. Höllt V. **Annu Rev Pharmacol Toxicol** 1986;26:59–77 (127 ref.)

Tyr1-substituted and fluorescent Pya1-enkephalins bind strongly and selectively to mu and delta opiate receptors. Mihara H, et al. **Biochem Biophys Res Commun** 1986 May 14;136(3):1170–6

A comparison of the binding of sigma opioids and phencyclidine, and the interaction with antipsychotic drugs in rat brain membranes. Downes CP, et al. **Br J Pharmacol** 1986 May;88(1):231–7

Evidence for opiate action at the brain receptors for thyrotropin-releasing hormone. Bhargava HN, et al. **Brain Res** 1986 Mar 19;368(2):262–7

Increased delta, but not mu, opiate receptor binding in the medulla oblongata of Long-Evans rats following 5-day water deprivation. Hwang BH, et al. **Brain Res** 1986 Apr 23;371(2):345–9

The interaction between gamma-type endorphins and HLA class I antigens. Claas FH, et al. **Hum Immunol** 1986 Apr;15(4):347–56

Role of adenylate cyclase in presynaptic alpha 2-adrenoceptor- and mu-opioid receptor-mediated inhibition of [3H]noradrenaline release from rat brain cortex slices. Schoffelmeer AN, et al. **J Neurochem** 1986 Jun;46(6):1711–7

Evidence that the potential antipsychotic agent rimcazole (BW 234U) is a specific, competitive antagonist of sigma sites in brain. Ferris RM, et al. **Life Sci** 1986 Jun 23;38(25):2329–37

Structure-activity studies of morphiceptin analogs: receptor binding and molecular determinants of mu-affinity and selectivity. Loew G, et al. **Mol Pharmacol** 1986 Jun;29(6):546–53

Characterization of phencyclidine and sigma receptor-binding sites in brain. Gundlach AL, et al. **Natl Inst Drug Abuse Res Monogr Ser** 1986; 64:1–13

Further evidence of phencyclidine/sigma opioid receptor commonality. Sircar R, et al. **Natl Inst Drug Abuse Res Monogr Ser** 1986; 64:14–23

Dynorphin 1–8 binds to opiate kappa receptors in the neurohypophysis. Gerstberger R, et al. **Neuroendocrinology** 1986;42(5):376–82

[Direct interaction of tricyclic antidepressants with opiate binding sites in the bovine adrenal medulla] Carydakis C, et al. **C R Acad Sci [III]** 1986;302(11):419–22 (Eng. Abstr.) **(Fre)**

RECEPTORS, GABA-BENZODIAZEPINE

'Endogenous ligands' of benzodiazepine receptors, their structural analogs. Development of new psychotropic drugs. Akhundov RA, et al. **Acta Physiol Pharmacol Bulg** 1985;11(4):3–11 (33 ref.)

Benzodiazepine sensitivity in normal human subjects. Hommer DW, et al. **Arch Gen Psychiatry** 1986 Jun;43(6):542–51

Benzodiazepine- and barbiturate-interactions with GABAA receptor responses on lactotrophs. Anderson RA, et al. **Brain Res** 1986 Apr 23; 371(2):287–92

Pipecolic acid antagonizes barbiturate-enhanced GABA binding to bovine brain membranes. Feigenbaum P, et al. **Brain Res** 1986 Apr 30; 372(1):176–9

Localization of GABAA and GABAB receptor subtypes on serotonergic neurons. Mennini T, et al. **Brain Res** 1986 Apr 23;371(2):372–5

Benzodiazepine receptor involvement in the control of receptive field size and responsiveness in primary somatosensory cortex. Oka JI, et al. **Brain Res** 1986 Jun 18;376(1):194–8

Activation of GABA receptors in the hypothalamus stimulates secretion of growth hormone and prolactin. Willoughby JO, et al. **Brain Res** 1986 May 21;374(1):119–25

Cultured neurons as model systems for biochemical and pharmacological studies on receptors for neurotransmitter amino acids. Schousboe A, et al. **Dev Neurosci** 1985;7(5–6):252–62 (56 ref.)

Biphasic effect of GABAA receptor agonists on prolactin secretion: evidence for two types of GABAA receptor complex on lactotrophes. Anderson R, et al. **Eur J Pharmacol** 1986 May 13;124(1–2):1–9

Decreased peripheral benzodiazepine binding sites in platelets of neuroleptic-treated schizophrenics. Gavish M, et al. **Eur J Pharmacol** 1986 Feb 18;121(2):275–9

Calcium alters the properties of [3H]diazepam binding sites in rat brain membranes. Wu PH, et al. **Int J Biochem** 1986;18(4):345–50

Alterations in biodistribution of [3H]Ro 15–1788 in mice by acute stress: possible changes in in vivo binding availability of brain benzodiazepine receptor. Inoue O, et al. **Int J Nucl Med Biol** 1985;12(5):369–74

Diurnal variations of benzodiazepine binding in rat cerebral cortex: disruption by pinealectomy. Acuña-Castroviejo D, et al. **J Pineal Res** 1986;3(2):101–9

Effects of insecticides on GABA-induced chloride influx into rat brain microsacs. Abalis IM, et al. **J Toxicol Environ Health** 1986; 18(1):13–23

The role of benzodiazepine receptors in the discriminative stimulus properties of delta-9-tetrahydrocannabinol. Mokler DJ, et al. **Life Sci** 1986 Apr 28;38(17):1581–9

AHN 086: an irreversible ligand of 'peripheral' benzodiazepine receptors. Lueddens HW, et al. **Mol Pharmacol** 1986 Jun;29(6):540–5

Lesion of noradrenergic neurones with DSP4 does not modify benzodiazepine receptor binding in cortex and hippocampus of rat. Marcel D, et al. **Neuropharmacology** 1986 Mar;25(3):283–6

The anxiolytic but not the sedative properties of tracazolate are reversed by the benzodiazepine receptor antagonist, Ro 15–1788. File SE, et al. **Neuropsychobiology** 1985;14(4):193–7

GABA receptor binding in rat cerebral cortex and superior cervical ganglion in the absence of GABAergic synapses. Balcar VJ, et al. **Neurosci Lett** 1986 May 23;66(3):269–74

GABAA and GABAB receptors on porcine pars intermedia cells in primary culture: functional role in modulating peptide release. Demeneix BA, et al. **Neuroscience** 1986 Apr;17(4):1275–85

Benzodiazepine receptors in the human spinal cord: a detailed anatomical and pharmacological study. Faull RL, et al. **Neuroscience** 1986 Mar; 17(3):791–802

Rat pup ultrasonic isolation calls: possible mediation by the benzodiazepine receptor complex. Insel TR, et al. **Pharmacol Biochem Behav** 1986 May; 24(5):1263–7

The inhibitory effect of endogenous convulsants quinolinic acid and kynurenine on the pentobarbital stimulation of [3H]flunitrazepam binding. Zarkovsky AM. **Pharmacol Biochem Behav** 1986 May; 24(5):1215–7

Receptor variation as a source of differential response to centrally acting agents: phylogenetic evidence. Hebebrand J, et al. **Prog Clin Biol Res** 1986;214:367–71

Possible involvement of low and high affinity GABA receptors in the chloride influx into synaptosomes. Sánchez C, et al. **Rev Esp Fisiol** 1986 Mar;42(1):1–5

Steroid hormone metabolites are barbiturate-like modulators of the GABA receptor. Majewska MD, et al. **Science** 1986 May 23; 232(4753):1004–7

[Pharmacochemistry through the history of benzodiazepines and their binding sites (2)] Gaignault JC, et al. **Ann Pharm Fr** 1985; 43(5):427–38 (Eng. Abstr.) **(Fre)**

[Current prospects for the benzodiazepines] Gut JP, et al. **Therapie** 1986 Jan–Feb;41(1):31–5 (Eng. Abstr.) **(Fre)**

[Occupation of central benzodiazepine receptors and anxiety] Le Fur G, et al. **Therapie** 1986 Jan–Feb;41(1):43–7 (Eng. Abstr.) **(Fre)**

[Nonuniform effect of prolonged haloperidol administration on the GABA(A) and benzodiazepine receptors in different parts of the brain] Vasar EE, et al. **Biull Eksp Biol Med** 1986 Apr;101(4):433–6 (Eng. Abstr.) **(Rus)**

[The role of GABA-benzodiazepine receptor complex in affecting the anxiolytic effect of 3-hydroxypyridines—new non-benzodiazepine tranquilizers] Voronina TA, et al. **Biull Eksp Biol Med** 1986 May; 101(5):571–3 (Eng. Abstr.) **(Rus)**

RECEPTORS, SEROTONIN

Antimigraine drug interactions with 5-hydroxytryptamine1A receptors. Hiner BC, et al. **Ann Neurol** 1986 May;19(5):511–3

Typical and atypical antipsychotic occupancy of D2 and S2 receptors: an autoradiographic analysis in rat brain. Altar CA, et al. **Brain Res Bull** 1986 Apr;16(4):517–25

Neuroleptic drugs and 5HT1 receptor: different potencies of various neuroleptic drugs on 5HT1 receptors in discrete regions of the rat brain. Harada T, et al. **Folia Psychiatr Neurol Jpn** 1985;39(4):551–7

Three distinct subtypes of serotonergic receptors mediate the triphasic blood pressure response to serotonin in rats. Kalkman HO, et al. **J Hypertension [Suppl]** 1984 Dec;2(3):S143–5

Effect of serotonin on murine macrophages: suppression of Ia expression by serotonin and its reversal by 5-HT2 serotonergic receptor antagonists. Sternberg EM, et al. **J Immunol** 1986 Jul 1; 137(1):276–82

Differential pharmacology and function of two 5-HT1 receptors modulating transmitter release in rat cerebellum. Raiteri M, et al. **J Pharmacol Exp Ther** 1986 May;237(2):644–8

Regional serotonin receptor studies: chronic methysergide treatment induces a selective and dose-dependent decrease in serotonin-2 receptors in mouse cerebral cortex. May PC, et al. **Life Sci** 1986 May 12;38(19):1741–7

Selective control by corticosterone of serotonin1 receptor capacity in raphe-hippocampal system. De Kloet ER, et al. **Neuroendocrinology** 1986;42(6):513–21

Dihydroergocristine-induced stimulation of the 5-HT autoreceptor in the hypothalamus of the rat. Moret C, et al. **Neuropharmacology** 1986 Feb; 25(2):169–74

A unique serotonin receptor in choroid plexus is linked to phosphatidylinositol turnover. Conn PJ, et al. **Proc Natl Acad Sci USA** 1986 Jun;83(11):4086–8

3,4-Methylenedioxymethamphetamine (MDMA): stereoselective interactions at brain 5-HT1 and 5-HT2 receptors. Lyon RA, et al. **Psychopharmacology (Berlin)** 1986;88(4):525–6

[Pharmacological analysis of the serotonin- and glutamatergic mechanisms in the suppressive effect of neuroleptics on the pedal self-stimulation of the ventral tectum of the midbrain] Talalaenko AN, et al. **Farmakol Toksikol** 1986 May-Jun;49(3):40–3 (Eng. Abstr.) **(Rus)**

[Role of various types of serotonin reception in the hypothalamic modulation of the release of luteinizing hormone] Ignatkov VIa, et al. **Fiziol Zh SSSR** 1986 Mar;72(3):316–22 (Eng. Abstr.) **(Rus)**

[Immunocytochemical and autoradiographic research on the growth of serotoninergic fibers to the cerebral ventricles in the perinatal period in rats] Ugriumov MV, et al. **Tsitologiia** 1986 Feb;28(2):160–4 (Eng. Abstr.) **(Rus)**

REFLEX

Stimuli that produce sensitization lead to elevation of cyclic AMP levels in tail sensory neurons of Aplysia. Ocorr KA, et al. **Brain Res** 1986 Apr 16;371(1):190–2

Periaqueductal gray inhibition of viscerointercostal and galvanic skin reflexes. Sonoda H, et al. **Brain Res** 1986 Mar 26;369(1–2):91–102

Antagonism of drug-induced yawning and penile erections in rats. Gower AJ, et al. **Eur J Pharmacol** 1986 Mar 18;122(2):239–44

Angiotensin I and II in the assessment of baroreceptor function in fetal and neonatal sheep. Scroop GC, et al. **J Dev Physiol** 1986 Apr; 8(2):123–37

Alterations in plasma noradrenaline in response to reflex modulation of sympathetic vasoconstrictor tone to skeletal muscles. Grassi G, et al. **J Hypertension [Suppl]** 1984 Dec;2(3):S131–3

Differential effects of apomorphine on spinal reflex activity following 6-hydroxydopamine or long-term haloperidol pretreatment. Jensen TS, et al. **J Neural Transm** 1986;65(2):125–34

Stimulation-produced spinal inhibition from the midbrain in the rat is mediated by an excitatory amino acid neurotransmitter in the medial medulla. Aimone LD, et al. **J Neurosci** 1986 Jun;6(6):1803–13

A useful tool for predicting the clinical effects of hypnotics in humans: averaged photopalpebral reflex. Mizuki Y, et al. **Methods Find Exp Clin Pharmacol** 1986 May;8(5):327–32

The role of the capsaicin-sensitive innervation of the rat urinary bladder in the activation of micturition reflex. Maggi CA, et al. **Naunyn Schmiedebergs Arch Pharmacol** 1986 Mar;332(3):276–83

Differential antagonism of diazepam-induced loss of the righting response. Witkin JM, et al. **Pharmacol Biochem Behav** 1986 Apr;24(4):963–5

[Noradrenaline suppression of the spinal efferent component of the pressor reflexes] Karagulova GO, et al. **Biull Eksp Biol Med** 1986 Apr; 101(4):387–9 (Eng. Abstr.) **(Rus)**

REINFORCEMENT (PSYCHOLOGY)

Central nervous system mediation of positive and negative reinforcement in neonatal albino rats. Kehoe P, et al. **Brain Res** 1986 Jun; 392(1–2):69–75

REINFORCEMENT SCHEDULE

6-Hydroxydopamine and excitotoxin lesions of medial prefrontal cortex fail to affect schedule-induced drinking in the rat. Christie MJ, et al. **Behav Brain Res** 1986 Feb;19(2):183-6

Pituitary-adrenal correlates of schedule-induced polydipsia and wheel running in rats. Tazi A, et al. **Behav Brain Res** 1986 Mar; 19(3):249-56

Intravenous self-administration of fencamfamine and cocaine by beagle dogs under fixed-ratio and progressive-ratio schedules of reinforcement. Risner ME, et al. **Drug Alcohol Depend** 1986 May;17(1):93-102

RESERPINE

Rapid reduction of mania by means of reserpine therapy [letter] Telner JI, et al. **Am J Psychiatry** 1986 Aug;143(8):1058

Binding of wheat-germ agglutinin to glycoconjugates in the salivary glands of reserpinized rats. Klein RM, et al. **Arch Oral Biol** 1986; 31(2):133-7

Reserpine inhibition of lipid peroxidation and protein phosphorylation in rat brain. Chakrabarti S, et al. **Biochem Pharmacol** 1986 May 1; 35(9):1611-3

Comparative responses of the central adrenaline- and noradrenaline-containing neurons after reserpine injections. Lambás-Señas L, et al. **Biochem Pharmacol** 1986 Jul 1; 35(13):2207-11

Time course of the changes of TH mRNA in rat brain and adrenal medulla after a single injection of reserpine. Biguet NF, et al. **EMBO J** 1986 Feb;5(2):287-91

LC/MS determination of bromazepam, clopenthixol, and reserpine in serum of a non-fatal case of intoxication. Tas AC, et al. **J Anal Toxicol** 1986 Mar-Apr;10(2):46-8

Neuroleptics and reserpine in refractory psychoses. Berlant JL. **J Clin Psychopharmacol** 1986 Jun;6(3):180-4

Is reserpine a human teratogen? Pauli RM, et al. **J Med Genet** 1986 Jun; 23(3):267-8

Responses mediated via beta-1 adrenoceptors but not beta-2 adrenoceptors exhibit supersensitivity after chronic reserpine pretreatment. Grassby PF, et al. **J Pharmacol Exp Ther** 1986 Jun; 237(3):950-8

Monoamines and their catabolites in the rabbit carotid body. Effects of reserpine, sympathectomy and carotid sinus nerve section. Leitner LM, et al. **Pflugers Arch** 1986 Jun;406(6):552-6

Phencyclidine-induced wet-dog shakes observed in rats after withdrawal from reserpine treatment. Nabeshima T, et al. **Pharmacol Biochem Behav** 1986 May;24(5):1275-9

RUBIDIUM

Chromium(III)ATP inactivating (Na+ + K+)-ATPase supports Na+-Na+ and Rb+-Rb+ exchanges in everted red blood cells but not Na+,K+ transport. Pauls H, et al. **Eur J Biochem** 1986 Jun 16; 157(3):585-95

Glucose reduces both Rb+ influx and efflux in pancreatic islet cells. Lindström P, et al. **FEBS Lett** 1986 May 5;200(1):67-70

[Evaluation of the local, skin-resorptive and sensitizing action of rubidium compounds] Akinfieva TA, et al. **Gig Tr Prof Zabol** 1986 Mar; (3):50-3 **(Rus)**

SCHIZOPHRENIA

Open multicentre trial of zuclopenthixol in mania and schizophrenia based on the AMDP scales. Bobon D, et al. **Acta Psychiatr Belg** 1986 Mar-Apr;86(2):152-76

A comprehensive study of chronic schizophrenic patients. II: Biological, neuropsychological, and clinical correlates of CT abnormality. Pandurangi AK, et al. **Acta Psychiatr Scand** 1986 Feb;73(2):161-71

3H-spiperone binding in platelet membranes: a possible biological marker for schizophrenia. Sethi BB, et al. **Acta Psychiatr Scand** 1986 Feb; 73(2):186-90

Correlates of lateral ventricular size in chronic schizophrenia, I: Behavioral and treatment response measures. Losonczy MF, et al. **Am J Psychiatry** 1986 Aug;143(8):976-81

A dopamine-dependent restitutive system for the maintenance of mental normalcy. Friedhoff AJ. **Ann NY Acad Sci** 1986;463:47-52

Family psychoeducation, social skills training, and maintenance chemotherapy in the aftercare treatment of schizophrenia. I. One-year effects of a controlled study on relapse and expressed emotion. Hogarty GE, et al. **Arch Gen Psychiatry** 1986 Jul;43(7):633-42

Longitudinal measurement of plasma homovanillic acid levels in schizophrenic patients. Correlation with psychosis and response to neuroleptic treatment. Pickar D, et al. **Arch Gen Psychiatry** 1986 Jul; 43(7):669-76

A negative, double-blind, placebo-controlled, clinical trial of verapamil in chronic schizophrenia. Grebb JA, et al. **Biol Psychiatry** 1986 Jun; 21(7):691-4

EEG asymmetry in schizophrenic patients before and during neuroleptic treatment. Merrin EL, et al. **Biol Psychiatry** 1986 May; 21(5-6):455-64

Lithium and haloperidol [letter] Nemes ZC, et al. **Biol Psychiatry** 1986 May;21(5-6):568-9

A randomised controlled trial of prophylactic neuroleptic treatment. Crow TJ, et al. **Br J Psychiatry** 1986 Feb;148:120-7

Short-term outcome in trial entrants and trial eligible patients. MacMillan JF, et al. **Br J Psychiatry** 1986 Feb;148:128-33

Schizophrenia with good and poor outcome [letter] Nimgaonkar VL, et al. **Br J Psychiatry** 1986 Mar;148:343-4

gamma-Endorphin and schizophrenia: amino acid composition of gamma-endorphin and nucleotide sequence of gamma-endorphin cDNA from pituitary glands of schizophrenic patients. Bovenberg RA, et al. **Brain Res** 1986 Jun 18;376(1):29-37

Activities of superoxide dismutase and glutathione peroxidase in schizophrenic and manic-depressive patients. Abdalla DS, et al. **Clin Chem** 1986 May;32(5):805-7

Promazine. A major plasma metabolite of chlorpromazine in a population of chronic schizophrenics. Sgaragli G, et al. **Drug Metab Dispos** 1986 Mar-Apr;14(2):263-6

Decreased peripheral benzodiazepine binding sites in platelets of neuroleptic-treated schizophrenics. Gavish M, et al. **Eur J Pharmacol** 1986 Feb 18;121(2):275-9

The interaction between gamma-type endorphins and HLA class I antigens. Claas FH, et al. **Hum Immunol** 1986 Apr;15(4):347-56

Low dose therapy: the future of neuroleptic psychopharmacology. A symposium held during the annual meeting of the American Psychiatric Association. May 1986, Washington, D.C. **J Clin Psychiatry** 1986 May; 47 Suppl:1-36

Early, targeted pharmacotherapeutic intervention in schizophrenia. Carpenter W Jr. **J Clin Psychiatry** 1986 May;47 Suppl:23-9 (48 ref.)

Relapse in chronic schizophrenics treated with fluphenazine decanoate is associated with low serum neuroleptic levels. Jayaram G, et al. **J Clin Psychiatry** 1986 May;47(5):247-8

Drug holidays and serum haloperidol levels in schizophrenic patients. McMillan DE, et al. **J Clin Psychiatry** 1986 Jul;47(7):373-4

Mesoridazine and thioridazine: clinical effects and blood levels in refractory schizophrenics. Vital-Herne J, et al. **J Clin Psychiatry** 1986 Jul;47(7):375-9

Behavioral changes following generic thioridazine [letter] Weber SS, et al. **J Clin Psychiatry** 1986 May;47(5):277-8

High dose alprazolam in schizophrenia [letter] Kulik FA, et al. **J Clin Psychopharmacol** 1986 Jun;6(3):191-2

Medication effects on one-carbon metabolism in schizophrenia, mania, and major depression. Morere DA, et al. **J Clin Psychopharmacol** 1986 Jun;6(3):155-61

The prescription of discretionary antipsychotic medication by state mental hospital psychiatrists. Benson PR. **J Health Soc Behav** 1986 Mar; 27(1):28-43

A comparative trial of depot pipothiazine. Steinert J, et al. **J Int Med Res** 1986;14(2):72-7

Topographic differences between normals and schizophrenics: the N120 evoked potential component. Buchsbaum MS, et al. **Neuropsychobiology** 1986;15(1):1-6

Fluperlapine vs haloperidol: a comparison of their neuroendocrinological profiles and the influence on serum lipids. Fleischhacker WW, et al. **Pharmacopsychiatry** 1986 May;19(3):111-4

Relevance of polymorphic drug oxidation in the use of neuroleptics in schizophrenia. Tang SW. **Prog Clin Biol Res** 1986;214:303-11 (20 ref.)

The interaction of neurotensin with dopaminergic pathways in the central nervous system: basic neurobiology and implications for the pathogenesis and treatment of schizophrenia. Nemeroff CB. **Psychoneuroendocrinology** 1986;11(1):15-37

Research methodology and the pharmacotherapy of the chronic schizophrenias. Ban TA, et al. **Psychopharmacol Bull** 1986; 22(1):36-41

An early phase II clinical trial of remoxipride in schizophrenia with measurement of plasma neuroleptic activity. Chouinard G, et al. **Psychopharmacol Bull** 1986;22(1):267-71

Clinical evaluation of ceruletide in schizophrenia: a multi-institutional cooperative double-blind controlled study. Itoh H, et al. **Psychopharmacol Bull** 1986;22(1):123-8

Ceruletide for schizophrenia: a review. Mattes JA, et al. **Psychopharmacol Bull** 1986;22(1):119-22 (32 ref.)

Pharmacological treatments of schizophrenia. Simpson GM. **Psychopharmacol Bull** 1986;22(1):33-5, 42-3

Cholecystokinin: a neuropeptide in the treatment of schizophrenia. Tamminga CA, et al. **Psychopharmacol Bull** 1986;22(1):129-32

The AMDP system in international clinical trials: a double-blind comparison of fluperlapine and haloperidol. Woggon B, et al. **Psychopharmacol Bull** 1986;22(1):47-51

Diurnal rhythm of plasma beta endorphin, cortisol and growth hormone in schizophrenics as compared to control subjects. Gil-Ad I, et al. **Psychopharmacology (Berlin)** 1986;88(4):496-9

Fluphenazine plasma levels in patients receiving low and conventional doses of fluphenazine decanoate. Marder SR, et al.

Psychopharmacology (Berlin) 1986;88(4):480–3

Attitudes of patients with schizophrenia toward taking medication. Davidhizar RE, et al. **Res Nurs Health** 1986 Jun;9(2):139–46

Investigating opioid peptides in schizophrenia and depression. Berger PA, et al. **Res Publ Assoc Res Nerv Ment Dis** 1986;64:309–33 (91 ref.)

Predictors of outcome in schizophrenia: the process-reactive dimension. Harrow M, et al. **Schizophr Bull** 1986;12(2):195–207

Flupenthixol decanoate and fluphenazine decanoate in chronic schizophrenia. Kong DS, et al. **Singapore Med J** 1985 Dec; 26(7):551–5

Cues of disability and treatment continuation of chronic schizophrenics. Dworkin RJ, et al. **Soc Sci Med** 1986;22(5):521–6

[Current aspects of the after care of schizophrenic patients] Maillard M, et al. **Ann Med Psychol (Paris)** 1985 Dec;143(10):946–51 **(Fre)**

[Schizophrenic excitement and the role of lithium in its therapy (apropos of 2 recent cases)] Skurnik N, et al. **Ann Med Psychol (Paris)** 1985 Dec;143(10):960–2 **(Fre)**

[Pharmacokinetics of pipothiazine palmitate, after intramuscular administration in schizophrenic patients] Blanc M, et al. **Therapie** 1986 Jan–Feb;41(1):27–30 (Eng. Abstr.) **(Fre)**

[Studies of the side effect profile of clozapine] Nitzsche M, et al. **Psychiatr Neurol Med Psychol (Leipz)** 1986 Mar;38(3):148–52 (Eng. Abstr.) **(Ger)**

[Dose and serum drug level and its clinical effects during the long-term treatment of chronic schizophrenia with flupenthixol depot] Lipska B, et al. **Psychiatr Pol** 1986 Jan–Feb;20(1):1–7 (Eng. Abstr.) **(Pol)**

[Determination of dopamine-beta-hydroxylase (DBH) and monoamine oxidase (MAO) activities in platelets and plasma in schizophrenic, maniac-depressive and neurotic patients] Xavier Vieira R, et al. **Acta Med Port** 1986 Jan–Feb;7(1):45–8 (Eng. Abstr.) **(Por)**

[Changes in the wave composition of evoked potentials during treatment of endogenous depression] Loginov VV, et al. **Zh Nevropatol Psikhiatr** 1986;86(3):431–5 (Eng. Abstr.) **(Rus)**

[Review and critical analysis of technics of psychosocial intervention in the family of schizophrenics] Adam A, et al. **Actas Luso Esp Neurol Psiquiatr Cienc Afines** 1986 Mar–Apr; 14(2):75–84 (49 ref.) (Eng. Abstr.) **(Spa)**

SCHIZOPHRENIA, CATATONIC

Catatonic schizophrenia: an international comparative study. Chandrasena R. **Can J Psychiatry** 1986 Apr;31(3):249–52

SCHIZOPHRENIA, PARANOID

Beta-adrenergic blockers for the control of aggressive behaviors in patients with chronic schizophrenia. Sorgi PJ, et al. **Am J Psychiatry** 1986 Jun;143(6):775–6

Bromocriptine in the treatment of neuroleptic-resistant schizophrenia. Gattaz WF, et al. **Biol Psychiatry** 1986 May;21(5–6):519–21

Imipramine-flupenthixol decanoate interaction. Cook PE, et al. **Can J Psychiatry** 1986 Apr;31(3):235–7

SCHIZOTYPAL PERSONALITY DISORDER

Borderline and schizotypal personality disorders treated with low-dose thiothixene vs placebo. Goldberg SC, et al. **Arch Gen Psychiatry** 1986 Jul;43(7):680–6

Progress in pharmacotherapy of borderline disorders. A double-blind study of amitriptyline, haloperidol, and placebo. Soloff PH, et al. **Arch Gen Psychiatry** 1986 Jul;43(7):691–7

Amitriptyline and haloperidol in unstable and schizotypal borderline disorders. Soloff PH, et al. **Psychopharmacol Bull** 1986;22(1):177–82

SELF STIMULATION

Reduction of the rewarding effect of brain stimulation by a blockade of dopamine D1 receptor with SCH 23390. Nakajima S, et al. **Pharmacol Biochem Behav** 1986 Apr;24(4):919–23

Roles of catecholamine terminals and intrinsic neurons of the ventral tegmentum in self-stimulation investigated in neonatally dopamine-depleted rats. Takeichi T, et al. **Pharmacol Biochem Behav** 1986 Apr;24(4):1101–9

[Pharmacological analysis of the serotonin- and glutamatergic mechanisms in the suppressive effect of neuroleptics on the pedal self-stimulation of the ventral tectum of the midbrain] Talalaenko AN, et al. **Farmakol Toksikol** 1986 May–Jun;49(3):40–3 (Eng. Abstr.) **(Rus)**

SENSORY DEPRIVATION

Modification of ultrastructural and neurochemical parameters in synaptosomes of the retino-deprived goldfish optic tectum. Contestabile A, et al. **Exp Brain Res** 1986;62(3):560–6

SEROTONIN

Effect on brain monoamines in the rat of substituted and protected analogues of the oxytocin fragment, prolyl-leucyl-glycinamide following N-terminal substitution by D- and L-pipecolic acid. Szabó G, et al. **Acta Physiol Hung** 1986;67(1):155–61

Involvement of a serotonergic control in the regulation of plasma levels of immunoreactive beta-endorphin. Cancela LM, et al. **Acta Physiol Pharmacol Latinoam** 1985;35(4):409–13

Serotonin stimulates gonadotrophin release by acting directly on the median eminence. Vitale ML, et al. **Acta Physiol Pharmacol Latinoam** 1985;35(4):473–9

Effects of pentagastrin and oxyphenonium on the levels of serotonin and 5-hydroxyindoleacetic acid in different parts of the digestive tract, blood and brain of rats. Pokora J, et al. **Acta Physiol Pol** 1984 Jul–Aug; 35(4):317–23

Regional and selective changes in blood flow of the feline small intestine induced by endoluminal serotonin. Grönstad KO, et al. **Acta Physiol Scand** 1986 Jun;127(2):207–13

Comparison between a serotonin and a noradrenaline reuptake blocker in the treatment of depressed outpatients. Biochemical aspects. Nyström C, et al. **Acta Psychiatr Scand** 1986 Feb;73(2):133–8

Biochemical and pharmacological characterization of histamine-mediated up-regulation of human platelet serotonin uptake. Evidence for a subclass of histamine H2 receptors (H2h) highly sensitive to H2 receptor antagonists. Gespach C, et al. **Agents Actions** 1986 Apr; 18(1–2):115–9

Separate purinoceptors mediate enhancement by adenosine of concanavalin A-induced mediator release and the cyclic AMP response in rat mast cells. Hughes PJ, et al. **Agents Actions** 1986 Apr; 18(1–2):81–4

Effects of aspartame ingestion on the carbohydrate-induced rise in tryptophan hydroxylation rate in rat brain. Fernstrom JD, et al. **Am J Clin Nutr** 1986 Aug;44(2):195–205

Changes in platelet beta-thromboglobulin, fibrinogen, albumin, 5-hydroxytryptamine, ATP, and ADP during and after surgery with extracorporeal circulation in man. Mezzano D, et al. **Am J Hematol** 1986 Jun;22(2):133–42

Serotonin uptake by bovine pulmonary artery endothelial cells in culture. II. Stimulation by hypoxia. Lee SL, et al. **Am J Physiol** 1986 May; 250(5 Pt 1):C766–70

Serotonin uptake by bovine pulmonary artery endothelial cells in culture. I. Characterization. Lee SL, et al. **Am J Physiol** 1986 May; 250(5 Pt 1):C761–5

Colocalization of luteinizing hormone and serotonin in secretory granules of mammalian gonadotrophs. Payette RF, et al. **Anat Rec** 1986 May; 215(1):51–8

Effect of electroconvulsive shock on serotonin activity. Essman WB. **Ann NY Acad Sci** 1986;462:99–104

Neurochemical mechanisms of mood stabilization. Focus on electroconvulsive therapy. Lerer B, et al. **Ann NY Acad Sci** 1986; 462:366–75 (74 ref.)

Serotonin and 5-hydroxyindoleacetic acid in brains of suicide victims. Comparison in chronic schizophrenic patients with suicide as cause of death. Korpi ER, et al. **Arch Gen Psychiatry** 1986 Jun;43(6):594–600

Ontogenesis of 5-hydroxytryptamine-like immunoreactive cells and their relationship with bombesin in chicken proventriculus. D'Este L, et al. **Basic Appl Histochem** 1986;30(1):109–17

Occurrence and functional significance of serotonin and catecholamine uptake by astrocytes. Kimelberg HK. **Biochem Pharmacol** 1986 Jul 15; 35(14):2273–81

The effect of selective 5-hydroxytryptamine uptake inhibitors on 5-methoxy-N,N-dimethyltryptamine-induced ejaculation in the rat. Rényi L. **Br J Pharmacol** 1986 Apr;87(4):639–48

Ontogenesis of unit activity in the raphe dorsalis of the behaving kitten: its relationship with the states of vigilance. Adrien J, et al. **Brain Res** 1986 Feb 26;366(1–2):10–21

Immunocytochemical localization of serotonin in the rat dentate gyrus following raphe transplants. Anderson KJ, et al. **Brain Res** 1986 Mar 26;369(1–2):21–8

Circadian corticosterone rhythm did not develop in rats seven weeks after destruction with 5,7-dihydroxytryptamine of the serotoninergic nerve terminals in the suprachiasmatic nucleus at the age of 16 days. Bánky Z, et al. **Brain Res** 1986 Mar 26;369(1–2):119–24

The effects of serotonin on the morpho-functional development of rat cerebral neocortex in tissue culture. Chubakov AR, et al. **Brain Res** 1986 Mar 26;369(1–2):285–97

Brain serotonin and catecholamine responses to repeated stress in rats. De Souza EB, et al. **Brain Res** 1986 Mar 5;367(1–2):77–86

GABA and serotonin (5-HT) pattern in the supraependymal fibers of the rat epithalamus: combined radioautographic and immunocytochemical studies. Effect of 5-HT content on [3H]GABA accumulation. Harandi M, et al. **Brain Res** 1986 Apr 9;370(2):241–9

Serotonin innervation of physiologically identified lamina I projection neurons. Hylden JL, et al. **Brain Res** 1986 Apr 9;370(2):401–4

One perfusion mixture for immunocytochemical detection of

noradrenaline, dopamine, serotonin and acetylcholine in the same rat brain. McRae-Degueurce A, et al. **Brain Res** 1986 Jun 18; 376(1):217-9

Localization of GABAA and GABAB receptor subtypes on serotonergic neurons. Mennini T, et al **Brain Res** 1986 Apr 23;371(2):372-5

Immunohistochemical demonstration of serotonin neurons in autonomic regions of the rat spinal cord. Newton BW, et al. **Brain Res** 1986 Jun 18;376(1):155-63

Neuroanatomical site of the inhibitory influence of anxiolytic drugs on central serotonergic transmission. Nishikawa T, et al. **Brain Res** 1986 Apr 16;371(1):123-32

Spinal cord serotonin release and raised blood pressure after brainstem kainic acid injection. Pilowsky PM, et al. **Brain Res** 1986 Feb 26; 366(1-2):354-7

Single unit response of noradrenergic, serotonergic and dopaminergic neurons in freely moving cats to simple sensory stimuli. Rasmussen K, et al. **Brain Res** 1986 Mar 26;369(1-2):336-40

Serotonin-immunoreactive nerve fibers of the rat pituitary: effects of anticatecholamine and antiserotonin drugs on staining patterns. Saland LC, et al. **Brain Res** 1986 Mar 19;368(2):310-8

Evidence that serotonin mediates non-cholinergic neocortical low voltage fast activity, non-cholinergic hippocampal rhythmical slow activity and contributes to intelligent behavior. Vanderwolf CH, et al. **Brain Res** 1986 May 28;374(2):342-56

5-Hydroxytryptamine (serotonin) causes a reduction in the afterhyperpolarization following the action potential in lamprey motoneurons and premotor interneurons. Van Dongen PA, et al. **Brain Res** 1986 Feb 26;366(1-2):320-5

Induced homotypic sprouting of serotonergic fibers in hippocampus. II. An immunocytochemistry study. Zhou FC, et al. **Brain Res** 1986 May 14;373(1-2):337-48

Cerebral perivascular serotonergic fibres have a peripheral origin in the gerbil. Alafaci C, et al. **Brain Res Bull** 1986 Feb;16(2):303-4

Interaction between platelet-released serotonin and thromboxane A2 on human digital arteries. Young MS, et al. **Clin Exp Pharmacol Physiol** 1986 Feb;13(2):143-52

Measurement of whole blood serotonin as a guide in prescribing psychostimulant medication for children with attentional deficits. Saul RC, et al. **Clin Neuropharmacol** 1986;9(2):189-95

Leech Retzius cells and 5-hydroxytryptamine. Leake LD. **Comp Biochem Physiol** [C] 1986;83(2):229-39 (73 ref.)

Carbohydrate metabolism and the temporal occurrence of a serotonin-like indole in the male and female reproductive tract and its relationship with PGF and infertility: a review. van der Horst CJ. **Cytobios** 1986; 45(181):85-95 (61 ref.)

Brain 5-hydroxytryptamine and plasma testosterone in L-tryptophan treated rats. Biswas NM, et al. **Endocr Res** 1985;11(3-4):131-7

The effects of some slow channel blocking drugs on high affinity serotonin uptake by rat brain synaptosomes. Brown NL, et al. **Eur J Pharmacol** 1986 Apr 9;123(1):161-5

Antagonism by some ergot derivatives of 5-HT-induced vasoconstriction. Conolan S, et al. **Eur J Pharmacol** 1986 Apr 16;123(2):299-302

Solubilization and characterization of the 5-hydroxytryptamine transporter complex from rat cerebral cortical membranes. Habert E, et al. **Eur J Pharmacol** 1986 Mar 18;122(2):197-204

In vivo evaluation by differential pulse voltammetry of the effect of thyrotropin-releasing hormone (TRH) on dopaminergic and serotoninergic synaptic activity in the striatum and nucleus accumbens of the rat. Crespi F, et al. **Exp Brain Res** 1986;62(2):329-34

Serotonin in the human infant carotid body. Perrin DG, et al. **Experientia** 1986 May 15;42(5):562-4

Amine sulfate formation in the central nervous system. Tyce GM, et al. **Fed Proc** 1986 Jul;45(8):2247-53

Significance of calcium for the prostaglandin E2-mediated secretory response to 5-hydroxytryptamine in the small intestine of the rat in vivo. Beubler E, et al. **Gastroenterology** 1986 Jun;90(6):1972-7

Time-related response of central serotonergic function to lithium administration. Otero Losada ME, et al. **Gen Pharmacol** 1986; 17(3):333-7

GABA-induced hypothermia in rats: involvement of serotonergic and cholinergic mechanisms. Serrano JS, et al. **Gen Pharmacol** 1986; 17(3):327-32

Allometric growth of the rat peritoneal mast cell mass and of the granular constituents: heparin, histamine and 5-hydroxytryptamine. Aldenborg F, et al. **Growth** 1985 Winter;49(4):510-8

Cytological features of serotonin-containing neurons and their processes in the retina of the carp (Cyprinus carpio). An immunohistochemical study using flat-mount preparations. Hayashi T, et al. **Histochemistry** 1986;84(4-6):423-5

Response of isolated uterus of rat, hamster and guinea pig to different uterine stimulants. Mehrotra PK, et al. **Indian J Exp Biol** 1985 Oct; 23(10):572-3

Effect of graded distension of urinary bladder on arterial blood pressure and neurohumors in rabbits. Shukla M, et al. **Indian J Physiol Pharmacol** 1985 Jul-Sep;29(3):159-64

Studies on vascular permeability increasing factors involved in 48-hour homologous PCA in the mouse ear. Inagaki N, et al. **Int Arch Allergy Appl Immunol** 1986;80(3):285-90

The serotonin syndrome: case responsive to propranolol [letter] Guzé BH, et al. **J Clin Psychopharmacol** 1986 Apr;6(2):119-20

Immunohistochemical distribution of substance P, serotonin, and methionine enkephalin in sexually dimorphic nuclei of the rat lumbar spinal cord. Micevych PE, et al. **J Comp Neurol** 1986 Jun 8; 248(2):235-44

Synaptic basis of swim initiation in the leech. III. Synaptic effects of serotonin-containing interneurones (cells 21 and 61) on swim CPG neurones (cells 18 and 208). Nusbaum MP. **J Exp Biol** 1986 May; 122:303-21

Swim initiation in the leech by serotonin-containing interneurones, cells 21 and 61. Nusbaum MP, et al. **J Exp Biol** 1986 May;122:277-302

Ultrastructural localization of serotonin and polypeptide YY (PYY) in endocrine cells of the human rectum. Lukinius AI, et al. **J Histochem Cytochem** 1986 Jun;34(6):719-26

Inter- and intracellular relationship of substance P-containing neurons with serotonin and GABA in the dorsal raphe nucleus: combination of autoradiographic and immunocytochemical techniques. Mágoul R, et al. **J Histochem Cytochem** 1986 Jun;34(6):735-42

Historical introduction: the Italian contribution to the discovery of 5-hydroxytryptamine (enteramine, serotonin). Erspamer V. **J Hypertension [Suppl]** 1986 Apr;4(1):S3-5

Three distinct subtypes of serotonergic receptors mediate the triphasic blood pressure response to serotonin in rats. Kalkman HO, et al. **J Hypertension [Suppl]** 1984 Dec;2(3):S143-5

Platelet content of serotonin and response to stress. Palermo A, et al. **J Hypertension [Suppl]** 1986 Apr;4(1):S43-5

Augmentation of vasoconstrictor responses to serotonin by acute and chronic factors: inhibition by ketanserin. Van Nueten JM, et al. **J Hypertension [Suppl]** 1986 Apr;4(1):S55-9

The specificity of ketanserin in the inhibition of serotonin-induced steroidogenesis in the rat adrenal zona glomerulosa. Williams BC, et al. **J Hypertension [Suppl]** 1984 Dec;2(3):S559-61

Effect of serotonin on murine macrophages: suppression of Ia expression by serotonin and its reversal by 5-HT2 serotonergic receptor antagonists. Sternberg EM, et al. **J Immunol** 1986 Jul 1; 137(1):276-82

Vascular responsiveness of simian digital artery to various vasoactive substances. Ito T, et al. **J Invest Dermatol** 1986 Jun;86(6):678-82

Peripheral and central short-term effects of fusaric acid, a DBH inhibitor, on tryptophan and serotonin metabolism in the rat. Chaouloff F, et al. **J Neural Transm** 1986;65(3-4):219-32

The inhibition of the cage-leaving response--a model for studies of the serotonergic neurotransmission in the rat. Rényi L, et al. **J Neural Transm** 1986;65(3-4):193-210

Regional distribution of immunoreactive-thyrotrophin-releasing hormone and substance P, and indoleamines in human spinal cord. Bennett GW, et al. **J Neurochem** 1986 Jun;46(6):1718-24

Exogenous tryptophan increases synthesis, storage, and intraneuronal metabolism of 5-hydroxytryptamine in the rat hypothalamus. Lookingland KJ, et al. **J Neurochem** 1986 Jul;47(1):205-12

Involvement of serotonin in the excitation of phrenic motoneurons evoked by stimulation of the raphe obscurus. Holtman JR Jr, et al. **J Neurosci** 1986 Apr;6(4):1185-93

Development of serotonin-containing neurons in Drosophila mutants unable to synthesize serotonin. Vallés AM, et al. **J Neurosci** 1986 May; 6(5):1482-91

Chronic clenbuterol treatment modulates a 5-hydroxytryptaminergic system. Francès H, et al. **J Pharm Pharmacol** 1986 Mar;38(3):247-8

Buspirone decreases the activity of 5-hydroxytryptamine-containing dorsal raphe neurons in-vitro. Trulson ME, et al. **J Pharm Pharmacol** 1986 May;38(5):380-2

Modification of serotonergic and noradrenergic neurotransmissions by repeated administration of monoamine oxidase inhibitors: electrophysiological studies in the rat central nervous system. Blier P, et al. **J Pharmacol Exp Ther** 1986 Jun;237(3):987-94

Voltage dependence of 5-hydroxytryptamine release at a synapse between identified leech neurones in culture. Dietzel ID, et al. **J Physiol (Lond)** 1986 Mar;372:191-205

Allosteric inhibition as a model to explain flatter displacement curves in binding experiments: application to 'heterogeneous' serotonin receptors. Gobbi M, et al. **J Recept Res** 1986;6(1):27-46

An active pathway for serotonin synthesis by renal proximal tubules. Sole MJ, et al. **Kidney Int** 1986 Mar;29(3):689-94

Serotonin uptake inhibitors and the prejunctional effects of serotonin on peripheral sympathetic nerves. Adler-Graschinsky E, et al. **Life Sci** 1986 Jul 7;39(1):61-8

Normal serotonin uptake by blood platelets and brain synaptosomes but selective impairment of platelet serotonin storage in mice with Chediack-Higashi syndrome. Lampugnani MG, et al. **Life Sci** 1986 Jun 16;38(24):2193-8

Correlations of serotonin and its metabolites in individual rat pineal glands over light:dark cycles and after acute light exposure. McNulty JA, et al. **Life Sci** 1986 Jul 7;39(1):1-6

Regional serotonin receptor studies: chronic methysergide treatment induces a selective and dose-dependent decrease in serotonin-2 receptors in mouse cerebral cortex. May PC, et al. **Life Sci** 1986 May 12;38(19):1741-7

Hepatic microvascular regulatory mechanisms. V. Effects of lodoxamide tromethamine or phentolamine-HCl on vascular responses elicited by serotonin. Reilly FD, et al. **Microcirc Endothelium Lymphatics** 1984 Dec;1(6):671-89

Serotonin-containing elements of the rat pituitary intermediate lobe. Palkovits M, et al. **Neuroendocrinology** 1986;42(6):522-5

The effect on brain 5-HT of central lysine-vasopressin administration into different cerebral ventricular compartments depends on the site of injection. Günther O, et al. **Neuropeptides** 1986 Apr;7(3):241-5

Coexistence of serotonin- and substance P-like immunoreactivity in nerve fibers apposing identified sympathoadrenal preganglionic neurons in rat intermediolateral cell column. Appel NM, et al. **Neurosci Lett** 1986 Apr 24;65(3):241-6

A spinal projection of 5-hydroxytryptamine neurons in the lamprey brainstem; evidence from combined retrograde tracing and immunohistochemistry. Brodin L, et al. **Neurosci Lett** 1986 Jun 6; 67(1):53-7

Inhibitory influence of monoamines and brainstem monoaminergic regions on the medullary swallowing reflex. Kessler JP, et al. **Neurosci Lett** 1986 Mar 28;65(1):41-6

Effect of serotonin on the dissociation of high-affinity binding of [3H]imipramine in mouse cerebral cortex. Kim SS, et al. **Neurosci Lett** 1986 Jun 18;67(2):123-8

Serotonin inhibits the depolarization-evoked release of endogenous glutamate from rat cerebellar nerve endings. Maura G, et al. **Neurosci Lett** 1986 Jun 18;67(2):218-22

Distinct functions for dopamine and serotonin in locomotor behaviour: evidence using the 5-HT1 agonist RU 24969 in globus pallidus-lesioned rats. Oberlander C, et al. **Neurosci Lett** 1986 Jun 18;67(2):113-8

Transplantation of dissociated foetal serotonin neurons into the transected spinal cord of adult rats. Privat A, et al. **Neurosci Lett** 1986 May 6; 66(1):61-6

Monoamine innervation of the oculomotor nucleus in the rat. A radioautographic study. Soghomonian JJ, et al. **Neuroscience** 1986 Apr; 17(4):1147-57

Physiological responses of guinea-pig myenteric neurons secondary to the release of endogenous serotonin by tryptamine. Takaki M, et al. **Neuroscience** 1985 Sep;16(1):223-40

Gamma-aminobutyrate, gastrin releasing peptide, serotonin, somatostatin, and vasopressin: ultrastructural immunocytochemical localization in presynaptic axons in the suprachiasmatic nucleus. van den Pol AN. **Neuroscience** 1986 Mar;17(3):643-59

Regional alterations in serotonin metabolism induced by oral exposure of rats to polychlorinated biphenyls. Seegal RF, et al. **Neurotoxicology** 1986 Spring;7(1):155-65

Comparison of the effects of the benzodiazepine midazolam and three serotonin antagonists on a consummatory conflict paradigm. Becker HC. **Pharmacol Biochem Behav** 1986 Apr;24(4):1057-64

Serotonergic mechanisms in the behavioral effects of buspirone and gepirone. Eison AS, et al. **Pharmacol Biochem Behav** 1986 Mar; 24(3):701-7

Microstructural analysis of the anorectic action of peripherally administered 5-HT. Fletcher PJ, et al. **Pharmacol Biochem Behav** 1986 Apr;24(4):1133-6

Recent developments in 5HT-related pharmacology of animal models of anxiety. Gardner CR. **Pharmacol Biochem Behav** 1986 May; 24(5):1479-85

5-HT and anxiety: promises and pitfalls. Johnston AL, et al. **Pharmacol Biochem Behav** 1986 May;24(5):1467-70

Effects of serotonergic agonists and antagonists on the locomotor activity of neonatal rats. Lucot JB, et al. **Pharmacol Biochem Behav** 1986 Mar; 24(3):537-41

Prenatal stress: effect on development of rat brain serotonergic neurons. Peters DA. **Pharmacol Biochem Behav** 1986 May;24(5):1377-82

Are serotonergic neurons involved in the control of anxiety and in the anxiolytic activity of benzodiazepines? Thiebot MH. **Pharmacol Biochem Behav** 1986 May;24(5):1471-7

Effects of elevated calcium on learned helplessness and brain serotonin metabolism in rats. Trulson ME, et al. **Pharmacol Biochem Behav** 1986 Mar;24(3):445-8

The effect of neonatal manipulation of hypothalamic serotonin levels on sexual activity in the adult rat. Wilson CA, et al. **Pharmacol Biochem Behav** 1986 May;24(5):1175-83

Parachlorophenylalanine-induced serotonin depletion increases offensive but not defensive aggression in male rats. Vergnes M, et al. **Physiol Behav** 1986;36(4):653-8

Protease and cyclooxygenase inhibitors synergistically prevent activation of human platelets. Ruggiero M, et al. **Proc Natl Acad Sci USA** 1986 May;83(10):3456-9

The effect of altered 5-hydroxytryptamine levels on beta-endorphin content in rat brain. Soliman KF, et al. **Proc Soc Exp Biol Med** 1986 Jun;182(2):187-93

Prostacyclin and thromboxane formation in human umbilical arteries following stimulation with vasoactive autacoids. Bjøro K. **Prostaglandins** 1986 Apr;31(4):699-714

Dissociation of the anorectic actions of 5-HTP and fenfluramine. Fletcher PJ, et al. **Psychopharmacology (Berlin)** 1986;89(2):216-20

The effects of a 5-HT1 receptor ligand isapirone (TVX Q 7821) on 5-HT synthesis and the behavioural effects of 5-HT agonists in mice and rats. Goodwin GM, et al. **Psychopharmacology (Berlin)** 1986;89(3):382-7

Circadian rhythm of serotonin transport in human platelets. Modai I, et al. **Psychopharmacology (Berlin)** 1986;88(4):493-5

Pharmacological investigations of the mechanisms underlying the effects of peripheral 5-HT on flavour consumption and preference. Montgomery AM, et al. **Psychopharmacology (Berlin)** 1986; 89(2):192-7

Sequestration of serotonin in stored platelets. Shimizu T, et al. **Transfusion** 1986 May-Jun;26(3):274-7

[Serotonin transport by blood platelets of depressive patients] Modai I, et al. **Harefuah** 1986 Jan 15;110(2):64-7 (Eng. Abstr.) **(Heb)**

[The function of the sympathetic nervous system determined by humoral factors in the maintenance hemodialysis patients] Minami M, et al. **Hokkaido Igaku Zasshi** 1986 Mar;61(2):186-94 (Eng. Abstr.) **(Jpn)**

[The role of serotonin, histamine and prostaglandins on potentiation of hypoxic pulmonary vasoconstriction by repeated intermittent hypoxic challenges in dogs] Nakanishi S. et al. **Nippon Kyobu Shikkan Gakkai Zasshi** 1986 Jan;24(1):42-8 (Eng. Abstr.) **(Jpn)**

SET (PSYCHOLOGY)

Does placebo response mediate runner's high? Hinton ER, et al. **Percept Mot Skills** 1986 Jun;62(3):789-90

SEX BEHAVIOR, ANIMAL

Gamma aminobutyric acid mediates ventromedial hypothalamic mechanisms controlling the execution of lordotic responses in the female rat. Mascó D, et al. **Behav Brain Res** 1986 Feb;19(2):153-62

Biochemical and radioautographic analysis of estrogen-inducible progestin receptors in female ferret brain and pituitary: correlations with effects of progesterone on sexual behavior and gonadotropin-releasing hormone-stimulated secretion of luteinizing hormone. Baum MJ, et al. **Brain Res** 1986 Mar 19;368(2):296-309

Dopaminergic control of male sex behavior in rats: effects of an intracerebrally-infused agonist. Hull EM, et al **Brain Res** 1986 Apr 2;370(1):73-81

Neonatal 6-hydroxydopamine lesion of forebrain norepinephrine does not eliminate critical period for behavioral effects of gonadal hormone manipulation. Pappas BA, et al. **Brain Res** 1986 May;391(2):310-4

Regulation of mating behaviour in the female rat by gonadotropin-releasing hormone in the ventral tegmental area: effects of selective destruction of the A10 dopamine neurones. Sirinathsinghji DJ, et al. **Brain Res** 1986 May 21;374(1):167-73

Changes in the immunoreactivities of an opioid peptide leumorphin in the hypothalamus and anterior pituitary during the estrous cycle of the rat and their relation to sexual behavior. Suda M, et al. **Brain Res** 1986 May 28;374(2):236-43

Removal of the vomeronasal organ impairs lordosis in female hamsters: effect is reversed by luteinising hormone-releasing hormone. Mackay-Sim A, et al. **Neuroendocrinology** 1986;42(6):489-93

Suppression of receptive and proceptive behavior in ovariectomized, estrogen-progesterone-primed rats by intraventricular beta-endorphin: studies of behavioral specificity. Wiesner JB, et al. **Neuroendocrinology** 1986;43(1):57-62

Norepinephrine infusions into the medial preoptic area inhibit lordosis behavior. Caldwell JD, et al. **Pharmacol Biochem Behav** 1986 Apr; 24(4):1015-23

Lordosis behavior and GABAergic neurotransmission. Fernández-Guasti A, et al. **Pharmacol Biochem Behav** 1986 Mar;24(3):673-6

GABAergic control of masculine sexual behavior. Fernández-Guasti A, et al. **Pharmacol Biochem Behav** 1986 Apr;24(4):1065-70

Effect of beta-endorphin on sociosexual proclivity in a choice paradigm. Wiesner JB, et al. **Pharmacol Biochem Behav** 1986 Mar;24(3):507-11

The effect of neonatal manipulation of hypothalamic serotonin levels on sexual activity in the adult rat. Wilson CA, et al. **Pharmacol Biochem Behav** 1986 May;24(5):1175-83

SLEEP

Benzodiazepines: half-life and daytime hyperarousal [letter] Soldatos CR. **Am J Psychiatry** 1986 Jun;143(6):813-4

Effects of brotizolam on the sleep-waking cycle of the cat. Kuhn FJ. **Arzneimittelforschung** 1986 Mar;36(3A):522-7

Ontogenesis of unit activity in the raphe dorsalis of the behaving kitten: its relationship with the states of vigilance. Adrien J, et al. **Brain Res** 1986 Feb 26;366(1-2):10-21

Intracerebroventricular infusion of somatostatin selectively increases paradoxical sleep in rats. Danguir J. **Brain Res** 1986 Mar 5; 367(1-2):26-30

Alpha adrenergic system in medial preoptic area involved in sleep-wakefulness in rats. Mohan Kumar V, et al. **Brain Res Bull** 1986 Apr;16(4):463-8

Alprazolam and lorazepam single and multiple-dose effects on psychomotor skills and sleep. Subhan Z, et al. **Eur J Clin Pharmacol** 1986;29(6):709-12

Influence of brown adipose tissue on deep cervical temperature during sleep in the young rabbit. Franzini C, et al. **Experientia** 1986 Jun 15; 42(6):604-6

Relationship between sleep variables and urinary excretion of adrenaline in nocturnal sleep. Nishihara K, et al. **Ind Health** 1985;23(4):279-82

Effects of melatonin and 5-methoxytryptamine on sleep-wake patterns in the male rat. Mirmiran M, et al. **J Pineal Res** 1986;3(2):135-41

Influence of some dopaminoceptor agents on nitrazepam-induced sleep in the domestic fowl (Gallus domesticus) and rats. Wambebe C. **Jpn J Pharmacol** 1986 Mar;40(3):357-65

Variation in pentobarbitone sleeping time in mice. 1. Strain and sex differences. Lovell DP. **Lab Anim** 1986 Apr;20(2):85-90

Variation in pentobarbitone sleeping time in mice. 2. Variables affecting test results. Lovell DP. **Lab Anim** 1986 Apr;20(2):91-6

Effects of corticotropin-releasing factor and growth hormone-releasing factor on sleep and activity in rats. Ehlers CL, et al. **Neuroendocrinology** 1986;42(6):467-74

Effects of Suanzaorentang on behavior changes and central monoamines. Hsieh MT, et al. **Proc Natl Sci Counc Repub China [B]** 1986 Jan; 10(1):43-8

N,N'-diallylbarbital potentiation of drug-induced sleep and motor incoordination. Tateoka Y, et al. **Res Commun Chem Pathol Pharmacol** 1986 Apr;52(1):17-28

Effects of methylmercury on hypnotic action of hexobarbital, liver hydroxylase and cytochrome P-450 in mice. Su MQ, et al. **Toxicology** 1986 Jun;39(3):233-45

[Nocturnal prolactin (PRL) levels and PRL release by metoclopramide in normoprolactinemic anovulation, and effects of bromocriptine in induction of ovulation] Suginami H, et al. **Nippon Sanka Fujinka Gakkai Zasshi** 1986 Apr;38(4):603-4 **(Jpn)**

[Serum prolactin levels during sleep and in metoclopramide stimulation in normoprolactinemic anovulation and ovulation induction with bromocriptine] Suginami H, et al. **Nippon Sanka Fujinka Gakkai Zasshi** 1986 May;38(5):728-34 (Eng. Abstr.) **(Jpn)**

[Duration of the narcotic action of nembutal under hyperbarism] Sledkov AIu, et al. **Farmakol Toksikol** 1986 May-Jun;49(3):32-5 (Eng. Abstr.) **(Rus)**

SLEEP DEPRIVATION

Stress hormonal response to exercise after sleep loss. Martin BJ, et al. **Eur J Appl Physiol** 1986;55(2):210-4

The effects of REM sleep deprivation on striatal dopamine receptor sites. Zwicker AP, et al. **Pharmacol Biochem Behav** 1986 Apr; 24(4):809-12

SLEEP, REM

The importance of fetal/neonatal REM sleep. Mirmiran M. **Eur J Obstet Gynecol Reprod Biol** 1986 May;21(5-6):283-91

Diurnal variations of brain noradrenaline metabolism of the methylmercury chloride-administered rat with reference to an altered circadian rhythm of paradoxical sleep. Arito H, et al. **Ind Health** 1985; 23(4):245-53

The effects of REM sleep deprivation on striatal dopamine receptor sites. Zwicker AP, et al. **Pharmacol Biochem Behav** 1986 Apr; 24(4):809-12

SLEEP STAGES

Regular 48-hour cycling of sleep duration and mood in a 35-year-old woman: use of lithium in time isolation. Welsh DK, et al. **Biol Psychiatry** 1986 May;21(5-6):527-37

Behavioral changes following generic thioridazine [letter] Weber SS, et al. **J Clin Psychiatry** 1986 May;47(5):277-8

SOCIAL ADJUSTMENT

Impairment of work and leisure in depressed outpatients. A preliminary communication. De Lisio G, et al. **J Affective Disord** 1986 Mar-Apr; 10(2):79-84

Can pregnancy be a placebo effect?: Terminology, designs, and conclusions in the study of psychosocial and pharmacological treatments of behavior disorders. Paul GL. **J Behav Ther Exp Psychiatry** 1986 Jun;17(2):61-81

Predictors of outcome in schizophrenia: the process-reactive dimension. Harrow M, et al. **Schizophr Bull** 1986;12(2):195-207

SODIUM

Effect of renal nerve activity on tubular sodium and water reabsorption in dog kidneys as determined by the lithium clearance method. Abildgaard U, et al. **Acta Physiol Scand** 1986 Feb;126(2):251-7

Intra- and interindividual variability in sodium intake in normal subjects and in patients with renal insufficiency. Luft FC, et al. **Am J Kidney Dis** 1986 May;7(5):375-80

Effects of calcium antagonist TMB-8 on active Na and Cl transport in rabbit ileum. Donowitz M, et al. **Am J Physiol** 1986 May; 250(5 Pt 1):G691-7

Tryptic modification of red-cell sodium pump behaviour. Harvey WJ, et al. **Biochim Biophys Acta** 1986 Apr 25;856(3):496-504

Na+-H+ exchange in the process of glucose-induced insulin release from the pancreatic B-cell. Effects of amiloride on 86Rb, 45Ca fluxes and insulin release. Lebrun P, et al. **Biochim Biophys Acta** 1986 May 29;886(3):448-56

The Ba2+ sensitivity of the Na+-induced Ca2+ efflux in heart mitochondria: the site of inhibitory action. Lukács GL, et al. **Biochim Biophys Acta** 1986 Jun 13;858(1):125-34

Basolateral amino acid transport systems in the perfused exocrine pancreas: sodium-dependency and kinetic interactions between influx and efflux mechanisms. Mann GE, et al. **Biochim Biophys Acta** 1986 Jun 26;858(2):263-74

Mechanism of inhibition by lithium of sodium transport in the toad bladder. Herrera FC, et al. **Biol Cell** 1985;55(3):257-63

Erythrocyte cation transport activities as a function of cell age. Hentschel WM, et al. **Clin Chim Acta** 1986 May 30;157(1):33-43

Chromium(III)ATP inactivating (Na+ + K+)-ATPase supports Na+-Na+ and Rb+-Rb+ exchanges in everted red blood cells but not Na+,K+ transport. Pauls H, et al. **Eur J Biochem** 1986 Jun 16; 157(3):585-95

Transport of ions across the blood-brain barrier. Betz AL. **Fed Proc** 1986 Jun;45(7):2050-4 (26 ref.)

Temperature sensitivity and substrate specificity of two distinct Na+-activated D-glucose transport systems in guinea pig jejunal brush border membrane vesicles. Brot-Laroche E, et al. **J Biol Chem** 1986 May 15;261(14):6168-76

Sugar binding properties of the melibiose permease in Escherichia coli membrane vesicles. Effects of Na+ and H+ concentrations. Damiano-Forano E, et al. **J Biol Chem** 1986 May 25;261(15):6893-9

Ca2+-induced down-regulation of Na+ channels in toad bladder epithelium. Garty H, et al. **J Biol Chem** 1986 Jun 5;261(16):7400-6

[3H]bumetanide binding to duck red cells. Correlation with inhibition of (Na + K + 2Cl) co-transport. Haas M, et al. **J Biol Chem** 1986 Jun 25;261(18):8434-41

Growth factors activate the bumetanide-sensitive

Na+/K+/Cl-cotransport in hamster fibroblasts. Paris S, et al. **J Biol Chem** 1986 May 15;261(14):6177-83

Early events elicited by bombesin and structurally related peptides in quiescent Swiss 3T3 cells. II. Changes in Na+ and Ca2+ fluxes, Na+/K+ pump activity, and intracellular pH. Mendoza SA, et al. **J Cell Biol** 1986 Jun;102(6):2223-33

Catecholamine-induced transport systems in trout erythrocyte. Na+/H+ countertransport or NaCl cotransport? Borgese F, et al. **J Gen Physiol** 1986 Apr;87(4):551-66

Acute volume expansion in humans releases a factor which inhibits the vascular Na+-K+ pump. Price MB, et al. **J Hypertension [Suppl]** 1984 Dec;2(3):S471-2

Activation of the voltage-sensitive sodium channel by a beta-scorpion toxin in rat brain nerve-ending particles. Bablito J, et al. **J Neurochem** 1986 Jun;46(6):1763-70

The in situ perfused spinal cord of the rat. Applicability of drugs and chemicals, sodium-lithium exchange, and calcium reduction to functional intact central nervous system tissue. Deutschmann W, et al. **J Pharmacol Methods** 1986 Apr;15(2):143-55

The interaction between the activator agents batrachotoxin and veratridine and the gating processes of neuronal sodium channels. Rando TA, et al. **Mol Pharmacol** 1986 May;29(5):467-77

The role of co-transported sodium in the effect of indirectly acting sympathomimetic amines. Bönisch H. **Naunyn Schmiedebergs Arch Pharmacol** 1986 Feb;332(2):135-41

Sodium-dependence of the saturability of carrier-mediated noradrenaline efflux from noradrenergic neurones in the rat vas deferens. Bönisch H, et al. **Naunyn Schmiedebergs Arch Pharmacol** 1986 Feb; 332(2):131-4

Regulation of phosphatidylinositol turnover in brain synaptoneurosomes: stimulatory effects of agents that enhance influx of sodium ions. Gusovsky F, et al. **Proc Natl Acad Sci USA** 1986 May;83(9):3003-7

Egg-laying hormone of Aplysia induces a voltage-dependent slow inward current carried by Na+ in an identified motoneuron. Kirk MD, et al. **Proc Natl Acad Sci USA** 1986 May;83(9):3017-21

SOMATOSTATIN

Plasma concentrations of motilin, somatostatin and pancreatic polypeptide before, during and after parturition. Jenssen TG, et al. **Acta Obstet Gynecol Scand** 1986;65(2):153-6

Influence on plasma levels of somatostatin, gastrin, glucagon, insulin and VIP-like immunoreactivity in peripheral venous blood of anaesthetized cats induced by low intensity afferent stimulation of the sciatic nerve. Uvnäs-Moberg K, et al. **Acta Physiol Scand** 1986 Feb;126(2):225-30

Are prostaglandins involved in somatostatin mediated inhibition of gastric secretion in the cat? Albinus M, et al. **Agents Actions** 1986 Apr; 18(1-2):205-9

Phorbol esters stimulate somatostatin release from cultured cells. Sugano K, et al. **Am J Physiol** 1986 May;250(5 Pt 1):G686-90

Specific binding and degradation of somatostatin by membrane vesicles from pig gut. Weber M, et al. **Am J Physiol** 1986 May; 250(5 Pt 1):G679-85

Somatostatin mediation of adenohypophysial secretion. Patel YC, et al. **Annu Rev Physiol** 1986;48:551-67 (100 ref.)

Gastro-intestinal tract function in sheep infused with somatostatin. Barry TN, et al. **Aust J Biol Sci** 1985;38(4):393-403

Somatostatin and cholecystokinin octapeptide differentially modulate the release of [3H]acetylcholine from caudate nucleus but not cerebral cortex: role of dopamine receptor activation. Arnerić SP, et al. **Brain Res** 1986 May 21;374(1):153-61

Intracerebroventricular infusion of somatostatin selectively increases paradoxical sleep in rats. Danguir J. **Brain Res** 1986 Mar 5; 367(1-2):26-30

Modifications in the cortical regional distribution of choline acetyltransferase, somatostatin and somatostatin binding sites in the normal rat and following lesion of the nucleus basalis. Epelbaum J, et al. **Brain Res** 1986 Apr 23;371(2):376-9

Neuropeptide Y-immunoreactive neurons in the striatum of cat and monkey: morphological characteristics, intrinsic organization and co-localization with somatostatin. Smith Y, et al. **Brain Res** 1986 May 7;372(2):241-52

Characterization of forms of immunoreactive somatostatin in sensory neuron and normal and deafferented spinal cord. Tessler A, et al. **Brain Res** 1986 Apr 9;370(2):232-40

Dopamine stimulates rat cortical somatostatin release. Thal LJ, et al. **Brain Res** 1986 May 7;372(2):205-9

Effect of hypophysectomy on somatostatin-14 and somatostatin-28 biosynthesis in the rat hypothalamus. Wetsel WC, et al. **Brain Res** 1986 Apr 9;370(2):315-20

Cysteamine effects on somatostatin, catecholamines, pineal NAT and melatonin in rats. Webb SM, et al. **Brain Res Bull** 1986 Mar; 16(3):315-20

Ultrastructural characterization of neurosecretory fibres immunoreactive for vasotocin, isotocin, somatostatin, LHRH and CRF in the pituitary of a teleost fish, Poecilia latipinna. Batten TF. **Cell Tissue Res** 1986; 244(3):661-72

Effect of somatostatin on amylase secretion from in vivo and in vitro rat pancreas. Singh M. **Dig Dis Sci** 1986 May;31(5):506-12

Growth hormone release: interaction of increased extracellular calcium and somatostatin. Stachura ME. **Endocr Res** 1986;12(1):69-92

The effect of age on somatostatin suppression of basal, growth hormone (GH)-releasing factor-stimulated, and dibutyryl adenosine 3',5'-monophosphate-stimulated GH release from rat pituitary cells in monolayer culture. Cuttler L, et al. **Endocrinology** 1986 Jul; 119(1):152-8

Inhibition of rat hypothalamic somatostatin release by somatostatin: evidence for somatostatin ultrashort loop feedback. Richardson SB, et al. **Endocrinology** 1986 May;118(5):2076-82

On the fate of centrally administered somatostatin in the rat: massive hypersomatostatinemia resulting from leakage into the peripheral circulation has effects on growth hormone secretion and glucoregulation. Tannenbaum GS, et al. **Endocrinology** 1986 May; 118(5):2137-43

Calcitonin gene-related peptide stimulates somatostatin release from isolated perfused rat stomach. Yamatani T, et al. **Endocrinology** 1986 May;118(5):2144-5

Effects of somatostatin on dopamine sensitive adenylate cyclase activity in the caudate-putamen of the rat. Moser A, et al. **Exp Brain Res** 1986; 62(3):567-71

Further studies on the inhibitory effects of somatostatin on the growth and steroidogenic capacity of rat adrenal zona glomerulosa. Robba C, et al. **Exp Pathol** 1986;29(2):77-82

Control of rat gastric somatostatin release by gamma-aminobutyric acid (GABA). Koop H, et al. **Horm Metab Res** 1986 Feb;18(2):94-7

VIP and hormone secretion from thyroidal follicular and C-cells. Laurberg P. **Horm Metab Res** 1986 Apr;18(4):230-3

Development of specific and non-specific somatostatin analogs. Nakano T, et al. **Horm Metab Res** 1986 Feb;18(2):98-102

Effect of infusion of salmon calcitonin on the secretion of somatostatin and gastrin in man. Woloszczuk W, et al. **Horm Metab Res** 1986 Mar; 18(3):197-200

Influence of beta-endorphin, somatostatin, substance P and vasoactive intestinal peptide on the proliferative response of human peripheral blood T lymphocytes to mercuric chloride. Nordlind K, et al. **Int Arch Allergy Appl Immunol** 1986;80(3):326-8

An immunohistochemical characterization of somatostatin-28 and somatostatin-281-12 in monkey prefrontal cortex. Lewis DA, et al. **J Comp Neurol** 1986 Jun 1;248(1):1-18

Somatostatin immunoreactive neurons in rat visual cortex: a light and electron microscopic study. Meinecke DL, et al. **J Neurocytol** 1986 Feb;15(1):121-36

Cyclic AMP regulates somatostatin mRNA accumulation in primary diencephalic cultures and in transfected fibroblast cells. Montminy MR, et al. **J Neurosci** 1986 Apr;6(4):1171-6

Effect of chronically administered somatostatin on the nude mouse. Johnson FE, et al. **J Surg Res** 1986 Apr;40(4):346-52

Methods for the identification of neuropeptide processing products: somatostatin and the tachykinins. Harmar AJ, et al. **Methods Enzymol** 1986;124:335-48

Somatostatin release from dissociated cerebral cortical cell cultures. Landon RM, et al. **Methods Enzymol** 1986;124:412-24

Localization of somatostatin receptors. Pelletier G, et al. **Methods Enzymol** 1986;124:607-17

Dopamine and somatostatin inhibit forskolin-stimulated prolactin and growth hormone secretion but not stimulated cyclic AMP levels in sheep anterior pituitary cell cultures. Ray KP, et al. **Mol Cell Endocrinol** 1986 May;45(2-3):175-82

Somatostatin effects on the cyclic AMP system and lipid metabolism in mouse brain. Catalan RE, et al. **Neurochem Res** 1986 Apr; 11(4):497-504

Somatostatin-sensitive neural system in the liver. Nakabayashi H, et al. **Neurosci Lett** 1986 Jun 6;67(1):78-81

Striatal neurons expressing somatostatin-like immunoreactivity: evidence for a peptidergic interneuronal system in the cat. Chesselet MF, et al. **Neuroscience** 1986 Mar;17(3):547-71

Somatostatin-immunoreactive amacrine cells of chicken retina: retinal mosaic, ultrastructural features, and light-driven variations in peptide metabolism. Ishimoto I, et al. **Neuroscience** 1986 Apr;17(4):1217-33

Somatostatin and CCK-8 modulate release of striatal amino acids: role of dopamine receptors. Arnerić SP, et al. **Peptides** 1986 Jan-Feb; 7(1):97-103

Characteristics of [D-Trp8]-somatostatin-sensitive B50 phosphorylation. Dokas LA, et al. **Peptides** 1985 Nov-Dec;6(6):1101-7

Effect of vasoactive intestinal peptide, peptide histidine isoleucine and growth hormone-releasing factor-40 on bombesin-like immunoreactivity, somatostatin and gastrin release from the perfused rat stomach. Schusdziarra V, et al. **Peptides** 1986 Jan-Feb; 7(1):127-33

Molecular forms of somatostatin, substance P and neurotensin in fresh human cerebral cortex. Bateman DE, et al. **Regul Pept** 1986 May; 14(3):211-6

Evidence for somatostatin binding sites in rabbit kidney. Roca B, et al.

Regul Pept 1986 Feb;13(3-4):273-81

Somatostatin increases the ratio between gastric mucosal blood flow and gastric acid and pepsin secretion in dogs. Bech K. **Scand J Gastroenterol** 1986 Mar;21(2):215-20

Effect of haemorrhagic shock and duodenal instillation of blood on the plasma profiles of somatostatin and motilin in pigs. A study of molecular plasma components. Jenssen TG, et al. **Scand J Gastroenterol** 1986 Apr; 21(3):281-90

Evidence of somatostatin as a humoral modulator of motilin release in man. A study of plasma motilin and somatostatin during intravenous infusion of somatostatin, secretin, cholecystokinin, and gastric inhibitory polypeptide. Jenssen TG, et al. **Scand J Gastroenterol** 1986 Apr; 21(3):273-80

[Comparative biochemical effects of the injection of cyclic and linear forms of vertebrate somatostatin on the honeybee in vivo. II. Blood lipids] Bounias M. **C R Soc Biol (Paris)** 1985;179(5):591-9 (Eng. Abstr.) **(Fre)**

[Effect of somatostatin on the rabbit Oddi's sphincter in vivo. Interrelation of somatostatin and cholecystokinin] Adami GF, et al. **Gastroenterol Clin Biol** 1986 Feb;10(2):108-11 (Eng. Abstr.) **(Fre)**

[Role of alpha-adrenoreceptors of the hypothalamus and amygdala in the response of the secretory glands of the stomach to neurotensin and somatostatin] Barashkova GM, et al. **Fiziol Zh SSSR** 1986 Apr; 72(4):498-502 (Eng. Abstr.) **(Rus)**

SOMATOTROPIN RELEASING HORMONE

TRH and GRF stimulate release of growth hormone through different mechanisms. Szabo M. **Am J Physiol** 1986 May;250(5 Pt 1):E512-7

Light and electron microscopic immunocytochemistry of GRF-like immunoreactive neurons and terminals in the rat hypothalamic arcuate nucleus and median eminence. Ibata Y, et al. **Brain Res** 1986 Apr 2; 370(1):136-43

Effects of GRF on paraventricular neurons in slices of guinea-pig hypothalamus. Poulain P, et al. **Brain Res** 1986 Apr 23;371(2):355-9

Effects of neonatal administration of monosodium glutamate on plasma growth hormone (GH) response to GH-releasing factor in adult male and female rats. Wakabayashi I, et al. **Brain Res** 1986 May 7; 372(2):361-5

Does growth hormone releasing factor desensitize the somatotroph? Interpretation of responses of growth hormone during and after 10-hour infusion of GRF 1-29 amide in man. Davis JR, et al. **Clin Endocrinol (Oxf)** 1986 Feb;24(2):135-40

Influence of dopaminergic, adrenergic and cholinergic blockade and TRH administration on GH responses to GRF 1-29. Jordan V, et al. **Clin Endocrinol (Oxf)** 1986 Mar;24(3):291-8

The interaction of growth hormone releasing hormone with other hypothalamic hormones on the release of anterior pituitary hormones. Looij BJ Jr, et al. **Clin Endocrinol (Oxf)** 1986 Feb;24(2):149-56

Desensitization to growth hormone-releasing factor (GRF) is associated with down-regulation of GRF-binding sites. Bilezikjian LM, et al. **Endocrinology** 1986 May;118(5):2045-52

Diminished pituitary responsiveness to growth hormone-releasing factor in aging male rats. Ceda GP, et al. **Endocrinology** 1986 May; 118(5):2109-14

The effect of age on somatostatin suppression of basal, growth hormone (GH)-releasing factor-stimulated, and dibutyryl adenosine 3',5'-monophosphate-stimulated GH release from rat pituitary cells in monolayer culture. Cuttler L, et al. **Endocrinology** 1986 Jul; 119(1):152-8

The effect of glucose and free fatty acids on growth hormone (GH)-releasing factor-mediated GH secretion in rats. Imaki T, et al. **Endocrinology** 1986 Jun;118(6):2390-4

Stimulation by alpha-adrenergic mechanisms of the secretion of growth hormone-releasing factor (GRF) from perifused rat hypothalamus. Kabayama Y, et al. **Endocrinology** 1986 Jul;119(1):432-4

Growth hormone (GH)-releasing factor stimulates hypothalamic somatostatin release: an inhibitory feedback effect on GH secretion. Katakami H, et al. **Endocrinology** 1986 May;118(5):1872-7

Purified chicken growth hormone (GH) and a human pancreatic GH-releasing hormone increase body weight gain in chickens. Leung FC, et al. **Endocrinology** 1986 May;118(5):1961-5

Localization of growth hormone-releasing hormone in the human hypothalamus and pituitary stalk. Werner H, et al. **J Clin Endocrinol Metab** 1986 Jul;63(1):47-50

Growth hormone-releasing factor stimulates milk production and sustains growth hormone release in Holstein cows. Enright WJ, et al. **J Dairy Sci** 1986 Feb;69(2):344-51

Synergistic interaction in bovine pituitary cultures between growth hormone-releasing factor and other hypophysiotrophic factors. Ingram CD, et al. **J Endocrinol** 1986 Apr;109(1):67-74

Stimulation of in-vivo growth hormone secretion in young chickens by rat hypothalamic growth hormone-releasing factor and synthetic analogues. Scanes CG, et al. **J Endocrinol** 1986 Mar;108(3):413-6

Measurement of growth hormone-releasing factor. Frohman LA, et al. **Methods Enzymol** 1986;124:371-89

Assay of growth hormone-releasing factor. Vale W, et al. **Methods Enzymol** 1986;124:389-401

Characteristics of the desensitization of growth hormone and cyclic AMP responses to growth hormone-releasing factor and prostaglandin E2 in rat anterior pituitary cells in culture. Simard J, et al. **Mol Cell Endocrinol** 1986 Jun;46(1):79-89

Effects of corticotropin-releasing factor and growth hormone-releasing factor on sleep and activity in rats. Ehlers CL, et al. **Neuroendocrinology** 1986;42(6):467-74

Down-regulation of growth hormone releasing factor receptors following continuous infusion of growth hormone releasing factor in vivo. Wehrenberg WB, et al. **Neuroendocrinology** 1986;43(2):266-8

Coexpression of human growth hormone-releasing factor 1-37-like and alpha-melanotropin-like immunoreactivities in neurones of the rat lateral dorsal hypothalamus. Fellmann D, et al. **Neurosci Lett** 1986 Jul 11;68(1):122-6

Effect of vasoactive intestinal peptide, peptide histidine isoleucine and growth hormone-releasing factor-40 on bombesin-like immunoreactivity, somatostatin and gastrin release from the perfused rat stomach. Schusdziarra V, et al. **Peptides** 1986 Jan-Feb; 7(1):127-33

Stepwise evaluation of the short child. With comments on the status of growth hormone therapy. Stelling MW. **Postgrad Med** 1986 May 1; 79(6):185-7, 190-2

Effects of growth hormone-releasing factor in the brain. Wehrenberg WB, et al. **Science** 1986 Jun 6;232(4755):1271-3

[Growth hormone (GH) response to GH-releasing factor in adult female rats treated with monosodium glutamate during the neonatal period] Hatano H. **Nippon Ika Daigaku Zasshi** 1986 Apr;53(2):191-7 (Eng. Abstr.) **(Jpn)**

STARTLE REACTION

Differential effects of dopamine agonists on acoustically and electrically elicited startle responses: comparison to effects of strychnine. Davis M, et al. **Brain Res** 1986 Apr 16;371(1):58-69

STEREOTYPED BEHAVIOR

Effects of acute and chronic carbamazepine administration on apomorphine-elicited stereotypy. Barros HM, et al. **Eur J Pharmacol** 1986 Apr 29;123(3):345-9

The effect of thioridazine on haloperidol induced behavioral hypersensitivity. Klawans HL, et al. **Life Sci** 1986 May 12; 38(19):1707-14

Selective dopamine D2 receptor reduction enhances a D1-mediated oral dyskinesia in rats. Rosengarten H, et al. **Life Sci** 1986 Jul 7; 39(1):29-35

Psychopharmacology of phencyclidine. Marwah J, et al. **Natl Inst Drug Abuse Res Monogr Ser** 1986;64:127-33

Amphetamine-induced stereotypic responses in Roman high- and Roman low-avoidance rats. Driscoll P, et al. **Pharmacol Biochem Behav** 1986 May;24(5):1329-32

Evidence that thioridazine enhances amphetamine-induced stereotypy via anticholinergic activity. Robertson A, et al. **Prog Neuropsychopharmacol Biol Psychiatry** 1986;10(1):33-40

[Synthesis and pharmacological studies of derivatives of 5- and 7-(O-hydroxyphenyl)-2,3-dihydro-1,4-diazepins] Kostka K, et al. **Acta Pol Pharm** 1985;42(5):442-7 (Eng. Abstr.) **(Pol)**

STRESS, PSYCHOLOGICAL

Effects of 6-hydroxydopamine-induced lesions of the paraventricular nucleus, and of prazosin, on the corticosterone response to restraint in rats. Gibson A, et al. **Neuropharmacology** 1986 Mar;25(3):257-60

Brain histamine regulation following chronic diazepam treatment and stress. Mazurkiewicz-Kwilecki IM, et al. **Pharmacol Biochem Behav** 1986 Mar;24(3):513-7

Prenatal stress: effect on development of rat brain serotonergic neurons. Peters DA. **Pharmacol Biochem Behav** 1986 May;24(5):1377-82

Biochemical and behavioral correlates of chronic stress: effects of tricyclic antidepressants. Soblosky JS, et al. **Pharmacol Biochem Behav** 1986 May; 24(5):1361-8

Norepinephrine alterations under stress conditions following the regular practice of meditation. Morrell EM, et al. **Psychosom Med** 1986 Mar-Apr;48(3-4):270-7

Unemployment stress: loss of control, reactance and learned helplessness. Baum A, et al. **Soc Sci Med** 1986;22(5):509-16

[Physical work capacity under different levels of measured stress in relation to type-A personality in intellectual workers] Mincheva L, et al. **Probl Khig** 1985;10:20-32 (Eng. Abstr.) **(Bul)**

[Histochemical, fluorescent autoradiographic study of paraganglion cells in the superior cervical ganglion of the newborn rat following maternal stress] Heym C, et al. **Acta Histochem [Suppl] (Jena)** 1986;32:59-62 (Eng. Abstr.) **(Ger)**

[Effect of stress-inducing factors on monkey behavior. II. Hormonal indices and their relation to behavior in the modelling of emotional stress in hamadryas baboons] Butovskaia ML, et al. **Biol Nauki** 1986;

(2):59-64 (Eng. Abstr.) **(Rus)**

[Indicators of catecholamine excretion in air traffic controllers] Kuprianov VA, et al. **Gig Tr Prof Zabol** 1986 Feb;(2):53-6 **(Rus)**

[Antistress and antineurotic action of psychotropic preparations in experiments on monkeys] Startsev VG, et al. **Vestn Akad Med Nauk SSSR** 1986;(3):30-3 (Eng. Abstr.) **(Rus)**

SUBSTANCE P

Design and synthesis of antagonists of substance P. Folkers K, et al. **Acta Chem Scand [B]** 1986 Apr;40(4):295-302

Antidromic nerve stimulation accelerates mucociliary activity in rabbit maxillary sinus. Lindberg S, et al. **Acta Otolaryngol (Stockh)** 1986 May-Jun;101(5-6):484-93

The effect of compound 48/80, substance P and pentagastrin on the isolated guinea pig atrium. Stanovnik L, et al. **Agents Actions** 1986 Apr, 18(1-2):197-200

Characterization of substance P effects on canine antral muscle. Mayer EA, et al. **Am J Physiol** 1986 Jul,251(1 Pt 1):G140-6

Substance P and neurotensin: their roles in the regulation of anterior pituitary function. Aronin N, et al. **Annu Rev Physiol** 1986; 48:537-49 (57 ref.)

A substance P antagonist also inhibits specific binding and mitogenic effects of vasopressin and bombesin-related peptides in Swiss 3T3 cells. Zachary I, et al. **Biochem Biophys Res Commun** 1986 May 29; 137(1):135-41

Immunocytochemical evidence for synaptic regulation of paraventricular vasopressin-containing neurons by substance P. Heike Y, et al. **Brain Res** 1986 Mar 26;369(1-2):341-6

Pharmacological characterization of the receptor mediating the adrenergic inhibition of responses to substance P in the cingulate cortex. Jones RS, et al. **Brain Res** 1986 Mar 5;367(1-2):151-61

Innervation of substance P neurons by catecholaminergic terminals in the neostriatum. Kubota Y, et al. **Brain Res** 1986 Jun 4;375(1):163-7

The localization and characterization of substance P and substance K in striatonigral neurons. Lee JM, et al. **Brain Res** 1986 Apr 16; 371(1):152-4

Colocalization of immunoreactive substance P and neurotensin in amacrine cells of the goldfish retina. Li HB, et al. **Brain Res** 1986 Feb 26;366(1-2):307-13

Immunoelectron microscopic study of substance P-containing fibers in feline cerebral arteries. Liu-Chen LY, et al. **Brain Res** 1986 Mar 26; 369(1-2):12-20

A substance P-containing hypothalamic neuronal system projects to the median eminence. Makara GB, et al. **Brain Res** 1986 May 28; 374(2):399-401

Two distinct calcitonin gene-related peptide-containing peripheral nervous systems: distribution and quantitative differences between the iris and cerebral artery with special reference to substance P. Matsuyama T, et al. **Brain Res** 1986 May 14;373(1-2):205-12

The co-occurrence of substance P-like immunoreactivity and dynorphin-like immunoreactivity in striatopallidal and striatonigral projection neurons in birds and reptiles. Reiner A. **Brain Res** 1986 Apr 16;371(1):155-61

Increased density of substance P binding sites in specific brainstem nuclei of spontaneously hypertensive rats. Shigematsu K, et al. **Brain Res** 1986 Apr 9;370(2):383-7

Distribution of substance K (neurokinin A) in the brain and peripheral tissues of rats. Takano Y, et al. **Brain Res** 1986 Mar 26; 369(1-2):400-4

Origins and distribution of calcitonin gene-related peptide-containing nerves in the wall of the cerebral arteries of the guinea pig with special reference to the coexistence with substance P. Wanaka A, et al. **Brain Res** 1986 Mar 26;369(1-2):185-92

Characterization of substance P-induced bronchoconstriction in the guinea-pig: a comparison with acetylcholine. Stewart AG, et al. **Clin Exp Pharmacol Physiol** 1986 Mar;13(3):223-32

Immunochemical evidence for substance P-like peptide in tissues of the earthworm Lumbricus terrestris: action on intestinal contraction. Kaloustian KV, et al. **Comp Biochem Physiol [C]** 1986;83(2):329-33

Substance P-induced intestinal secretion of water and electrolytes. McFadden D, et al. **Gut** 1986 Mar;27(3):267-72

Three dimensional observation of the nerve fibers along the cerebral blood vessels. Itakura T, et al. **Histochemistry** 1986;84(3):217-20

Influence of beta-endorphin, somatostatin, substance P and vasoactive intestinal peptide on the proliferative response of human peripheral blood T lymphocytes to mercuric chloride. Nordlind K, et al. **Int Arch Allergy Appl Immunol** 1986;80(3):326-8

The effects of intrathecal administration of arginine-vasopressin and substance P on blood pressure and adrenal secretion of epinephrine in rats. Riphagen CL, et al. **J Auton Nerv Syst** 1986 Jun;16(2):91-9

Dopamine antagonist haloperidol decreases substance P, substance K, and preprotachykinin mRNAs in rat striatonigral neurons. Bannon MJ, et al. **J Biol Chem** 1986 May 25;261(15):6640-2

Immunohistochemical distribution of substance P, serotonin, and methionine enkephalin in sexually dimorphic nuclei of the rat lumbar spinal cord. Micevych PE, et al. **J Comp Neurol** 1986 Jun 8; 248(2):235-44

Inter- and intracellular relationship of substance P-containing neurons with serotonin and GABA in the dorsal raphe nucleus: combination of autoradiographic and immunocytochemical techniques. Mâgoul R, et al. **J Histochem Cytochem** 1986 Jun;34(6):735-42

Substance P: binding properties and studies on cellular responses in guinea pig macrophages. Hartung HP, et al. **J Immunol** 1986 May 15; 136(10):3856-63

Effects of hypoxia on neuropeptide levels in the rabbit superior cervical ganglion. Hanson G, et al. **J Neurobiol** 1986 Jan;17(1):51-4

Regional distribution of immunoreactive-thyrotrophin-releasing hormone and substance P, and indoleamines in human spinal cord. Bennett GW, et al. **J Neurochem** 1986 Jun;46(6):1718-24

Activation of micturition reflex by substance P and substance K: indirect evidence for the existence of multiple tachykinin receptors in the rat urinary bladder. Maggi CA, et al. **J Pharmacol Exp Ther** 1986 Jul; 238(1):259-66

Motor effect of neurokinins on the rat duodenum: evidence for the involvement of substance K and substance P receptors. Maggi CA, et al. **J Pharmacol Exp Ther** 1986 Jul;238(1):341-51

Characterization of substance P-induced contractions of guinea-pig trachea. Malo PE, et al. **J Pharmacol Exp Ther** 1986 Jun; 237(3):782-6

Methods for the identification of neuropeptide processing products: somatostatin and the tachykinins. Harmar AJ, et al. **Methods Enzymol** 1986;124:335-48

Neuroleptic treatment induces region-specific changes in levels of neurokinin A and substance P in rat brain. Lindefors N, et al. **Neuropeptides** 1986 Apr;7(3):265-80

Coexistence of serotonin- and substance P-like immunoreactivity in nerve fibers apposing identified sympathoadrenal preganglionic neurons in rat intermediolateral cell column. Appel NM, et al. **Neurosci Lett** 1986 Apr 24;65(3):241-6

Neurogenic inflammation caused by wool fabric in the rat; possible mediation by substance P. Helme RD, et al. **Neurosci Lett** 1986 May 23;66(3):333-7

Substance P-immunoreactive neurons in the neocortex of the rat: a subset of the glutamic acid decarboxylase-immunoreactive neurons. Penny GR, et al. **Neurosci Lett** 1986 Mar 28;65(1):53-9

The effects of substance P on neuromuscular transmission in the frog. Akasu T. **Neurosci Res** 1986 May;3(4):275-84

Axonal transport of substance P-hydrolyzing peptidase in rat sciatic nerves. Kato T, et al. **Neurosci Res** 1986 Feb;3(3):247-52

Search for a physiological role of substance P in gastrointestinal motility. Barthó L, et al. **Neuroscience** 1985 Sep;16(1):1-32 (367 ref.)

Substance P in the human brain. Mai JK, et al. **Neuroscience** 1986 Mar; 17(3):709-39

The glutamate decarboxylase-, leucine enkephalin-, methionine enkephalin- and substance P-immunoreactive neurons in the neostriatum of the rat and cat: evidence for partial population overlap. Penny GR, et al. **Neuroscience** 1986 Apr;17(4):1011-45

Nasal absorption of substance P in rats. Karasek E, et al. **Pharmazie** 1986 Apr;41(4):289-90

Isolated plasma membranes regulate neurotransmitter expression and facilitate effects of a soluble brain cholinergic factor. Kessler JA, et al. **Proc Natl Acad Sci USA** 1986 May;83(10):3528-32

Molecular forms of somatostatin, substance P and neurotensin in fresh human cerebral cortex. Bateman DE, et al. **Regul Pept** 1986 May; 14(3):211-6

Substance P distribution and effects in the canine epicardial coronary arteries. Brum JM, et al. **Regul Pept** 1986 Mar;14(1):41-55

Catabolism of substance P and neurotensin in the rat stomach wall is susceptible to inhibitors of angiotensin converting enzyme. Orloff MS, et al. **Regul Pept** 1986 Mar;14(1):21-31

Ontogeny of substance P in the digestive tract, spinal cord and hypothalamus of the human fetus. Paulin C, et al. **Regul Pept** 1986 Apr; 14(2):145-53

Does liver-intestine significantly degrade circulating endogenous substance P in man? Henriksen JH, et al. **Scand J Gastroenterol** 1986 Apr;21(3):300-4

Flushing and plasma substance P concentration during infusion of synthetic substance P in normal man. Schaffalitzky De Muckadell OB, et al. **Scand J Gastroenterol** 1986 May;21(4):498-502

SUCKING BEHAVIOR

Conditioned aversions and their memories in 5-day-old rats during suckling. Kehoe P, et al. **J Exp Psychol [Anim Behav]** 1986 Jan; 12(1):40-7

SYMPATHOMIMETICS

Enhanced adrenergic constriction of iliac artery with removal of endothelium in conscious dogs. Young MA, et al. **Am J Physiol** 1986 May;250(5 Pt 2):H892-7

The effect of sympathomimetic drugs on bone capillaries. Döhler JR, et al. **Arch Orthop Trauma Surg** 1986;105(1):62-5

Sympathomimetic protein secretion by young and aged lacrimal gland. Bromberg BB, et al. **Curr Eye Res** 1986 Mar;5(3):217-23

Episodic patterns of luteinizing hormone and follicle-stimulating hormone release: differential secretory dynamics and adrenergic control in ovariectomized rats. Condon TP, et al. **Endocrinology** 1986 Jun; 118(6):2525-33

The role of co-transported sodium in the effect of indirectly acting sympathomimetic amines. Bönisch H. **Naunyn Schmiedebergs Arch Pharmacol** 1986 Feb;332(2):135-41

[Effect of the phospholipid composition of liposomes on the rate of release of adrenomimetics contained in them] Sazonova LIa, et al. **Fiziol Zh** 1986 May-Jun;32(3):322-7 (Eng. Abstr.) **(Rus)**

SYNAPTIC RECEPTORS

Separate purinoceptors mediate enhancement by adenosine of concanavalin A-induced mediator release and the cyclic AMP response in rat mast cells. Hughes PJ, et al. **Agents Actions** 1986 Apr; 18(1-2):81-4

Interactions of drugs and electroshock treatment on cerebral monoaminergic systems. Barkai AI. **Ann NY Acad Sci** 1986; 462:147-62

The biochemistry of electroconvulsive therapy. Discussion of Part III. Decina P. **Ann NY Acad Sci** 1986;462:172-3

Neurotransmitter receptor mapping by autoradiography and other methods. Kuhar MJ, et al. **Annu Rev Neurosci** 1986;9:27-59

N-methyl D-aspartate acts as an antagonist of the photoreceptor transmitter in the carp retina. Ariel M, et al. **Brain Res** 1986 Apr 30; 372(1):143-8

Increased density of substance P binding sites in specific brainstem nuclei of spontaneously hypertensive rats. Shigematsu K, et al. **Brain Res** 1986 Apr 9;370(2):383-7

Neurotransmitter receptor binding studies predict antiemetic efficacy and side effects. Ison PJ, et al. **Cancer Treat Rep** 1986 May;70(5):637-41

Cultured neurons as model systems for biochemical and pharmacological studies on receptors for neurotransmitter amino acids. Schousboe A, et al. **Dev Neurosci** 1985;7(5-6):252-62 (56 ref.)

[3H]imipramine displacement and 5HT uptake inhibition by tryptoline derivatives: in rat brain 5-methoxytryptoline is not the autacoid for [3H]imipramine recognition sites. Barbaccia ML, et al. **Eur J Pharmacol** 1986 Apr 9;123(1):45-52

Radioligand binding to central phencyclidine recognition sites is dependent on excitatory amino acid receptor agonists. Loo P, et al. **Eur J Pharmacol** 1986 Apr 29;123(3):467-8

High correlation between the localization of [3H]TCP binding and NMDA receptors. Maragos WF, et al. **Eur J Pharmacol** 1986 Apr 9; 123(1):173-4

Differential effects of antidepressant drugs on [3H]dihydroalprenolol and [3H]imipramine ligand recognition sites in olfactory bulbectomized and sham-lesioned rats. Jesberger JA, et al. **Gen Pharmacol** 1986; 17(3):293-307

Substance P: binding properties and studies on cellular responses in guinea pig macrophages. Hartung HP, et al. **J Immunol** 1986 May 15; 136(10):3856-63

Activation of micturition reflex by substance P and substance K: indirect evidence for the existence of multiple tachykinin receptors in the rat urinary bladder. Maggi CA, et al. **J Pharmacol Exp Ther** 1986 Jul; 238(1):259-66

Motor effect of neurokinins on the rat duodenum: evidence for the involvement of substance K and substance P receptors. Maggi CA, et al. **J Pharmacol Exp Ther** 1986 Jul;238(1):341-51

Isolation and identification of an endogenous ligand for the phencyclidine receptor. DiMaggio DA, et al. **Natl Inst Drug Abuse Res Monogr Ser** 1986;64:24-36

Characterization of phencyclidine and sigma receptor-binding sites in brain. Gundlach AL, et al. **Natl Inst Drug Abuse Res Monogr Ser** 1986; 64:1-13

Further evidence of phencyclidine/sigma opioid receptor commonality. Sircar R, et al. **Natl Inst Drug Abuse Res Monogr Ser** 1986; 64:14-23

Chronic iminodipropionitrile (IDPN) causes no changes in the rat brain phencyclidine (PCP) receptor. Rothman RB, et al. **Neuropeptides** 1986 Apr;7(3):259-63

Dihydroergocristine-induced stimulation of the 5-HT autoreceptor in the hypothalamus of the rat. Moret C, et al. **Neuropharmacology** 1986 Feb; 25(2):169-74

Covalent labeling of neurotensin receptors in rat gastric fundus plasma membranes. Mazella J, et al. **Peptides** 1985 Nov-Dec;6(6):1137-41

Human serum Cohn fraction IV (alpha-globin enriched) inhibits ligand binding at neurotransmitter receptors in human brain. Andorn AC, et al. **Proc Natl Acad Sci USA** 1986 Jun;83(12):4572-5

[Binding of tritiated imipramine to human platelets. 1 or several binding sites?] Scotto di Tella AM, et al. **Encephale** 1986 Jan-Feb;12(1):13-7 (Eng. Abstr.) **(Fre)**

[Pharmacological analysis of the serotonin- and glutamatergic mechanisms in the suppressive effect of neuroleptics on the pedal self-stimulation of the ventral tectum of the midbrain] Talalaenko AN, et al. **Farmakol Toksikol** 1986 May-Jun;49(3):40-3 (Eng. Abstr.) **(Rus)**

TESTOSTERONE

Dissociation of the effects of castration and testosterone replacement on sexual behavior and neural metabolism of dopamine in the male rat. Baum MJ, et al. **Brain Res Bull** 1986 Feb;16(2):145-8

Brain 5-hydroxytryptamine and plasma testosterone in L-tryptophan treated rats. Biswas NM, et al. **Endocr Res** 1985;11(3-4):131-7

Evidence for activation of the central nervous system-pituitary mechanism for gonadotropin secretion at the time of puberty in the male rat. Matsumoto AM, et al. **Endocrinology** 1986 Jul;119(1):362-9

Regulation of beta-endorphin, corticotropin-like intermediate lobe peptide, and alpha-melanotropin-stimulating hormone in the hypothalamus by testosterone. Wardlaw SL. **Endocrinology** 1986 Jul; 119(1):19-24

The effect of neuroleptic drugs on serum testosterone level in the male rat. Okonmah AD, et al. **Gen Pharmacol** 1986;17(2):235-8

The influence of social cues on the reproductive endocrinology of male brown-headed cowbirds: field and laboratory studies. Dufty AM Jr, et al. **Horm Behav** 1986 Jun;20(2):222-34

Single subcutaneous doses of a luteinizing hormone-releasing hormone antagonist suppress serum gonadotropin and testosterone levels in normal men. Pavlou SN, et al. **J Clin Endocrinol Metab** 1986 Aug; 63(2):303-8

Effect of long-term infusion of an LH-releasing hormone agonist on testicular function in bulls. von Rechenberg W, et al. **J Endocrinol** 1986 May;109(2):R9-11

Testosterone metabolites do not participate in the control of hypothalamic LH-releasing hormone. Zanisi M, et al. **J Endocrinol** 1986 May; 109(2):291-6

Influence of subcutaneous melatonin implantation on gonadal development and on plasma levels of luteinizing hormone, testosterone, estradiol, and corticosterone in the pigeon. John TM, et al. **J Pineal Res** 1986;3(2):169-79

Absence of LHRH effect on testosterone production by Leydig cells from fetal mouse testis. Pointis G, et al. **J Steroid Biochem** 1986 Jan; 24(1):307-10

Effects of dopaminergic drugs on plasma levels of steroid hormones in conscious dogs. Goiny M, et al. **Life Sci** 1986 Jun 23; 38(25):2293-300

Modulation and role of Ca2+ in LH and LHRH agonist action in rat Leydig cells. Cooke BA, et al. **Med Biol** 1986;63(5-6):259-63

The different mechanisms for suppression of pituitary and testicular function. Sandow J, et al. **Med Biol** 1986;63(5-6):192-200

Interactions of testosterone and short-photoperiod exposure on the neuroendocrine axis of the male Syrian hamster. Steger RW, et al. **Neuroendocrinology** 1986;43(1):69-74

Testosterone removal in rats results in a decrease in social aggression and a loss of social dominance. Albert DJ, et al. **Physiol Behav** 1986; 36(3):401-7

The arachidonic acid cascade is involved in the masculinizing action of testosterone on embryonic external genitalia in mice. Gupta C, et al. **Proc Natl Acad Sci USA** 1986 Jun;83(12):4346-9

[Effect of tyrosine on serum concentrations of LH, FSH and testosterone in adult men] Ni J, et al. **Sheng Li Hsueh Pao** 1985 Jun;37(3):303-6 (Eng. Abstr.) **(Chi)**

[Changes in testosterone levels in rabbit embryo testes after removal of the hypothalamus (encephalectomy)] Proshliakova EV, et al. **Biull Eksp Biol Med** 1986 May;101(5):616-9 (Eng. Abstr.) **(Rus)**

[Brain monoamines and the hypophyseo-gonadal system of adult rats after the androgenization of their mothers during pregnancy] Naumenko EV, et al. **Ontogenez** 1986 May-Jun;17(3):285-92 (Eng. Abstr.) **(Rus)**

THERAPEUTIC EQUIVALENCY

Branded or generic propranolol? [letter] Garcia-Buñuel L. **Lancet** 1986 Jun 21;1(8495):1443

THIOPROPERAZINE

[Changes in plasma prolactin and magnesium in male rats treated with thioproperazine and/or bromocriptine] Marois G, et al. **Ann Endocrinol (Paris)** 1985;46(6):399-405 (Eng. Abstr.) **(Fre)**

THIORIDAZINE

Dissolution of thioridazine hydrochloride from the coprecipitate with pectin. Takahashi Y, et al. **Chem Pharm Bull (Tokyo)** 1986 Jan; 34(1):327-32

Comment: Thioridazine bioequivalence [letter] Meyer HM Jr. **Drug Intell Clin Pharm** 1986 Apr;20(4):311-2

Mesoridazine and thioridazine: clinical effects and blood levels in refractory schizophrenics. Vital-Herne J, et al. **J Clin Psychiatry** 1986 Jul;47(7):375-9

Behavioral changes following generic thioridazine [letter] Weber SS, et al. **J Clin Psychiatry** 1986 May;47(5):277-8

The effect of thioridazine on haloperidol induced behavioral hypersensitivity. Klawans HL, et al. **Life Sci** 1986 May 12; 38(19):1707–14

Evidence that thioridazine enhances amphetamine–induced stereotypy via anticholinergic activity. Robertson A, et al. **Prog Neuropsychopharmacol Biol Psychiatry** 1986;10(1):33–40

Concentrations of thioridazine and thioridazine metabolites in erythrocytes. Svensson C, et al. **Psychopharmacology (Berlin)** 1986; 89(3):291–2

[Changes in the wave composition of evoked potentials during treatment of endogenous depression] Loginov VV, et al. **Zh Nevropatol Psikhiatr** 1986;86(3):431–5 (Eng. Abstr.) **(Rus)**

THIOTHIXENE

Borderline and schizotypal personality disorders treated with low–dose thiothixene vs placebo. Goldberg SC, et al. **Arch Gen Psychiatry** 1986 Jul;43(7):680–6

THIRST

Unilateral substantia nigra lesions and schedule–induced polydipsia. Mittleman G, et al. **Physiol Behav** 1986;36(3):437–40

THYROID HORMONES

Seasonal changes in the plasma concentration of sexual steroids, corticosterone and thyroid hormone in the hen with special respect to the moulting period. Szelényi Z, et al. **Acta Vet Hung** 1985; 33(3–4):189–98

Adrenal phenylethanolamine–N–methyltransferase activity in the young rat: influence of thyroid hormones and insulin–induced hypoglycemia. Gripois D, et al. **Biol Neonate** 1986;49(4):219–23

Influence of thyroid hormones on rat cerebellar cell aggregation and survival in culture. Sarafian T, et al. **Brain Res** 1986 May; 391(2):261–70

Thyroid neuroendocrinology: neural regulation of thyroid hormone secretion. Ahrén B. **Endocr Rev** 1986 May;7(2):149–55 (88 ref.)

Epidermal growth factor: effect on circulating thyroid hormone levels in sheep. Corcoran JM, et al. **Endocrinology** 1986 Jul;119(1):214–7

Regulation of thyrotropin (TSH) bioactivity by TSH–releasing hormone and thyroid hormone. Menezes–Ferreira MM, et al. **Endocrinology** 1986 May;118(5):2125–30

VIP and hormone secretion from thyroidal follicular and C–cells. Laurberg P. **Horm Metab Res** 1986 Apr;18(4):230–3

In vitro effects of thyroid hormones on red blood cell Ca++–dependent ATPase activity. Costante G, et al. **J Endocrinol Invest** 1986 Feb; 9(1):15–20

Serum thyrotropin by ultrasensitive immunoradiometric assay and serum free thyroid hormones in pregnancy. Pacchiarotti A, et al. **J Endocrinol Invest** 1986 Apr;9(2):185–9

[Evaluation of thyroid function (letter)] Arlet P. **Rev Med Interne** 1986 Jan;7(1):92 **(Fre)**

[Comparative histologic and hormonal studies of the thyroid gland with special reference to sudden infant death (SIDS)] Risse M, et al. **Z Rechtsmed** 1986;96(1):31–8 (Eng. Abstr.) **(Ger)**

[Hormonal and lipid changes in patients with chronic renal insufficiency in hemodialysis (letter)] Simó R, et al. **Med Clin (Barc)** 1986 Apr 5; 86(13):566–7 **(Spa)**

THYROTROPIN

Postnatal development of brain TRH, serum TSH and thyroid hormones in the male and female rat. Gayo L, et al. **Acta Endocrinol (Copenh)** 1986 May;112(1):7–11

Human foetal prolactin but not thyrotropin secretion is decreased by bromocriptine. Roti E, et al. **Acta Endocrinol (Copenh)** 1986 May; 112(1):35–42

Characterization of the pituitary response in the TRH test by kinetic modeling. Swartz CM, et al. **Acta Endocrinol (Copenh)** 1986 May; 112(1):43–8

Can neonatal treatment with a related hormone adapt the receptor for itself? Csaba G, et al. **Acta Physiol Hung** 1986;67(1):65–9

Regulation of thyrotropin (TSH) bioactivity by TSH–releasing hormone and thyroid hormone. Menezes–Ferreira MM, et al. **Endocrinology** 1986 May;118(5):2125–30

The effects of anterior hypothalamic deafferentation on thyrotropin (TSH) biosynthesis and response to TSH–releasing hormone. Taylor T, et al. **Endocrinology** 1986 Jun;118(6):2417–24

Thyrotropin and norepinephrine stimulate the metabolism of phosphoinositides in FRTL–5 thyroid cells. Philp NJ, et al. **FEBS Lett** 1986 Jul 7;202(2):193–6

The anti–oestrogen tamoxifen does not interfere with the dopaminergic control of prolactin and TSH release in normogonadotrophic oligozoospermic man. van Bergeijk L, et al. **Horm Metab Res** 1986 Apr;18(4):272–6

Thyrotrophin–releasing hormone does not accumulate glycosylated thyrotrophin, but changes heterogeneous forms of thyrotrophin within the rat anterior pituitary gland. Mori M, et al. **J Endocrinol** 1986 May; 109(2):227–31

Serum thyrotropin by ultrasensitive immunoradiometric assay and serum free thyroid hormones in pregnancy. Pacchiarotti A, et al. **J Endocrinol Invest** 1986 Apr;9(2):185–9

Age–related differences in the pituitary prolactin response to thyrotropin–releasing hormone. Arnetz BB, et al. **Life Sci** 1986 Jul 14; 39(2):135–9

THYROXINE

Postnatal development of brain TRH, serum TSH and thyroid hormones in the male and female rat. Gayo L, et al. **Acta Endocrinol (Copenh)** 1986 May;112(1):7–11

Hormones in perinatal rat and spiny mouse: relation to altricial and precocial timing of birth. Lamers WH, et al. **Am J Physiol** 1986 Jul; 251(1 Pt 1):E78–85

Role of thyroxine in functional gastric development. Tseng CC, et al. **Am J Physiol** 1986 Jul;251(1 Pt 1):G111–6

L–thyroxine, cortisol, and diet affect the postnatal development of the facial part of the skull in developing rats. Maeda N, et al. **Anat Anz** 1986;161(2):99–104

Effect on wool growth of thyroxine replacement in thyroidectomized merino rams. Maddocks S, et al. **Aust J Biol Sci** 1985;38(4):405–10

Thyroxine treatment reduces the anorectic effect of estradiol in rats. Young JK. **Behav Neurosci** 1986 Apr;100(2):284–7

Thyroxine increases neonatal mouse submandibular gland mRNA–directed synthesis of epidermal growth factor. Walker P. **Biochem Cell Biol** 1986 Apr;64(4):290–6

Studies on L–arginase in developing rat small intestine, brain, and kidney. II. Effect of hydrocortisone and thyroxine. Konarska L, et al. **Biochem Med Metab Biol** 1986 Apr;35(2):170–8

More on the Amerlex kit analog method for thyroxin. Ekins RP, et al. **Clin Chem** 1986 Jun;32(6):1243–6

One–step immunoassays for free (unbound) hormones: the effects of tracer binding by serum proteins [letter] Wilkins TA. **Clin Chem** 1986 Jun; 32(6):1238–9

Is the dilution experiment a valid technique for assessing the validity of free thyroxin assay? [letter] Wilkins TA. **Clin Chem** 1986 Jun; 32(6):1241

Familial dysalbuminaemic hyperthyroxinaemia: studies of albumin binding and implications for hormone action. Barlow JW, et al. **Clin Endocrinol (Oxf)** 1986 Jan;24(1):39–47

Cholecystographic agents and sulfobromophthalein inhibit the binding of L–thyroxine to plasma membranes of rat hepatocytes. Felicetta JV, et al. **Endocrinology** 1986 Jun;118(6):2500–4

In vivo formation of diiodotyrosine by extrathyroidal thyroxine ether–link cleavage and effects of mononitrotyrosine on this pathway in the rat. Meinhold H, et al. **Endocrinology** 1986 Jun;118(6):2305–11

Effect of different beta–blocking drugs and adrenaline on the conversion of thyroxine to triiodothyronine in isolated rat hepatocytes. Aanderud S, et al. **Horm Metab Res** 1986 Feb;18(2):110–3

Serum concentrations of prolactin, thyroxine and triiodothyronine relative to season and the estrous cycle in the mare. Johnson AL. **J Anim Sci** 1986 Apr;62(4):1012–20

The effect of environmental temperature on concentrations of thyroxine and triiodothyronine after thyrotropin releasing hormone in steers. Pratt BR, et al. **J Anim Sci** 1986 May;62(5):1346–52

Seasonal changes in concentrations of plasma hormones in the male ring dove (Streptopelia risoria). Lea RW, et al. **J Endocrinol** 1986 Mar; 108(3):385–91

Control of the development of the ipsilateral retinothalamic projection in Xenopus laevis by thyroxine: results and speculation. Hoskins SG. **J Neurobiol** 1986 May;17(3):203–29 (125 ref.)

Growth hormone treatment and circulating thyroxine [letter] Gómez–Pan A, et al. **Lancet** 1986 May 3;1(8488):1030–1

Involvement of developing sympathetic nervous system in thyroxine–mediated submandibular gland nerve growth factor and epidermal growth factor responses. Lakshmanan J, et al. **Pediatr Res** 1986 Mar;20(3):232–6

Thyroxine increases submandibular gland nerve growth factor and epidermal growth factor concentrations precociously in neonatal mice: evidence for thyroid hormone–mediated growth factor synthesis. Walker P. **Pediatr Res** 1986 Apr;20(4):281–4

Indomethacin inhibits thrombin–, but not thyroxin–stimulated resorption of fetal rat limb bones. Hoffmann O, et al. **Prostaglandins** 1986 Apr; 31(4):601–8

The effect of salivary glands extirpation, duct ligation, and thyroxine administration on body weight in rats. D'Antonio GM, et al. **Rev Odontol UNESP** 1984;13(1–2):99–104

[Effect of thyroid hormones on the nuclear–cytoplasmic transport of RNA] Adylova AT, et al. **Probl Endokrinol (Mosk)** 1986 Mar–Apr; 32(2):74–6 (Eng. Abstr.) **(Rus)**

[Effect of thyroxine on the hemoglobin affinity to oxygen and 2,3–diphosphoglycerate level in rat erythrocytes] Sukhomlinov BF, et al. **Ukr Biokhim Zh** 1986 Mar–Apr;58(2):84–6 (Eng. Abstr.) **(Rus)**

TRANQUILIZING AGENTS

Changes in popular attitudes and beliefs about tranquilizers. 1970–1979. Clinthorne JK, et al. **Arch Gen Psychiatry** 1986 Jun;43(6):527–32

Is there a trend away from tranquillizing women? Bass MJ, et al. **Can J Public Health** 1986 Mar–Apr;77(2):119–22

A comparative trial of depot pipothiazine. Steinert J, et al. **J Int Med Res** 1986;14(2):72–7

[Synthesis and pharmacological studies of derivatives of 5- and 7–(O–hydroxyphenyl)–2,3–dihydro–1,4–diazepins] Kostka K, et al. **Acta Pol Pharm** 1985;42(5):442–7 (Eng. Abstr.) **(Pol)**

TRANQUILIZING AGENTS, MAJOR

Open multicentre trial of zuclopenthixol in mania and schizophrenia based on the AMDP scales. Bobon D, et al. **Acta Psychiatr Belg** 1986 Mar–Apr;86(2):152–76

The spectrum concept of neuroleptic toxicity [letter] Conlon P. **Am J Psychiatry** 1986 Jun;143(6):811

Safety of the combination of lithium and neuroleptic drugs. Goldney RD, et al. **Am J Psychiatry** 1986 Jul;143(7):882–4

Pharmacotherapy for patients with borderline personality disorder. Gunderson JG. **Arch Gen Psychiatry** 1986 Jul;43(7):698–700

Family psychoeducation, social skills training, and maintenance chemotherapy in the aftercare treatment of schizophrenia. I. One–year effects of a controlled study on relapse and expressed emotion. Hogarty GE, et al. **Arch Gen Psychiatry** 1986 Jul;43(7):633–42

Within–session data [letter] Lynch MR, et al. **Biol Psychiatry** 1986 May 21(5–6):573–4

EEG asymmetry in schizophrenic patients before and during neuroleptic treatment. Merrin EL, et al. **Biol Psychiatry** 1986 May; 21(5–6):455–64

A comparison of the binding of sigma opioids and phencyclidine, and the interaction with antipsychotic drugs in rat brain membranes. Downes CP, et al. **Br J Pharmacol** 1986 May;88(1):231–7

A randomised controlled trial of prophylactic neuroleptic treatment. Crow TJ, et al. **Br J Psychiatry** 1986 Feb;148:120–7

Short–term outcome in trial entrants and trial eligible patients. MacMillan JF, et al. **Br J Psychiatry** 1986 Feb;148:128–33

Typical and atypical antipsychotic occupancy of D2 and S2 receptors: an autoradiographic analysis in rat brain. Altar CA, et al. **Brain Res Bull** 1986 Apr;16(4):517–25

Variation in the ability of neuroleptics to block the inhibitory influence of dopaminergic neurons on the activity of cells in the rat prefrontal cortex. Thierry AM, et al. **Brain Res Bull** 1986 Feb;16(2):155–60

Neuroleptic blood levels and clinical response. Rockland LH. **Can J Psychiatry** 1986 May;31(4):299–303

Early neuroleptic response in psychotic men and women: correlation with plasma HVA and MHPG. Bowers MB Jr, et al. **Compr Psychiatry** 1986 May–Jun;27(3):181–5

Characterization of the hepatic prolactin receptors induced by chronic iron deficiency and neuroleptics. Barkey RJ, et al. **Eur J Pharmacol** 1986 Mar 18;122(2):259–67

Decreased peripheral benzodiazepine binding sites in platelets of neuroleptic–treated schizophrenics. Gavish M, et al. **Eur J Pharmacol** 1986 Feb 18;121(2):275–9

Neuroleptic drugs and 5HT1 receptor: different potencies of various neuroleptic drugs on 5HT1 receptors in discrete regions of the rat brain. Harada T, et al. **Folia Psychiatr Neurol Jpn** 1985;39(4):551–7

The effect of neuroleptic drugs on serum testosterone level in the male rat. Okonmah AD, et al. **Gen Pharmacol** 1986;17(2):235–8

Patients' competency to give informed consent to medication. Beck JC, et al. **Hosp Community Psychiatry** 1986 Apr;37(4):400–2

Determination of piquindone in canine plasma and urine by high–performance liquid chromatography. Brooks MA, et al. **J Chromatogr** 1986 Mar 7;375(2):349–57

Low dose therapy: the future of neuroleptic psychopharmacology. A symposium held during the annual meeting of the American Psychiatric Association. May 1986, Washington, D.C. **J Clin Psychiatry** 1986 May; 47 Suppl:1–36

'Antipsychotic' or 'neuroleptic' [letter] Burton HB. **J Clin Psychiatry** 1986 Jul;47(7):392

Early, targeted pharmacotherapeutic intervention in schizophrenia. Carpenter W Jr. **J Clin Psychiatry** 1986 May;47 Suppl:23–9 (48 ref.)

Depot neuroleptics: a comparative review of standard, intermediate, and low–dose regimens. Kane JM, et al. **J Clin Psychiatry** 1986 May; 47 Suppl:30–3 (18 ref.)

The future of neuroleptic psychopharmacology. Ortiz A, et al. **J Clin Psychiatry** 1986 May;47 Suppl:3–11 (122 ref.)

Low–dose treatment strategies. Van Putten T, et al. **J Clin Psychiatry** 1986 May;47 Suppl:12–6 (21 ref.)

Neuroleptics and reserpine in refractory psychoses. Berlant JL. **J Clin Psychopharmacol** 1986 Jun;6(3):180–4

The prescription of discretionary antipsychotic medication by state mental hospital psychiatrists. Benson PR. **J Health Soc Behav** 1986 Mar; 27(1):28–43

Specific binding of 3H–SCH 23390 to dopamine D1 receptors in vivo. Andersen PH, et al. **Life Sci** 1986 Apr 21;38(16):1507–14

Evidence that the potential antipsychotic agent rimcazole (BW 234U) is a specific, competitive antagonist of sigma sites in brain. Ferris RM, et al. **Life Sci** 1986 Jun 23;38(25):2329–37

Involvement of extrapyramidal motor mechanisms in the suppression of locomotor activity by antipsychotic drugs: a comparison between the effects produced by pre– and post–synaptic inhibition of dopaminergic neurotransmission. Ahlenius S, et al. **Pharmacol Biochem Behav** 1986 May;24(5):1409–15

Fluperlapine vs haloperidol: a comparison of their neuroendocrinological profiles and the influence on serum lipids. Fleischhacker WW, et al. **Pharmacopsychiatry** 1986 May;19(3):111–4

Is conformational analysis a key to solve the structure––activity problem of neuroleptics? Misztal S, et al. **Pharmazie** 1986 Apr;41(4):277–81 (56 ref.)

Recent news in the chemistry and pharmacology of neuroleptics with special regard to the work carried out in Czechoslovakia. Protiva M. **Pharmazie** 1986 Apr;41(4):225–32 (179 ref.)

Relevance of polymorphic drug oxidation in the use of neuroleptics in schizophrenia. Tang SW. **Prog Clin Biol Res** 1986;214:303–11 (20 ref.)

Drug effects on serine metabolism in psychiatric patients. Waziri R, et al. **Psychiatry Res** 1986 Jun;18(2):119–26

Research methodology and the pharmacotherapy of the chronic schizophrenias. Ban TA, et al. **Psychopharmacol Bull** 1986; 22(1):36–41

An early phase II clinical trial of remoxipride in schizophrenia with measurement of plasma neuroleptic activity. Chouinard G, et al. **Psychopharmacol Bull** 1986;22(1):267–71

Pharmacological treatments of schizophrenia. Simpson GM. **Psychopharmacol Bull** 1986;22(1):33–5, 42–3

The AMDP system in international clinical trials: a double–blind comparison of fluperlapine and haloperidol. Woggon B, et al. **Psychopharmacol Bull** 1986;22(1):47–51

Involvement of different dopamine receptors in rat diphasic motility response to apomorphine. Vaccheri A, et al. **Psychopharmacology (Berlin)** 1986;89(3):265–8

First person account: a parent's view on enforcing medication. Slater E. **Schizophr Bull** 1986;12(2):291–2

[Pharmacokinetic study of isofloxythepin in animals] Poláková L, et al. **Cesk Farm** 1986 Apr;35(3):97–101 (Eng. Abstr.) **(Cze)**

[Determination of plasma concentrations in the drug treatment of psychoses] Knudsen P, et al. **Ugeskr Laeger** 1986 Mar 31; 148(14):849–52 **(Dan)**

[Pharmacokinetic aspects of the effects and interactions of various neuro– and psychotropic drugs] Melzacka M. **Postepy Hig Med Dosw** 1985 Nov–Dec;39(6):581–611 (204 ref.) (Eng. Abstr.) **(Pol)**

[Identification of neuroleptics by using the characteristics of the spatial organization of the EEG] Monakhov KK, et al. **Farmakol Toksikol** 1986 May–Jun;49(3):27–32 (Eng. Abstr.) **(Rus)**

[Pharmacological analysis of the serotonin– and glutamatergic mechanisms in the suppressive effect of neuroleptics on the pedal self–stimulation of the ventral tectum of the midbrain] Talalaenko AN, et al. **Farmakol Toksikol** 1986 May–Jun;49(3):40–3 (Eng. Abstr.) **(Rus)**

[Clinical aspects and significance of measuring concentrations of neuroleptics and antidepressants in the blood] Cheshkova E, et al. **Zh Nevropatol Psikhiatr** 1986;86(4):573–6 (Eng. Abstr.) **(Rus)**

TRANQUILIZING AGENTS, MINOR

An interim multicentre report on 677 anxious geriatric out–patients treated with buspirone. Napoliello MJ. **Br J Clin Pract** 1986 Feb;40(2):71–3

Neuroanatomical site of the inhibitory influence of anxiolytic drugs on central serotonergic transmission. Nishikawa T, et al. **Brain Res** 1986 Apr 16;371(1):123–32

Syntheses of 3,4–dihydro–2H–1,4–benzoxazine–2–acetates and related compounds. Masuoka Y, et al. **Chem Pharm Bull (Tokyo)** 1986 Jan; 34(1):130–9

Psychopharmacology and psychotherapy in the treatment of anxiety. Freedman AM. **Curr Psychiatr Ther** 1986;23:101–18 (47 ref.)

Buspirone decreases the activity of 5–hydroxytryptamine–containing dorsal raphe neurons in–vitro. Trulson ME, et al. **J Pharm Pharmacol** 1986 May;38(5):380–2

Discriminative stimulus effects of atypical anxiolytics in baboons and rats. Ator NA, et al. **J Pharmacol Exp Ther** 1986 May;237(2):393–403

Anxiolytic effects of progesterone are sexually dimorphic. Rodriguez–Sierra JF, et al. **Life Sci** 1986 May 19;38(20):1841–5

The anxiolytic but not the sedative properties of tracazolate are reversed by the benzodiazepine receptor antagonist, Ro 15–1788. File SE, et al. **Neuropsychobiology** 1985;14(4):193–7

Serotonergic mechanisms in the behavioral effects of buspirone and gepirone. Eison AS, et al. **Pharmacol Biochem Behav** 1986 Mar; 24(3):701–7

The effects of Ro 15–1788 on anxiolytic self–administration in the rhesus monkey. Johanson CE, et al. **Pharmacol Biochem Behav** 1986 Apr; 24(4):855–9

Are serotonergic neurons involved in the control of anxiety and in the anxiolytic activity of benzodiazepines? Thiebot MH. **Pharmacol Biochem Behav** 1986 May;24(5):1471-7

Interaction of buspirone and dopaminergic agents on punished behavior of pigeons. Witkin JM, et al. **Pharmacol Biochem Behav** 1986 Mar; 24(3):751-6

Effects of Suanzaorentang on behavior changes and central monoamines. Hsieh MT, et al. **Proc Natl Sci Counc Repub China [B]** 1986 Jan; 10(1):43-8

Open trial of buspirone in the treatment of major depressive disorder. Schweizer EE, et al. **Psychopharmacol Bull** 1986;22(1):183-5

[Clinical methods for studying anxiolytic agents] Guelfi JD. **Therapie** 1986 Jan-Feb;41(1):37-41 (Eng. Abstr.) **(Fre)**

[Occupation of central benzodiazepine receptors and anxiety] Le Fur G, et al. **Therapie** 1986 Jan-Feb;41(1):43-7 (Eng. Abstr.) **(Fre)**

[Critical study of the clinical actions of 5-HTP] Teixeira M. **Actas Luso Esp Neurol Psiquiatr Cienc Afines** 1986 Mar-Apr; 14(2):104-12 **(Por)**

[The role of GABA-benzodiazepine receptor complex in affecting the anxiolytic effect of 3-hydroxypyridines--new non-benzodiazepine tranquilizers] Voronina TA, et al. **Biull Eksp Biol Med** 1986 May; 101(5):571-3 (Eng. Abstr.) **(Rus)**

TRANYLCYPROMINE

Synergistic action of alprazolam with tranylcypromine in drug-resistant atypical depression with panic attacks. Ries RK, et al. **Biol Psychiatry** 1986 May;21(5-6):522-6

Rapid antidepressant effect of addition of lithium to tranylcypromine. Tariot PN, et al. **J Clin Psychopharmacol** 1986 Jun;6(3):165-7

Detection and quantitation of a ring-hydroxylated metabolite of the antidepressant drug tranylcypromine. Baker GB, et al. **J Neural Transm** 1986;65(3-4):233-43

Effects of tranylcypromine enantiomers on monoamine uptake and release and imipramine binding. Tuomisto J, et al. **J Neural Transm** 1986; 65(2):135-45

Regional cerebral pharmacokinetics of the dopaminergic neurotoxin 1-methyl-4-phenyl-1,2,3,6-tetrahydropyridine as examined by positron emission tomography in a baboon is altered by tranylcypromine. Moerlein SM, et al. **Neurosci Lett** 1986 May 15;66(2):205-9

TRIAZOLAM

The carry-over effects of triazolam compared with nitrazepam and placebo in acute emergency driving situations and in monotonous simulated driving. Laurell H, et al. **Acta Pharmacol Toxicol (Copenh)** 1986 Mar;58(3):182-6

Repeated administration of diazepam and triazolam to subjects with histories of drug abuse. Roache JD, et al. **Drug Alcohol Depend** 1986 May;17(1):15-29

Bioavailability of two oral formulations of triazolam using radioreceptor assay. Lapka R, et al. **Pharmazie** 1986 Apr;41(4):256-7

TRIFLUOPERAZINE

Effect of trifluoperazine and other drugs on matrix vesicle formation by chicken growth plate chondrocytes in primary cell culture. Schalk EM, et al. **Biochem Pharmacol** 1986 Jul 15;35(14):2373-9

The high affinity calcium inhibition of parathyroid adenylate cyclase is not calmodulin dependent. Oldham SB, et al. **Calcif Tissue Int** 1986 May;38(5):275-81

Development and application of a specific radioimmunoassay for trifluoperazine N4'-oxide to a kinetic study in humans. Aravagiri M, et al. **J Pharmacol Exp Ther** 1986 May;237(2):615-22

Effect of trifluoperazine on rabbit cortical collecting tubular response to vasopressin. Dillingham MA, et al. **J Physiol (Lond)** 1986 Mar; 372:41-50

Effects of calmodulin antagonists Cd2+ and trifluoperazine on mixed lymphocyte culture cell-mediated lysis and antibody-dependent cell cytolysis. Wolff CH. **Scand J Immunol** 1986 Jun;23(6):663-8

Effect of heparin on platelet aggregation inhibited by PGI2, trifluoperazine and verapamil. Weber DR, et al. **Thromb Res** 1986 May 15;42(4):477-87

TRIMEPRAZINE

Relative bioavailability of trimeprazine tablets investigated in man using HPLC with electrochemical detection. Hu OY, et al. **J Pharm Pharmacol** 1986 Mar;38(3):172-6

[Biotransformation of alimemazine] Pfeifer S, et al. **Pharmazie** 1986 Feb; 41(2):111-3 (Eng. Abstr.) **(Ger)**

TRYPTAMINES

Reevaluation of the products of tryptamine catalyzed by rabbit liver N-methyltransferases. Crooks PA, et al. **Biochem Pharmacol** 1986 May 1;35(9):1600-3

Tryptamine depletion in the rat striatum following electrolytic lesions of the substantia nigra. Juorio AV, et al. **Brain Res** 1986 Apr 23; 371(2):385-9

Characterization and quantitative autoradiography of [3H]tryptamine binding sites in rat brain. Kaulen P, et al. **Brain Res** 1986 Feb 26; 366(1-2):72-88

Effect of tryptamine on the behavior of mice. Sugimoto Y, et al. **J Pharmacobiodyn** 1986 Jan;9(1):68-73

Effects of melatonin and 5-methoxytryptamine on sleep-wake patterns in the male rat. Mirmiran M, et al. **J Pineal Res** 1986;3(2):135-41

Physiological responses of guinea-pig myenteric neurons secondary to the release of endogenous serotonin by tryptamine. Takaki M, et al. **Neuroscience** 1985 Sep;16(1):223-40

TRYPTOPHAN

Tryptophan in horseradish peroxidase. Ohlsson PI, et al. **Acta Chem Scand [B]** 1986 Apr;40(4):257-61

Stability of tryptophan in total parenteral nutrient solutions [letter] Johnston SJ. **Am J Hosp Pharm** 1986 Jun;43(6):1424

Maternal dietary substrates and human fetal biophysical activity. I. The effects of tryptophan and glucose on fetal breathing movements. Devoe LD, et al. **Am J Obstet Gynecol** 1986 Jul;155(1):135-9

The adenosine triphosphate-pyrophosphate isotopic exchange reaction: a tool for determination of tryptophan. Trezeguet V, et al. **Anal Biochem** 1986 May 1;154(2):618-23

Effect of sustained exercise on concentrations of plasma aromatic and branched-chain amino acids and brain amines. Acworth I, et al. **Biochem Biophys Res Commun** 1986 May 29;137(1):149-53

Quantification of the importance of individual steps in the control of aromatic amino acid metabolism. Salter M, et al. **Biochem J** 1986 Mar 15;234(3):635-47

Tryptophanyl adenylate formation by tryptophanyl-tRNA synthetase from Escherichia coli. Merle M, et al. **Biochemistry** 1986 Mar 11; 25(5):1115-23

Detection of energy transfer between tryptophan residues in the tubulin molecule and bound bis(8-anilinonaphthalene-1-sulfonate), an inhibitor of microtubule assembly, that binds to a flexible region on tubulin. Prasad AR, et al. **Biochemistry** 1986 Jun 17;25(12):3536-40

Molecular basis for the anti-sickling activity of aromatic amino acids and related compounds: a proton nuclear magnetic resonance investigation. Russu IM, et al. **Biochemistry** 1986 Feb 25;25(4):808-15

Spin-lattice relaxation in the triplet state of the buried tryptophan residue of ribonuclease T1. Ghosh S, et al. **Biophys J** 1986 Mar; 49(3):753-60

Stimulation of tryptophan uptake into brain microvessels by D-glutamine. Gorgievski-Hrisoho M, et al. **Brain Res** 1986 Mar 5;367(1-2):395-7

Brain 5-hydroxytryptamine and plasma testosterone in L-tryptophan treated rats. Biswas NM, et al. **Endocr Res** 1985;11(3-4):131-7

Separation of tryptophan pyrrolooxygenase into three molecular forms. A study of their substrate specificities using tryptophyl-containing peptides and proteins. Camoretti-Mercado B, et al. **Eur J Biochem** 1986 Apr 15;156(2):317-25

The interaction of the trp repressor from Escherichia coli with L-tryptophan and indole propanoic acid. Lane AN. **Eur J Biochem** 1986 Jun 2;157(2):405-13

Plasma free tryptophan concentration in children with attention deficit disorder. Hoshino Y, et al. **Folia Psychiatr Neurol Jpn** 1985; 39(4):531-5

Neurotransmitter precursor therapies in affective disorders. von Lerber-Good WF. **Int J Vitam Nutr Res [Suppl]** 1986;29:69-82 (39 ref.)

Tryptophan requirement of growing swine as determined by the oxidation of an indicator amino acid. Lin FD, et al. **J Anim Sci** 1986 Mar; 62(3):660-4

Novel form of transcription attenuation regulates expression the Bacillus subtilis tryptophan operon. Shimotsu H, et al. **J Bacteriol** 1986 May; 166(2):461-71

Evidence for involvement of tryptophan residue in the low-affinity saccharide binding site of ricin D. Hatakeyama T, et al. **J Biochem (Tokyo)** 1986 Apr;99(4):1049-56

Chromatographic separation and determination of tryptophan in food-stuffs after barytic hydrolysis using Fractogel TSK HW 40 S. Huet JC, et al. **J Chromatogr** 1986 Mar 21;355(2):451-5

Influence of tryptophan loading on urinary excretion of anthranilic acid and 3-hydroxyanthranilic acid by men and women as determined by alkali flame ionization gas chromatography. van der Poll JM, et al. **J Chromatogr** 1986 Mar 7;375(2):213-23

The serotonin syndrome: case responsive to propranolol [letter] Guzé BH, et al. **J Clin Psychopharmacol** 1986 Apr;6(2):119-20

Dissociation of depressive mood and vegetative symptoms during treatment with L-tryptophan [letter] Siddiqui AR, et al. **J Clin Psychopharmacol** 1986 Apr;6(2):118-9

Repair of tryptophan radicals by antioxidants. Jovanovic SV, et al. **J Free Radic Biol Med** 1985;1(2):125-9

Peripheral and central short-term effects of fusaric acid, a DBH inhibitor, on tryptophan and serotonin metabolism in the rat. Chaouloff F, et al. **J Neural Transm** 1986;65(3-4):219-32

Exogenous tryptophan increases synthesis, storage, and intraneuronal metabolism of 5-hydroxytryptamine in the rat hypothalamus.

Lookingland KJ, et al. **J Neurochem** 1986 Jul;47(1):205-12

L-tyrosine and L-tryptophan transport in red blood cells in normal subjects. Effects of other amino acids, temperature and medium of incubation. Widmer J, et al. **Neuropsychobiology** 1986;15(1):7-12

Interaction of tryptophan with lecithin liposomes: NMR and turbidity studies. Viti V, et al. **Physiol Chem Phys Med NMR** 1985; 17(4):413-20

[Erythrocyte membrane transport of L-tyrosine and L-tryptophan in 66 patients with depressive syndromes. Preliminary results] Pringuey D, et al. **Acta Psychiatr Belg** 1986 Mar-Apr;86(2):131-40 (Eng. Abstr.) **(Fre)**

TRYPTOPHAN HYDROXYLASE

AGN 2979 [3(3-methoxyphenyl)-3-(3-dimethylaminopropyl)-4, 4-dimethylpiperidine-2,6-dione]. An inhibitor of the activation of tryptophan hydroxylase. Boadle-Biber MC, et al. **Biochem Pharmacol** 1986 May 1;35(9):1521-6

Effect of 1-methyl-4-phenyl-1,2,3,6-tetrahydropyridine (MPTP) on striatal tyrosine hydroxylase and tryptophan hydroxylase in rat. Matsuda LA, et al. **Neuropharmacology** 1986 Mar;25(3):249-55

TYROSINE

Identification of tyrosine O-sulfate in proteins by reverse-phase high-performance liquid chromatography: use of base hydrolysis combined with precolumn derivatization using phenyl isothiocyanate. Christie DL, et al. **Anal Biochem** 1986 Apr;154(1):92-9

Pharmacokinetics of tiropramide after single doses in man. Arigoni R, et al. **Arzneimittelforschung** 1986 Apr;36(4):738-44

Effect of sustained exercise on concentrations of plasma aromatic and branched-chain amino acids and brain amines. Acworth I, et al. **Biochem Biophys Res Commun** 1986 May 29;137(1):149-53

The conversion of native adenylylated glutamine synthetase into phosphotyrosine enzyme by micrococcal nuclease. Kimura K, et al. **Biochem Biophys Res Commun** 1986 Jun 13;137(2):716-21

Tyr1-substituted and fluorescent Pya1-enkephalins bind strongly and selectively to mu and delta opiate receptors. Mihara H, et al. **Biochem Biophys Res Commun** 1986 May 14;136(3):1170-6

Quantification of the importance of individual steps in the control of aromatic amino acid metabolism. Salter M, et al. **Biochem J** 1986 Mar 15;234(3):635-47

K+-dependent stimulation of tyrosine hydroxylation in striatal slices: role of Ca2+/calmodulin and Ca2+/phospholipid-dependent mechanisms. Knorr AM, et al. **Biochem Pharmacol** 1986 Jun 15;35(12):1929-32

Determination of chemical properties of individual histidine and tyrosine residues of concanavalin A by competitive labeling with 1-fluoro-2,4-dinitrobenzene. Jackson GE, et al. **Biochemistry** 1986 Apr 8;25(7):1657-62

Tyrosine transport into isolated rat brain synaptosomes. Ionic dependence and kinetic studies. Diez-Guerra FJ, et al. **Biochim Biophys Acta** 1986 May 28;857(2):209-16

Radioiodination of tyrosine residue(s) of ox testis and of wheat germ calmodulins. Dutoit C, et al. **Biochim Biophys Acta** 1986 Jun 5; 871(2):130-6

The effect of tyrosine conjugation on the critical micellar concentration of free and glycine-conjugated bile salts. Mills CO, et al. **Biochim Biophys Acta** 1986 May 21;876(3):677-83

Synthesis and biliary excretion of tyrosine-conjugated bile salts in Wistar rats. Mills CO, et al. **Biochim Biophys Acta** 1986 May 21; 876(3):667-76

In vivo studies on the formation of m-tyrosine and o-tyrosine from L-phenylalanine in rats. Ishimitsu S, et al. **Chem Pharm Bull (Tokyo)** 1986 Feb;34(2):768-74

In vivo formation of diiodotyrosine by extrathyroidal thyroxine ether-link cleavage and effects of mononitrotyrosine on this pathway in the rat. Meinhold H, et al. **Endocrinology** 1986 Jun;118(6):2305-11

Fluorescence from L-tyrosine and its quenching by phosphate ions and deoxyribonucleic acid. Verma NC. **Indian J Biochem Biophys** 1985 Aug; 22(4):218-22

Neurotransmitter precursor therapies in affective disorders. von Lerber-Good WF. **Int J Vitam Nutr Res** [**Suppl**] 1986;29:69-82 (39 ref.)

Evidence of the activity of tyrosine kinase(s) and of the presence of phosphotyrosine proteins in pea plantlets. Torruella M, et al. **J Biol Chem** 1986 May 25;261(15):6651-3

High-performance liquid chromatography of tyrosine-containing peptides by pre-column derivatization involving formylation followed by fluorescence reaction with 1,2-diamino-4,5-dimethoxybenzene. Ishida J, et al. **J Chromatogr** 1986 Mar 28;356(1):171-7

Tyrosine phosphorylation of a 66,000 Mr soluble protein in lectin-activated human peripheral blood T lymphocytes. Wedner HJ, et al. **J Immunol** 1986 Jun 1;136(11):4226-31

Phosphorylation of an Escherichia coli protein at tyrosine. Cortay JC, et al. **J Mol Biol** 1986 Jan 20;187(2):305-8

L-tyrosine and L-tryptophan transport in red blood cells in normal subjects. Effects of other amino acids, temperature and medium of incubation. Widmer J, et al. **Neuropsychobiology** 1986;15(1):7-12

Two juxtaposed tyrosyl-OH groups participate in phi X174 gene A protein catalysed cleavage and ligation of DNA. van Mansfeld AD, et al. **Nucleic Acids Res** 1986 May 27;14(10):4229-38

Cholecystokinin-associated COOH-terminal peptides are fully sulfated in pig brain. Eng J, et al. **Proc Natl Acad Sci USA** 1986 May; 83(9):2832-5

Adjuvanticity of stearyl tyrosine on inactivated poliovirus vaccine. Landi S, et al. **Vaccine** 1986 Jun;4(2):99-104

Tyrosine biosynthesis in Sorghum bicolor: isolation and regulatory properties of arogenate dehydrogenase. Connelly JA, et al. **Z Naturforsch** [C] 1986 Jan-Feb;41(1-2):69-78

Tyrosine biosynthesis in Sorghum bicolor: characteristics of prephenate aminotransferase. Siehl DL, et al. **Z Naturforsch** [C] 1986 Jan-Feb; 41(1-2):79-86

[Effect of tyrosine on serum concentrations of LH, FSH and testosterone in adult men] Ni J, et al. **Sheng Li Hsueh Pao** 1985 Jun;37(3):303-6 (Eng. Abstr.) **(Chi)**

[Erythrocyte membrane transport of L-tyrosine and L-tryptophan in 66 patients with depressive syndromes. Preliminary results] Pringuey D, et al. **Acta Psychiatr Belg** 1986 Mar-Apr;86(2):131-40 (Eng. Abstr.) **(Fre)**

[Effect of tiropramide on solid gastric emptying time in man] Corinaldesi R, et al. **Minerva Med** 1986 Apr 21;77(17):675-7 (Eng. Abstr.) **(Ita)**

[Hydrophily of surface non-polar fragment in the protein molecule--a new approach to the stabilization of enzymes. Chemical modification of tyrosine residues in trypsin] Mozhaev VV, et al. **Dokl Akad Nauk SSSR** 1986;288(4):1006-9 **(Rus)**

TYROSINE AMINOTRANSFERASE

Inhibition of aromatic L-amino acid decarboxylase and tyrosine aminotransferase by the monoamine oxidase inhibitor phenelzine. Dyck LE, et al. **J Neurochem** 1986 Jun;46(6):1899-903

The effect of age on the induction of tyrosine aminotransferase and tryptophan oxygenase genes by physiological stress. Wellinger R, et al. **Mech Ageing Dev** 1986 Apr;34(2):203-17

TYROSINE HYDROXYLASE

Modulation by basic polypeptides of ATP-induced activation of tyrosine hydroxylase prepared from bovine adrenal medulla. Morita K, et al. **Arch Biochem Biophys** 1986 May 15;247(1):84-90

Relationships between catecholaminergic neurons and cholecystokinin-containing neurons in the caudal part of the dorsomedial medulla oblongata of the rat: light and electron microscopic observations by the 'mirror technique'. Kubota Y, et al. **Brain Res** 1986 Apr 9;370(2):343-8

Ultrastructural analysis of synapses involving tyrosine hydroxylase-containing neurons in the ventral periventricular hypothalamus of the macaque. Thind KK, et al. **Brain Res** 1986 Feb 26;366(1-2):37-52

Localization of the human tyrosine hydroxylase gene to 11p15: gene duplication and evolution of metabolic pathways. Craig SP, et al. **Cytogenet Cell Genet** 1986;42(1-2):29-32

Time course of the changes of TH mRNA in rat brain and adrenal medulla after a single injection of reserpine. Biguet NF, et al. **EMBO J** 1986 Feb;5(2):287-91

Evidence for a specific effect of BHT 920, an azepine derivative, on tyrosine hydroxylase in the dopaminergic system of the rat. Jennewein HM, et al. **Eur J Pharmacol** 1986 Apr 29;123(3):363-9

Electron microscopic analysis of tyrosine hydroxylase, dopamine-beta-hydroxylase and phenylethanolamine-N-methyltransferase immunoreactive innervation of the hypothalamic paraventricular nucleus in the rat. Liposits Z, et al. **Histochemistry** 1986;84(2):105-20

Distribution of tyrosine hydroxylase and neuropeptide Y-like immunoreactive neurons in rabbit medulla oblongata, with attention to colocalization studies, presumptive adrenaline-synthesizing perikarya, and vagal preganglionic cells. Blessing WW, et al. **J Comp Neurol** 1986 Jun 8;248(2):285-300

The distribution of tyrosine hydroxylase, dopamine-beta-hydroxylase, and phenylethanolamine-N-methyltransferase immunoreactive neurons in the feline medulla oblongata. Reiner PB, et al. **J Comp Neurol** 1986 Jun 22;248(4):518-31

A monoclonal antibody against tyrosine hydroxylase: application in light and electron microscopy. Semenenko FM, et al. **J Histochem Cytochem** 1986 Jun;34(6):817-21

An improved method for tyrosine hydroxylase immunolabeling of catecholamine cells in whole mounted rat retina. Versaux-Botteri C, et al. **J Histochem Cytochem** 1986 Jun;34(6):743-7

A simplified 14CO2-trapping microassay for tyrosine hydroxylase activity. Shen RS, et al. **J Neurosci Methods** 1986 Apr;16(2):163-73

Inhibitory action of hydralazine on catecholamine-synthesizing enzymes prepared from bovine adrenal medulla. Morita K, et al. **Jpn J Pharmacol** 1986 Mar;40(3):445-53

In situ activity and phosphorylation of tyrosine hydroxylase in the median eminence. Porter JC. **Mol Cell Endocrinol** 1986 Jun;46(1):21-7

Dopamine autoreceptor regulation of the kinetic state of striatal tyrosine hydroxylase. Strait KA, et al. **Mol Pharmacol** 1986 Jun;29(6):561–9

Some catecholamine inhibitors do not cause accumulation of nuclear estrogen receptors in rat hypothalamus and anterior pituitary gland. Blaustein JD, et al. **Neuroendocrinology** 1986;43(2):143–9

Effect of 1–methyl–4–phenyl–1,2,3,6–tetrahydropyridine (MPTP) on striatal tyrosine hydroxylase and tryptophan hydroxylase in rat. Matsuda LA, et al. **Neuropharmacology** 1986 Mar;25(3):249–55

Anatomical evidence for interactions between catecholamine– and adrenocorticotropin–containing neurons. Baker H, et al. **Neuroscience** 1986 Feb;17(2):469–84

Restricted diffusion of tyrosine hydroxylase and phenylethanolamine N–methyltransferase from digitonin–permeabilized adrenal chromaffin cells. Kelner KL, et al. **Proc Natl Acad Sci USA** 1986 May; 83(9):2998–3002

[Catecholaminergic centers of the sheep encephalon. Immunocytochemistry. II. Mesencephalon and diencephalon] Tillet Y, et al. **C R Acad Sci [III]** 1986;302(5):151–6 (Eng. Abstr.) **(Fre)**

[Topography of the catecholamine neurons in the brain stem of the human fetus: an immunohistochemical study using antibodies to tyrosine hydroxylase] Takahashi H, et al. **No To Shinkei** 1986 Jan; 38(1):87–97 (Eng. Abstr.) **(Jpn)**

VASOPRESSINS

Bradykinin and vasopressin stimulate Na+–K+–Cl– cotransport in cultured endothelial cells. Brock TA, et al. **Am J Physiol** 1986 Jun; 250(6 Pt 1):C888–95

Phorbol esters, vasopressin and angiotensin II block alpha 1–adrenergic action in rat hepatocytes. Possible role of protein kinase C. Garcia–Sainz JA, et al. **Biochim Biophys Acta** 1986 Jun 16;887(1):69–72

Homologous and heterologous desensitization of one of the pathways of the alpha 1–adrenergic action. Effects of epinephrine, vasopressin, angiotensin II and phorbol 12–myristate 13–acetate. Garcia–Sainz JA, et al. **Biochim Biophys Acta** 1986 Jun 16;887(1):73–9

Vasopressin and/or glucagon rapidly increases mitochondrial calcium and oxidative enzyme activities in the perfused rat liver. Assimacopoulos–Jeannet F, et al. **J Biol Chem** 1986 Jul 5; 261(19):8799–804

Inhibition by lithium of the hydroosmotic action of vasopressin in the isolated perfused cortical collecting tubule of the rabbit. Cogan E, et al. **J Clin Invest** 1986 May;77(5):1507–14

Fastigial nucleus stimulation and concurrent activation of cardiovascular receptors; differentiate effects on arterial pressure, heart rate and vasopressin release. Del Bo A, et al. **J Hypertension [Suppl]** 1984 Dec; 2(3):S49–51

Pressor effect of centrally administered neuropeptide Y in rats: role of sympathetic nervous system and vasopressin. Vallejo M, et al. **Life Sci** 1986 May 19;38(20):1859–66

Effects of dopamine and vasopressin on histamine–induced increases in macromolecular permeability in the canine forelimb. Adamski SW, et al. **Microcirc Endothelium Lymphatics** 1985 Feb;2(1):27–39

Central adrenergic control of vasopressin release. Brooks DP, et al. **Neuroendocrinology** 1986;42(5):416–20

Dorsal medullary oxytocin, vasopressin, oxytocin antagonist, and TRH effects on gastric acid secretion and heart rate. Rogers RC, et al. **Peptides** 1985 Nov–Dec;6(6):1143–8

Role of cholecystokinin in corticotropin release: coexistence with vasopressin and corticotropin–releasing factor in cells of the rat hypothalamic paraventricular nucleus. Mezey E, et al. **Proc Natl Acad Sci USA** 1986 May;83(10):3510–2

VASOTOCIN

Ultrastructural characterization of neurosecretory fibres immunoreactive for vasotocin, isotocin, somatostatin, LHRH and CRF in the pituitary of a teleost fish, Poecilia latipinna. Batten TF. **Cell Tissue Res** 1986; 244(3):661–72

Plasma levels of arginine vasotocin, prolactin, aldosterone and corticosterone during prolonged dehydration in the domestic fowl: effect of dietary NaCl. Arnason SS, et al. **J Comp Physiol [B]** 1986; 156(3):383–97

Calcium–independent stimulation of glycogenolysis by arginine vasotocin and catecholamines in liver of the axolotl (Ambystoma mexicanum) in vitro. Janssens PA, et al. **J Endocrinol** 1986 Apr;109(1):75–84

VIOLENCE

Acute care for the violent patient. Reid GW. **J Arkansas Med Soc** 1986 Apr;82(11):541–3

VISUAL PERCEPTION

Effects of lithium on visual perception in manic–depressive patients without acute symptomatology. Kropf D, et al. **Neuropsychobiology** 1986;15(1):34–42

WAKEFULNESS

Effects of brotizolam on the sleep–waking cycle of the cat. Kuhn FJ. **Arzneimittelforschung** 1986 Mar;36(3A):522–7

Alpha adrenergic system in medial preoptic area involved in sleep–wakefulness in rats. Mohan Kumar V, et al. **Brain Res Bull** 1986 Apr;16(4):463–8

Effects of melatonin and 5–methoxytryptamine on sleep–wake patterns in the male rat. Mirmiran M, et al. **J Pineal Res** 1986;3(2):135–41

[EEG studies in rats to determine the threshold levels of chlorpromazine with respect to the state of vigilance] Bergschicker R, et al. **Biomed Biochim Acta** 1986;45(3):401–12 (Eng. Abstr.) **(Ger)**

ZIMELIDINE

Comparison between a serotonin and a noradrenaline reuptake blocker in the treatment of depressed outpatients. Biochemical aspects. Nyström C, et al. **Acta Psychiatr Scand** 1986 Feb;73(2):133–8

The effects of desipramine, zimelidine, electroconvulsive treatment and lithium on rat brain biogenic amines: a comparison with peripheral changes. Karoum F, et al. **Eur J Pharmacol** 1986 Mar 4; 121(3):377–85

A double–blind comparative trial of zimelidine, amitriptyline, and placebo in patients with mixed anxiety and depression. Amsterdam JD, et al. **Pharmacopsychiatry** 1986 May;19(3):115–9

Acute effects of different antidepressant drugs on saliva secretion and accommodation range. Knorring L, et al. **Pharmacopsychiatry** 1986 May; 19(3):106–10

*U.S. GOVERNMENT PRINTING OFFICE: 1986-491-327:21004

The *Psychopharmacology Bulletin* is available on subscription from the Superintendent of Documents, Government Printing Office, Washington, D.C. 20402. Subscription price $19.00 per year for the United States. All other countries add $4.75 for postage. This price was in effect at time of printing. Prices are subject to change. Please make check or money order payable to the Superintendent of Documents. An annual subscription for four quarterly issues begins with the next issue following receipt of the order. Single copies and back issues may also be ordered from the Superintendent of Documents. The expiration date is printed on the top line of the address label. Change of address and complaints about non-receipt of issues should be sent to the Superintendent of Documents and should include the old address, preferably a mailing label, as well as the new address.
